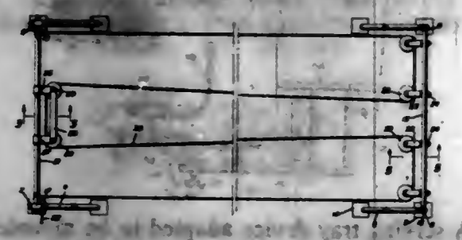
1. An article supporting rack comprising an elongated rectangular frame including a pair of relatively long longitudinal side pieces and a pair of relatively short end pieces connecting the longitudinal side pieces, outwardly extending portions projecting from the ends of the frame adapted to be penetrated by fastening means for mounting



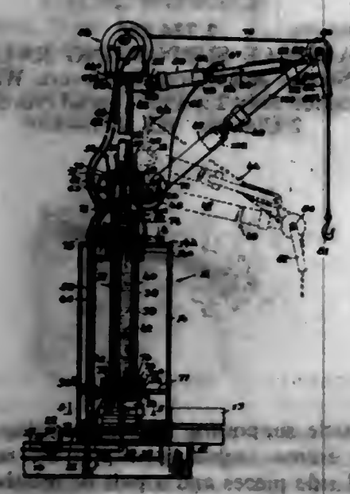
the rack in generally horizontal position against a wall or other vertical surface, and a pair of separate strips of sponge rubber substantially rectangular in cross section substantially filling the frame, one strip being secured to each of the inside surfaces of the longitudinal side pieces of the frame, said strips having the major portions of their inner surfaces disposed in closely spaced parallelism and each strip having the junctures of its said inner surface and each exposed outer surface right angular thereto beveled so that the strips combine to provide a narrow slit extending substantially the full length of the frame and having flaring lips opening on each outer surface adapted for the ready insertion of small articles to be held in gripping engagement by the opposed inner surfaces of the strips.

2,774,482

**CLOTHESLINE SUPPORT**

Nelson R. Haynie, Gothenburg, Nebr.

Application September 8, 1953, Serial No. 378,828
1 Claim. (Cl. 211—119.09)



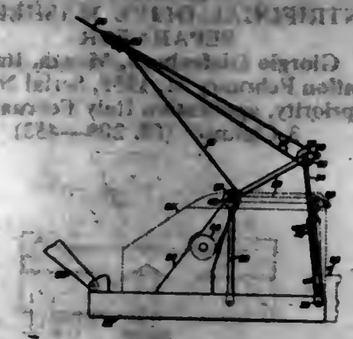
A clothesline supporting structure comprising a first pair of posts and a second pair of posts supported in the ground in a rectangular arrangement, a brace for each post also supported in the ground and with the upper ends of the braces spaced from an adjacent post, bearing blocks secured between each of said first pair of posts and their related braces, a shaft rotatably supported in said bearing blocks, a bar secured between the second pair of posts and their related braces, brackets attached respectively to the shaft and bar and having pulleys supported thereby, said shaft being rotatable in its related bracket, a line trained over the pulleys and having its ends attached to the shaft, and means for turning the shaft for winding the line thereon to tighten the line.

2,774,483

**HYDRAULIC CRANE DEVICE**

Clifford H. Raymond, Iron River, Mich.

Application September 11, 1953, Serial No. 379,661
17 Claims. (Cl. 212—35)



1. A hydraulic crane device comprising a vertical cylinder, a piston therein, a boom pivoted on said cylinder, a piston rod extending upwardly from the piston, a guy device pivoted on said piston rod and connected with the outer end of the boom, a first hydraulic motor for rotating said cylinder and with it said boom and guy, a second hydraulic motor carried by said piston rod adjacent said guy, a winch associated with a said second motor and driven thereby, a cable wound on said winch and passing over the outer end of said boom, and separate hydraulic means for extending and contracting said boom and guy device respectively.

2,774,484

**GANTRY**

Fred L. White, Marion, Ohio, assignor to The Osgood Company, Marion, Ohio, a corporation of Ohio

Application May 20, 1953, Serial No. 356,217
2 Claims. (Cl. 212—59)

1. A machine of the character described having a chassis, a frame pivotally mounted on said chassis for rotation about a vertical axis, a boom pivoted at one end to said frame at one side of said axis, and having its opposite end free, a counterweight removably mounted on said frame at the opposite side of said vertical axis from said boom, a gantry fixedly secured to said frame, a cylinder pivotally connected at its lower end to said frame, a piston reciprocable in said cylinder and having a piston rod secured thereto to project outwardly of said cylinder, a leg member pivotally connected at one end to said gantry, means pivotally connecting the projecting end of said piston rod to said leg member intermediate the ends of said leg member, the other end of said leg member having means whereby it may be connected to said counterweight so that said counterweight may be lifted and lowered, respectively, upon raising and lowering of said piston in said cylinder, and means extending serially between said gantry and leg member and the free end of said boom for raising and lowering said boom.

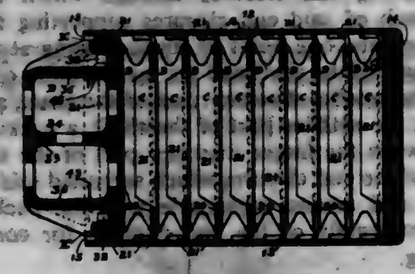
2,774,485

**RUBBER SHOCK ABSORBING MECHANISMS FOR RAILWAY CAR DRAFT RIGGINGS**

Vernon S. Danielson, Chicago, Ill., assignor to W. H. Miner, Inc., Chicago, Ill., a corporation of Delaware

Application May 13, 1954, Serial No. 429,604
4 Claims. (Cl. 213—46)

1. In a shock absorbing mechanism for railway draft rigging, the combination with a structure presenting vertically spaced, top and bottom, longitudinally extending, interior guide walls and laterally spaced, longitudinally extending side guide walls; of a column of cushioning units disposed in the space defined by said walls, said units being divided into groups, each consisting of a plurality of units, each of said units consisting of a pair of rectangular metal plates disposed at right angles to the axis of the column and a solid mass of rubber disposed between and bonded to said plates; interengaged bosses and sockets on said plates for keeping the units aligned with respect to each other; and means for stabilizing the column under compression comprising: rectangular aligning follower plates alternated with the groups of units; bosses and sockets on said follower plates interengaged with the sockets and bosses of the adjacent units to position the units with respect to the follower plates; and a pair of flanges on each edge of each follower plate disposed normal thereto, one of which flanges extends from one end of the edge into juxtaposition to the center of that edge and upstands from one face of the follower plate, and the other one of which flanges extends from the other end of that edge into juxtaposition to the center of the edge and upstands from the other face of the follower plate, said flanges having sliding engagement with said walls to maintain the follower and unit plates at right angles to said axis, thereby to stabilize the column under compression.



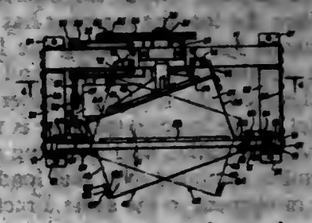
2,774,486

**DRAFT GEARS FOR RAILWAY DRAFT RIGGING**

Eric G. Fennell, Kenmore, N. Y., assignor to W. H. Miner, Inc., Chicago, Ill., a corporation of Delaware

Application July 18, 1955, Serial No. 522,596
7 Claims. (Cl. 213—45)

1. A draft gear for railway draft rigging comprising: a metallic casing of rectangular section closed at its rear end and open at its front end; a resilient column in said casing; a pressure applying plunger telescoped into said casing and projecting forwardly therefrom; a generally rectangular base on said plunger; grooves in the sides of said base extending from the top to the bottom of the base; a retainer bar disposed in each groove extending from end to end thereof and having a portion at each end of the bar extending beyond the groove; and triangular flanges at the front corners of the casing engaged by said extending portions of the retaining bars for holding the plunger in the casing, thereby to hold the gear together as a unit.



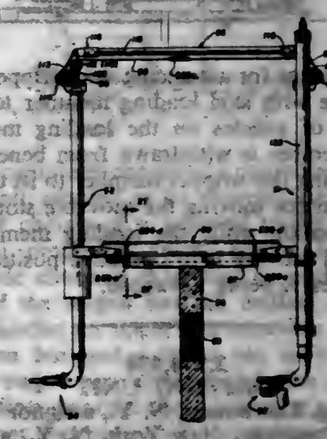
2,774,487

**PACK TURNOVER APPARATUS**

Clifford P. Rosenfeld, Hillsdale, N. J., and Leo C. Wilkens, Pearl River, N. Y., assignors, by mesne assignments, to Mickle Printing Press & Manufacturing Company, Chicago, Ill., a corporation of Delaware

Application July 30, 1953, Serial No. 371,364
20 Claims. (Cl. 214—1)

1. In apparatus for inverting piles of sheets, a box-like carrier opened at one side thereof and arranged for rotary movement about a horizontal axis passing axially through said side, said carrier being disposed transversely of and at an oblique angle with respect to said axis and in normal position presenting opposed parallel wall portions thereof in horizontal position to receive therein a pile of sheets, and means for rotating said carrier about said axis from said normal position through an angle of approximately 180° in a direction such that said carrier will assume a rearward inclination as it rotates whereby the pile of sheets is retained therein and inverted.



2,774,488

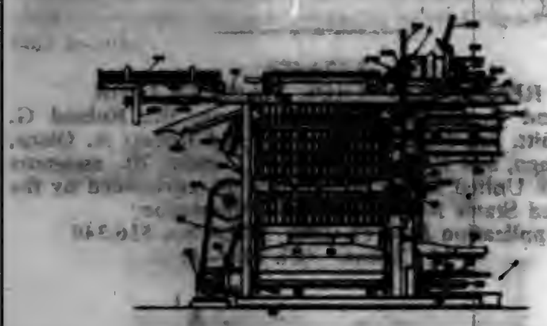
**REMOTE-CONTROL MANIPULATOR**

Raymond C. Goertz, Downers Grove, Ill., Roland G. Schmitt, Jr., Fort Worth, Tex., and Robert A. Olson, Chicago, and Robert B. Wehrle, Lemont, Ill., assignors to the United States of America as represented by the United States Atomic Energy Commission

Application June 17, 1955, Serial No. 516,340
11 Claims. (Cl. 214—1)

7. A remote-control manipulator comprising spaced generally parallel master and slave arms, a support extending between the arms, means mounting the arms on the support for longitudinal movement axial of the arms with respect to the support and for angular movement with respect to the support about axes at the support, a handle and a grasper connected with the lower ends of the master arm and the slave arm, respectively, a link interconnecting the upper ends of the arms to transmit angular movement from the master arm to the slave arm, the link moving toward or away from the support during axial movements of the arms, a first tie means extending from the upper end of the master arm, along the same to the support, along the support to the slave arm, and along the same to the lower end thereof, and a second tie means extending from the upper end of the slave arm, along the same to the support, along the support to the master arm, and along the same to the lower end thereof.

2,774,489



**STACKING AND UNSTACKING MACHINE**

Gustav Grigas, Honolulu, Territory of Hawaii, assignor to Hawaiian Pineapple Company, Limited, Honolulu, Territory of Hawaii, a corporation of Hawaii

Application December 17, 1954, Serial No. 476,021
16 Claims. (Cl. 214—6)

1. An apparatus for loading articles upon a pallet including feed means for supplying a stream of said articles, pallet support means, a loading member mounted for generally horizontal reciprocating movement over said pallet support means, said loading member receiving said articles from the feed means to carry them over the pallet and including a stop member mounted adjacent its forward edge movable to and from an operative position in

which it engages the foremost row of articles upon the loading member and an inoperative position in which it is clear of said articles, means for interrupting said supply stream when the loading member has received a load of articles, means for reciprocating the loading member to and from a position over the pallet, and means for stripping the articles from the loading member to form a layer upon the pallet as the loading member is withdrawn from its position over the pallet, said stripping means including a stripper member mounted over said loading member for reciprocating movement in the same direction as the load-

ing member, means for advancing said stripper member in timed sequence with said loading member to engage the rearmost row of articles on the loading member while the loading member is withdrawn from beneath the load and for retracting the stripper member to its original position, and means for moving the movable stop member to inoperative position while the loading member is being withdrawn and moving it to operative position while the loading member is being advanced.

---

2,774,490

**SHIPPING UNIT**

Allen K. Strong, Larchmont, N. Y., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

Application December 30, 1954, Serial No. 478,746

The terminal portion of the term of the patent subsequent to January 4, 1972, has been disclaimed

4 Claims. (Cl. 214—10.5)

1. A shipping unit comprising in combination a pile composed of laterally unsupported courses of filled bags of oblong shape each course containing at least one bag disposed longitudinally along one side of said pile and another bag disposed between the inner side thereof and the opposite side of the pile and adjacent courses having a longitudinally disposed bag on opposite sides of said pile and a lifting skid located under the bottom course of the pile, said skid consisting essentially of a pair of parallel hollow members extending longitudinally under said pile and located centrally under said longitudinally disposed packages and having walls sufficiently rigid to support at least 25% of the weight of the pile and an internal size sufficient to receive the forks of a lift truck and a flexible web connecting said hollow members and having a length such as to support the central area of said bottom course when they are lifted.

2,774,491

**ROTARY FEEDING DEVICE FOR PULP MAKING APPARATUS**

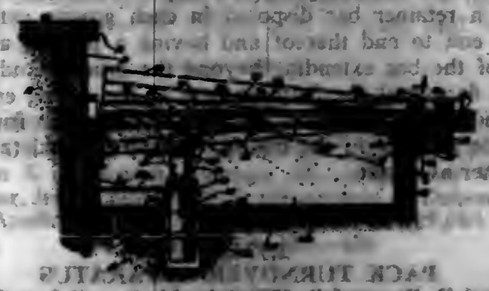
Hjalmar S. Mossing, New York, N. Y., assignor to American Defibrator Inc., New York, N. Y., a corporation of New York

Application July 23, 1953, Serial No. 369,936

3 Claims. (Cl. 214—17)

1. A rotary feeder comprising a rotor having material-holding pockets, a housing enclosing the rotor, the housing having inlet and delivery passages from which material is respectively received and delivered by the pockets, means for supplying steam under pressure into the housing, the rotor having a stepped shaft providing shaft-sections of various diameters, the shaft having relatively large diameter portions situated close to the body of the rotor and small diameter portions situated remotely therefrom, the housing having end closures through which the shaft extends, each of said end closures supporting the shaft at spaced points, one point of support being at the large diameter part of the shaft and the second point of support being at the smaller diameter part of the shaft, a bearing supporting the smaller part of the shaft, a packing interposed between the larger diameter part of the shaft and the parts of the end closures which surround said parts of the shaft, and means engageable with the packing and operable externally of the end closures for compacting the packing.

---



2,774,492

**TRUCK DOCK RAMP**

John B. Harrison, Memphis, Tenn., assignor to Dover Corporation, a corporation of Delaware

Application January 13, 1955, Serial No. 481,543

1 Claim. (Cl. 214—38)

In a loading dock including a road surface for highway trucks and a loading platform abruptly elevated above the road surface, ramp means adapted to support a highway truck adjacent the platform and comprising a stationary ramp support located below the road surface and elongated horizontally in generally parallel spaced relation to the adjacent edge of the loading platform, vertically extendable jacking means mounted below the road surface between the ramp support and the loading platform, a cylindrical torque tube adapted to rest on the jacking means in substantially parallel spaced relation to the adjacent edge of the platform, two pairs of horizontally spaced vertical bracket plates welded to the tube in substantially encircling relation thereto on opposite sides

of the longitudinal center of the tube, four parallel generally horizontal flanges fixed to the upper edges of said respective bracket plates, four anchor brackets disposed in a straight horizontal series substantially parallel to the torque tube and individually anchored to the ramp support in horizontal alinement with said respective torque tube bracket flanges, two longitudinal ramp units formed substantially as mirror images of each other; each ramp unit including two parallel longitudinal rails dimensioned lengthwise to extend horizontally from the ramp support substantially to the loading platform, a rectangular floor plate fixed to the upper edges of both rails and extending longitudinally for the full length of the rails and laterally beyond opposite sides of the respective rails, the longitudinal marginal edge of the floor plate on an inboard side thereof being turned sharply upward, and two pivotal support brackets attached to the underside of the respective rails adjacent one end of the ramp unit; the horizontal spacing between the longitudinal rails of the respective ramp units corresponding to the horizontal spacing between the two bracket flanges on the respective ends of the torque tube, four pivotal connectors pivotally connecting said respective anchor brackets individually to the respective support brackets on the two ramp units, means firmly securing said respective torque tube bracket flanges to the respective rails on the two ramp units, and removable plate means bridging the upturned marginal edges of the floor plates of the two ramp units to form a raised longitudinal curb between the two units.

2,774,493

**METHOD FOR UNLOADING VEHICLES**

August P. Winter, St. Vital, Manitoba, Canada

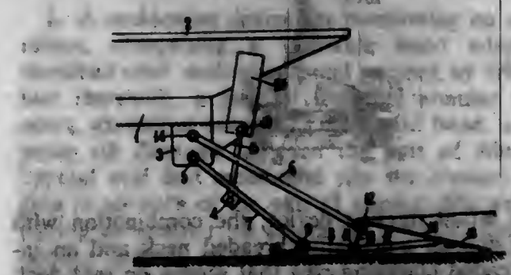
Application October 7, 1954, Serial No. 460,933

1 Claim. (Cl. 214—83)

The steps in a method of unloading granular material from a railway box car comprising upending the car by a hydraulic ram, lowering the upended car by exhausting the ram, and directing the exhaust of the ram to an impactor arranged to impact the lower end of the car by upward strokes on the bottom thereof.

---

2,774,494



**LIFTING ARRANGEMENT FOR LOADING VEHICLES**

Carl O. Malmström, Karlskrona, Sweden

Application September 27, 1954, Serial No. 458,656

Claims priority, application Sweden September 30, 1953

2 Claims. (Cl. 214—77)

1. An arrangement for lifting and lowering goods to and from a vehicle or the like comprising a lifting platform hinged at its inward end to the upper of two pairs of superposed arms of equal extended length, pivotally connected at one of their ends to the vehicle and pivotally interconnected at their other ends by a link, the lower of said pair of arms being formed in two parts connected by a knuckle permitting the parts of the arm to assume an upwardly directed obtuse angle when the outward ends of the arms rest on the ground and ensuring that the parts of the arm form a substantially straight line when the platform is raised, a cantilever arm mounted on the lower pivotal connection of the link for engagement with a stop on the platform to support the latter and lifting means such as an hydraulic cylinder and piston connected between the vehicle and the lower pair of said arms for raising and lowering said arms and thereby the platform.

---

2,774,495

**UNLOADING UNITS FOR TRAILER WAGONS**

Dietrich D. Regier, Henderson, Nebr.

Application June 3, 1955, Serial No. 513,102

3 Claims. (Cl. 214—83.36)

1. A self-contained completely operable and assembled unloading unit adapted to be mounted between a wagon box and the chassis of a wheeled trailer comprising: a unitary steel supporting frame having laterally spaced elongated side channels extending beyond the front and rear ends of the wagon box; an endless unloading conveyor web having an upper run movable upon the floor of the wagon box and a lower run movable below the floor of the wagon box within said frame and comprising a pair of endless sprocket chains carrying material-moving flights; a front conveyor shaft, rotatably mounted on the front extension of said frame channels, having a pair of sprockets secured thereto for engagement with said chains; conveyor chain tighteners carried on said frame front extension; power-actuated conveyor driving means carried on said frame front extension; a rear conveyor shaft, rotatably mounted on the rear extension of said frame, having a pair of drive sprockets secured thereto in engagement with said endless chains; power transmitting means, for rotating said rear conveyor shaft, operatively connected with said power-actuated driving means; said power-actuated driving means comprising a conveyor drive mechanism consisting of an electric motor, a crankshaft adapted to be driven by said motor, a connecting rod reciprocated by said crankshaft, a short link connecting said connecting rod with one arm of a bellcrank that is pivotally supported on said front frame extension, a link-rod connected at one end by a short link to the other arm of said bellcrank for transmitting reciprocatory motion to a pawl and ratchet wheel drive operatively connected with said rear conveyor shaft; and a power take-off shaft driving connection on the outer end of said crankshaft.

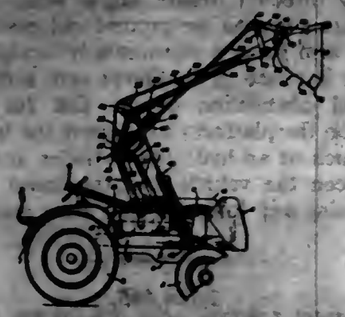
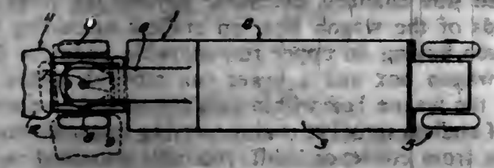
2,774,496

**TRACTOR MOUNTED HIGH LIFT LOADER**



Evan E. Durkins, Ottawa, Kans., assignor to Ottawa Steel, Inc., Ottawa, Kans., a corporation of Kansas

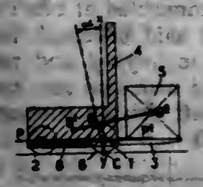
Application August 3, 1955, Serial No. 526,262



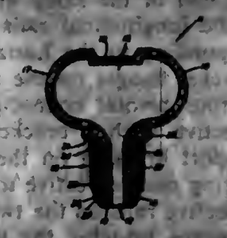
6 Claims. (Cl. 214—140)

1. In a material handling implement for attachment to a tractor, a frame, laterally spaced arms one on each side of the tractor and extending forwardly thereof, a bucket mounted adjacent the forward end of the arms and positioned adjacent the forward end of the tractor when the

arms are in lowered position; support links having lower ends pivotally connected to the frame, a crossbar extending transversely of the tractor and fixed to the upper portions of the support links, bearing means on the rearward portions of the arms and pivotally mounted on the crossbar for swinging movement of said arms; levers fixed relative to the bearing means and swingable with the arms, brace links pivotally connecting said levers with the frame in spaced relation to the support links, and hydraulically operated lifting means supported by the frame and connected to the arms intermediate the length thereof for raising and lowering said lifting arms.



2,774,497
NOTCHED GOOSENECK TRAILER CONSTRUCTION
William E. Martin, Kewanee, Ill.
Application April 16, 1953, Serial No. 349,159
15 Claims. (Cl. 214—506)



1. In a trailer, a bed, a hitch unit to connect said trailer bed with towing hitch means on a towing vehicle, said hitch unit incorporating a tongue connected with said trailer bed and extending outwardly away from said trailer bed, and loading ramps comprising side wings on said tongue disposed in spaced relation to said trailer bed, said side wings terminating intermediate the length of said tongue.

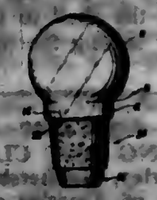
2,774,498
MATERIALS HANDLING FORK TRUCK
Jacques Cordes, Versailles, and Jean Desor, Paris, France
Application October 28, 1954, Serial No. 465,354
Claims priority, application France November 4, 1953
6 Claims. (Cl. 214—731)

1. Material handling fork truck comprising an underslung horizontal platform of relatively substantial weight embodied in the essential structure of said truck, the upper face of which platform lies in place somewhat below the longitudinal axis of the front wheel axle, means mounted on said platform for controlling the lifting and handling operations, load holding means comprising a fork having pivoted prongs; an apron member for supporting said pivoted prongs, this apron member comprising two sleeve members provided with transverse slots; two prongs the journals of which are force driven in said sleeves, these journals being provided with slots mating with the aforesaid slots; a pair of small-cylindrical bushings and a locking cap with a friction washer therebetween for holding in place said journals; a laminated spring extending through the slots of the sleeve members and the slots of the journals, this laminated spring connecting the two prongs; means for tensioning or loading the spring which, under normal conditions, holds the prongs in parallel relationship.

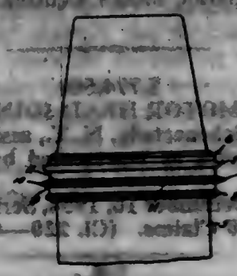
2,774,499
BOTTLE STOPPER
Claude H. Strickland, Edward D. Ehrets, and Donald Lee Robb, Cincinnati, Ohio, assignors to Schenley Industries, Inc., New York, N. Y., a corporation of Delaware
Application October 24, 1953, Serial No. 388,785
1 Claim. (Cl. 215—7)

A bottle stopper comprising a tubular shank having an open lower end and an open upper end, a hollow bulbous handle integral with the upper end and in fluid communication with the shank, said handle at the juncture with the shank forming an annular outstanding shoulder on the exterior of the upper end of the shank; a yieldable sleeve member circumposed about the shank for positioning in the neck of a bottle and rotatable relative to the shank to permit rotation of the handle with respect to the bottle when the shank is inserted into and removed from the neck of a bottle, said shank having an annular seat formed exteriorly adjacent its lower end, an annular elastic member having a lip fixedly circumposed in the seat against displacement therefrom and bearing against the lower end of the yieldable member to locate it against axial movement, said handle having opposing hollow sides and a top to accommodate the expanding contents of a bottle into which it is inserted and having a central recessed portion extending across the top and down the sides, said recessed portion being disposed at the center of the handle above and in line with the shank to receive a seal extending from the sides of the recessed portion down along the outside of the neck of a bottle and adapted to be fixed thereto at opposite points, and said handle having bulged ends forming hand grips to afford increased leverage for manual rotation of the handle.

2,774,500
INFANT NURSING DEVICE
Dino J. Bertini, Cleveland, Ohio
Application January 18, 1956, Serial No. 559,964
10 Claims. (Cl. 215—11)



1. In an infant nursing device, the combination with a bottle having an externally threaded neck and an internally threaded clamping ring that screws on said neck and that has a top flange that overlies the top of the bottle and defines a central opening, of a nursing nipple having

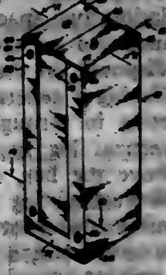


a hollow flexible apertured teat portion that projects through said opening and a base portion within said ring that forms a partition between the bottle and said teat portion and that includes a collapsible annular shoulder that underlies said flange and that is disposed between said flange and said bottle top, means providing a passage for liquid through said base portion to said teat portion, and means controlled by collapse of said shoulder by pressure applied thereto by said clamping ring for regulating the flow through said passage.

2,774,501
BOTTLE STOPPER
Dan Robb, Cincinnati, Ohio, assignor to Schenley Industries, Inc., New York, N. Y., a corporation of Delaware
Application September 21, 1953, Serial No. 381,300
7 Claims. (Cl. 215—46)

3. A bottle stopper comprising a head, an outwardly tapering shank projecting from said head, there being a peripheral groove formed in said shank adjacent to and spaced inwardly from the projecting end thereof, an open ended yieldable shell slidably circumposed about said shank, said shank being slidable with respect to said shell to expand and contract the latter for sealing and unsealing a bottle opening, and a resilient ring having an internal rib and circumposed about said shank with said rib seated in said groove, said ring being in engagement with said shell to prevent the removal of the latter from said shank, the groove having a side wall facing the head and disposed normal to the axis of the shank and on which the rib is seated to urge the ring into engagement with the shell, said rib being narrower than said groove to permit movement of said ring and shell relative to said shank.

2,774,502
CUSHIONING BAND FOR CYLINDRICAL OBJECTS
Edward J. Nowak, Eagle River, Wis.
Application May 22, 1953, Serial No. 356,551
2 Claims. (Cl. 215—100)

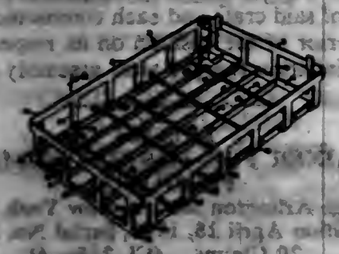


2. A cushioning device for positioning on a cylindrical object, comprising a yieldable band adapted to be stretched over such object and secured by frictional contact therewith, a pair of identical annular ribs spaced apart, extending outwardly from said band, a central annular rib disposed between the pair of ribs, extending beyond said first mentioned ribs for contact with a surface in advance of the pair of annular ribs and said band having an annular slit extending inwardly from the outer surface thereof at the base of said central annular rib lending flexibility to said central annular rib.

2,774,503
CUSHIONED SHIPPING CRATE
Clyde Maurice Moore, Richmond, Va., assignor to Moore Industries, Inc., Richmond, Va., a corporation of Virginia
Application September 19, 1951, Serial No. 247,236
5 Claims. (Cl. 217—63)

1. A demountable shipping crate comprising; separable panels defining the walls of said crate, means releasably joining adjacent edges of adjacent panels, an inflatable cushion fixed to the inner face of each of said panels, said cushions covering substantially the entire area of their respective panels and fixed thereto around their peripheral portions, and valve means in each panel accessible from the exterior of said crate and each communicating directly with the interior of the cushion on its respective panel to provide for inflation thereof after assembly of said crate.

2,774,504
CONTAINER FOR LIQUID COMMERCIAL PRODUCTS
George Arlington Moore, New York, N. Y.
Application April 28, 1955, Serial No. 504,468
20 Claims. (Cl. 220—4)



1. A square elongated heavy duty container of aluminum sheet of relatively heavy guage comprising an assembly of two pre-shaped structural components formed of said sheet that provide initially, six stably formed enclosure walls of said container consisting of four side walls arranged in opposing pairs and two opposed end walls, the bottom end walls being constructed two-ply in general and being provided with wall buttress portions bonded to surface portions of the upper wall layer thereof, two opposed side walls having marginal side flanges bent inwardly along their respective opposing vertical corner edges with bottom ends of said flanges disposed in abutment with the upper surface of said upper wall layer of the bottom end wall adjacent free corner edges thereof, the exterior surfaces of said flanges being in coplanar relationship with surfaces of said edges, two opposed alternate side walls being disposed in surface contact with the entire exterior surfaces of said marginal and corner edges, said alternate walls having marginal flanges bent inwardly over marginal surface portions of said pair of first mentioned side walls including a pair of lower transverse marginal flanges bent upwardly from two opposed corner edges of the exterior wall layer of said bottom end wall, the top end wall opposed to said bottom end wall being integral of the first mentioned two opposed side walls and being flatly disposed between two upwardly bent marginal flange portions thereof and provide two outwardly ex-

posed by-pass open ports of the top end wall co-operatively provided by outwardly spaced enclosure wall surface sides of upper wall portions of said alternate side walls including upper portions of said flanges thereof, said pair of by-pass open ports providing means of access into the interior of said container for bar apparatus used in bonding the constructed seams formed of the assembly of said two structural components, the surfaces of said seams being provided with pre-applied resinous adhesive, after which, said ports may be closed and sealed by bonding together engaged surfaces of bent wall portions that provides the open ports and that are disposed in parallel, each opposed pair of wall portions being bent in alternate direction to be in overlapped surface to surface relationship, engaged surfaces of which have pre-applied epoxy resin adhesive compound thereupon and upon being cured, effects the bonding thereof including other said constructed seams of the container.

2,774,585
**WORK TRAY**
Harold N. Ipsen, Rockford, Ill.
Application July 1, 1953, Serial No. 365,997
3 Claims. (Cl. 220—4)

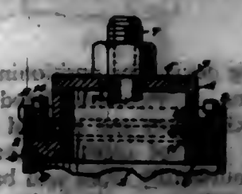
1. A work tray comprising a generally rectangular horizontal frame including two spaced parallel side bars, a plurality of arms mounted on each of said bars, each of said arms being disposed on the outside of the corresponding bar and having a generally L-shape with the horizontal leg projecting in through an opening in the bar and with the vertical leg spaced outwardly from and projecting up above the bar, an enlargement rigid with the end of said vertical leg inside said bar and larger than said opening to prevent the arm from shifting outwardly relative to the bar, a generally rectangular rail wider than and spaced above said frame and fastened to the upper ends of the vertical legs of said arms, and a plurality of bars disposed between said side bars parallel to the latter and rigidly connected to said frame whereby all of said bars cooperate to form the work supporting bottom of the tray.

---

2,774,586
**DOOR CONSTRUCTIONS FOR LAUNDRY MACHINERY**
Hermann Miller, Detroit, Mich., assignor to Miller Laundry Company, Detroit, Mich.
Application May 3, 1956, Serial No. 582,420
6 Claims. (Cl. 220—24)

1. In a combination including a horizontal cylindrical shell having a front door opening where vertical edges are near the flat ends of the shell and whose horizontal edges are well above and well below the center axis of the shell to define a large low front opening, and including a front door construction for closing and exposing said opening, said door construction including an upper half hinged at its upper edge to the shell near but above the upper edge of the door opening and a lower half having its lower edge sometimes positioned near but below the lower edge of the door opening, with both halves hinged to each other near the center of the opening, the construction being such that the upper half can swing up on its upper edge as a pivot to expose the opening and at the same time and therewith the lower half can swing up on its upper edge as a pivot to overlie the upper half, and both halves can swing down together to form a continuous door to close the opening and including means for swinging the halves upwardly together or downwardly together to expose or close the opening, in such a combination sealing means for moving the halves after they are in position to close the opening towards the axis of the shell to seal the halves tightly against the shell for sealing the opening then closed by the door.

---

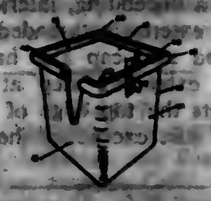


2,774,597
**SEALING DISC CLOSURE**
Charles Warren Hurley, Gaithersburg, Md., assignor to the United States of America as represented by the Secretary of the Army
Application December 10, 1954, Serial No. 474,629
13 Claims. (Cl. 220—37)

1. A closure for a container, comprising an inverted cup-shaped plug having an end wall and a screw threaded side wall, said end wall being formed with an upwardly directed non-circular recess, a resilient disc having a central portion formed with a depending non-circular hollow boss providing an upwardly directed non-circular recess, said boss being complementary to said recess of said end wall and being non-rotatably seated therein, said disc having an annular free edge portion disposed concentrically outwardly of said plug, a substantially rigid plug actuating member, said member having a non-circular boss below the same, said last-named boss being complementary to said recess of said disc and being fixedly seated therein, means securing said actuating means to said disc, and separate means securing said disc and plug together.

---

2,774,598
**MOTOR HEAD JOINT**
John E. Larsen, Schenectady, N. Y., assignor to the United States of America as represented by the Secretary of the Army
Application December 10, 1954, Serial No. 474,628
10 Claims. (Cl. 220—46)



9. In a motor head seal a tube having a series of circumferentially spaced apertures in its wall near one end thereof, a tubular head member comprising a cap portion and an outwardly extending circular flange integral with said cap portion, said flange having a diameter substantially the same as the internal diameter of said tube, said

flange having a channel formed in the periphery of its cylindrical surface an O-ring adapted to fit within said channel and forming a sealing means between said flange and the inner wall of said motor tube, a shear ring having a plurality of circumferentially spaced threaded bores formed therein, a pair of semi-circular snap ring segments having circumferentially spaced openings formed therein, said segments provided with outwardly extending ears integral to the outer periphery of said snap ring segments, each said ears being disposed within a respective aperture in said tube, and cap screws passing through openings in said segments and threadedly engaged in the threaded holes in said shear ring to bear against the upper surface of said flange and maintain said head member against axial movement outwardly of said one end.

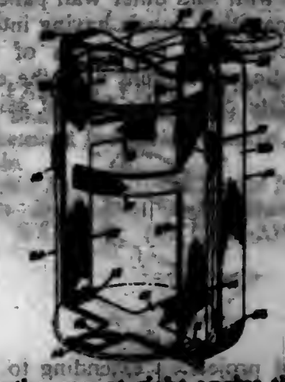
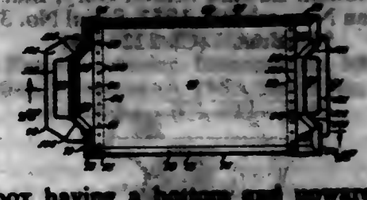
2,774,509
**PROTECTIVE STRIP FOR CONTAINERS**
Carl W. Knobloch, Erie, Pa., assignor to Erie Art Metal Company, Inc., Erie, Pa., a corporation of Pennsylvania
Application November 9, 1953, Serial No. 390,933
2 Claims. (Cl. 220—73)



1. In combination, a buffer strip for a container and an open top container having upwardly directed walls comprising a continuous sheet of material bent back on itself to form a first and a second leg, the first leg being bent away from the second leg to form an extending portion, and the second leg bent to form a second extending portion generally parallel to and spaced from the first extending portion, said extending portions then bent toward each other and terminating in end portions in spaced relation to each other and to said parallel portions to form a groove therebetween, and resilient buffer means disposed in said groove, said buffer means comprising a buffer strip, a holding section, and an intermediate section between said buffer strip and said holding section, said holding section and said buffer section retaining said end portions in supporting relation thereto, said buffer portion, said holding portion, and said intermediate portion defining two grooves, said end portions being disposed in said grooves, said strip being formed to conform to the periphery of said container and attached to the inner periphery thereof, said first leg being attached to the inside of said container around the upper peripheral edge and the part bent out of said first leg being disposed above said upwardly extending sides and extending outwardly therefrom, the upper edge of said container and said buffer strip extending outwardly from the upper edge of said container and around the entire periphery of said container.

---

2,774,510
**PAINT CAN HOLDER**
Arthur L. Lagen, Charlottesville, Va.
Application February 20, 1956, Serial No. 566,478
6 Claims. (Cl. 220—90)



A combination paint can holder, brush wiper and brush holder comprising an elongated strip adapted to pass under the paint can, the ends of said strip being bent upwardly at right angles to the portion thereof below the paint can, and extending upwardly beyond the top of the can, one end of said strip being bent across the top of the can in freely spaced relationship thereto forming a brush wiper, first means for securing the ends of said brush wiper to the other end of said strip, said other end of said strip being bent outwardly away from said can and downwardly parallel to itself to form a handle having inner and outer portions freely spaced apart, second means for securing the end of said handle portion to the portion of said strip passing under the can, a base supporting strip secured to the portion of said first strip

passing under the can at right angles thereto, and a pair of side strips secured to the ends of said first strip on opposite sides of the can, said side strips being bent around the periphery of the can whereby to engage the same snugly, and a pair of laterally spaced upwardly extending ears secured to the upper end of said handle portion and adapted to receive therebetween the handle of the paint brush.

---

2,774,511
**TOTE BOX**
Benjamin David Mandel and Sandra M. Scherr, Los Angeles, Calif.
Application January 11, 1956, Serial No. 493,366
1 Claim. (Cl. 220—97)

A tote box having a bottom and upwardly and outwardly extending opposed side walls and end walls, one of said walls comprising a first centrally located outwardly open channel-shaped portion of substantial width lying inwardly of the normal plane of said wall, the wall opposite said one wall comprising a centrally located inwardly open channel-shaped portion of substantial width lying outwardly of the normal plane of its wall, said channel-shaped portions extending the height of said walls and being open-ended at the top thereof, said outwardly open channel being also open-ended at the bottom thereof, whereby a plurality of said boxes may be nested one within the other with their corresponding elements superimposed or stacked one upon the other with an outwardly facing channel overlying an inwardly facing channel and interengaging means at the top and bottom portions of said opposed walls preventing relative lateral displacement between stacked boxes comprising tongue segments on the upper edges of said opposed walls, said tongue ends having upstanding portions engaging side portions of the channel of a similar box stacked thereon.

---

2,774,512
**BOTTLE CARRIER**
Robert M. Dunning, St. Paul, Minn., assignor to Waldorf Paper Products Company, St. Paul, Minn., a corporation of Minnesota
Application September 22, 1951, Serial No. 247,878
2 Claims. (Cl. 220—115)

1. A bottle carrier including a pair of sections hingedly connected together, each section including an end

wall panel, an outer wall panel, a second end wall panel, and five partition walls all foldably connected in consecutive relation along generally parallel fold lines, said end wall panels and partition panels being of substantially one-third the width of the outer wall panels, the intermediate panel of said five partition panels being secured in surface contact with said outer wall panels, the outermost of said five partition panels having integral inwardly directed projections on the planes of the partition panels each extending to a point near the center line of the said intermediate panel, the first of said five panels

having an outward projection extending to a point near the center line of said intermediate panel, fold lines connecting the outermost partition panels and projections of one section with the corresponding parts of the other section, and a bottom member, said bottom member including a glue flap overlapping one of said outer wall panels and secured thereto, said glue flap having a notch in its free end, one of the second partition panels of said five having a projection on its lower edge intermediate its side edges forming a vertical extension thereof of similar shape to said notch.

---

2,774,513

**SHAKER FOR A COMMODITY**

Solomon Edward Miller, Gary, Ind.

Application November 8, 1952, Serial No. 319,451

9 Claims. (Cl. 222—99)

1. A device of the kind described comprising a hollow outer member, a hollow non-collapsible inner container member mounted for movement in the outer member, said inner container member being provided with a passage to permit dispensing of a commodity therefrom, and an actuator carried by one of the members for actuating the inner container member.

---

2,774,514

**COMBINATION SALT AND PEPPER SHAKER**

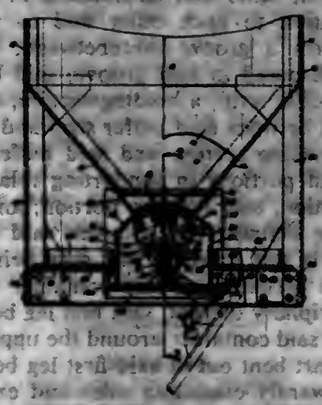
Donald Sheppard, Ottawa, Ontario, Canada, assignor of one-half to Wilfred Charron, Eastview, Ontario, Canada

Application January 25, 1954, Serial No. 406,040

2 Claims. (Cl. 222—142.9)

1. A combination salt and pepper shaker comprising a cylindrical container open at top and bottom with a horizontal platform spaced a short distance above the open bottom of said container, said container being exteriorly threaded about its open top, a hollow tube coaxial with said cylindrical container rising from said platform to the level of the top of said container and a pair of radial wings extending from diametrical opposite sides of said tube to the wall of the container dividing the section of said container above said platform into two companion compartments each with an open top and a closed bottom; a semi-circular shutter valve normally covering the open top of one compartment; a spindle stem secured to said valve and depending through said tube and extending below said platform; manually operable, spring retracted mechanism housed in said container below said platform engaging the lower end of said valve spindle stem for rotating it through 180 degrees; a closure plate threadedly attached to the open bottom of said cylindrical container and enclosing said mechanism; and a perforated shaker cap applied to the top of said cylindrical container to overlie and enclose said shutter valve in close fitting non-binding relation, said cap being readily removable for refilling the compartments without interference by the shutter valve or its operating mechanism, said perforated shaker cap having a depending, interiorly threaded skirt that screws on the exteriorly threaded top of said cylindrical container and said cap also having an interiorly disposed inwardly extending step at its junction with said skirt that abuts the top edge of the container, the depth of said step just exceeding the thickness of said shutter valve.

---



2,774,515

**TRANSPORTATION CONTAINERS FOR BULK MATERIALS**

Carl E. Johannesen and Albert S. Noble, Cleveland, Ohio, assignors to The Youngstown Steel Door Company, Cleveland, Ohio, a corporation of Ohio

Application July 20, 1953, Serial No. 368,978

6 Claims. (Cl. 222—185)

1. A container for bulk materials comprising a supporting base, a bottom discharge opening, a frame extending around and downwardly below said discharge opening, a shaft journalled in said frame, linkage secured to and operable by said shaft, a door hingedly mounted upon said frame below said discharge opening for closing said frame, said door swinging downwardly when being opened, means connecting said door to said linkage, a sleeve journalled in said container and mounted upon said shaft for rotation relative thereto about the axis of said shaft, and a rotary valve for closing said discharge opening, said valve being mounted to and rotatable with said sleeve, said valve rotating downwardly when being opened, said shaft and said sleeve being operable independently of each other to open and close said door and said valve.

2,774,516

**APPARATUS FOR WEIGHING AND PACKAGING POWDER OR GRANULAR MATERIAL**

Ejler Jensen, Copenhagen, Denmark, assignor to F. L. Smidth & Co., New York, N. Y., a corporation of New Jersey

Application December 13, 1946, Serial No. 682,967

6 Claims. (Cl. 222—195)

1. In apparatus for weighing and packaging pulverulent material, the combination of a supply bin for the material and having means for maintaining the material in a fluidized condition, an elongated distributing tube connected to the discharge outlet of the supply bin, a plurality of discharge means leading from the distributing tube at longitudinally spaced points, and a riser pipe extending upwardly from the tube at a point remote from the supply bin for equalizing the pressure head of fluidized material flowing to the discharge means.

---

2,774,517

**FLUID DISPENSER DEVICE**

James E. Teagarden, Altadena, and Benjamin D. Mankin, Los Angeles, Calif.

Application September 19, 1952, Serial No. 310,096

7 Claims. (Cl. 222—385)

1. A fluid dispensing device comprising a cylinder, an internal projection means in the wall of the cylinder, a resilient piston operatively mounted in the cylinder, a resilient external projection means associated with the piston for limiting its stroke in the cylinder, the resiliency of the piston and the external projection means being adapted for snapping them past the internal projection means into the cylinder, a valve mounted in the wall of the cylinder for valving fluid therethru, a second valve for valving fluid out of the cylinder, and a spring means for urging the piston through a return stroke.

---

2,774,518

**MOLDABLE CONE BELLOWS**

Norman Gerome, New York, N. Y.

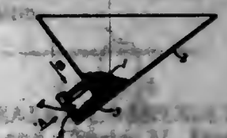
Application June 8, 1953, Serial No. 359,124

16 Claims. (Cl. 222—386)

1. A vertically compressible bellows comprising a single body of material shaped to form a series of concentric steps converging upwardly, each step having a generally upright wall and a generally horizontal wall, said bellows having radial grooves ascending with the steps, and said grooves being deeper than the individual steps, said grooves narrowing to accommodate the reduction in peripheral length of the steps when the bellows is compressed, the lower end of each of said grooves terminating in an upright wall to yield outwardly when the bellows is compressed.

---

2,774,519



**TABLET FEED HOPPERS**

Leslie Aldred, Blackley, Manchester, England, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain

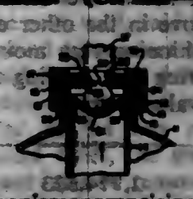
Application July 31, 1952, Serial No. 301,864

Claims priority, application Great Britain August 3, 1951

6 Claims. (Cl. 222—319)

3. Tablet feed mechanism comprising a hopper having a base sloping relative to the horizontal, an outlet passage of limited depth leading from the lower end of said hopper, a brush movably mounted adjacent said outlet passage, the longitudinal extent of said brush being located in a plane which is at right angles to the plane of the base and extending transversely thereof, the bristles of said brush extending toward but terminating short of the plane of said base whereby said brush partially closes said outlet passage, and means for oscillating said brush in said plane in which the longitudinal extent of said brush is located.

---



2,774,520

**VALVE MECHANISM**

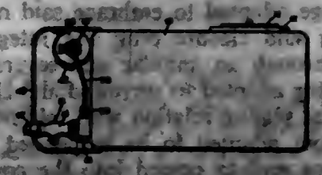
Le Roy C. Lansley, Birmingham, Mich.

Application November 4, 1955, Serial No. 544,912

6 Claims. (Cl. 222—394)

1. A valve mechanism comprising a resilient housing having the least one thin stretchable wall under tension, with a ball valve in contact therewith, another wall of said housing having an opening therein which serves as a valve seat for said ball, said ball being normally held on said seat by the tension of said first named wall, and said first named wall of said housing having a plurality of apertures therein.

---

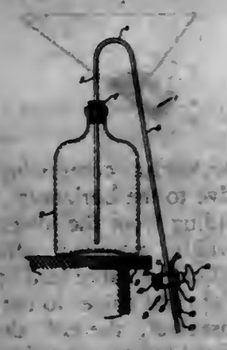


2,774,521

**BEVERAGE CONTAINER AND DISPENSER**

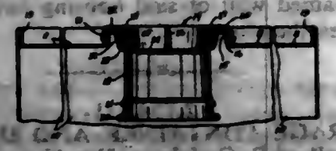
Delbert B. Creighton, Van Nuys, Calif.

Application March 4, 1955, Serial No. 492,138



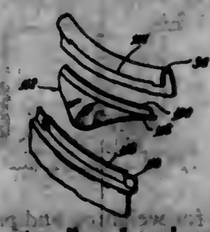
8 Claims. (Cl. 222—399)

1. A storage container and dispenser for draught beer, which comprises a generally rectangular corrosion resistant tank, the height of said tank being less than the conventional spacing between shelves of a household



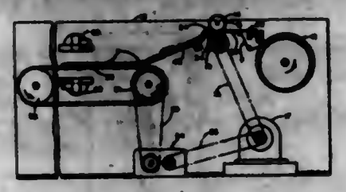
refrigerator, a fill plug in the upper wall of said tank, a fitting in the lower portion of one end wall of said tank, a spigot threaded into said fitting and including sealed valve means for drawing beverage from said tank, a U-shaped handle mounted on said tank and bridging over said one end wall, mounting means provided on said handle, a gas pressure cartridge mounted in said mounting means, a tube connecting said cartridge to said fitting, and passage means in said fitting to effect communication between said tube and the inside of said tank.

2,774,522
SIPHONS
Mark Cosulich, San Francisco, Calif.
Application December 5, 1955, Serial No. 550,941
1 Claim. (Cl. 222—416)



A siphon of the character described, comprising a tube bent to present a gooseneck and two legs projecting therefrom, one leg being longer than the other one and having a transverse bearing with a conical inner face formed integral therewith so as to communicate with the leg passage, a conical valve stem revolvable in the bearing and having a ground fit therewith and having a transverse passage adapted for lining up with the leg passage when the valve stem is firmly seated in the bearing, a handle at the larger end of the valve stem, the stem having an annular groove in the other end spaced from the bearing, and a cushioning ring mounted in said groove and normally clearing the bearing to allow of partial withdrawal of the valve stem.

2,774,523
PULL SPOUT CLOSURE FOR CONTAINERS
Glenn T. Rishe, Auburn, Ind., assignor to Rishe Metal Products Corporation, Auburn, Ind., a corporation
Application June 8, 1953, Serial No. 360,061
12 Claims. (Cl. 222—525)



1. A pull spout closure unit for a container having an opening surrounded by an upstanding neck, comprising a closure member having a closure plug and an outer sealing flange adapted to embrace said neck, said flange surrounding said closure plug and integrally connected therewith through an annular and severable diaphragm, a retainer ring adapted to surround and clamp said flange in permanent sealing relation with said neck, and a tubular pull spout adapted to be suspended by said sealing flange at one end to extend into the container when in retracted position and slidable through said opening into sealing engagement with said sealing flange at its opposite end to project outwardly from said container in pouring position upon said diaphragm being severed.

2,774,524
COMBINATION OF COOKING UTENSIL AND SPOUT
Walter W. Krause and Fred C. Schwenker, Chicago, Ill., assignors to Dormeyer Corporation, Chicago, Ill., a corporation of Illinois
Application November 1, 1954, Serial No. 466,949
7 Claims. (Cl. 223—87)

1. In a cooking utensil, a housing member having an inset upper marginal edge, a cooking well having an outwardly and downwardly turned flange adapted to engage said marginal edge, and a spout member having an upwardly turned flange adapted to removably engage between said marginal edge and said downwardly turned flange to maintain said housing member and cooking well in mutually stable alignment.

2,774,525
PLEATING APPARATUS
William H. Angevine, Jr., Bristol, R. I., assignor to Cranston Print Works Company, Cranston, R. I., a corporation of Rhode Island
Application July 1, 1955, Serial No. 519,386
5 Claims. (Cl. 223—32)

1. A pleating machine for continuously pleating an extended web of sheet material in a direction transversely thereof comprising a frame, a pair of cylindrical driven rolls mounted on said frame and having a pressure nip for feeding a web of sheet material therethrough, at least one of the said rolls having a plurality of laterally spaced peripheral grooves therein, a plurality of flat spring strip members extending through said grooves between said rolls, the flat side of said members being generally parallel to the floors of said grooves, and web restraining means providing a longitudinally extended passageway of substantial thickness extending from adjacent the nip of said roll means for receiving and folding said web as it is fed from said roll means and confining said web in a direction generally perpendicular thereto continuously to provide adjacent, successive, irregular pleats therein.

2,774,526
GARMENT HANGER
Emily I. Reuter, Ashland, Ohio
Application September 7, 1954, Serial No. 454,494
4 Claims. (Cl. 223—89)

1. An adjustable clothes hanger comprising a pair of substantially U-shaped hanger elements each including a pair of legs interconnected by a web, the legs of one member slidably telescoping within the legs of the other, and a supporting hook assembly movably mounted on one of the legs for suspending the hanger, said supporting hook assembly including an elongated resilient flat strip having slots adjacent each end thereof of substantially the same cross-sectional shape as said one of said legs, said one of said legs being received in said slots and normally retaining said strip in a bowed position, and a supporting hook attached to said strip.

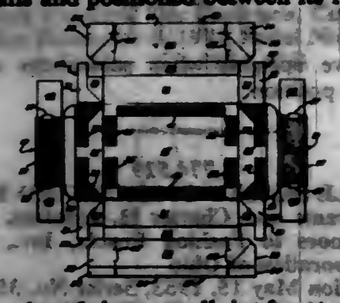
2,774,527
GARMENT HANGER COVER
Arden L. Iverson, Lincolnwood, Ill., assignor to Para-Lex Products Company, Chicago, Ill., a corporation of Illinois
Application November 12, 1953, Serial No. 391,436
2 Claims. (Cl. 223—98)

1. In a shielded garment hanger unit including a wire garment hanger of flexible lightweight construction provided with a suspending stunk having arms diverging downwardly therefrom interconnected at the lowermost ends thereof with a cross strut, the provision of a rigidity imparting protective cover fixedly applied in intimate and tight bracing relation to substantially the entire length of the arms and strut of said hanger, said cover having a body portion of substantially the same outline and outer dimensions of said hanger as defined by the arms and strut thereof, the lowermost margin of said body portion extending downwardly below said strut throughout at least substantially the longitudinal length thereof, a first zone of pressure sensitive adhesive extending substantially the full width of said body portion near the bottom margin thereof and being of sufficient width to overlie said strut above and below the same and further being in intimate contact with a side surface of said strut throughout at least substantially its entire length, a pair of wings integrally formed with converging margins and integral with said body portion and each being closely folded about an arm of said hanger in intimate bracing contact therewith and into face-to-face contact with said body portion, said wings being provided with vertically directed centrally located margins in overlapped relation, the lowermost margins of said wings substantially coinciding with the lowermost margin of said body portion, and a second zone of pressure sensitive adhesive on the innermost faces of said wings in adhering contact with said first zone to position said wings in fixed relation with said body portion and in tightly drawn intimate bracing contact with and between said strut and said arms.

2,774,528
FOLDING LADDER
Harris W. Crouse, Winchester, Mass.
Application March 15, 1954, Serial No. 416,869
6 Claims. (Cl. 228—37)

1. A folding ladder comprising: a pair of side uprights; a bar mounted on each of said uprights and slidably in the longitudinal direction thereof; a plurality of rungs connecting said uprights and journalled thereon for rotation from a position perpendicular thereto to a position nearly parallel thereto; and means on said bars for locking said rungs in said perpendicular position, said locking means comprising a series of pairs of blocks, mounted on said bars, each pair engaging an end of a rung and limiting the rotation of the rung with respect to the bar, and lock members adapted to fix said bars to their respective uprights when said rungs are in said perpendicular position.

2,774,529
STAPLE SEALED CORRUGATED BOX
Walter J. Abrams and Charles H. Jennings, Cincinnati, Ohio, assignors to Fashion Frocks, Inc., Cincinnati, Ohio, a corporation of Ohio
Application May 15, 1953, Serial No. 355,234
3 Claims. (Cl. 229—33)



1. A box made of corrugated paper comprising a bottom wall, a lid, a rear wall interconnecting said bottom wall and said lid, a pair of end walls joined to said bottom wall at the ends thereof, a front wall joined to said bottom wall opposite the rear wall, said front wall and said bottom wall being joined by a score line formed on said corrugated paper, said front wall being incised along a line extending longitudinally thereof, said incision extending from the interior of the box outwardly partially through said corrugated sheet, the portion of said front wall on the side of said incision remote from said bottom wall being overfolded along said incision at right angles to the front wall and constituting a flap extension, said lid including a lip extending forwardly of the front portion of the lid, said lip being disposed to overlie said flap extension when the lid is in the closed position, means securing the end walls to the front wall, said lid being provided with lid flaps adjacent to the ends thereof, said lid flaps being disposed interiorly of said end walls when the lid is closed, said front wall inclining outwardly at the upper edge thereof due to the resiliency of said corrugated paper, whereby said flap extension protrudes beyond said lip when the lid is in the closed position, the incision in said front wall providing a line of weakening along which said box can readily be opened by cutting said flap from said front wall.

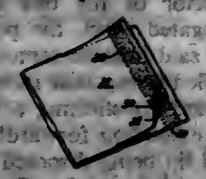
2,774,530
CELL WALL CARTON
Hubert V. Bolding, Clarksville, and Ernest G. Gowens, Jeffersonville, Ind., assignors to The Bradley & Gilbert Company, Louisville, Ky., a corporation of Kentucky
Application February 27, 1956, Serial No. 568,815
8 Claims. (Cl. 229—34)

1. A tray-type double-wall box structure which in erected condition comprises a rectangular bottom, side and end wall forming panels extending from the side

edges and end edges respectively of said bottom and forming spaced double walls, each of said side and end wall forming panels being delineated by hinge lines to define an outer wall, a bridging panel, and an inner wall spaced from said outer wall, the inner walls of the end wall forming panels being end inner walls, the inner walls of the side wall forming panels being side inner walls, means for maintaining the bottom hinge lines of said side inner walls in fixed relation to said bottom, bellows fold means interconnecting the adjacent vertical edge portions of said outer walls to facilitate erection and collapse of said carton, brace means including inner end braces each of which being hinged to its respective vertical edge of said side inner walls and positioned between its respective end

outer wall and end inner wall in face-to-face bracing engagement with an adjacent predetermined portion of its respective end inner wall, said brace means including means for fixedly positioning the bottom hinge edges of said inner end braces adjacent said bottom and parallel to the end edges of said bottom on lines substantially directly under the inner horizontal hinge line of their respective end bridging panels, each of said inner end braces having a fold line extending diagonally upwardly from its outermost bottom corner portion to facilitate collapse and erection of said end braces, and means on said end inner walls operatively engaging said brace means to hold the erected carton in braced and interlocked erected condition.

---



2,774,531

**DISPOSABLE WASTE RECEPTACLE**

Daniel Rosenthal, Brooklyn, N. Y.

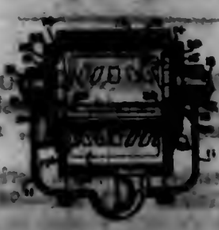
Application March 19, 1954, Serial No. 417,350

1 Claim. (Cl. 229—53)

A receptacle for waste and the like which comprises a folding paper bag closed at one end and open at the other end, the open end of the bag being provided with a plurality of substantially parallel cuts extending a substantial distance toward the closed end of the bag, the inboard ends of the cut lines being interconnected by fold lines extending transversely across the bag, one of the end portions of the bag between said cuts being provided with a deposit of a pressure-sensitive material protected by a superimposed but readily removable strip of sheet material.

---

2,774,532



**VACUUM PUMP**

Edward J. Beach, Brooklyn, N. Y., assignor to Beach-Russ Company, Brooklyn, N. Y., a corporation of New York

Substitute for abandoned application Serial No. 574,459, January 25, 1945. This application March 5, 1953, Serial No. 340,444

4 Claims. (Cl. 230—153)

1. In a vacuum pump, an elliptically cam-bored cylinder, cylinder heads mounted on the ends of said cylinder and provided with bearings for the shaft of the pump and also having cylindrical recesses coaxial with said bearings and having flat loop walls, inlet ports upon said base walls of said cylindrical recesses, a rotor of smaller diameter than said cylinder mounted eccentrically therein and provided with a shaft supported in said bearings, a slide valve mounted in a slot in said rotor and extending therefrom into contact with said cylinder, said slide valve having inlet ports in its edges for aligning with

said inlet ports, rotor end plates mounted on the ends of said rotor and engaging into said cylindrical recesses and having inlet ports aligned with the inlet ports of said slide valve in certain positions of said valve, flat and thin cut-off plates mounted on said rotor end plates and having inlet ports aligned with the inlet ports of said rotor end plates, and light resilient means for urging said flat cut-off plates against the base walls of said cylindrical recesses, and outlet means in said cylinder.

---

2,774,533

**COIN COLLECTING DEVICE**

Max L. Gaunt, Providence, R. I.

Application February 6, 1951, Serial No. 209,615

2 Claims. (Cl. 232—44)

1. A transversely elongate coin receiving device for a box designed to receive multiple-coin fares, said device having a base and an upper surface having therein a hopper-like depression with front, rear and side walls, the front wall being substantially plain and sloping downwardly and rearwardly at an angle of approximately 60° to the horizontal, that surface of the rear wall which is opposed to the front wall being curved convexly toward said plain front wall, the upper portion of the convexly curved rear wall having a slope angle which is substantially less than the slope angle of the front wall, the terminal portion of said convexly curved rear wall having a downward and rearward slope approximating the slope of the flat front wall, the side walls converging downwardly toward each other, and the several walls terminating at their lower portions at an elongate exit slot of narrow front-to-rear width.

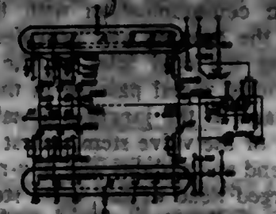
---

2,774,534

**ELECTRICAL COUNTING AND LIKE DEVICES**

Roland Harris Dunn, London, England, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware

Application July 16, 1952, Serial No. 298,843



Claims priority, application Great Britain July 17, 1951

7 Claims. (Cl. 235—92)

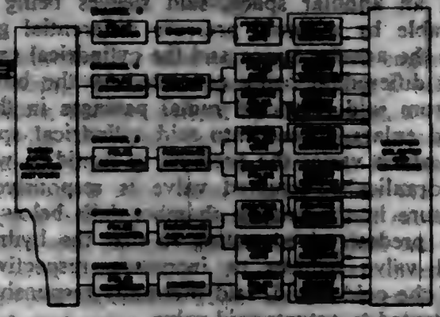
1. A divider comprising two electrical counting chains, each containing a succession of counting elements, interconnections between predetermined pairs of said elements the particular pairs being used for a particular desired divisor, each pair consisting of one counting element from each of said chains, an output circuit connected with all of said interconnections, means forming part of said interconnections for producing an impulse in said output

circuit when both elements of a pair are operated, an input circuit connected to one of said counting chains, said one counting chain being adapted to step when an input

impulse is received by said input circuit, and means for causing the other of said counting chains to step when an impulse is produced in said output circuit.

---

2,774,535



**VARIABLE AMPLITUDE SIGNAL ANALYZER**

Lloyd D. Anderson, Takoma Park, Md.

Application April 21, 1951, Serial No. 221,481

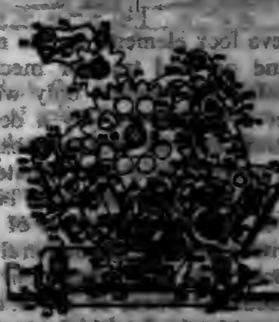
11 Claims. (Cl. 235—92)

(Granted under Title 35, U. S. Code (1952), sec. 266)

1. In a stress cycle counter the improvement comprising a plurality of channels in parallel connection, at least one of said channels including a positive memory tube and a negative memory tube, means comprising an input voltage having an instantaneous value representative of the instantaneous magnitude of stress on an object being metered to cause conduction of said positive memory tube when the voltage increases through a predetermined datum level, means connecting said input voltage to cause conduction of said negative memory tube when said voltage decreases through a predetermined datum level, a positive memory element actuated when said positive memory tube conducts, and a negative memory element actuated when said negative memory tube conducts, first switching means interconnecting the positive memory tube present in each channel except the channel with the positive memory tube of the channel corresponding to the next higher datum level, second switching means interconnecting the negative memory tube present in each channel except the highest with the negative memory tube of the channel corresponding to the next lower datum level, said first switching means arranged so that as said voltage increases through successively higher datum levels conduction of all positive memory tubes except the one at the highest datum level reached is cut off, said second switching means arranged so that as said voltage decreases through successively lower datum levels conduction of all negative memory tubes except the one at the lowest datum level reached is cut off.

---

2,774,536



**CALCULATING MACHINE**

Harold J. Cleall, Clara's Valley, Calif., assignor to Friden Calculating Machine Co., Inc., a corporation of California

Application June 23, 1950, Serial No. 169,675

9 Claims. (Cl. 235—134)

1. A calculating machine accumulator comprising a base, a pair of side plates disposed perpendicular to said base and in parallel relationship to each other, separator plates uniformly spaced apart between said side plates in spaced apart relationship to the latter, means rigidly securing said side plates and separator plates to said base, a pair of sleeves extending through said separator plates adjacent said base and in spaced apart and parallel relationship to each other, bail shafts extending one through each of said sleeves and through said side plates, an accumulator gear shaft extending through said side and separator plates in spaced and parallel relationship to said sleeves, accumulator gears mounted on said accumulator gear shaft and disposed one in each ordinal space between said plates, a tens-transfer cam on each accumulator gear, a drive gear shaft extending through said plates in spaced and parallel relationship to said accumulator gear shaft, drive gears mounted on said drive gear shaft, one in each ordinal space between adjacent plates and meshing with the coordinal accumulator gears, positive tens-transfer levers mounted on one of said sleeves one in each ordinal space between adjacent plates and spring-urged in a direction to impart tens-transfer movements to the coordinal accumulator gears, negative tens-transfer levers mounted on the other of said sleeves one in each ordinal space between adjacent plates and spring-urged in a direction to impart

tens-transfer movements to the coordinal accumulator gears, latch lever shafts extending through said plates at respectively opposite sides of said accumulator gear shaft and in spaced and parallel relationship to the latter, positive latch levers mounted on one of said latch lever shafts one in each ordinal space between adjacent plates and spring-urged to position to engage the corresponding positive tens-transfer levers and individually latch the tens-transfer levers in inoperative position, negative latch levers mounted on the other of said latch lever shafts one in each ordinal space between adjacent plates and spring-urged to position to latch the corresponding negative tens-transfer levers in inoperative position, each latch lever engaging a tens-transfer lever of the next higher order and said latch levers being moved to release the tens-transfer levers by the tens-transfer cams on the coordinal accumulator gears when the accumulator gears are turned through ten unit spaces from their "0" positions, a bail mounted on each of said bail shafts and respectively effective to restore said positive and negative tens-transfer levers from their gear engaging to their latched positions, and a power driven cam connected to said bails to operate said bails in a predetermined manner during each operating cycle of the associated calculating machine.

---

2,774,537

**TOTALIZING MECHANISM**

Alva C. Russell, Stamford, and William F. Barnett, New Canaan, Conn., assignors to Pitney-Bowes, Inc., Stamford, Conn., a corporation of Delaware

Application January 12, 1953, Serial No. 331,326

9 Claims. (Cl. 235—139)

1. A register mechanism having a plurality of numeral wheels each having transfer gear teeth associated therewith, each numeral wheel having a main driving gear

and a transfer driving gear and differential gearing between said driving gears and the numeral wheel whereby the latter may be driven by either of said driving gears while the other is being held against turning at a predetermined rate or by both said main driving gear and transfer driving gear rotating simultaneously at twice said predetermined rate; and transfer mechanism between a numeral wheel of lower order and a numeral wheel of next higher order to transfer to the latter a full increment of movement and including means to lock the transfer driving gear of the numeral wheel of higher order against turning in both the "9" position and the "0" position thereof, said locking means including co-

operating Geneva lock elements on the numeral wheel of lower order and on said transfer mechanism movable relatively to unlocking position only when the numeral wheel of lower order moves idly a determinate extent past "9" position and to locking position when said numeral wheel moves idly a determinate extent before it reaches its "0" position, the gear ratio between the transfer gear teeth of the numeral wheel of lower order and the transfer driving gear of the numeral wheel of higher order being such as to compensate for said idle movements of the numeral wheel of lower order and to impart to the numeral wheel of higher order a full increment of movement.

## APPARATUS FOR MIXING LIQUIDS OF DIFFERENT TEMPERATURES

William John a'Beckett, Mona Vale, New South Wales, Australia

Application September 9, 1955, Serial No. 533,455

Claims priority, application Australia September 10, 1954

7 Claims. (Cl. 236—12)

1. An apparatus for mixing liquids of different temperatures to provide a constant temperature effluent, said apparatus comprising a housing incorporating a mixing chamber and having inlet ports for liquids of different temperatures and an outlet port for the mixed effluent, a hydraulically actuated valve means adapted to vary the input of the cold liquid, a thermally responsive means disposed in said mixing chamber, said hydraulically actuated valve means comprising a stationary valve stem having an enlarged head and a shank with a shouldered portion, restricted radial passages in the shouldered portion of the shank, the shank being provided with internal passageways communicating with hot and cold liquid outlet ports disposed in spaced relationship longitudinally in the wall of the shank, said shank being rigidly affixed in the housing so that the passageways of the shank are respectively in communication with the hot and cold inlet ports of the housing and provided with a passageway connecting the cold inlet of the housing with at least one restricted radial passage in the shouldered portion of the shank at the junction of said shank with the enlarged head of the valve stem, a first cylindrical sleeve closed at one end and slidably and non-rotatably disposed over the enlarged head of the valve stem, and a second cylindrical sleeve slidably and non-rotatably disposed on said shank of said valve stem one end of which abuts with and is secured in liquid tight manner to the open end of said first cylindrical sleeve, said second sleeve being adapted to vary the opening of the outlet ports in the wall of the shank and also adapted to permit the flow of liquid from the outlet ports into the mixing chamber, the free end of said enlarged head and the closed end of the first sleeve defining a cylindrical space, the shank end of the enlarged head of the valve stem and that end of the second sleeve which abuts with the first sleeve defining an annular space, said sleeves being slidably displaceable by a liquid pressure differential generated between the annular space and the cylindrical space, said pressure differential being generated by the bleeding of liquid from said restricted radial passages in the shank past said enlarged head into said cylindrical space, and a valve which varies the pressure of liquid to which the said hydraulically actuated valve is responsive as the temperature in the mixing chamber falls below or rises above a predetermined setting so that the hydraulically actuated valve reduces or increases, respectively, the input of the cold liquid, said thermally responsive means being adapted to actuate said valve.

2,774,539

## THERMOSTATIC OVER-TEMPERATURE PILOT SHUT OFF

Samuel G. Eddie, Chicago, Ill., assignor to The Dole Valve Company, Chicago, Ill., a corporation of Illinois

Application July 28, 1954, Serial No. 444,548

2 Claims. (Cl. 236—31)

1. In an over temperature pilot gas shut off valve, a valve body having an inlet for gas leading thereinto, an outlet for pilot gas leading therefrom and a spaced outlet for main burner gas also leading therefrom, a valve controlling the flow of gas into said valve body through said inlet, spring means biasing said valve to a closed position and a thermal electrically energized electromagnet holding said valve open, a valve within said body controlling the flow of gas through said burner outlet, spring means biasing said valve in an open position, a thermostatic element on the end of said valve body having operative connection with said valve, for closing the same when the temperature sensed reaches the temperature for which the thermostatic element is set, a pilot gas valve in said valve body and having a thermostatic element extending outside of said valve body for contact with the tank of a hot water heater, and a passageway from said inlet through said pilot gas valve and from said pilot gas valve through said pilot gas outlet and including a valve seat, said thermostatic element for said pilot gas valve comprising a resilient disk, and said pilot gas valve being mounted on said disk for resilient engagement with the end said valve seat and resiliently permitting overtravel thereof.

---

2,774,540

## AUTOMOBILE THERMOSTAT

Edwin W. Parlance, Highland Park, Ill., assignor to Flexonics Corporation, a corporation of Illinois

Application February 2, 1951, Serial No. 209,853

10 Claims. (Cl. 236—34)

1. A thermostat for internal combustion engines comprising a casing having an opening defining a valve seat, a thermostatic bellows carried by the casing, a valve cooperable with said seat, said valve being mounted for bodily generally axial movement when it is adjacent its closed position, a valve stem connected to the bellows and having a terminal end portion disposed substantially at said valve seat, the valve and said terminal end portion of said valve stem being pivotally interconnected for relative pivotal movement about an axis extending transversely of said valve stem, and means for tilting said valve about said axis after said valve has begun an opening movement.

---

2,774,541

## THERMOSTATICALLY OPERATED SHUT-OFF VALVE

Samuel G. Eddie, Chicago, Ill., assignor to The Dole Valve Company, Chicago, Ill., a corporation of Illinois

Application August 23, 1954, Serial No. 451,142

3 Claims. (Cl. 236—48)

1. In a thermostatically operated shut-off valve of the class described, a valve body having a power member guided therein for movement therealong for operating a device to be operated, a cylinder extending within said valve body and forming a guide for said power member, a casing forming an outward continuation of said cylinder and containing a fusible thermal responsive material in association with said cylinder, for extending said power member from said cylinder upon predetermined temperature rise, a valve chamber within said valve body, an inlet into said valve body and chamber and an outlet therefrom, a valve seat separating said inlet from said outlet, a rectilinearly movable valve cooperable with said seat, a snap acting disk supported adjacent its periphery within said valve chamber and carrying said valve, an operating member for said disk having fulcrum points engaging said disk inwardly of its support, a rectilinear guide for said operating member, and a right angled drive from said power member to said operating member comprising a ball having engagement with said operating member, and a cam operated by said power member and movable at right angles to the axis of movement of said operating member and valve, said cam having an inclined cam surface engageable with said ball to move the same to effect movement of said snap acting disk past its dead center position, to move said valve into engagement with said seat with a snap action upon the extension of said power member from said cylinder effected by said predetermined temperature rise.

---

2,774,542

## RAIL SPLICE

William T. Anthony, Bethlehem, Pa., assignor to Bethlehem Steel Company, a corporation of Pennsylvania

Application February 19, 1953, Serial No. 337,356

5 Claims. (Cl. 238—261)

1. In a rail-splice for connecting adjacent rail ends, comprising a pair of splice bars disposed on opposite sides of the rails and adapted to fit between the head and base flanges of the rail, each splice bar having continuous and uniform contact with the underside of the rail head and the topside of the rail flange, one of said splice bars being formed with a plurality of pins extending through holes therein and welded thereto each having adjacent to its outer end vertically aligned grooves, and the other splice bar adapted for longitudinal adjustment and formed with a plurality of keyhole-slots, a forged depression and inclined outer lips formed adjacent to each keyhole slot, said inclined outer lips engaging the vertically aligned grooves in the pins when the splice bar is longitudinally adjusted for frictional engagement, and causing the splice bar to retain full contact with the rail head and flange.

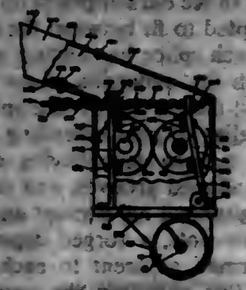
---

2,774,543

## PLURAL ROTOR IMPACT GRINDING MILL WITH COOLING MEANS

Bernhard Keller, Zurich, Switzerland, and Eugene John Mayer de Barencze, Toronto, Ontario, Canada

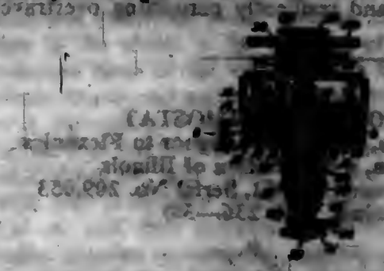
Application February 18, 1953, Serial No. 336,167



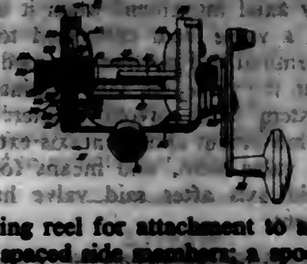
6 Claims. (Cl. 241—65)

11. In a grinding mill having a rotor with a horizontal axis of rotation, blades radially extending from said rotor, and means for driving said rotor; a housing surrounding said rotor and providing a chamber therefor, said housing including an arcuate screen positioned below said rotor defining the bottom of said chamber, an inner arcuate wall above said rotor defining the top of said chamber, an outer arcuate wall above said rotor spaced from said inner wall and provided with a plurality of circumferentially spaced apertures, a plurality of radial partitions connecting said inner and outer walls and dividing the space between said walls into a plurality of arcuate channels in communication with said circumfer-

entially spaced apertures, respectively, said housing being provided with an axially extending central opening, said driving means extending through said central opening with clearance therebetween, a shell surrounding said driving means and connected with said outer wall of said housing about said central opening, said shell being provided with a peripheral opening adjacent said housing and in communication with said central opening and with an exhaust opening remote from said housing, means adjacent said shell and connected with said driving means for facilitating air circulation through said shell, and further means adjacent said rotor housing and connected to said driving means for directing air circulation through said housing, whereby upon actuation of said driving means and said rotor air is automatically sucked into and through said peripheral opening, a part of said air passing through said central opening into said annular channels and out said radial apertures to cool said chamber, another part of said air passing out said shell exhaust opening remote from said housing to cool said driving means.



2,774,544
CORN CRACKING APPARATUS WITH A YIELDINGLY MOUNTED ROLL FOR THE PASSAGE OF FOREIGN OBJECTS
Arthur W. Rasmussen and George A. Rasmussen, Tekamah, Nebr.
Application August 21, 1953, Serial No. 375,635
3 Claims. (Cl. 241—232)

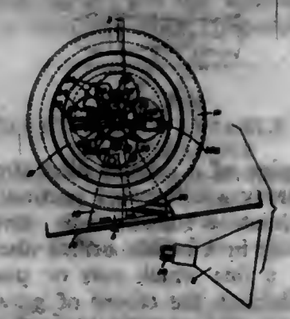


2. In a grain cracker, the combination which comprises an elongated housing having a base frame in the lower part, spaced vertically disposed parallel stationary bars having openings in the upper ends mounted on said base frame and positioned in one side of the housing, spaced vertically disposed floating bars also having openings in the upper ends pivotally mounted on the base frame and positioned with the openings thereof aligned with the openings of the stationary bars, a pair of cracking rolls positioned in the housing, means for rotatably mounting one of said rolls on the stationary bars, means for rotatably mounting the other of said rolls on the floating bars, rods freely mounted in the openings in the upper ends of the stationary bars and extended laterally therefrom, the ends of the rods at one side of the stationary bars extending freely through the openings in the upper ends of the floating bars, springs on the portions of the rods positioned between the stationary and floating bars, springs on ends of the rods extending from the sides of the stationary bars opposite to the sides on which the floating bars are positioned, the springs on the extending ends of the rods having greater tension than the springs between the bars, nuts threaded on the ends of the rods for adjusting the tension of the springs, and an elongated hopper positioned below the rolls for receiving the cracked grain.

2,774,545
FISHING REEL
Roy L. Chambers, Washington, D. C.
Application October 6, 1955, Serial No. 538,824
7 Claims. (Cl. 242—84.4)

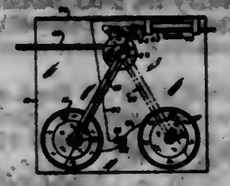
1. A fishing reel comprising a conventional support arm adapted for mounting on the butt end of a fishing rod, a gear frame, a speed-up gearing in said frame, a reciprocable crankshaft connected to said gearing for providing a drive in reverse direction and having a crank and handle fixed to its free end and a spool mounted on its front end for direct driving by means of the crank handle, a low-pitch thread means on said shaft for reciprocating it the width of said spool, and a rotor bracket having a line guide fixed thereto at the rim of said spool, said rotor being driven by said reverse drive, whereby said line guide will have a relative winding speed with respect to said spool equivalent to a gear ratio of one more than that of the speed-up gearing.

2,774,546
FISHING REEL
John Bolle, Pompano Beach, Fla.
Application March 31, 1953, Serial No. 346,948
9 Claims. (Cl. 242—84.6)



1. In a fishing reel for attachment to a casting rod, a frame having spaced side members; a spool for a fishing line rotatively supported between the side members with capacity for free endwise play in either direction, said spool having trunnions respectively at opposite ends thereof; and rotation-restraining means including a disk of friction material affixed to one end of the spool, and a screw bushing to serve as a non-rotative braking element in which the trunnion on the last mentioned end of the spool is journaled, adjustable in the corresponding side member of the frame with its inner end confronting the friction disk on the reel whereby, with the axis of the spool positioned vertically and the friction disk contacting the non-rotative braking element, the spool is restrained to overcome the jerk caused by the whip effect of the rod in casting the line, whereby upon wrist movement of the rod through a partial turn to bring the reel into horizontal position, the retarding restraint upon the reel is gradually minimized and the reel eventually released for free rotation to permit free unwinding of the line, and whereby upon wrist movement of the rod in the opposite direction after the force of the cast is substantially expended, the spool is shifted axially by gravity and the friction disk thereon is again brought into contact with the non-rotative braking element and is thus retarded to prevent overrunning of the line.

2,774,547
REEL
Cecil Hugh Latimer-Needham, Broadstone, and Ronald F. Worlidge, Lower Parkstone, England, assignors to Flight Refuelling Limited, London, England, a British company
Application April 1, 1952, Serial No. 279,775
Claims priority, application Great Britain April 3, 1951
3 Claims. (Cl. 242—86)



3. For use in reeling the unwinding of a reel, such as a reel upon which a trailing connection between two aircraft is wound, the sub-combination which comprises a frame secured upon one of the aircraft, the reel, a shaft rotatably carried by said frame and upon which the reel is fixed, a pinion fixed upon said shaft, a crank element pivotally mounted on said frame, a train of two-stage speed-reduction gearing carried by said frame and operatively connected with said pinion and said crank to transmit movement from said pinion to said crank element, at least one extensible and contractable liquid spring member having one end fixed to said frame and the other end

operatively connected with said crank element, the resistance of said liquid spring member being provided by elastic volumetric compression of a liquid between its fixed and movable ends, a motor carried by said frame, gear means operatively connected between said motor and said reel to transmit motion at reduced speed from the motor to the reel in the direction for winding in said extensible connecting member, and controllable means for disconnecting said motor from the reel to enable said extensible member to be payed out freely.

2,774,548
WIRE PAYOFF APPARATUS
Estyle D. Hanson, Baltimore, Md., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application February 6, 1953, Serial No. 335,124
3 Claims. (Cl. 242—128)

3. In apparatus for paying off wire from reels wherein a pair of reels are spaced from one another and are connected by a section of wire that extends therebetween, the improvement which comprises an arm mounted pivotally above the reels and having means for guiding the wire being payed off from one of the reels, power-driven means for shifting the arm from a position over one reel to a position over the other reel, means for controlling the power-driven means, and switch means located between the reels for actuating the control means and responsive to movement of the section of wire extending between the reels at the movement a reel being unwound becomes exhausted

2,774,549
BOBBIN HOLDER
Robert Rulon-Miller and Werner H. Taber, Bristol, R. I., assignors to Dixon Corporation, a corporation of Rhode Island
Application June 3, 1954, Serial No. 434,142
8 Claims. (Cl. 242—130)

1. A bobbin holder comprising a tubular body having slots therethrough, resilient arms outwardly of the body connected to said body and located in registry with said slots and movable therethrough upon flexing, and abutments carried by said body and rotatable relative thereto

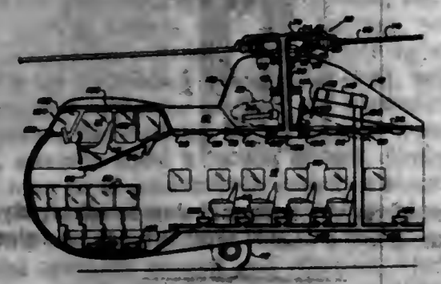
into and out of registry with said slots to selectively block or permit the moving of said arms through said slots.

2,774,550
STRAND TENSION DEVICE
Alphonse F. Pieper, Brighton, N. Y.
Application August 15, 1955, Serial No. 528,214
4 Claims. (Cl. 242—156)

1. In a strand tensioning means, a support including a pair of spaced parallel cylindrical openings and a pair of cylindrical arms of refractory material removably positioned in said openings, said support having another opening located between and transversely of and partially intersecting the first mentioned openings, a tapered nylon pin removably positioned in said other opening engaging the peripheries of said arms, and a threaded plug in said other opening engaging the nylon pin and acting to force the pin against said arms.

2,774,551
STRAND TENSIONING MECHANISM
Alphonse F. Pieper, Brighton, N. Y.
Application August 15, 1955, Serial No. 528,213
3 Claims. (Cl. 242—156)

1. In a strand tensioning mechanism including a frame, spaced ears on the frame, a metal plate having a supporting portion along one edge and bearing portions, a plate extending through said bearing portions, and pivotally mounted at its ends in said ears, a comb member of refractory material fastened to said supporting portion, a fastening screw extending through said comb member and supporting portion, and a stop located on the frame under the opposite edge of the plate, the improvement which consists in a spiral spring under compression having one end engaging said frame and a reduced spiral portion at its opposite end threaded on said fastening screw and acting to hold the plate against said stop.



2,774,552

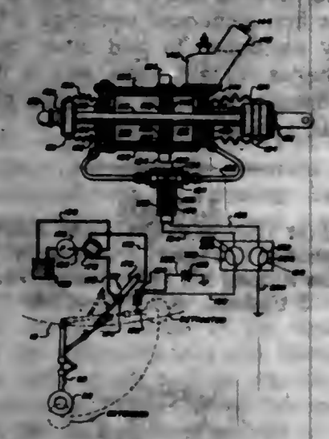
**HELICOPTER AIR CIRCULATING SYSTEM**

Nicholas C. Glad, Stratford, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware

Application April 25, 1955, Serial No. 503,604

12 Claims. (Cl. 244—17.11)

1. In an air circulating system for a helicopter type aircraft in combination, a fuselage having a cabin, a suction duct extending along said fuselage in communication with said cabin, a hollow mast having its lower end connected with said suction duct, and means for creating a suction to withdraw air from said cabin through said duct and said hollow mast including a rotatable blade having a spanwise duct communicating with said mast at its inboard end and communicating with a blade orifice outboard from said mast.



2,774,553

**DAMPER BY-PASS FOR LAG-LEAD CONTROL OF HELICOPTER ROTOR BLADES**

Harry T. Jensen, Milford, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware

Application April 4, 1955, Serial No. 498,819

11 Claims. (Cl. 244—17.17)

2. In a helicopter having a body, a landing gear, a sustaining rotor comprising a shaft, a rotor hub mounted on said shaft, a rotor blade connected to said hub by a hinge permitting blade movement in the plane of rotation relative to said hub, damping means interconnecting said blade and said hub for controlling said movement about said hinge, and means operated by said landing gear for controlling said damping means.

10. A rotary wing aircraft having a fuselage, said fuselage having a pilot compartment, a rotor hub, a blade pivoted on said hub for lag-lead movements, a damper controlling the lag-lead movements of said blade, pilot operable means in said compartment, and means interconnecting said pilot operable means with said damper for varying the damping effect of said damper during flight.

2,774,554

**JET FLOW CONTROL FOR JET-SUSTAINED AND JET-PROPELLED AIRCRAFT**

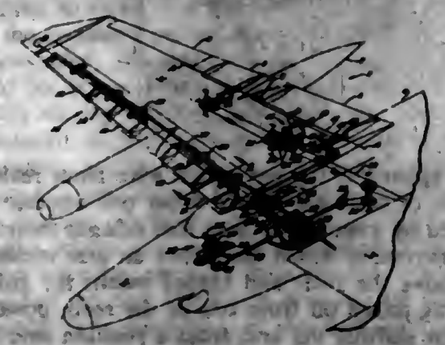
Peter Frederick Ashwood, Farnham, and George William Crouse, Aldershot, England, assignors to Power Jets (Research and Development) Limited, London, England, a British company

Application May 25, 1953, Serial No. 357,116

Claims priority, application Great Britain May 30, 1952

5 Claims. (Cl. 244—23)

1. In the jet pipe of a jet-propelled aircraft, a nozzle unit including firstly a bifurcated portion having a forwardly facing inlet, a downwardly turned discharge branch terminating in a nozzle orifice discharging to atmosphere along a line which cuts or passes near to a transverse line through the center of gravity of the aircraft, and a rearwardly extending branch terminating in a rearwardly discharging jet nozzle orifice, in combination secondly with deflecting means movable in said bifurcated portion from a position blocking up the said downwardly turned discharge branch while leaving the rearwardly extending branch open, to a position blocking up the rearwardly extending branch and deflecting the jet into the downwardly turned branch, said deflecting means including at least one element which, when the means are in the position for deflecting the jet downwards, provides guiding surfaces lying substantially along the desired path of the deflected jet.



2,774,555

**LEADING EDGE FLAP AND CONTROL SYSTEM**

James E. Crawford and Eugene V. Browne, Los Angeles, John E. Glenn, Hawthorne, and John D. Pigford, Inglewood, Calif., assignors to Northrop Aircraft, Inc., Hawthorne, Calif., a corporation of California

Application February 19, 1953, Serial No. 337,723

2 Claims. (Cl. 244—42)

1. In an airplane having a laterally extending wing: a first flap assembly mounted on the trailing edge of said wing for angular movement through an operating range between retracted and full down positions with respect to said wing; a predetermined portion of said operating range adjacent said retracted position constituting an initial range and the remainder of said operating range constituting a final range of said first flap assembly; a second flap assembly mounted on the leading edge of said wing for angular movement between retracted and full down positions with respect to said wing; a first and a second set of actuators pivotally attached to and extending between said wing and said first and second flap assemblies, respectively, and adapted to move said respective flap assemblies between said retracted and full down positions thereof when actuated; power means mounted in said airplane for actuating said second set of actuators;

a control unit pivotally mounted on said plane; control means operationally connecting said control unit and said first set of actuators whereby said first flap assembly may be moved throughout said operational range in response to movements of said control unit; a follow up mechanism, including a movable element adapted to control the flow of power to said power means, operationally extending between said first flap assembly and said second power means whereby said second flap assembly is caused to assume said retracted position or said full down position at such times as said first flap assembly is positioned in said initial or said final range, respectively.

2,774,556

**AIRCRAFT WITH VARIABLE WING ARRANGEMENT**

Roger A. Robert, Boulogne-sur-Seine, France

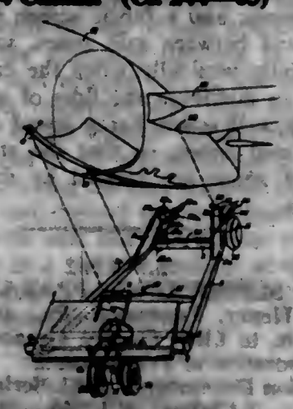
Application June 13, 1951, Serial No. 231,360

Claims priority, application France April 13, 1946

8 Claims. (Cl. 244—46)

1. In an aircraft having a fuselage member, two supporting wings on said fuselage member disposed substantially in the form of a cross having different wing areas defining different wing loadings and adapted respectively to support the aircraft at high speeds and at relatively low speeds, and the branches of the cross intersecting along the longitudinal axis of the aircraft, the fuselage member being mounted for rotation about said axis relatively to the remainder of the aircraft, and means for rotating said fuselage member about said axis thereby selectively to bring a desired one of said wings to an aircraft-supporting position.

2,774,557



**AIRCRAFT TAKE-OFF CARRIAGE AND THE METHOD OF UTILIZING SAME**

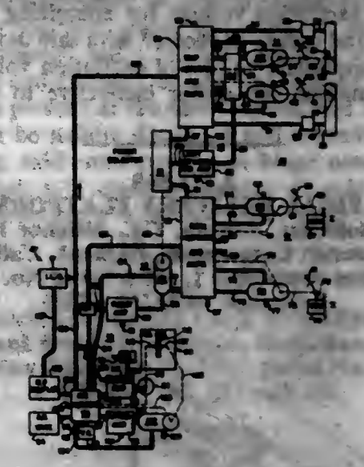
Wdzwoled John Jakimiak and Georges Jules Bernard Victor Herelt, Paris, France, assignors to Societe Nationale de Constructions Aeronautiques du Sud-Est, Paris, France

Application April 15, 1953, Serial No. 349,016

Claims priority, application France May 2, 1952

24 Claims. (Cl. 244—63)

1. An assembly adapted for conveying over and launching from rough ground an aircraft having a fuselage and a retractable landing gear comprising, in combination, a launching carriage displaceable over rough ground having a dismountable light weight rectangular frame structure including two longitudinal girders and two cross members, and the height of which is determined in order to move the same under the fuselage of the aircraft to be launched, a set of front steering wheels and a set of rear wheels on the carriage, main braking means associated with said rear wheels for applying a braking force to the carriage, means on the aircraft connected to said main braking means for actuating the same for handling the carriage to launch the hoisted aircraft therefrom, means on the carriage for actuating said main braking means after releasing of said aircraft from the carriage, means on the carriage for securing the aircraft thereto while resting on the belly of its fuselage, supplemental propelling means supported by the carriage for moving the same to launch the aircraft, means for mounting said supplemental propelling means on the carriage, means on the aircraft connected to said propelling means for starting the same, supplemental braking means on the carriage for applying a supplemental braking force thereto after releasing of the aircraft therefrom to quickly stop said carriage, means on the carriage operable at the release of the aircraft from said carriage for actuating said supplemental braking means, a towing cross-country vehicle, a rigid coupling device universally mounted on said towing vehicle, means for connecting said coupling device to said carriage for moving the same to hoist the aircraft thereon and to convey it to a starting position to launch the hoisted aircraft, means for disconnecting said coupling device from said carriage at said starting position, said towing vehicle having a winch provided with a rope the free end of which is anchored to the bottom of the aircraft fuselage at the front thereof to hoist the aircraft on the carriage, and means on the carriage coinciding the longitudinal planes of symmetry of the carriage and of the aircraft during the hoisting operation.



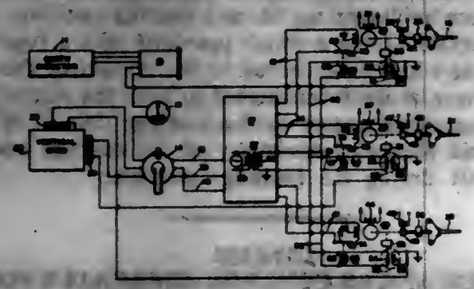
2,774,558

**ATTACK ANGLE CONTROL APPARATUS FOR POWERED AIRCRAFT**

Ross C. Alderson, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware

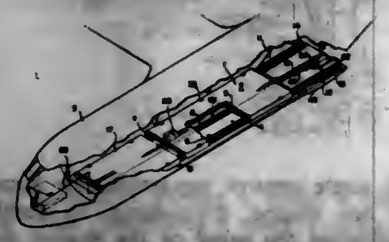
Application January 18, 1951, Serial No. 206,578

42 Claims. (Cl. 244—77)



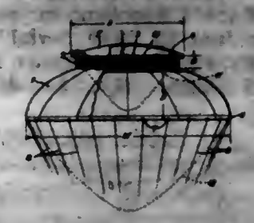
21. Attack angle control apparatus, for aircraft having at least one engine, comprising, in combination: means for adjusting the speed of the engine; means for adjusting the manifold pressure of the engine; means responsive to deviation of the attack angle of the craft from a selected value; and means connected to both said adjusting means and to said responsive means for simultaneously controlling operation of both said adjusting means in accordance with said deviation.

42. Control apparatus comprising, in combination: servomotor means for causing change, within a range of values, in a variable to be controlled; selecting means giving a signal in accordance with a selected value of the variable; follow-up means giving a signal which varies non-uniformly with operation of said servomotor means and is greatest for positions thereof resulting in values



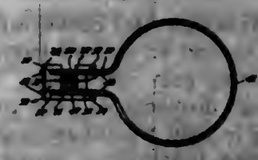
of said variable near the lower end of said range; responsive means giving a signal which varies non-uniformly with the actual value of said variable and is greatest for values of said variable near the upper end of said range; and means connected to said servomotor means, said selecting means, said follow-up means, and said responsive means for controlling said servomotor means in accordance with all said signals, the ranges of values of the signals from said follow-up means and said responsive means being so selected that when the value of said variable is near the lower end of said range the apparatus operates essentially as a proportioning system, while as the value of said variable increases the apparatus is smoothly transformed to essentially a floating system, without any abrupt transition.

2,774,559
**POSITIONING SYSTEM MONITOR**
Alan M. MacCallum, Maywood, N. J., assignor to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware
Application December 15, 1949, Serial No. 133,043
2 Claims. (Cl. 244—77)



1. A positioning system having a motor for operating a controlled member in response to a control signal, follow-up means connected to the motor for preventing oscillation of the system, said means comprising a two-part inductive device for developing a follow-up signal, a source of excitation voltage for energizing one part of said device, and means connected with said device and said motor and responsive to loss of excitation voltage by said device for making the motor ineffective to said control signal.

2,774,560
**AERIAL DELIVERY PLATFORM**
Francis B. Johnson, Atlanta, Ga., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Application September 1, 1954, Serial No. 453,631
8 Claims. (Cl. 244—138)



1. An aerial delivery platform adapted to be carried by an aircraft and released therefrom in flight comprising, a load supporting panel, extraction means connecting with said panel and releasably securing said platform to said aircraft, normally stowed drag producing means connecting with said panel and with said extraction means for decreasing the free fall terminal velocity of said device and for stabilizing the platform in a right-side-up position throughout its descent in response to actuation of said ejection means, a plurality of spring-like arms swingably carried by the underside of said panel adjacent the outer edges thereof for movement between a retracted position resting against the underside of said panel and an extended position projecting generally outwardly from the panel for absorbing shock loads and maintaining the platform right-side-up when landing, spring means acting between said panel and said arms and urging the latter into the extended position, and means carried by said panel for securing said arms in a retracted position against the action of said spring means while said platform is carried by said aircraft.

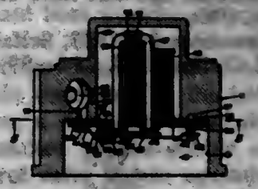
2,774,561
**LOAD-RETARDING CANOPY OF PREFORMED TYPE**
Walter S. Finken, Brooklyn, N. Y., assignor to Leonard P. Frieder, Great Neck, N. Y.
Application April 26, 1954, Serial No. 425,447
4 Claims. (Cl. 244—145)

1. A load-retarding canopy comprising a preformed lower zone of flexible sheet material having a circular horizontal cross-section throughout its depth and open at both ends, the opening at its upper end being of substantially smaller diameter than the opening at its lower end; a monitor top aligned with said upper opening and including a preformed upper zone of flexible sheet material having a circular horizontal cross-section throughout its depth, said upper zone being open at its lower end and closed at its upper end, and having its lowest diameter substantially greater than the diameter of the upper opening in the lower zone, so as to provide overlapping margins of the zones having substantial radial dimensions, the overlapping margins of the zones defining between them on air passage of substantial radial length and effective to direct an outward flow of air substantially at right angles to the path of movement of the canopy; means connecting the upper zone to the lower zone adjacent its upper opening, said connecting means comprising a plurality of flexible straps adapted to extend vertically when loaded and when vertically extended defining a plurality of peripheral openings between said zones; and a fabric screen extending between said straps and between said zones, said screen extending substantially vertically when the canopy is deployed and serving to distribute the flow of air evenly through said openings, said screen being sewed only to said straps and not to said zones, so that the stresses transmitted between said zones are carried by the straps and not by the screen.

2,774,562
**SUPPORTING APPARATUS**
William F. Henry, Edgewood, Pa., assignor, by mesne assignments, to Little Garden Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Application December 8, 1952, Serial No. 324,727
2 Claims. (Cl. 248—125)

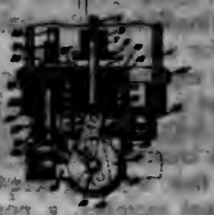
1. In an apparatus for supporting an article, a vertical column, a bracket on the column in the form of a rectangular frame having opposed pairs of long and short sides and an elongated opening therein substantially

longer than the corresponding transverse dimension of said column, the opposed short sides of said frame having edges adapted to frictionally engage the opposed surfaces of said column, and one long side of said frame having a gap therein, said gap being sufficiently wide to permit said frame to be slipped laterally onto or from said column, and a member including a portion for supporting said article, said member having parallel arm portions with hook-like ends, said frame having an extension from one short side thereof, said extension being provided with vertical holes arranged on a line generally perpendicular to the long sides of the frame and spaced apart a distance greater than the thickness of said column, said hook-like ends engaged in, and removably locked in said holes and said arm portions being so positioned that said article supporting portion extends in a generally horizontal direction from said column, the length of said member being so proportioned to the transverse dimension of the column that when the article is supported by said member the frictional forces between said edges and the column are adequate to maintain the frame, the member, and the article in any elevated position on the column, the article supporting portion of the member being positioned on said frame on the opposite side of said column from said extension, the arm portions of said member extending generally parallel with the long sides of said frame on opposite sides of said column, one of said arms extending across said gap in said frame to prevent the frame from slipping sideways from the column.



2,774,563
**COLLAPSIBLE GUN REST**
Herman K. Pribil, Schenectady, N. Y.
Application October 19, 1953, Serial No. 386,727
1 Claim. (Cl. 248—127)

A rest for shoulder weapons comprising a pair of open top containers, means hingedly connecting the tops of corresponding end walls of said containers, a pair of uprights each having an elongated opening provided therethrough, a pair of pins each mounted in an upper portion of the side walls of one of said containers and extending through the elongated opening in one of said uprights whereby said upright can be slid longitudinally and pivoted on its respective pin, each container having a lateral slot in the bottom thereof below said pin for receiving an end of its respective upright, a pair of shoulders provided along the side walls of each container from the hinged end thereof to the bottom slot therein for cooperating with said slot and pin for supporting its respective upright in a vertical position at times and for supporing said upright within its container when in a substantially horizontal position.



2,774,564
**ELECTROMAGNETICALLY OPERATED CONTROLLER FOR VALVES OR THE LIKE**
Lawrence C. Biggie, Altadena, Calif., assignor to General Controls Co., Glendale, Calif., a corporation of California
Application May 24, 1951, Serial No. 228,071
11 Claims. (Cl. 251—30)

1. In a valve structure; a support having a pair of spaced ports; a member having jet openings corresponding to the ports and detachably secured to the support; said jet openings extending in spaced relationship; said jet openings having edges that are defined by plane surfaces; and a tiltable structure mounted on the member and at a point intermediate the jet openings, and having a valve closure with plane surfaces cooperating with said

edges for alternately exposing one jet opening and closing the other opening in accordance with the angular position of the tiltable structure.

2,774,565
**VALVE FOR GAS WATER HEATERS**
Siegfried Kleine and Hans Dörges, Remscheid, Germany, assignors to Johann Vaillant Kommanditt Gesellschaft, Remscheid, Germany
Application March 13, 1951, Serial No. 215,343
6 Claims. (Cl. 251—75)

1. A fitting for gas water heaters, comprising a valve casing having a passage through it, a valve adapted to shut off the passage and provided with a control member, said valve opening and closing by the movement of said control member, a hand operated control mechanism comprising a gear housing which is fastened to said valve casing, a bail shaped crank pivoted in said gear housing and provided with a control lever extending through a slot provided in said gear housing and being rotatable in this slot about an angle of approx. 180° between an "open" and a "closed" position, a ring covering said slot and fastened at said bail shaped crank, connecting rods pivoted at the two sides of said ring, a push rod that can be axially displaced and extending into the valve casing, said connecting rods hinge connected with said push rod, said control member of said valve connected for movement with said push rod.

2,774,566
**FLUID COOLED PERMEABLE TURBINE BLADE**
Edward Adams Richardson, Bethlehem, Pa.
Application December 12, 1947, Serial No. 791,200
4 Claims. (Cl. 253—39.15)

1. In a turbine, a rotor, a hollow permeable metal blade, spaced metal ribs depending from the outer end of said blade remote from the rotor and into the interior of the blade, bolt means secured to said ribs and to said rotor whereby the blade may be placed under initial compression, a source of gaseous cooling fluid and means to conduct said cooling fluid into the interior of the hollow blade, said fluid flowing around said bolt and through the permeable blade.

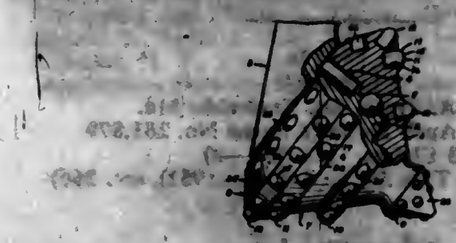
2,774,567
**TRIPOD JACK**
Ralph G. Shroyer, Columbus, Ohio, assignor of one-third to Harry L. Mollman and one-third to Myer W. Mollman, Columbus, Ohio
Application November 28, 1953, Serial No. 393,310
5 Claims. (Cl. 254—99)

1. A duo-functional operating handle of round single piece bar stock for use in a tripod jack having a sheet metal main frame member of channel formation comprising a rear wall and a pair of side walls, an apertured flap member integral with the rear wall and overlying the upper end of the channel member, a bearing assembly seated upon said flap, a lifting screw rotatably mounted within said channel member, a portion of said lifting screw adjacent its upper end extending through openings in said bearing assembly, said lifting screw being provided with a transverse hole above the flap member, said operating handle being characterized by a horizontal portion on said handle extending through the transverse hole in the lifting screw at the upper end thereof to thereby support the screw on the bearing assembly, a portion of the surface of the horizontal portion of the handle being flattened to engage the upper surface of the bearing assembly whereby load applied to said load lifting means is transmitted through the horizontal portion of the handle to the bearing assembly and thence to said flap, said flattened portion holding the handle in a horizontal position when load is applied to the lifting screw.

2. In a jack of the tripod type, a sheet metal main frame member adapted to receive a lifting screw, and comprising a rear wall and a pair of side walls, each of said side walls being provided adjacent its upper end with an offset bulging cam portion, said bulging cam portion being inclined outwardly from the forward edge of the side wall, a pair of legs, one of said legs being pivotally mounted on one side of the offset bulging cam portion, and the other leg being pivotally mounted on the other bulging cam, said legs being cammed outwardly to extended position, and cammed inwardly towards the sheet metal main frame member to a position of close parallelism when not in use.

2,774,568
**POST HOLE DIGGER AND DRIVING MEANS THEREOF**
Glen H. Jones, Indianola, Iowa
Application June 15, 1953, Serial No. 361,495
3 Claims. (Cl. 255—19)

1. In combination with a post hole digger having a vertically disposed U-frame and a power head slidably mounted in said U-frame having an auger mounted thereon, a telescoping drive, said drive comprising a tubular member having an H-shaped shaft slidably mounted therein, said tubular member further having a plurality of opposed rollers axially mounted on the inner surface thereof and received between the flanges of the said H-shaped shaft, a universal joint mounted on the outer ends of said H-shaft, a second universal joint mounted on the outer end of the tubular member and positioned to engage the aforementioned power head.



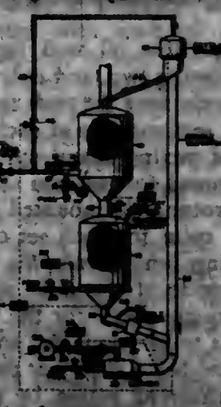
2,774,569
**EARTH MOVING HYDRAULIC SUCTION NOZZLES**
Karl Oscar F. Jacobsen, Seattle, Wash.
Application April 5, 1954, Serial No. 426,833
3 Claims. (Cl. 255—24)

1. The earth-moving hydraulic suction nozzle device comprising a nozzle base member of tubular form adapted for connection to an hydraulic suction conduit for drawing of earth materials through said tubular member by hydraulic suction applied thereto, a plurality of elongated members carried by said tubular member and projecting beyond one end thereof at locations spaced apart around the circumference of said tubular member, said elongated members throughout their length being of substantially uniform width measured circumferentially of said tubular member, said elongated members being formed to converge mutually in the direction away from said tubular member, a generally pointed nozzle tip member interconnecting the projecting ends of said convergent members to form an open grid structure of generally conical form through which indrawn hydraulic liquid and earth materials pass before flowing through said tubular member, and helical spring means received concentrically within said open grid structure and extending lengthwise thereof substantially throughout the length of said grid structure, the successive coils of said helical spring means being of progressively graduated diameters to fit closely within said grid structure and reinforce the same against inward deformation of the elongated members thereof, said helical spring means coils being spaced apart to permit passage therebetween of said indrawn liquid and materials and serving as a deflector of indrawn objects otherwise tending to become lodged between said elongated members.

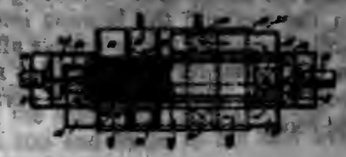
2,774,570
**ROLLER CUTTER FOR EARTH DRILLS**
Robert A. Cunningham, Houston, Tex., assignor to Hughes Tool Company, Houston, Tex., a corporation of Delaware
Application May 3, 1954, Serial No. 428,640
5 Claims. (Cl. 255—367)

1. In a roller cutter for earth boring drills, a cutter body comprising, a pair of integral oppositely extending conical portions symmetrical about a common axis and having a common base intermediate the ends of the cutter body, one of said portions having a plurality of cutting elements thereon adapted to engage and disintegrate the bottom of a hole being drilled, said cutting elements including a series of cutters surrounding the body proximate said base, and an annular series of cylindrical inserts of hard wear resistant material secured in the other of said portions and spaced from said base, said

inserts having their axes extending outwardly and substantially normal to the surface of said other portion and presenting protrusions at the surface thereof to effect disintegrating action and to maintain gage of the well bore being drilled.



2,774,571
**CONE TYPE WELL DRILL**
Erwin A. Morlan, Houston, Tex., assignor to Hughes Tool Company, Houston, Tex., a corporation of Delaware
Application July 6, 1954, Serial No. 441,360
4 Claims. (Cl. 255—367)

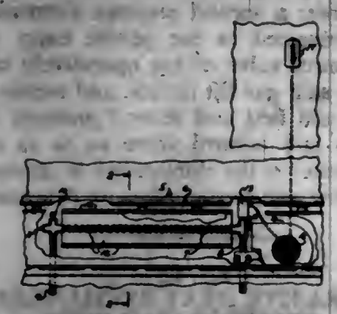


4. In an earth boring drill having a plurality of conical cutters rotatably mounted thereon, each of said cutters having annular series of wear resistant inserts arranged thereon and protruding from the surface thereof to disintegrate the entire bottom of the hole being formed by the drill; the improvement comprising nose portions on the cutters in mutually confronting relation and terminating proximate the axis of the drill, a plurality of axially spaced annular series of wear resistant inserts secured in each nose and protruding from the surface thereof, series of inserts on the respective noses being so spaced along the noses that a track made by one series overlaps the track made by the corresponding series of another nose whereby the nose portions disintegrate the formation traversed by said nose portions.

2,774,572
**IMPROVED PEBBLE HEATER**
Robert R. Geisz, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Application November 5, 1951, Serial No. 254,965
4 Claims. (Cl. 257—2)

1. In a heat transfer apparatus comprising a pebble heating chamber, a heat transfer chamber located below said heating chamber, means for gravitating pebbles downwardly through said chambers, and a gas lift pebble elevating means having a gas entry, a pebble entry, a gas exit and a pebble exit adapted to remove pebbles from the bottom of said heat transfer chamber and to deliver said pebbles to the top of said heating chamber, the improvement comprising, a first pressure determining means operatively connected to the bottom of said heat transfer chamber; a second pressure determining means operatively connected to the pebble entry of said gas lift means; control valve means operatively connected to the gas exit of said gas lift means; and means operatively connected to said first and second pressure determining means and to said control valve so as to control said valve in response to the differential in pressure existing between said first and second pressure determining means.

2,774,573
**REGENERATIVE HEAT EXCHANGER WITH RECIPROCABLE RODS**
Sven Holm, Wellsville, N. Y., assignor to The Air Preheater Corporation, New York, N. Y.
Application July 16, 1952, Serial No. 299,105
6 Claims. (Cl. 257—6)



1. A heat exchanger having a casing providing a series of passages for hot gases arranged in alternation with passages for relatively cool air all bounded by parallel wall members; a bundle of reciprocable, parallel rods extending through said wall members and laterally of said passages, said rods being of a length to simultaneously extend across all of said passages and to project beyond the extreme wall at either end of said series by an amount greater than the stroke of reciprocation of said rods; cross-bar means located at either end of said bundle of rods and secured to both ends of all of said rods; means connected to each of said cross-bars and operable to apply drawing forces to opposite ends of said rods in alternation to effect their reciprocation to move portions thereof from gas passages into adjacent air passages and vice versa; means forming a pair of chambers at either end of said series of passages of a width to receive the portions of said rods that project from the end wall member on either movement of reciprocation of said rods; conduit means interconnecting said chambers with spaced hot gas passages for circulating gas through said chambers to heat the rod portions therein; valves across said conduits controlling the flow of gas through said chambers; and means responsive to the position of said rods for opening the valves controlling flow through the chamber occupied by rod portions that project into said chamber and for closing said valves on retraction of said rods.

2,774,574
**BASEBOARD RADIATOR**
Grayden M. Patterson, Austin, Minn.
Application October 23, 1952, Serial No. 316,343
1 Claim. (Cl. 257—133)

In a baseboard radiator the combination of an elongated housing of low height adapted to be secured adjacent the baseboard in a room, said housing having apertured upper portions through which air is discharged, an elongated heating element mounted within the interior of said housing between the upper and lower portions thereof and extending longitudinally through the housing, a plurality of elongated heat-transferring fins extending longitudinally along said heating element and substantially

radially outwardly from said heating element into spaced relation with said housing, said fins being secured to said heating element along the length thereof in heat-transmitting relation, and a blower mounted within said housing and having an air discharge opening disposed in close proximity with one end of said heating element and said fins and directing air longitudinally between said fins, the center of the air discharge opening being disposed below

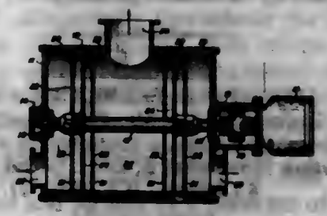
said heating element and directing a proportionately greater quantity of air between the downwardly extending fins as compared to the air driven between the upwardly extending fins, whereby portions of the air driven longitudinally between the downwardly extending fins will circulate between the fins and the housing into proximity with the upwardly extending fins to receive all of the heat available from the upwardly extending fins and then be discharged through the apertured upper portions of the housing into the room.

---

**2,774,575**
**REGENERATOR**
**Hellmuth Walter, Upper Montclair, N. J., assignor to Worthington Corporation, a corporation of Delaware**
**Application March 7, 1952, Serial No. 275,364**
**5 Claims. (Cl. 257—221)**

1. In a regenerator, a shell having one end open, a tube sheet closing said open end, said tube sheet constructed of a plurality of sections disposed parallel and in spaced relation to each other, means connecting the sections of the tube sheet to permit expansion and contraction of one section of the tube sheet without transferring thermal stresses to the other section, a removable head attached to said tube sheet and shell having an inlet for the medium to be heated and an outlet pipe for heated medium, at least one partition means coacting with one of the tube sheet sections to form an inlet chamber and an outlet chamber inwardly of said inlet chamber, said inlet chamber communicating with said inlet and said outlet chamber communicating with said outlet pipe, a plurality of U-shaped tubes having their inner legs connected to one of said sections of the tube sheet and their outer legs connected to another of said sections of the tube sheet and disposed to extend into said shell to form an inner heat exchange section and an outer heat exchange section, the outer legs of said U-shaped tubes communicating with said inlet chamber and the inner legs of said U-shaped tubes communicating with said outlet chamber, means in said shell forming an inlet for hot gases, means on said shell forming an outlet to exhaust cool the gases from said shell, and means in said shell coacting with said inlet and outlet means to direct the flow of hot gases in a sinuous path over and about said inner and outer heat exchange sections.

---



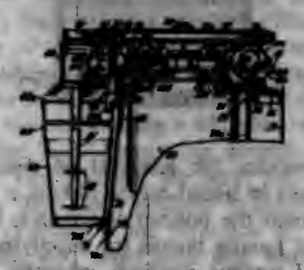
**2,774,576**
**BLENDER**
**Milton A. Frank, Sr., Frederick, Md.**
**Application April 11, 1952, Serial No. 281,879**
**13 Claims. (Cl. 259—9)**
**(Granted under Title 35, U. S. Code (1952), sec. 266)**

1. A blender comprising the combination of a closed container, an opening in the bottom wall of said container, a sleeve secured in said opening and extending upwardly within said container to a point below the top thereof, a shaft connected to a rotating source of power on the exterior of said container and extending through said sleeve to a point above said sleeve, a downwardly extending blade carrying sleeve surrounding and spaced from said first-mentioned sleeve and attached to said shaft at the upper end thereof, bearing means for said blade carrying sleeve said bearing means including a bearing near the top of said blade carrying sleeve, openings in said blade carrying sleeve positioned at a point near its upper end, below the bearing and above the liquid level in said container.

---

**2,774,577**
**HOMOGENIZERS FOR OIL WELL LIQUIDS**
**Terry O. Anderson and James E. Brandon, Duncan, Okla., assignors to Halliburton Oil Well Cementing Company, Duncan, Okla.**
**Application August 26, 1955, Serial No. 530,842**
**2 Claims. (Cl. 259—9)**

1. A homogenizer for oil well liquids comprising a cylindrical vessel having two, and only two, sets of stator disks mounted therein near the ends thereof so as to provide two churning sections, one at each end of the vessel, and an impact and mixing chamber in the center of the vessel, a shaft mounted for rotation about the axis of the cylindrical vessel, rotor disks mounted on said shaft, there being at least one rotor for each set of stator disks, two inlets for conveying liquids into the vessel, said inlets being disposed outside of the disks at opposite ends of the vessel, and a single outlet for the vessel located centrally thereof so as to be connected to the mixing chamber, the arrangement being such that two streams of liquid are subjected to churning action by the disks and then caused to converge and be thrown together in the mixing chamber.



**2,774,578**
**METHODS AND APPARATUS FOR WHIPPING FOOD PRODUCTS**
**Newton E. Spicer, Jr., Oakdale, Edward M. Gregson, East Northport, and Henry L. Hesse, Oakdale, N. Y., assignors to National Dairy Research Laboratories, Inc., Oakdale, N. Y., a corporation of Delaware**
**Application September 24, 1952, Serial No. 311,221**
**5 Claims. (Cl. 259—25)**

1. A closed system for providing a continuous output of a whipped plastic product, comprising pumping means including at least two stages for introducing the solid, unwhipped product into a conduit under pressure, said pumping means comprising a screw feed device and gear pump connected in series and establishing a substantially constant volume of flow in the conduit at varying pressures, means for introducing gas continuously into the product within the conduit including an orifice, means for providing a gas behind the orifice at a pressure which is at least twice the maximum pressure of the product within the conduit, and closed whipping means for receiving the product and the gas from the conduit and for agitating the same to incorporate the gas uniformly throughout the product in a continuous whipping operation.

---

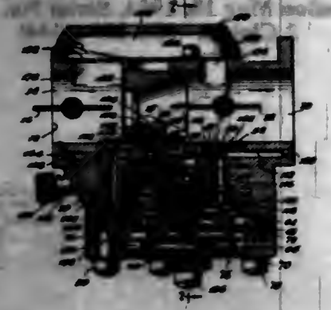
**2,774,579**
**MULTIPLE DRINK MIXING MACHINE**
**Le Roy A. Brown and John R. Bouchardge, Rock Falls, Ill., assignors to Prince Castle Mfg. Division, Inc., Sterling, Ill., a corporation of Illinois**
**Application February 23, 1954, Serial No. 411,701**
**6 Claims. (Cl. 259—131)**

1. A multiple drink mixing machine comprising a support, a spider mounted on said support and including a circular center portion, a motor mounted on said spider, a master driving wheel driven by said motor, a plurality of mixing spindles mounted on said spider around said circular center portion, a plurality of spindle driving means, one associated with each of said spindles for selectively driving any one or more of said spindles from said master driving wheel, an energization circuit for said motor including a control switch, a switch actuating member in the form of an open ring pivotally mounted to said spider at the open end thereof and including means for operating said switch, said open ring including a circular section extending around said center portion, container actuated plungers one for each spindle for rendering the associated spindle, driving means effective to drive said associated spindle from said master driving wheel, said container actuated plungers being spaced around a circle having a diameter of the order of the diameter of said circular section, and means on each of said container actuated plungers for engaging a different part of said circular section for operating said switch actuating member to close said switch in response to operation of said container actuated plungers whereby said motor is energized whenever said master driving wheel is in driving engagement with any one of said spindle driving means.

---

**2,774,580**
**PAINT MIXING DEVICE**
**Stanley J. O'Brien and Alfred S. Karcewski, Lansdale, Pa.**
**Application May 18, 1954, Serial No. 430,538**
**2 Claims. (Cl. 259—144)**

1. A paint mixing device for use in a paint can comprising; a flat metallic sheet of rectangular configuration having a top edge, a bottom edge, and side edges; one of the corners of said sheet being obliquely cut from said top edge to one of said side edges; and a pair of triangular wing-like members integrally attached to said sheet on opposite sides thereof, the said members lying in spaced planes perpendicular to the plane of said sheet and each having an edge coplanar with the bottom edge of said sheet; the said sheet having cut-out portions corresponding in size and shape to the said wing-like members.



---

**2,774,581**
**EVAPORATIVE COOLER**
**Marvin W. Bowersox, Elk City, Kans.**
**Application October 26, 1954, Serial No. 464,361**
**2 Claims. (Cl. 261—24)**

1. An evaporative cooler comprising, a housing having bottom, side, end and top walls, said housing being adapted to contain evaporative liquid in the lower portion thereof, a baffle secured to the side and end walls intermediate the bottom and top walls and curving inwardly and downwardly from said side and end walls and terminating in an inwardly turned substantially continuous flange having spaced relation to the evaporative liquid level in the housing, said inwardly turned flange defining a central opening through the baffle, fibrous material in the housing between the baffle and bottom wall and extending into the evaporative liquid in the housing, louvers in the side walls adjacent to and below the portion of the baffle secured to the side walls for entry of air into the housing, said housing having an opening in a selected wall for introducing evaporative liquid into the portion containing the fibrous material, said housing having an air discharge opening in the upper portion thereof above the baffle, and a motor driven fan in the upper portion of the housing and aligned with the air discharge opening whereby operation of the fan draws air through the louvers and wetted fibrous material between the baffle and evaporative liquid level to cool the air by evaporation of said liquid and then through the opening in the baffle and discharges the cooled air through the air discharge opening.

2,774,583
CARBURETOR
Robert F. Brochu, Arlington Heights, Ill., assignor, by mesne assignments, to Mall Tool Company, a corporation of Illinois
Application April 3, 1952, Serial No. 280,321
5 Claims. (Cl. 261—41)

1. A carburetor of the class described comprising a body providing an air passage therethrough, a jet for supplying fuel to air passing through said passage, a fuel inlet for said carburetor, a pair of passages connecting said jet with said inlet, and a freely movable weight for controlling one of said passageways, said weight being normally inoperative but moved to close said passage under the force of gravity when said carburetor is inverted, whereby said weight meters the supply of fuel.

2,774,583
APPARATUS FOR PRODUCING FIRE EXTINGUISHING FOAM
Edward Hatton, Ealing, London, England
Application August 14, 1953, Serial No. 374,387
Claims priority, application Great Britain February 3, 1953
5 Claims. (Cl. 261—76)

2. In a nozzle for producing a fire extinguishing foam and projecting it as a substantially streamline jet formed as a continuous tube having air inlets in its walls and an apertured closure defining an inlet end to which a supply of water under pressure to which a foam agent is admixed may be connected, an ejector member in said apertured closure defining a turbulence chamber having axially aligned apertured end plates, one of which is movable toward and away from the other, for atomising liquid directed therethrough, a cylindrical member having air inlets in its walls secured at one end to said closure and positioned about said ejector member and extending inwardly of said tube therefrom, a second cylindrical member of larger diameter than said first mentioned cylindrical member and having air inlets in its walls positioned in said tube in partially overlapping relation to said first mentioned cylindrical member and means forming a closure between said second cylindrical member and said tube, and a secondary apertured closure on said second cylindrical member with said first mentioned cylindrical member extending through the aperture therein, said cylindrical members forming progressively larger air-suction chambers progressively downstream from said ejector member.

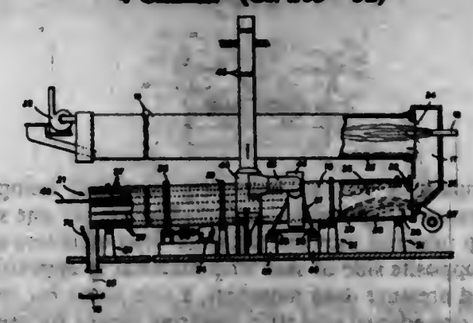
2,774,584
GAS AND FLUID MIXING DEVICE
Ella P. Agbuckle, New York, N. Y.
Application February 18, 1953, Serial No. 337,503
7 Claims. (Cl. 261—76)

2. A faucet attachment including a casing having internal threads to connect it to a faucet, perforated means in the casing, and washer means resting on the perforated means, said washer means having a perforated disc covering the opening in the washer, rims on both sides of the washer, the rim on one side of the washer extending radially inwardly to a greater extent than on the other side thereof, both rims being attached to the washer.

2,774,585
APPARATUS FOR PURIFYING LIQUID MATERIALS
John J. Wirt, Cleveland, Ohio
Application August 17, 1953, Serial No. 374,637
The entire term of the patent to be granted has been dedicated irrevocably to the free use of the Public of the United States and the Territories thereof
2 Claims. (Cl. 261—122)

1. In an apparatus for removal of dissolved or suspended substances in liquid media having a tank or other container at or near the bottom of which is located a porous medium and having means for supplying a gas under pressure to said porous medium whereby said gas diffuses through said porous medium thence through the liquid medium, thereby separating said dissolved or suspended substances from said liquid medium, an improvement characterized in that the walls of the pores of said porous medium have been coated with a thin coating of an organosiloxane resin having an average of from 1 to 1.7 monovalent hydrocarbon radicals per silicon, at least a major portion of the silicon atoms being connected by Si—O—Si linkages, any remaining silicon atoms being connected by linkages selected from the group consisting of Si—C—Si and Si—Si.

2,774,586
FLOOR SCRAPING MACHINE HAVING FLOATING SCRAPER
Anthony F. Becker, Houston, Tex., assignor to The American Floor Surfacing Machine Company, Toledo, Ohio, a corporation of Ohio
Application June 14, 1954, Serial No. 436,510
9 Claims. (Cl. 262—9)



1. In a floor scraping device, a wheeled framework, a cutter arm housing on said framework, cutter arm channels in said housing, cutter arms loosely mounted in said channels being free to move vertically and longitudinally therein, cutter blades on the forward end of said arms, a rotatable cam shaft mounted on said framework and eccentric cams mounted on said cam shaft,

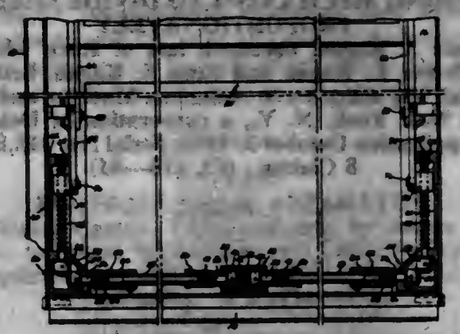
one of said cams being positioned adjacent each of said channels and means for yieldingly maintaining said cutter arms in contact with said eccentric cams and said cutter blades in contact with the floor to be scraped.

2,774,587
APPARATUS FOR COOLING CEMENT CLINKER
Henry D. Mayenschein and John E. Veley, Fairborn, Ohio
Application September 30, 1952, Serial No. 312,222
4 Claims. (Cl. 263—32)

1. Cooling apparatus for cement clinker and the like comprising an elongated cylinder supported for rotation about the axis thereof with said axis slightly inclined with respect to the horizontal for gravity flow of clinker therethrough, means for introducing hot clinker particles at the higher end of said cylinder for passage therethrough and discharge from the lower end thereof, means for introducing cooling fluid endwise into said cylinder with resulting formation of hot gases therewithin, means forming a plurality of enclosed pockets mounted in angularly spaced relation on the outside of said cylinder intermediate the ends thereof, means forming a plurality of vent openings in said cylinder each connecting directly with the inner end of one of said pockets, the outer end of each of said pockets being open, said pockets extending circumferentially of said cylinder in the direction of rotation thereof a distance from said vents such that when the inner end of each thereof is below the level of said clinker particles within said cylinder the outer end is above said clinker level, a hood surrounding said cylinder and said pockets, means for rotating said cylinder in the direction from the inner ends of said pockets to the outer ends thereof to cause portions of said clinker particles to drop by gravity into successive said pockets for temporary lifting thereby exteriorly of said cylinder followed by gravity return into said cylinder from the successive rising said pockets while said hot gases pass outwardly of said cylinder into said hood from the outer ends of said pockets, and means for venting said hot gases from said hood.

2,774,588
MAGNETICALLY CONTROLLED SAMPLE ADDITION MEANS
Hamel J. Otis, Hammond, Ind., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application December 29, 1955, Serial No. 556,260
5 Claims. (Cl. 263—47)

1. A combustion boat comprising a closely wound spiral of quartz tubing, said spiral having between about 5 and 20 turns, a diameter of between about 0.375 and 0.75 inch, said tubing being open at both ends, a hook means at one end of said spiral for manipulating the boat to discharge fluids therefrom, and detachable coupling means linked to



the said hook means, said coupling means including paramagnetic bar means and hook means on said coupling means engaging the hook means on said spiral.

2,774,589
CUTTING TORCH MACHINE HAVING REVOLVING TEMPLATE MOUNTS
Joseph Bonner, San Francisco, Calif.
Application July 2, 1954, Serial No. 441,990
4 Claims. (Cl. 266—23)

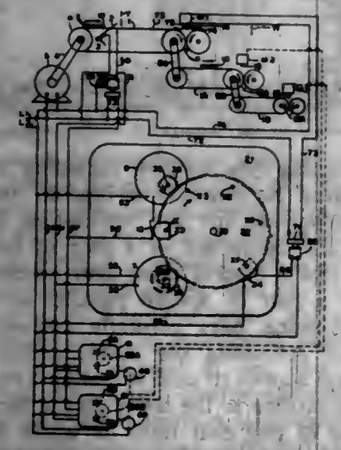
4. In combination with a cutting machine having a plurality of movable cutting torches and a tracing element engageable with a template and controlling the movement of said cutting torches, a template mount comprising, a base, a swivel plate pivoted on said base, template-mounting means on said plate whereby the mounted template is centered with reference to said pivot, and locking means operable to lock said plate with the template in any of a plurality of angular positions about the center of said pivot.

2,774,590
MECHANICAL OPERATOR FOR AWNING TYPE WINDOWS
Donn C. Blanchard, Miami, Fla., assignor, by mesne assignments, to Stanley Building Specialties Company, a corporation of Florida
Application May 28, 1954, Serial No. 433,045
4 Claims. (Cl. 268—23)

1. In an awning type window including a plurality of vertically spaced horizontally swingable ventilators, an operating mechanism for the ventilators comprising a central gear unit composed of a pair of facing beveled driven gears and a central drive gear meshing with said driven gears, a pair of spaced parallel vertical screws, elongated actuating bars pivotally connected to said ventilators for activating the latter, means operatively connecting said screws to said actuating bars for imparting rectilinear motion to the latter during rotation of said screws, a pair of end gear units of which includes first and second relatively perpendicular and meshing gears, said first gears being fixed to said screws, externally splined stub shafts fixedly supporting said second gears, tubular connectors carried by the stub shafts and a pair

of coaxial drive shafts having inner ends operatively and detachably engaged with said driven gears, and said drive shafts having outer ends telescopingly engaged with the connectors of said stub shafts.

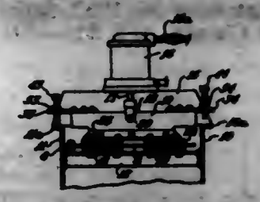
---



2,774,591
WINDOW OPERATOR
Deane N. Jewett, Fraser, Mich., assignor to Detroit Hardware Manufacturing Company, Detroit, Mich., a corporation of Michigan
Application September 2, 1952, Serial No. 307,520
2 Claims. (Cl. 268—105)

1. A window operator for swinging a border member of an outwardly-projecting window relatively to the frame of the window opening, said operator comprising an elongated thrust bar member having a resilient portion adapted to bend arcuately during the swinging of said window outward from said frame, a first elongated guideway mounted on said frame, a first slider mounted on the inner end of said thrust bar member in sliding engagement with said first guideway for travel therealong, the outer end of said thrust bar member being fixedly pivoted to said border member, a second elongated guideway mounted on the inner portion of said thrust bar member, a pivot mounted on said frame, a window-operating arm member pivotally mounted on said pivot and pivotally connected to said thrust bar member intermediate the ends thereof, a second slider mounted on the outer end of said arm member in sliding engagement with said second guideway for travel therealong, said arm member having an arcuate portion with gear teeth thereon disposed concentric with said pivot, a gear meshing with said teeth, a shaft rotatably mounted on said frame and drivingly connected to said gear, and a rotary handle operatively connected to said shaft.

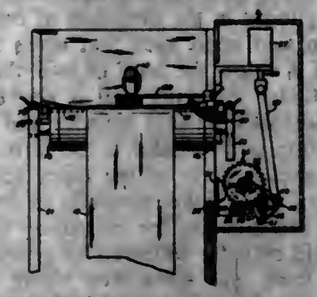
---



2,774,592
TIMING MECHANISM TO DIVIDE SHEETS PROPORTIONATELY
Benjamin S. Kagan, deceased, late of Rock Island, Ill., by Esther E. Kagan and Zona S. Kagan, heirs, Rock Island, Ill., assignors to American Machine and Metals, Inc., New York, N. Y., a corporation of Delaware
Application October 2, 1952, Serial No. 312,834
8 Claims. (Cl. 270—81)

1. In a machine adapted to operate on a sheet, means for moving a sheet at a constant speed past the machine, detector means in the path of said sheet, a rotatable cam, means including a first constant speed motor for rotating said cam from its initial position at one speed while the sheet passes said detector means, circuit means connecting said detector means and said first constant speed motor for initiating rotation of said cam thereby upon engagement of said detector means by a sheet, a second device including a constant speed motor for rotating said cam at a different speed after the sheet has passed said detector means, circuit means for initiating rotation of said cam by said second device constant speed motor upon disengagement of said detector means by the sheet, and an actuator for the machine engaged by said cam in its travel.

---

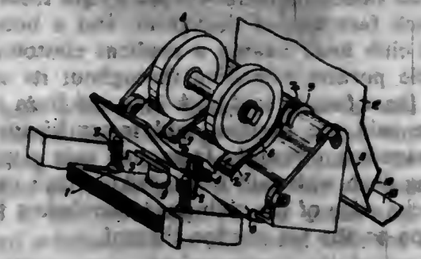


2,774,593
APPARATUS FOR GUIDING STRIP MATERIAL
Robert D. Lewis, Crooksville, and Karl F. Wietzel, Zanesville, Ohio, assignors to Armco Steel Corporation, Middletown, Ohio, a corporation of Ohio
Application December 2, 1952, Serial No. 323,595
2 Claims. (Cl. 271—2.6)

1. Apparatus for guiding strip material, comprising fixed pressure drag members adapted to contact one side of said strip material movable pressure drag members engaging the opposite side of said strip material in opposition to said fixed pressure drag members, a side guide for engagement by one edge of said strip material, means for applying pressure to said movable pressure drag members, and means to selectively vary the intensity of pressure applied to one edge of said strip material with respect to the other, whereby a differential pressure may be applied transversely of said strip material, to cause said strip material to hug said side guide.

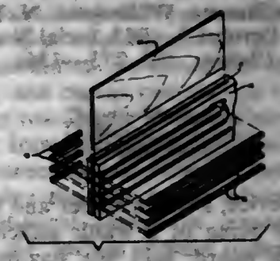
---

2,774,594
MATERIAL GUIDING APPARATUS
Allen L. Loucks, Baltimore, Md., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application March 10, 1955, Serial No. 493,531
3 Claims. (Cl. 271—2.6)



1. Apparatus for guiding a thin metal foil strip having a predetermined width, which comprises a guide roller over which such a strip is advanced continuously and normally along a predetermined path of travel, means for mounting the guide roller for rotation on its longitudinal axis, means operable for changing the angular relationship of the longitudinal axis of the roller with respect to the normal path of travel of the strip, a pair of electrical contacts mounted on the roller for rotation therewith and positioned substantially flush with the periphery, said contacts being spaced apart a distance slightly greater than the width of the strip and extending circumferentially only partially around the roller so that when the strip deviates slightly from its normal path of travel, one or the other of said contacts engages and disengages the strip once per revolution of the roller, means for insulating the contacts electrically from the strip so long as the strip maintains said normal path of travel, means for impressing an electrical potential between the strip and the contacts, and solenoid operated means connected to said contacts and designed to be energized, when any one of the contacts is engaged by the strip, to actuate the means for changing the angular relationship of the longitudinal axis of the roller in such a manner as to cause the strip to return to its normal path of travel.

---



2,774,595
APPARATUS FOR SEPARATING STACKED FLAT ARTICLES
Hugh Ernest James Butler, Harrow, England, assignor to Hall Telephone Accessories Limited, London, England, a British company
Application July 15, 1952, Serial No. 298,908
Claims priority, application Great Britain July 24, 1951
3 Claims. (Cl. 271—12)

1. Apparatus for separating a flat article from the top of a stack of such articles, comprising a base, support means on said base for retaining said articles in stacked relation, suction means disposed on said base for movement along a path located above and substantially centrally of said stack, said suction means, when at one portion of said path of movement thereof and connected to a source of low pressure, being disposed above said support means for engaging the central portion of the uppermost article so as to draw, raise and remove said article from said stack, a pair of arms carried by said base and located, respectively, above said support means and spaced from said suction means on opposite sides of said one portion of said path of movement of the latter, a stop on each of said arms for engagement with the lateral portions of said article, means on said base for adjusting said arms toward and away from said support means, respectively, said arms with said stops normally extending further toward said support means and said stack than said suction means, with said stops being vertically spaced from said top of said stack, whereby said article, upon being rasied by said suction means, abuts with its lateral portions against said stops and is centrally buckled upwardly while being removed from said stack but again becomes flat upon movement of said suction means along said path and away from said stops, a first guide located on said base and adjacent another portion of said path of movement of said suction means, said first guide being arranged at an upward slant relative to said base and said path and intersecting the latter so as to engage the leading edge of said article upon arrival of said suction means at said other portion of said path of movement, thereby guiding said article upwardly, said first guide being provided with a pair of spaced parallel slots extending therethrough in the direction of movement of said article therealong, said slots being substantially aligned with said stops, a pair of spaced, parallel shafts rotably supported on said base adjacent the ends of said slots, respectively, a pair of endless flexible belts supported on said shafts for movement in respective endless paths, corresponding portions of said belts extending through said slots for movement along the article-engaging part of said first guide, a third shaft mounted on said base and above said first guide, a pair of friction rollers rotatably mounted on said third shaft and opposite said slots, said rollers being in peripheral engagement with said belts, respectively, means operatively connected to at least one of said shafts for driving said belts along said endless paths, whereby said article, upon release from said suction means due to disconnection of the latter from said source of low pressure, will have said lateral portions thereof entrained between said rollers and said belts for movement along said first guide and with said central portion of said article out of contact with said rollers and belts, and a second, subtantially vertical guide on said base and adjacent the end of said first guide remote from said suction means for receiving said article in flat condition from said first guide and providing a drop path for said article toward a conveyer belt when the latter is located beneath said second guide.

---

2,774,596
HOCKEY STICK
Henrik N. Brodersborg, Champlain, N. Y.
Application October 26, 1955, Serial No. 542,827
1 Claim. (Cl. 273—67)

A hockey stick comprising a solid elongated handle integrally formed at its lower end with a head member for contacting the puck, said head member having a longitudinally extending central slot extending inwardly from the lower end thereof, a rectangular plate formed of several plies of veneer within said slot for widening the head, and laminated means for preventing the head from splitting or breaking, said laminated means comprising the sides of said head member having a plurality of vertically spaced, longitudinally extending slots disposed at right angles to said first slot and having their inner ends staggered with respect to each other, and a thin piece of plywood secured within each of said vertically spaced slots.

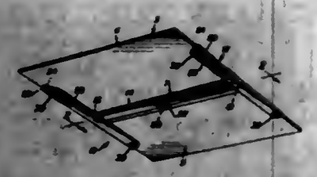
---

2,774,597
FOOTBALL GAME APPARATUS
Paul Folger, Canton, Ohio, assignor, by mesne assignments, to Joseph W. Edwards and Lewis W. Watkins
Application August 19, 1953, Serial No. 375,119
6 Claims. (Cl. 273—94)

1. In a game apparatus, a board having a simulated football field thereon having end zones at opposite ends and side lines at opposite sides, an oblong panel of less length and less width than the simulated football field imposed upon said simulated football field and spaced from the ends and sides thereof and lines indicating 1-yard lines extending transversely from one side line to

the other throughout the spaces between the end zones and ends of said panel and extending transversely from each sideline to the adjacent side of the panel throughout the length of the panel, apertures in the side lines at the intersections therewith of each of the 1-yard lines, a pair of dials upon the panel having indicia thereon representing all types of plays which may occur in a football game, each dial comprising three concentric circles, the circles on one dial representing kickoffs and punts, punt returns and intercepted pass returns, the circles on the other dial representing line plays, passes, and field goal and extra point attempts, a rotatable spinner hand concentrically mounted upon each dial for selectively indicating the play upon any of the three circles thereon, an individual playing piece simulating a football movably supported upon the simulated football field and movable thereon at the will of a player in accordance with the result of a spin of either of said rotatable spinning hands, and a distance marker of a length equal to the spacing between ten of said 1-yard lines and having depending post portions for insertion into any equally spaced pair of said apertures in the side lines.

---



2,774,598
**TURNTABLE DEVICES**
Gene Streece, Whitestone, N. Y.
Application October 7, 1953, Serial No. 384,650
5 Claims. (Cl. 273—136)

2. In a game device, a box member and a game board; said box member being of a width sufficient to receive therein said game board; said box having a horizontal wall thereon extending across the entire extent of the box, the upper surface of said wall being adapted to underlie and be in supporting engagement with said game board, the latter being an independently movable member operatively movable into and out of said box and adapted for positioning upon said horizontal wall; and rotary mounting means on said board and wall, said means comprising two coacting male and female snap fastener elements proportioned for relative rotary movement when said elements are in operative engagement, one of said elements being only on said horizontal wall and the other only on said board, whereby the board is rotatably supported by said wall.

---

2,774,599
**FOLDING GAMEBOARD AND RIGIDIFYING AND TURNING ATTACHMENT THEREFOR**
Gilbert M. Dunn, Concord, N. H.
Application October 11, 1954, Serial No. 461,396
5 Claims. (Cl. 273—136)

1. For use on and in association with a manually foldable table-type gameboard, a rigidifying and turning attachment for said gameboard comprising a strip member separate from said gameboard and having a pivoting boss intermediate its respective ends, and clamping and retaining adapters removably attachable to opposite marginal edge portions of said gameboard and adapted to bridge the central portion of said gameboard parallel to each other and at right angles to said strip member, the ends of said strip member being detachably connectible with the intermediate portions of said adapters, whereby to permit the gameboard to be converted from its compact folded form to unfolded playing form with the half-sections coplanar and joined rigidly with each other.

---

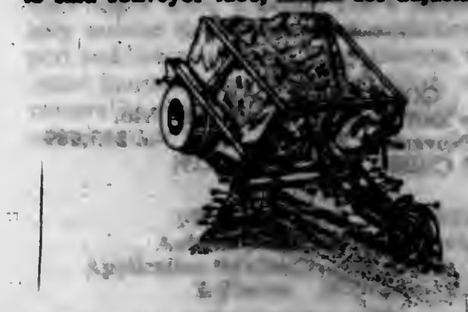
2,774,600
**ANTI-NICKING GOLF CLUB**
Milton B. Reach, Springfield, Mass.
Application February 25, 1954, Serial No. 412,494
4 Claims. (Cl. 273—174)

2. A golf club with a head comprising heel and toe portions and extending therebetween a rigid front striking face, a back face spaced therefrom, and a bottom sole area; said club head having a resilient elastomer insert with a sole portion extending throughout its sole area from said front face to said back face and from said heel portion to said toe portion; said insert having a face portion extending upwardly from said sole portion and terminating flush with said front striking face and forming the facial edge of the club head therebelow from the heel portion to the toe portion thereof.

---

2,774,601
**DEVICE FOR USE IN PLAYING GOLF**
Frederick G. White, New Rochelle, N. Y.
Application June 1, 1953, Serial No. 358,765
2 Claims. (Cl. 273—190)

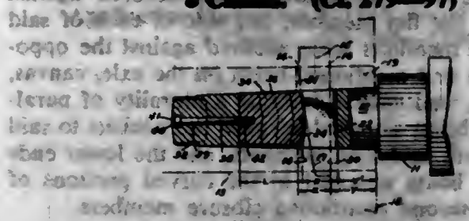
1. A golf training device comprising a generally crescent-shaped compressible cushion, formed of spongy material and having a substantially rectangular cross-section, the concave portion being adapted to fit the human neck, said body having upper and lower faces for engagement with the chin and chest of a player and having an uncompressed thickness of the order of 2½ inches such that, when the body is held between the chin and the chest of a player, the player's head will be in the position normally occupied when the ball is correctly addressed, said body, at one end thereof, having an increased thickness for engagement with the shoulder of the player during the follow-through of a golfing stroke.



---

2,774,602
**MATERIAL SPREADING APPARATUS**
George H. Sanderson, Ada, Ohio
Application January 10, 1952, Serial No. 265,851
6 Claims. (Cl. 275—2)

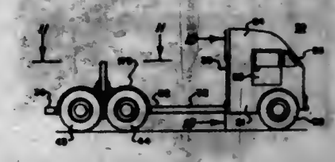
1. A rock salt spreading device of a type adapted for ready mounting and removal from the tail gate of a dump truck at a gated aperture thereof wherein said device when so mounted is rendered operable upon movement of the dump bed to an elevated position thereby to spread material over the surface of a highway, said device comprising a hopper, mounting means on said hopper comprising a plurality of laterally extending flanges adapted for passage through the gated aperture of the said tail gate and engageable with the



inner walls of the tail gate thereby attaching the hopper to the truck and constructed and arranged to be maintained therein by lowering of the aperture gate of the truck tail gate, agitating means in said hopper for moving material entering the hopper at said mounting means to an outlet opening at one end of said hopper, an auger type conveyor flight and tube extending laterally from said hopper at the outlet thereof and communicating therewith, a housing for the discharge end of said conveyor flight, said conveyor tube having a single elongated slotted outlet at the end remote from said hopper, a vertically slideable material control gate mounted on the hopper for movement into the hopper outlet at the inlet to said conveyor tube, means for adjustably varying the

control gate setting for material flow to said conveyor tube, a depending discharge chute at the outlet end of said housing and pivotally mounted about the discharge end of said conveyor tube, a deflector element pivotally mounted at the lower end of said chute and extending downward substantially in alignment with the front wall of the chute, and driving means including a wheel mounted on said device and adapted for engagement with the road surface upon elevation of the dump bed, said driving means including power transfer for simultaneously driving the material agitating means and the conveyor means with rotation of said wheel as the truck moves along the road, whereby said driving means functions to vary the quantity of flow in proportion to the rate of travel of the vehicle.

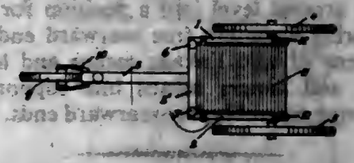
---



2,774,603
**TOOL SHANK AND HOLDBACK KEYWAY CONSTRUCTION**
Robert O. Jackson, St. Clair Shores, Mich., assignor to Beaver Tool and Engineering Corporation, Royal Oak, Mich., a corporation of Michigan
Application February 4, 1954, Serial No. 408,278
8 Claims. (Cl. 279—97)

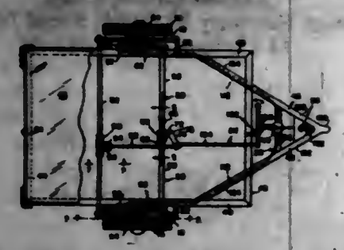
1. A holdback keyway construction for a tool having a taper shank, comprising a slot formed transversely through the longitudinal center line of said shank, said slot being dimensioned to form the sides and bottom end of said keyway and a locating surface, and an insert member having a thickness suitable for insertion in said slot and a width not exceeding the diameter of said shank, one end of said insert member being shaped to provide a working face for said keyway and the other end formed to engage the said locating surface of said slot, the length of said insert member being dimensioned to establish the desired length for the holdback keyway formed in said tool shank between the bottom end of said slot and the said working face of said insert member, and means for detachably securing said insert member in said slot whereby the length of said keyway may be varied as a function of the length of said insert member.

---



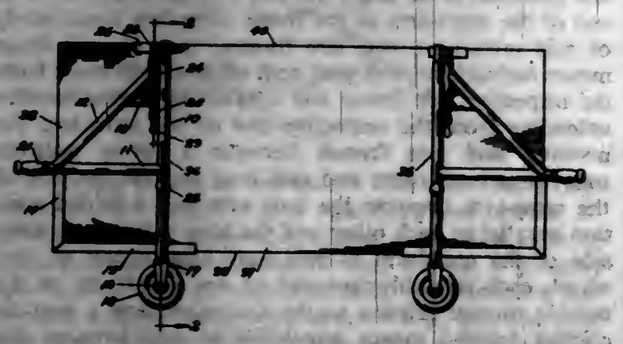
2,774,604
**TRUCKS OR OTHER TYPES OF VEHICLES FOR MOVING HEAVY MATERIAL HAVING A VERTICALLY ADJUSTABLE LOAD CARRYING FRAME**
Herbert A. Rendel and Robert L. Schauer, Lemon Grove, Calif.
Application February 18, 1955, Serial No. 489,248
14 Claims. (Cl. 280—6)

1. A heavy load carrying vehicle including forward and rear sections, said forward section including a front frame adapted to be wheel supported and to be advanced by a motor, said rear section including a rear frame, means connecting said rear frame to the front frame for relative up and down movement of the rear frame while the rear frame remains substantially horizontal, wheels at opposite sides of the rear frame, springs mounted for bodily displacement relative to the wheels and through which a portion of rear frame imposed load is supported by the wheels, means interconnecting the springs and wheels for transmitting said portion of rear frame load to the wheels and interconnecting the rear frame and wheels for transmitting the remainder of rear frame load to the wheels, and means operable to raise the horizontally remaining rear frame including elevator means connected in rear frame supporting relation with the springs and means connecting said elevator means with the rear frame for raising the rear frame relative to the wheels, springs and elevator means in response to operation thereof while the springs remain under rear frame imposed load.



---

2,774,605
**COLLAPSIBLE INVALID'S VEHICLE**
Gert Schleidebach, Hanau (Main), Germany, assignor to Adam Wilhelm Lehr, Offenbach (Main), Germany
Application July 22, 1952, Serial No. 300,316
Claims priority, application Germany July 25, 1951
1 Claim. (Cl. 280—39)



A foldable invalid's chair comprising, in combination a rigid generally T-shaped main frame, a steering fork rotatably mounted on the free end of the long arm of said frame, a front wheel supported by said fork, said wheel being pivotal between a position aligned with said arm and positions at an angle thereto, a hinge means at each end of the cross-arm of the frame extending transversely of said cross-arm, two side frames, each of said hinge means including a pivot post bent off at a right angle from the respective side frame and a receiving sleeve therefor extending from the respective end of the cross-arm for pivoting said side frames between a set-up position parallel to each other and said long arm on the side of the cross-arm opposite the long arm and a folded position parallel to each other and the long arm on the same side of the cross-arm as said long arm, a pair of rear wheels each rotatably mounted on one side frame on the outside thereof relative to the cross-arm, and a seat including bracing means attachable to and between the side frames in the set-up position thereof, thereby retaining the frames in the said position.

2,774,606
**TRAILER WITH ELEVATABLE BED**
Lorenz Baswegen, Harper Woods, and Paul E. Kreiker, Royal Oak, Mich.
Application June 17, 1954, Serial No. 437,341
7 Claims. (Cl. 280—44)

1. A trailer of the type described comprising a framed trailer body, draft framing conjoined to said body at its forward end adapted to be removably connected to a draft vehicle, trailer body hanger means rotatably supported on said body framing, independent wheel axle shafts supported on said body framing forward of said hanger means and substantially parallel thereto, said wheel axle shafts having crank arms and wheel supporting stub shafts on said crank arms outwardly of said body framing, semi-elliptic wheel spring assemblies fixedly and rotatably anchored at their forward ends on each side of said body framing and free at their rearward ends to rotate about their forward ends, said spring assemblies being mounted on said stub shafts, said hanger means having eccentric crank arms outboard of said trailer body engageable upon and disengageable from said free rear ends of said spring assemblies upon rotation of said latter crank arms, linkage means movably supported on said body and draft framing simultaneously coupling said wheel axle shafts together and rotating said hanger means out of an engaging position with said spring assemblies, and simultaneously disassociating said wheel axle shafts and rotating said hanger means into a position for engagement with said spring assemblies, and hydraulic lift means mounted on said body and draft framing adapted to raise said trailer body and said hanger means out of engagement with said spring assembly free rearward ends and to lower said trailer body to ground level when said spring assemblies and said hanger means have been disassociated by relative movement of said linkage means, and adapted to raise said trailer body and said hanger means from ground level into a position for engagement with said spring assembly free rearward ends upon relative movement of said linkage means and to lower said trailer body and hanger means into supported position upon said spring assembly free rearward ends.

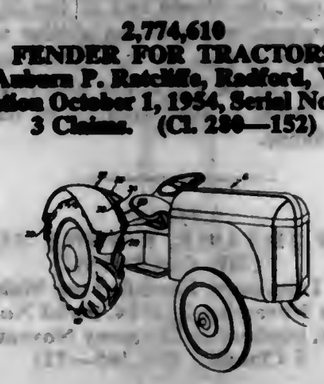
2,774,607
**PANEL HANDLER**
Richard L. Palmer, Indianapolis, Ind., assignor to Palmer Industries, Inc., a corporation of Indiana
Application August 1, 1955, Serial No. 525,593
6 Claims. (Cl. 280—47.3)

1. A unit for handling panels comprising a standard; a wheel mounted at the lower end of the standard; a member secured to the standard and extending laterally therefrom; a substantially right angled member of angle iron form, said right angled member having an upright length secured to said first member remotely from said standard, and a horizontal length secured to said standard below said first member, each of said lengths having a leg lying in a common plane and another leg extending in a common direction therefrom, said legs receiving a corner portion of said panel thereagainst; a clamp jaw slidingly carried by an upper portion of said standard, said jaw having a leg also turned in said direction; and means shifting said jaw in directions parallel to said standard for engagement and disengagement with a panel edge opposite said horizontal length leg.

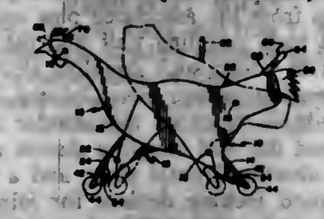
2,774,608
**GOLF CLUB CART**
Archie Earl Sanders, Kansas City, Mo.
Application November 23, 1953, Serial No. 393,689
2 Claims. (Cl. 280—47.19)

1. An improved club cart comprising: an axle, a pair of wheels, said pair of wheels spaced on said axle, a tongue, said tongue having one end thereof attached at a right angle to the mid-length of said axle, a beam, said beam being parallel with and secured on said axle, a second beam, said second beam being parallel with and secured on said tongue, a flat member, said flat member being of a rectangular shape having a width substantially equal to the length of the first mentioned beam, said flat member being secured flatwise on the beams with one edge thereof flush with the side of the beam opposite the tongue connection thereto, closure members, said closure members being secured flatwise against the side of the first mentioned beam on the axle and the mentioned one edge of the flat member, said closure members being projected above the flat member, said closure members being curved above the flat member, said closure members being equally spaced on the first mentioned beam, a second plurality of closure members, each of said second plurality of closure members having a curved edge and a straight edge, the straight edge of said second closure members being secured against the bottom of the flat member, one side of each of said second closure members being secured against the opposite side of the first mentioned beam on the axle, canvas, strip members, said canvas forming a plurality of parallel pockets by being attached between the pockets to said flat member with said strip members, and the lower ends of the canvas being attached to the curved portions of said first and second mentioned closure members.

2,774,609
**DOLLY WITH DISASSEMBLY FACILITATING MEANS**
Raymond C. Wieger, Livonia, Mich.
Application January 4, 1954, Serial No. 401,862
1 Claim. (Cl. 280—79.1)

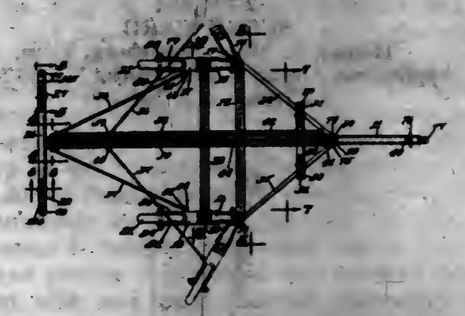


A portable truck comprising side frame members having a plurality of longitudinally-spaced vertically-extending dovetail grooves on the inner sides thereof, said side frame members further having dovetail projections on the respective opposite ends thereof, a plurality of short intermediate and end frame members having respectively dovetail projections on the respective opposite ends thereof, corner parts having vertically-extending dovetail grooves adapted to receive the end projections of the side and end frame members, said intermediate frame members being secured by their end projections to the dovetail groove in the inner side of the side frame members, said end frame members being secured between the dovetail grooves in the corner parts, said corner parts having depending projections and squared openings in



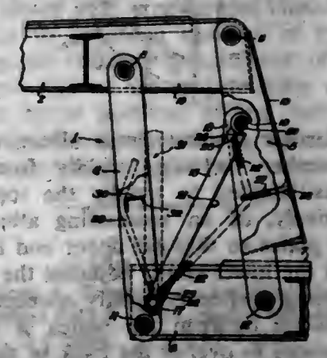
their upper ends, a castor sleeve adapted to be releasably secured to the depending projection of each corner part and having a thumb screw thereon, a castor fork and roller journaled on the castor sleeve, and corner posts removably secured within the squared openings of the corner parts.

2,774,610
**FENDER FOR TRACTORS**
Auburn P. Ratcliffe, Radford, Va.
Application October 1, 1954, Serial No. 459,712
3 Claims. (Cl. 280—152)



1. In a tractor, in combination, a wheel-supported axle an adapter frame removably bolted on said axle adjacent to said wheel, a sector-shaped plate constituting a safety guard and opposed to said frame, a wheel fender cooperating with a tread portion of said wheel and having a flange interposed between said frame and guard, and nut-equipped bolts passing through cooperating portions of said frame, guard, and flange.

2,774,611
**COMBINATION ROCKER-GLIDER AND PUSHCART**
Hugh C. Steeber, Royal Oak, Mich., and George A. Moore, Encinitas, Calif.
Application November 7, 1955, Serial No. 545,406
1 Claim. (Cl. 280—218)

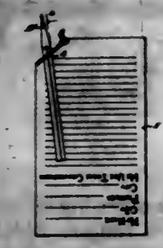


A child's mechanical riding toy comprising; a body portion comprising two vertical side panels in horizontally opposed, spaced relation; crossbars extending therebetween; said side panels having opposed downwardly and rearwardly extending leg portions; a seat assembly fixed to and between said panels; said seat assembly having opposed, downwardly and forwardly extending leg portions, means to pivotally engage said seat assembly with said body portion; said means comprising a pivot bolt extending through adjacent portions of said seat assembly and said body portion; a coil spring axially mounted on each of said bolts; one end of said spring being fixed to one of the rearwardly extending leg portions; the other end of said spring being fixed to one of the forwardly extending leg portions.

2,774,612
**DROP FRAME BOAT TRAILER**
Ralph S. Evans, Miami, Fla.
Application September 30, 1955, Serial No. 537,639
3 Claims. (Cl. 280—414)

1. A boat trailer comprising a longitudinally disposed tubular center beam, a tongue slidably mounted in said center beam, a transversely disposed axle spaced from the forward end of the beam and secured to the under surface thereof, said axle having inclined hubs on ends thereof, wheel mounting arms pivotally connected to said hubs, wheel carrying brackets pivotally mounted on said wheel mounting arms, wheels rotatably mounted in the wheel carrying brackets, a traveler slidably mounted on the center beam, stabilizer bars connecting the traveler to the wheel carrying brackets, a latch for locking the traveler in position with the wheels positioned for travel, boat carrying cradles extended from sides of the center beam, and braces connecting ends of the axle to the forward end of the center beam, the axes of the hubs at the ends of the axle being inclined whereby upon movement of the trailer to the rear and with the locking means of the traveler released the wheels move outwardly and upwardly in relation to the axle and beam.

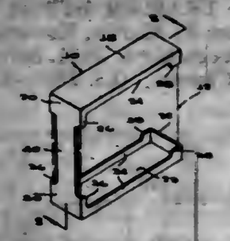
2,774,613
**SAFETY LOCKING BAR FOR FOLDING TRAILER HITCH**
William E. Martin, Kewanee, Ill.
Application December 4, 1951, Serial No. 259,799
4 Claims. (Cl. 280—415)



1. A self-locking hitch mechanism for a trailer comprising a hitch tongue, a support on the trailer bed, fore and aft pivotal shafts on said tongue, fore and aft pivotal shafts on said support, a ling connecting said forward shafts, a link connecting the rearward shafts, and a motion locking means interposed between said links comprising a safety bar, pivotal means to swingably carry one end of said bar on one link to permit the other end of said bar to swing freely relative to said links, a latching element on the other of said links, and a releasable latch means supported upon the freely swingable end of said bar and arranged to connect with said latching element on the other of said links; said pivotal means, said bar and said element all being disposed along a line intersecting one of said pivotal shafts when said bar is disposed in latched position with said element whereby

stresses in either direction through said link bar are directed through said one pivotal shaft and its associated mounting.

---

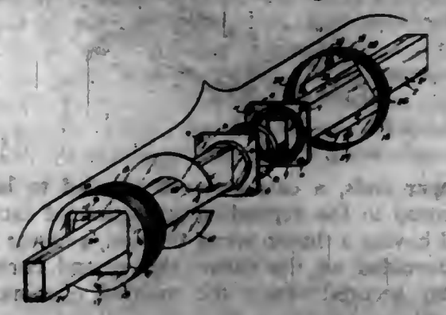


2,774,614
SCORE CARD
Thomas R. Moss, Dyersburg, Tenn.
Application August 9, 1955, Serial No. 527,367
1 Claim. (Cl. 281—1)

A score card comprising a rectangular relatively stiff sheet, one face of said sheet having printed thereon indicia and spaced lines, there being two groups of indicia and two groups of spaced lines, a score line extending between the upper and lower edges of said sheet and disposed midway between the side edges of said sheet, said sheet also having a diagonally disposed score line across each upper corner whereby a triangular tab may be bent upwardly and at right angles to said sheet, said sheet having an opening through each tab to receive and hold a pencil used in placing scores between said lines, the openings in said tabs registering upon bending of said sheet along said first mentioned score lines.

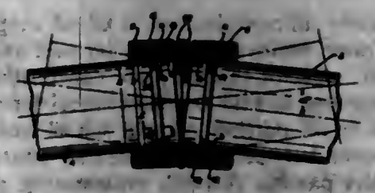
---

2,774,615
HOLDER FOR PHONOGRAPH ALBUM RECORDS
Joe G. Joseph, San Antonio, Tex.
Application May 24, 1955, Serial No. 510,617
3 Claims. (Cl. 281—20)



1. A holder for a phonograph album comprising: a C-shaped member including rigidly formed top and bottom plates adapted to overlie the top and bottom ends, respectively, of an upstanding album positioned between said plates so that the upper end is adjacent the top plate and the lower end is adjacent the bottom plate, and a connecting portion integrally connected at its ends to and extending between the plates at corresponding ends of the plates to overlie the back of the album, said connecting portion being inherently resilient and biasing the plates by its resiliency toward each other into engagement with said upper and lower ends of the album.

---

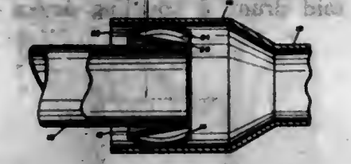


2,774,616
QUICK RELEASE COUPLING HAVING DETACHABLE SCREW THIMBLE-GLAND
Roy F. Dodd and Albert A. Nims, Baltimore, Md., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Application May 7, 1953, Serial No. 353,460
2 Claims. (Cl. 285—33)

2. In a coupling device for waveguide sections of non-equilateral rectangular cross-section and having rectangular coupling flanges at their ends, an externally threaded coupling member having a hole therethrough of configuration similar to that of the flanges whereby it may be assembled over one of said flanges onto one of said waveguide sections, an annular retaining ring having a side opening of a width somewhat greater than the shorter dimension of the waveguide cross-section but smaller than the longer dimension thereof, whereby it may be assembled on said one of said waveguide sections to retain said member thereon, an internally threaded collar closed at one end, the closed end of the collar having a hole therethrough of configuration similar to that of the flanges and a pair of pins on said closed end projecting toward the open end of the collar and engageable with the waveguide flange to limit rotation of the collar with respect to said flange.

---

2,774,617
ANGULARLY TILTABLE, RAPIDLY ADJUSTABLE TUBE COUPLING
Karl Ludwig Lassinger, Frankfurt am Main, Germany
Application November 2, 1954, Serial No. 466,255
Claims priority, application Germany November 16, 1953
5 Claims. (Cl. 285—71)



1. A rapidly connectible coupling for angularly tiltable pipes, comprising, in combination, two identical coupling sleeves, one on each pipe end to be connected, with the inside diameter of the coupling sleeves being greater than the outside diameter of the pipes, an arched annular recess in the inside wall of each coupling sleeve and a ring-shaped protuberance on each pipe end interlocking with the aforesaid recesses to prevent parting of the coupling sleeves from the associated pipe ends, a sealing gasket between each coupling half and the corresponding pipe end with which such coupling sleeve is associated, the said sealing gaskets being located, with respect to the pipe ends, in front of the annular recesses and extending beyond the said coupling sleeves and the pipe ends to define abutting frontal seals, and a pair of diametrically opposed locking devices for joining the two coupling sleeves and pressing the aforesaid frontal seals against each other.

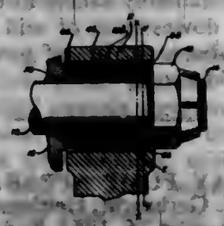
2,774,618
COMBINATION BALL AND SLIP JOINT FOR PIPES
Winston T. Alderson, San Diego, Calif.
Application September 13, 1954, Serial No. 455,676
4 Claims. (Cl. 285—223)

1. A combination ball and slip joint for pipes comprising first pipe end portion and a second pipe end portion in coaxial overlapping relation to the first pipe end portion, a resilient tapered collar having its smaller end peripherally sealed to the first pipe end portion, a hollow ball sleeve defining a major portion of a sphere and peripherally sealed to the larger end of said tapered collar and extending in returned overlapping relation to said collar, said ball sleeve having continuous internal frictional engagement with said second pipe end portion during substantial angular movement of said first pipe end portion.

---



2,774,619
SEALING MEANS FOR A SLIDABLE MEMBER IN A PRESSURE UNIT
Jean Mercier, New York, N. Y.
Application January 22, 1954, Serial No. 405,581
Claims priority, application France July 4, 1953
4 Claims. (Cl. 286—26)

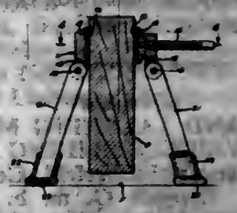
1. Equipment of the character described comprising a container, a plunger slidably mounted in said container, said container having a bore at one end through which said plunger extends, said bore having an annular groove in its inner periphery, a resilient sealing ring in said annular groove encompassing said plunger, a sleeve of resilient material rigidly mounted at one end with respect to said container adjacent said bore, on the inner side of said ring, extending into said container and encompassing said plunger, the free end of said sleeve defining an annular lip normally resiliently retained against said plunger.

---

2,774,620
RESILIENT JOINT
Leon F. Thiry, Chagrin Falls, and Dan T. Bradley, Shaker Heights, Ohio; said Bradley assignor to Harris Products Company, a corporation of Ohio
Application February 11, 1952, Serial No. 271,010
2 Claims. (Cl. 287—85)

2. A bearing comprising in combination an externally cylindrical inner member, an internally cylindrical outer member coaxial with and spaced radially outwardly of the inner member, and an annular rubber-like bushing element dilated upon the inner member and engaging said members in pressure friction adherence, said bushing element in its free state having a bore substantially less in diameter than the outer diameter of the inner member, and having in the free state a central portion of considerably greater wall thickness than the thickness of at least one end portion, and at least one end portion having an average annular cross-sectional area in the dilated state before insertion into the outer member substantially less than the annular cross-sectional area between the said inner and outer members, the central portion of the bushing having in its free state an average annular cross-sectional area greater than the annular cross-sectional area between the inner and outer members, the wall thickness of the central and at least one end portion of the bushing being so proportioned that, when the dilated bushing mounted upon the inner member is contractilely inserted into the outer member, the central portion is radially compressed and at least the said one end portion is expanded into pressure friction engagement with said outer member contiguous with and axially beyond the engagement of the central portion to the outer member, the length of the bushing measured along the bore being substantially the same in both the free and assembled states.

---



2,774,621
FLEXIBLE GASKETS
Frederick L. Kilbourne, Jr., Woodmont, Conn., assignor to The Connecticut Hard Rubber Company, New Haven, Conn., a corporation of Connecticut
Application February 1, 1954, Serial No. 407,525
3 Claims. (Cl. 288—23)

1. A gasket constructed principally of cured polydimethylsiloxane elastomer and having around the elastomer a sheathing of a nonelastic macromolecular organic structural material more resistant to liquid chemicals than the polydimethylsiloxane, bonded to the elastomer and selected from the class consisting of polytrifluorochloroethylene and polytetrafluoroethylene said gasket having closed path grooves and closed path ridges on substantially all extended surfaces of the gasket to provide corrugated surfaces longitudinal of the gasket, whereby deformation of the gasket under normal compressive forces flexes portions of the corrugated nonelastic sheathing into a projected area different from that covered by the undeformed gasket.

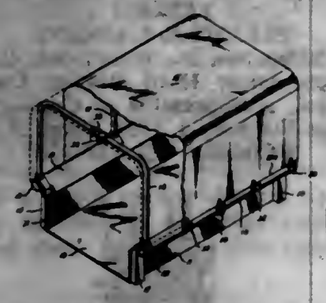
2,774,622
DOOR HOLDER
William A. Priebe, Los Angeles, Calif.
Application July 9, 1954, Serial No. 442,291
1 Claim. (Cl. 292—288)

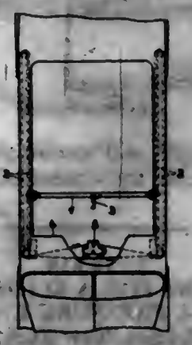


In a door holder to hold a pivoted door against pivotal movement in either direction, a U-shaped bracket adapted to extend around the vertical edge of a door, a pair of door-contacting jaws having non-abrasive abutting surfaces of non-metallic resilient material adapted to contact and clamp against the opposite vertical sides of said door adjacent said edge, one of said jaws being fixed on one arm of said bracket and the other of said jaws being

movable with respect thereto, a rotatable screw carried by the second arm of said bracket and supporting said movable jaw for movement toward and from said door upon rotation, said screw having a handle at its end spaced from said door, a single rigid leg member pivoted to each arm of said bracket on axes located below the plane of said screw and depending therefrom on the opposite sides of said door, said leg members being pivoted about an axis extended parallel to the plane of said door and each being formed with a knee so that with its upper end extended outwardly at an angle from said door its lower end extends more nearly perpendicularly to the floor, said legs lying in a vertical plane passing substantially through the axis of said screw and friction slide-resistant floor-contacting shoes at the lower ends of said leg members.

---

2,774,623
**BRACKET FOR SUPPORTING VEHICLE TOP BOW**
Bennie D. Owen, Houston, Tex.
Application July 16, 1953, Serial No. 368,334
6 Claims. (Cl. 296—104)



1. A bracket suitable for use on the wall of a vehicle body or the like, which wall has an upper section sloping upwardly and outwardly and terminating along its upper edge in an outturned, horizontally extending, rolled portion, and wherein a stake box is carried by the side wall, said bracket comprising, a circular body section having its inner circumferential face conforming to and adapted to slidably engage the outer circumferential face of said rolled portion about an arc in excess of 180°, a flat section extending from one end of the circular body portion and engageable with the upper surface of the sloped portion of said side wall to provide a stop limiting rotation of the bracket in one direction, a tie down eye carried by the bracket outboard of the zenith of the rolled portion with the stop means engaged, an anchoring leg carried by the flat section and extending into the stake box when the stop means is engaged to prevent movement of the bracket along the rolled portion, said anchoring leg having a length dimension which will clear the wall of the stake box most remote from said rolled portion as the bracekt is rotated about the rolled portion to remove the anchoring leg from the stake box, said bracket when rotated about the rolled portion to remove the anchoring leg from the stake box being slidable along the rolled portion of the side wall.

---

2,774,624
**OPERATING AND LATCHING MECHANISM FOR A VEHICLE SLIDING ROOF**
Helmut Lewer, Wuppertal-Elberfeld, Germany, assignor to Firma Gebr. Happich G. m. b. H., Wuppertal-Elberfeld, Germany, a corporation of Germany
Application June 30, 1954, Serial No. 440,497
Claims priority, application Germany June 30, 1953
8 Claims. (Cl. 296—137)

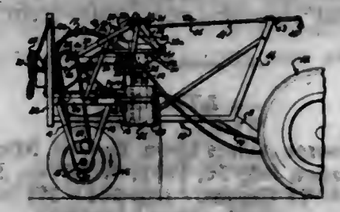
1. A closing device for a sliding roof for a vehicle comprising a hook member secured to the front end of the said roof, a cross beam disposed on top of the said vehicle, the said hook member being adapted to pull the said sliding roof tightly against the said cross beam, a cable drum secured to the said cross beam, a cable wound on the said drum and adapted to open and close, respectively, the said sliding roof upon turning of the said drum, and a driving member for the turning of the said drum, a coupling device disposed be-

tween the said drum and the said driving member and controlled by the said cable, said coupling device including means for disconnecting said drum from said driving member, said hook member operatively engaging said driving member simultaneously with the disconnection of said drum from said driving member.

---

2,774,625
**APPARATUS UTILIZING DETONATION WAVES FOR SPRAYING POWDERS**
George P. Hawley and Edward T. Tune, Speedway, Ind., assignors to Union Carbide and Carbon Corporation, a corporation of New York
Application October 21, 1954, Serial No. 463,643
2 Claims. (Cl. 299—28.6)

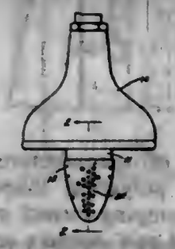
1. In a detonation gun having an elongated barrel having an open end, said barrel having a length-to-diameter ratio sufficiently high to permit the formation of a detonation therein, mixing chamber means directly and continuously communicating with said barrel for forming and passing to said barrel charges of detonatable fluid fuel mixture, means for supplying the components of said detonatable fluid fuel mixture to said mixing chamber means, supply means associated with said barrel for providing comminuted solid material in said detontable fluid fuel mixture, and means associated with said barrel for igniting said fluid fuel mixture in said barrel to initiate said detonation and propel said comminuted solid material from said gun, the improvement which comprises employing, as said supply means, powder entry tube means passing substantially axially through said elongated barrel to a point downstream of said igniting means for introducing a gas-borne stream of powder into said fluid fuel mixture in said barrel.



---

2,774,626
**SPRAY PUMP APPARATUS**
Osceola J. Gerbracht, Hettinger, N. Dak.
Application August 26, 1954, Serial No. 452,255
6 Claims. (Cl. 299—45)

5. A wheeled apparatus for traveling over the terrain and spraying plants growing thereon comprising, a supply line for delivering carrying fluid, spaced nozzles for overlying the terrain during operation of the apparatus, means for supplying carrying fluid under substantially constant pressure from said supply line to said nozzles to deliver the carrying fluid at a substantially continuous and controlled manner through said nozzles, a mounting



structure on said apparatus, a pump assembly mounted on said mounting assembly, said mount being reciprocable upwardly and downwardly for removing and inserting

said pump assembly into a source of liquid chemical, and a drive mechanism interconnecting said apparatus with the pump assembly for driving thereof at a rate proportional to the rate of travel of said wheeled apparatus.

---

2,774,627
**SHOWER CONE**
Felix J. Johnson, Sausalito, Calif.
Application November 2, 1953, Serial No. 389,666
4 Claims. (Cl. 299—83)

1. A hollow cone member having a cavity in the lower portion of the cone filled with water soluble perfumed crystals, said cavity having outside perforated side walls for admitting water to the interior of said cavity when said cone is in use, said cone having a permanent imbedded magnet in its upper structure magnetically engaging with a shower head.

---

2,774,628
**APPARATUS FOR DISPENSING UNDER PRESSURE**
Kathleen B. Engstrum, Arlington, Va.
Application May 10, 1954, Serial No. 428,553
10 Claims. (Cl. 299—95)

2. For use with an atomizing nozzle formed to discharge fluent mixtures under pressure from a container loaded with a liquefied gaseous medium, a syphon means inside of the container comprising a chamber, a foraminous barrier across said chamber, said chamber having openings on each side of said barrier, and discharge tubing coupled in said openings and to said atomizing nozzle, said barrier serving to separate any flocculated material from deflocculated material in said fluent mixture discharging through said syphon means, thereby preventing clogging of said atomizing nozzle, said chamber below said barrier having an internal volume greater than the internal volume of said tubing below said barrier, whereby any flocculated material in said chamber below said barrier is deflocculated by pressure into a fine dispersed state for efficient atomization by said nozzle.

---

2,774,629
**VARIABLE AREA FUEL NOZZLES**
T Cyril Nees, Bainbridge Township, Geauga County, and Frank C. Bayer, East Cleveland, Ohio, assignors to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application September 8, 1950, Serial No. 183,772
7 Claims. (Cl. 299—118)

6. In a nozzle having an inlet and an outlet, means defining a chamber communicating at one end with said inlet and at the other end with said outlet, piston means slidable in said chamber, metering means operated by said piston means for providing increased flow with increased inlet pressure, and check valve means for preventing flow from said outlet to said other end of said chamber while allowing flow in the reverse direction to permit free movement of said piston means in response to increased inlet pressure.

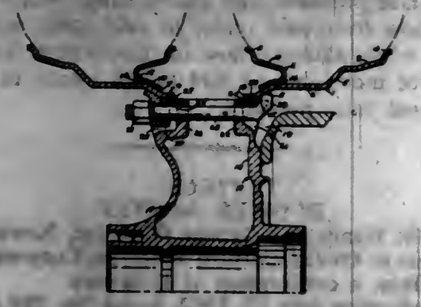
---

2,774,630
**BLOWER NOZZLE**
Thomas W. Henry and George D. Beggs, Newark, Ohio, assignors to Owens-Corning Fiberglas Corporation, Toledo, Ohio, a corporation of Delaware
Application July 17, 1952, Serial No. 299,488
4 Claims. (Cl. 299—140)

1. A blower comprising a horizontally disposed body having opposed surfaces spaced to provide an elongated passage extending vertically through the blower body; chambers within said body adapted to contain gases; a plurality of parallel channels disposed in a row at each side of the passage for discharging gas under pressure from each chamber in the form of a blast; the lower portions of surfaces bounding the passage in said blower body being arranged in substantial parallelism, the gas-discharge channels being configurated to direct the gases of the blasts in converging relation at an included angle of approximately twenty-four degrees and out of contact with the substantially parallel surfaces of the walls of the passage.

---

2,774,631
**TWO-PART ORIFICE SPRAY NOZZLE AND METHOD OF MAKING SAME**
Fred W. Wahlin, Oak Park, Ill., assignor to Spraying Systems Co., Bellwood, Ill., a corporation of Illinois
Application June 11, 1952, Serial No. 292,798
8 Claims. (Cl. 299—153)



1. A spray nozzle having a passage therein with a dome shaped end which is concentric with and has the

summit thereof concentric with the axis of said passage, said nozzle having at said passage end a spray orifice which is elongated in a direction leading across the summit of said dome shaped end and opens outwardly from said dome shaped end of the passage to the exterior of the nozzle, said orifice being elevationally contoured in conformity to said dome shaped end and having portions of the length thereof which slope downwardly from an interposed place of narrower orifice width to respective places of greater orifice width which face outwardly from the nozzle respectively in directions away from one another.

---

2,774,632
TIRE RIM
Rupert L. Aikin, Grosse Pointe Woods, Mich., assignor to Kelsey-Hayes Wheel Company, Detroit, Mich., a corporation of Delaware
Application December 29, 1954, Serial No. 478,305
3 Claims. (Cl. 301—13)

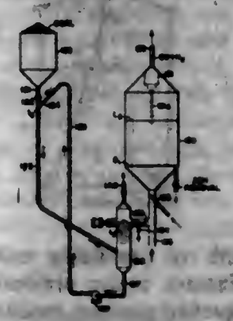
1. A tire rim of the type having an annular well comprising an endless annular member having a tire bead seat, a tire retaining flange at one edge of said tire bead seat, a well side wall at the other edge of said tire bead seat, a well base connecting into said side wall and a mounting portion connecting into the edge of said base spaced from said side wall and extending axially beyond said base and decreasing in diameter away from said base, and a second endless annular V-shaped member having a tire bead seat, a tire retaining flange at one edge of said last-mentioned tire bead seat and a return bent portion at the other edge of said last-mentioned tire bead seat rigidly secured to said base and extending over said mounting portion to reinforce the latter, said return bent portion cooperating with said base and side wall to form the annular well, said mounting portion providing a frusto-conical surface and a substantially radially extending surface, one of said surfaces being engageable with a clamp, and the other of said surfaces being engageable with a seat.

---

2,774,633
WHEEL COVER
George Albert Lyon, Detroit, Mich.
Application June 11, 1953, Serial No. 360,863
4 Claims. (Cl. 301—37)

1. In a cover structure for a wheel, a cover comprising divergent circular portions having at their junction spaced apertures, a circular part on the rearside of said cover having spaced tabs projecting through said apertures and overlying the opposite and outer side of said cover to interlock said part of said cover and forming an interrupted annular ornamentation on said outer side of the cover, and wheel engaging cover retaining fingers carried by and projecting rearwardly from said circular part.

---

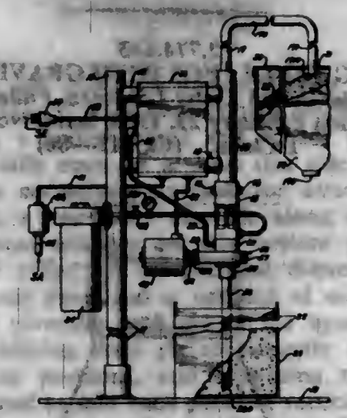


2,774,634
WHEEL COVER
George Albert Lyon, Detroit, Mich.
Application July 30, 1952, Serial No. 301,633
11 Claims. (Cl. 301—37)

1. As an article of manufacture, a circular wheel cover made from a polygonal shaped stamping having the corners of the stamping turned under the main body of the cover, each of said corners comprising an axially extending resilient flange notched out at the rear extremity to define an opening of sufficient width for receiving a cover retaining spring clip, the base of said notched portion being turned upon itself toward the cover proper and forming a shoulder at said opening engageable by a spring clip.

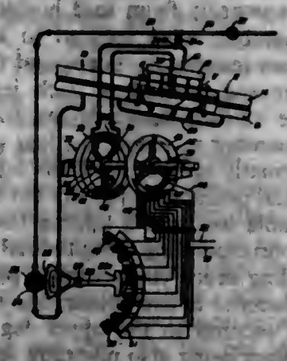
---

2,774,635
SOLIDS PUMP APPLIED TO COAL GASIFICATION
Henry J. Ogorzaly, Summit, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Original application October 22, 1949, Serial No. 123,070. Divided and this application June 1, 1954, Serial No. 433,359
2 Claims. (Cl. 302—14)



1. In a system for introducing solid particles of relatively low density from a low pressure zone into a treatment zone operating at higher pressure, the combination which comprises a standpipe for a high density liquid, means for feeding said solids at low pressure into the top of said standpipe, means for circulating a stream of dense liquid, from a quiescent receiver zone, at high velocity into the top of said standpipe and downwardly through the standpipe so as to entrain and carry said particles downwardly with said stream notwithstanding their low density and the buoyant effect of said dense liquid, the quiescent receiver zone connected with the lower end of said standpipe, wherein the particles are permitted to rise out of said liquid into a collecting zone, and an impelling feeder for moving said collected particles transversely into the treatment zone, the standpipe being of such height and the liquid of such density as to balance the pressure differential between the low pressure zone and the treatment zone.

---



2,774,636
HOPPER LOADERS
Carl H. Whitlock, Avon Township, Oakland County, Mich.
Application October 21, 1955, Serial No. 542,024
9 Claims. (Cl. 302—17)

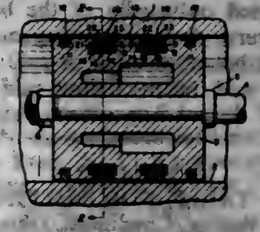
1. In a hopper loader, venturi means including air jets therein creating a vacuum therebelow and an airstream thereabove, a rigid suction tube positionable in a container of material to be loaded into a hopper, a flexible connector associated in rotatable sealed relationship with said venturi removably and flexibly connecting said rigid suction tube to said venturi in communication with the vacuum side thereof, the lower end of said suction tube being diagonally cut, and means operative responsive to the establishment and maintenance of a predetermined vacuum in said suction tube rotating said suction tube whereby to assure withdrawal of material from said container substantially uniformly around the lower end of said suction tube, and a discharge tube communicating between said venturi airstream and said hopper.

---

2,774,637
APPARATUS FOR CONVEYING PULVERULENT MATERIAL
Karl Jens Sylvest, Copenhagen, Denmark, assignor to F. L. Smidth & Co., New York, N. Y., a corporation of New Jersey
Application February 24, 1954, Serial No. 412,345
12 Claims. (Cl. 302—29)

1. In a system for conveying pulverulent material, the combination of a covered channel having an inclined bottom, means for supplying the material to the channel at the high end, a source of air under pressure, means for passing air from the source through the material in the channel to render the material sufficiently fluent to form a layer flowing along the bottom of the channel, means for varying the action of the supplying means, and means responsive to the difference in pressure of the air before and after it has passed through the layer of material to vary the action of the supplying means, said responsive means being normally inactive.

---



2,774,638
ECCENTRIC TRACK ADJUSTMENT
David Lucien Spencer, Leeds, England, assignor to The Elmco Corporation, Salt Lake City, Utah, a corporation of Utah
Application June 28, 1954, Serial No. 439,775
Claims priority, application Great Britain June 26, 1953
3 Claims. (Cl. 305—9)

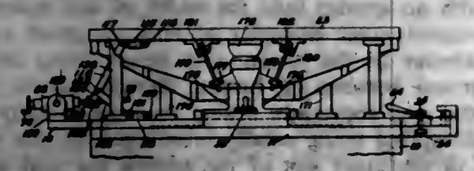
1. Endless track-tensioning means for an endless track unit having a track frame, a main idler wheel carried at one end of the track frame, a drive sprocket carried at the other end of the track frame, and an endless track extending therebetween comprising a cylindrical mounting member on which the main idler wheel is rotatable, a pair of spindles extending through said mounting member parallel to the axis thereof, said spindles being spaced apart one on each side of the axis of the mounting member, bearing means mounting one of said spindles in the track frame, tie means at each end of the spindles connecting said spindles in rigid relationship, and an operating member secured to one tie means for effecting angular adjustment about the axis of the spindle located in said bearing means and to cause arcuate movement of the other spindle for effecting angular adjustment of said mounting member.

---

2,774,639
PISTON RING EXPANDER
Julius Naab, Easton, Pa., assignor to Ingersoll-Rand Company, New York, N. Y., a corporation of New Jersey
Application September 25, 1956, Serial No. 611,929
4 Claims. (Cl. 309—35)

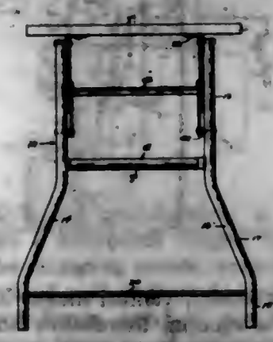
1. A piston having a peripheral encircling groove, said groove consisting of an inner slot and a narrower outer slot, a piston ring in the groove, a spring having a maximum width no greater than the width of said outer slot and a relaxed outer diameter at least as great as the outer diameter of the piston, said spring being located in said groove between the bottom thereof and the inner side of the ring constantly urging the ring radially outward, said spring being axially misaligned so that when in place in the inner slot of the groove the said spring can expand only until it abuts against the outer boundary of the inner slot.

2,774,640
**COLLAPSIBLE REAR SEAT SERVICE TRAY FOR AUTOMOBILES**
Clement R. Harmon and Charles R. Twenty, Toledo, Ohio
Application July 5, 1955, Serial No. 519,722
5 Claims. (Cl. 311—21)



1. A collapsible service tray comprising a centrally disposed vertical guide channel, a rectilinear tray, a guide member on one edge of said tray and movable along said channel, swinging support means pivotally connected to each side of said tray on a pivot line parallel to but removed from said first edge of said tray, means for attaching to a vertical surface the lower end of said guide channel and the upper ends of said support means, adjustable locking means carried in said centrally disposed channel, and a spring pressed plunger cooperating with said locking means and carried on said tray.

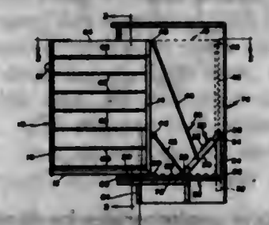
2,774,641
**AUTOMOBILE SERVING TRAY HOLDER**
Robert L. Borders, Jr. and Geraldine Sitz, Gadsden, Ala.
Application July 22, 1955, Serial No. 523,649
2 Claims. (Cl. 311—22)



1. For use in supporting a serving tray on the outside of an automobile having a window with a gutter above it, a relatively rigid frame having substantially vertically extending arms, hook members at the upper ends of said arms disposed to hook over the gutter, an inwardly extending member adjacent the lower end of said frame adapted to engage a side of the automobile body, said arms being bowed outwardly intermediate said hook members and said inwardly extending member whereby they are positioned outwardly of the body of the automobile, a transverse tray supporting member connected to the outwardly bowed portion of said arms, and a tray leg support on said frame below said tray supporting member.

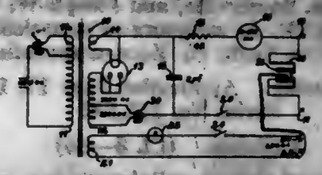
2,774,642
**ADJUSTABLE TABLE FOR MILLING MACHINES**
Campbell Ernst Waller, Cincinnati, Ohio, assignor to The Cincinnati Milling Machine Co., Cincinnati, Ohio, a corporation of Ohio
Application March 21, 1955, Serial No. 495,460
7 Claims. (Cl. 311—35)

1. A tilting table structure for a milling machine or the like including a base and a table supported in spaced relation thereto, supporting means intervening the base and table including a ball and socket swivel, a power means carried by the base and engaging the table at a plurality of points in spaced relation to said ball and socket swivel for effecting tilting of the table about two axes intersecting at said swivel and lying in a plane parallel to said base, and means attached to said table along one of said axes and spaced from said swivel for preventing rotary movement of said table about an axis passing through said swivel perpendicular to said plane, said means including a second ball and socket joint having interfitting parts, one of which is secured to the table and the other guided on said base for confined movement along said one of said axes.



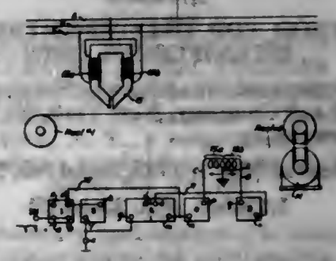
2,774,643
**FOLDING TABLE LEGS WITH GRAVITY LOCK**
David Gladeden and Lester Gladeden, Philadelphia, Pa.
Application February 23, 1955, Serial No. 489,911
1 Claim. (Cl. 311—86)

A folding table construction, comprising a rectangular table top and a supporting leg at each corner of said table top, each leg comprising a vertically extending upper end portion, a vertically extending lower end portion which is offset outwardly from said upper end portion, and a diagonally extending intermediate portion which is connected at its upper end to said upper end portion and at its lower end to said lower end portion, the two legs situated at each end of said rectangular table top being rigidly secured to each other by means of horizontal bars which are secured at their respective ends to said legs, one horizontal bar being secured to the upper end portions of said legs, the other of said horizontal bars being secured to the lower end portions of said legs, whereby the two legs at each end of the rectangular table top are rigidly secured together to form a single integral unit, four longitudinal frame members secured to the under-side of said table top, one at each corner thereof, said frame members being all disposed longitudinally of said table top, each said frame member comprising an angle bar having an upper horizontal flange and a vertically extending flange projecting downwardly from said horizontal flange, each said frame member being secured to said table top by means of screws securing its horizontal flange to the table top, the upper end portion of each leg being pivotally secured to the vertical flange of the correspondingly located frame member to render the legs pivotally movable from their normally upright positions supporting the table top to horizontal positions generally flat against the underside of said table top, and a folding brace between each leg and its corresponding longitudinal frame member, each said folding brace comprising a pair of bars which are pivotally secured to each other, one of said bars being also pivotally secured to the upper leg portion and the other of said bars being also pivotally secured to the vertical flange of said longitudinal frame member, and a stop portion on one of said bars which is engageable with the other of said bars when the legs are in upright position and said bars are disposed at an angle of 180 degrees to each other to prevent further angular movement of said bars relative to each other beyond said angle of 180 degrees.



2,774,644
**DRAWER AND STABILIZING MEANS THEREFOR**
Ray A. Patterson, El Cajon, Calif.
Application February 15, 1954, Serial No. 416,324
4 Claims. (Cl. 312—331)

1. A drawer and stabilizing means therefor for installation in an enclosure structure having a baseboard, said drawer having a bottom panel and a back panel and being substantially open on at least one side, said stabilizing means comprising a track for attachment to the baseboard, a free roller movable along said track, a rigid elongated member on said bottom panel and riding on said roller, an upright post disposed to the rear of said back panel and at one end of said track, a lever member pivotally attached to the upper end of said post, stabilizing rods pivoted directly upon said lever at spaced positions, said stabilizing rods being pivotally attached to said back panel at vertically spaced positions, said track extending to the rear of said back panel when the drawer is in retracted position and said lever and stabilizing rods being disposed behind said back panel of the drawer in all positions thereof.



2,774,645
**METHOD FOR REACTIVATING CATHODE RAY TUBES**
Joseph B. Batchelor, Jr., Monroe, Ga., assignor to Wesley R. Schaun, Chicago, Ill.
Application February 8, 1954, Serial No. 408,721
4 Claims. (Cl. 316—2)

1. The method of rejuvenating a used television cathode ray tube having an indirectly heated cathode with a heater and a single-aperture cup-shaped grid, said method comprising the steps of energizing the heater with substantially normal voltage, applying a direct voltage between the cathode and the grid making the latter so highly positive with respect to the former as to cause build-up of current flow between the cathode and the grid which is greatly in excess of the rated, normal cathode current, and removing said voltage at the time the current reaches a reference value for the magnitude of the applied voltage

which is characteristic of a new tube of the type under treatment, said reference current having a value of substantially 60 milliamperes thereby to (*a*) reactivate the cathode material and (*b*) remove any foreign matter present in the aperture of the grid.

2,774,646
**MAGNETIC RECORDING METHOD**
Byron E. Phelps, Poughkeepsie, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application December 31, 1951, Serial No. 264,341
8 Claims. (Cl. 346—74)

1. Apparatus for receiving and recording successive time displaced discrete intelligence pulses on a moving magnetic record medium, including in combination: a moving magnetic record medium; first controllable means for continuously generating either a magnetic flux of a first polarity or of a second polarity opposite to said first polarity on said and record medium; second means for controlling said first controllable means to change the magnetic flux polarity on said magnetic recording medium from either said first polarity of magnetization to said second polarity of magnetization, or vice versa, upon receipt of each one of said intelligence pulses, whereby each intelligence pulse is represented on said magnetic record medium solely by a change in either direction of the polarity of magnetization of said magnetic record medium.

## CHEMICAL

2,774,647
**DYEING OF POLYESTERS WITH VAT DYES**
Jerry M. Mecco, Somerville, and Joseph W. Creely, East Bound Brook, N. J., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine
No Drawing. Application May 17, 1952, Serial No. 288,544
2 Claims. (Cl. 8—34)

1. A process of dyeing fibrous polyesters of a glycol and a polycarboxylic acid with vat dyes, which comprises heating the said polyester fibers in an aqueous dyebath containing an unesterified leuco vat dye, a reducing agent and sodium tripolyphosphate, and having a pH between 6.5 and 7.5, at a temperature between the boiling point of water and 290° F., the pH of the aqueous dyebath during dyeing being maintained between 6.5 and 7.5 by means of the sodium tripolyphosphate buffer, and oxidizing the dyestuff on the fiber after dyeing is complete.

2,774,648
**DYEING OF POLYACRYLONITRILE WITH VAT DYES**
Jerry M. Mecco, Somerville, and Joseph W. Creely, East Bound Brook, N. J., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine
No Drawing. Application May 17, 1952, Serial No. 288,541
5 Claims. (Cl. 8—34)

1. A method of dyeing with vat dyes polyacrylonitrile fibers which are copolymers of acrylonitrile and a small amount of methyl acrylate and spun from a concentrated aqueous thiocyanate solution, which comprises heating at a temperature between 160°–325° F. the said fibers in an aqueous dyebath containing an unesterified leuco vat dyestuff, a reducing agent and a sufficient amount of zirconium oxychloride to substantially reduce heat yellowing of said fiber, the dyebath having a pH between 6 and 8, maintaining the pH of said aqueous dyebath between 6 and 8 during said heating until the dyeing is complete and oxidizing the dyestuff on the fiber.

2,774,649

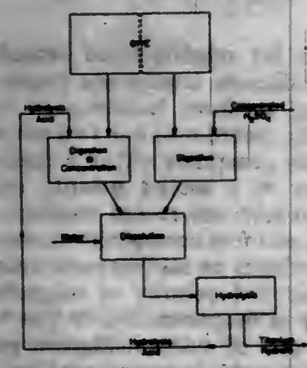
## DYEING OF CELLULOSE CARBOXYLIC ACID ESTERS WITH VAT DYES

Jerry M. Mecca, Somerville, and Joseph W. Creely, East Bound Brook, N. J., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application May 17, 1952, Serial No. 288,542

4 Claims. (Cl. 8—36)

1. A method of dyeing cellulose esters of carboxylic acids with vat dyes which comprises heating the said cellulose ester material in an aqueous dyebath containing an unesterified leuco vat dyestuff, a reducing agent and sodium tripolyphosphate and having a pH between 6.5 and 7.5, at a temperature between 160° F. and the boiling point thereof, maintaining the pH of the said dyebath between 6.5 and 7.5 by means of said sodium tripolyphosphate buffer during said heating until the dyeing is complete, and regenerating the vat dye on the said cellulose material by oxidation.



2,774,650

## METHOD FOR DECOMPOSITION OF TITANIFEROUS ORES

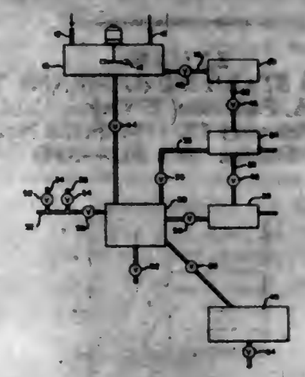
Asmr G. Oppegaard, Fredrikstad, Norway, assignor to National Lead Company, New York, N. Y., a corporation of New Jersey

Application May 1, 1953, Serial No. 352,547

1 Claim. (Cl. 23—117)

Process for decomposition of titaniferous material with sulfuric acid which comprises the following steps: (1) separating said material into two portions; (2) reacting one of said portions with concentrated sulfuric acid, the amount of concentrated sulfuric acid used being sufficient to form a product from 35% to 40% basic; (3) reacting the other portion of said material with hydrolysis acid and simultaneously concentrating to form a product, the amount of hydrolysis acid used being sufficient to form a product which is neutral to 10% acidic; and (4) subsequently dissolving and combining the so-formed products in an aqueous media to form a solution which has a basicity from 15% to 25%.

2,774,651



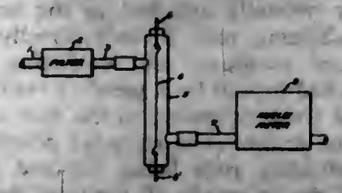
## DRYING AGENT AND PROCESS OF MAKING THE SAME

Kenneth A. Loftman, Boston, Mass., assignor to Godfrey L. Cabot, Inc., Boston, Mass., a corporation of Massachusetts

Application November 7, 1952, Serial No. 319,287

8 Claims. (Cl. 23—122)

1. A process for producing a desiccant which comprises the steps of reacting calcium silicate with a solution of sulfuric acid having a concentration of between 10 and 35%, and in a molar amount of at least 95% of the molar amount of calcium silicate, and agglomerating the resulting product to form agglomerates by densifying to a bulk density of above about 19 lbs./cu. ft.



2,774,652

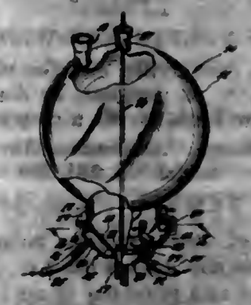
## HALOGEN VAPOR DETECTOR

Bernard Vonnegut, Alplaus, N. Y., assignor to General Electric Company, a corporation of New York

Application September 22, 1951, Serial No. 247,864

1 Claim. (Cl. 23—232)

The method of measuring the relative amount of halogen in a gas which comprises freeing said gas from condensation nuclei which may be present, bringing a volume of said gas into contact with a platinum surface heated to a temperature of about 500 to 800° C. whereby condensation nuclei composed of platinum halides are formed by chemical interaction of halogen with said heated platinum, humidifying said volume of gas, condensing water vapor about said condensation nuclei to form a droplet cloud, irradiating said droplet cloud with a beam of light to indicate the amount of scattering of light by said droplet cloud as a measure of said halogen.



2,774,653

## CHEMICAL APPARATUS FOR REACTING CHEMICALS REQUIRING HEAT TRANSFER

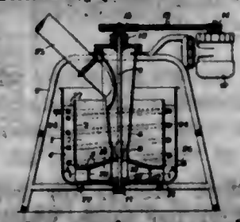
Aristodemo J. Cannetto, Rye, N. Y.

Application March 26, 1953, Serial No. 344,863

3 Claims. (Cl. 23—259)

1. An apparatus for reactive chemicals requiring heat transfer comprising a substantially spherical glass vessel adapted to receive the chemicals, said vessel at the bottom thereof having a relatively large, substantially circular opening, a laterally extending, substantially circular flange integrally formed in the bottom of said vessel around said opening, a substantially funnel-shaped metallic member adapted to be positioned in and close said opening, a laterally extending, substantially circular flange integrally formed in the mouth of said funnel-shaped member adapted to coincide with said flange in said vessel, means for securing said flanges together, a jacket freely and unobstructably spaced from and connected to the outer surface of said funnel-shaped member, adapted to circulate a heat transfer fluid around the outside of said funnel-shaped member, said jacket having an inlet and an outlet, means for supplying heat transfer fluid to said inlet, said vessel having an open neck, said funnel-shaped member including an open neck, a bottom outlet stopper within said neck, an elongated rod connected at its lower end to said stopper and extending upwardly through the open neck of said vessel, said funnel-shaped member being coated with a thin layer of glass.

2,774,654



## CONTACT MIXER

John Alva Reed, Gleadop, England, assignor, by mesne assignments, to Tootal Broadhurst Lee Company Limited, Manchester, England, a British company

Application February 26, 1952, Serial No. 273,440

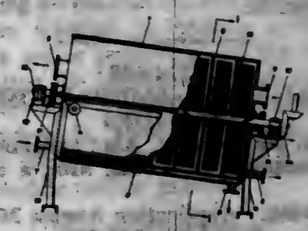
Claims priority, application Great Britain March 1, 1951

6 Claims. (Cl. 23—285)

1. An apparatus for treating one substance with another of which at least one is a liquid comprising a cylindrical tank, a central passage element rising from a level above the bottom of the tank to a level above the top of the tank, a cylindrical partition within the tank surrounding said central passage element with its upper end below the top of the tank and below the top of the central passage element and its lower end above the bottom of the tank to define an outer flow chamber between itself and the cylindrical wall of the tank and to define an inner flow chamber between itself and said central passage element, a lower partition extending from the lower end of said cylindrical partition to the lower end of said central passage element to define between itself and the bottom of the tank a connecting space between the central passage element and the outer flow chamber, and an impeller located in said connecting space immediately beneath the central passage element, said central passage element having at least one opening therein below the mid-height of said cylindrical partition at a level above the impeller to connect the central passage element with the inner flow chamber.

2,774,655

## APPARATUS FOR PURIFYING RAW SULPHUR



Gerlando Marullo and Domenico Maragliano, Milan, Italy, assignors to Montecatini, Societa Generale per l'Industria Mineraria e Chimica, a corporation of Italy

Original application February 8, 1951, Serial No. 210,024, now Patent No. 2,699,783, dated September 21, 1954. Divided and this application May 23, 1952, Serial No. 289,620

Claims priority, application Italy March 28, 1950

4 Claims. (Cl. 23—286)

1. In apparatus for purifying raw sulphur, a hollow drum, supports for said drum to hold it in a position inclined with respect to the horizontal, inlet and outlet means for passing molten sulphur through the lower half of said drum, inlet and outlet means for passing an $SO_2$-gas current through the upper half of said drum in countercurrent relationship to the molten sulphur, a rotary shaft passing through said drum along its axis, seal bearings for said shaft at both heads of said drum, means for rotating said shaft, a plurality of spaced radially arranged baffles mounted in and dividing the lower part of said drum into a number of imperforate-walled compartments open at the top, said baffles extending up only to a point slightly below said axial shaft, and a plurality of spaced sheet metal discs having a diameter slightly smaller than the inner diameter of said drum concentrically fitted on said shaft to rotate therewith and extending into said compartments.

2,774,656

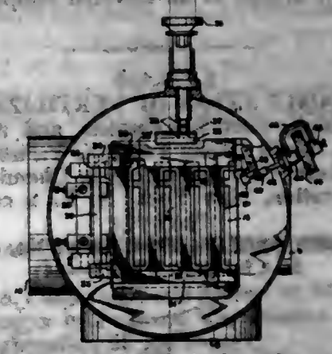
## SUPPLEMENTARY FUEL MIXTURE FOR COLD STARTING DIESEL ENGINES

Stanley R. Newman, Beacon, and Herbert E. Vermillion, Wappingers Falls, N. Y., assignors to The Texas Company, New York, N. Y., a corporation of Delaware

No Drawing. Application August 28, 1953, Serial No. 377,239

4 Claims. (Cl. 44—53)

1. A supplementary fuel mixture for manifold introduction into a diesel engine for cold starting comprising 5 to 50 percent diethyl ether and 50 to 95 percent of a compound selected from the group consisting of ethylene glycol diethyl ether and diethylene glycol diethyl ether.



2,774,657

## PROPORTIONING AND MIXING APPARATUS

Hartwig M. Hanson, Baltimore, Md., assignor to The C. M. Kemp Manufacturing Company, Baltimore, Md., a corporation of Maryland

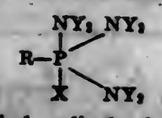
Application March 25, 1954, Serial No. 418,737

6 Claims. (Cl. 48—184)

6. In a gas and air mixing device, the combination of a tightly closed partitioned casing having air, gas and mixing chambers therein, the casing having inlet openings leading through the casing wall and collecting with the respective air and gas chambers and having an outlet leading through the casing wall to the mixing chamber, an orificed flat cover plate extending over the outlet ends of said air and gas chambers, an orificed slide valve slidable over said flat cover plate over the air and gas chambers, means to reciprocally slide the slide valve to vary the flow of air and gas therethrough simultaneously, and adjustable auxiliary valve means in one of the gas orifices of said orificed cover plate and flush with the slide valve, shaped to provide a substantially V-shaped orifice opening toward the slide valve and covered and uncovered

thereby in its reciprocation and extending in the direction of sliding of the slide valve adjacent the orifice cover plate over the gas chamber to provide an additional gas inlet area to the mixing chamber which increases in size both because of the withdrawal of the reciprocating plate in its reciprocation and of the direction and shape of the auxiliary valve orifice.

---



2,774,658

## HERBICIDAL ALKYL-AMINO-PHOSPHONIUM HALIDES

William T. Dye, Jr., Decatur, Ala., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application August 30, 1955, Serial No. 531,571
12 Claims. (Cl. 71—2.7)

7. A method of destroying undesirable plants which comprises contacting said plants with a herbicidal composition comprising an inert carrier and as the essential active ingredient, in a quantity which is injurious to said plants, a phosphonium halide having the formula

in which R is an alkyl radical of from 6 to 22 carbon atoms, X is selected from the class consisting of chlorine and bromine and Y is an alkyl radical of from 1 to 4 carbon atoms.

---

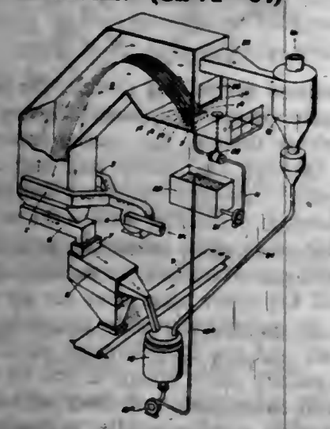
2,774,659

## POLYMERIZATION PRODUCTS OF UREA AND ALPHA,BETA UNSATURATED ACIDS USED AS SOIL CONDITIONER

Gerhard Abel and Theodor Volker, Darmstadt, Germany, assignors to Rohm & Haas G. m. b. H., Darmstadt, Germany

No Drawing. Application August 25, 1953, Serial No. 376,520
Claims priority, application Germany August 25, 1952
18 Claims. (Cl. 71—28)

1. As new compounds, polymerization products of the reaction products obtained by reacting urea with $\alpha:\beta$-unsaturated acids of the general formula $H_2C{=}CRCOOH$ where R is selected from the group consisting of hydrogen, alkyl and aryl groups at an elevated temperature below 200° C.



---

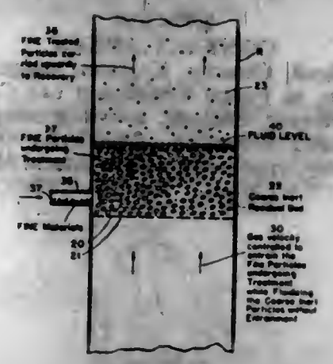
2,774,660

## GRANULATION OF FERTILIZERS

Lucien H. Cook, Port Washington, and Alexander W. Hodge, Jr., South Ozone Park, N. Y., and John Colonias, Elizabeth, N. J., assignors to Chemical Construction Corporation, New York, N. Y., a corporation of Delaware

Application April 26, 1954, Serial No. 425,362
15 Claims. (Cl. 71—64)

1. The process for the production of uniform and moisture-stable granules of a nitrogen fertilizer which comprises: heating said nitrogen fertilizer to a temperature slightly above its melting point; jetting the resulting molten fertilizer upwardly under a positive pressure into an uninterrupted, unidirectional stream consisting of a homogeneous body of liquid; separating such stream into droplets by the forces of gravity and surface tension; countercurrently contacting said droplets with an inert cooling gas and thereby removing moisture from said droplets; and recovering a uniform and moisture-stable product.



---

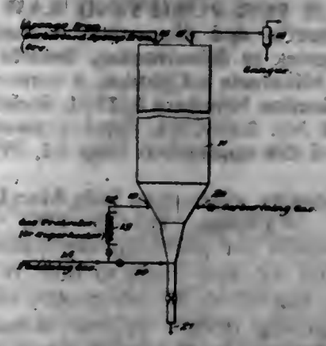
2,774,661

## METHOD OF HEAT-TREATING FINES IN A COARSE SOLIDS FLUIDIZED BED

Frank S. White, Stockbridge, Mass., assignor to The Dorr Company, Stamford, Conn., a corporation of Delaware

Application August 7, 1951, Serial No. 240,687
5 Claims. (Cl. 75—9)

1. The continuous process for heat-treating finely-divided thermally reactive solids, which comprises establishing in an enclosed chamber a bed of thermally-stable non-reactive coarse solids at a predetermined temperature of incandescence on a gas-permeable support with a freeboard space overlying the bed, introducing reactive fine solids from an external source into the bed while maintaining the bed as a homogeneous non-stratifying fluidized bed by passing therethrough a gas stream uprising at a velocity sufficient to fluidize both the coarse and fine bed solids as well as to entrain fine solids from the upper surface of the bed but insufficient to entrain coarse solids thereby dispersing such fine solids throughout said fluidized bed, reacting such fine solids during such dispersal, controlling the time of residence of fine solids in the bed to be sufficient to react such fine solids and discharging the reacted fine solids from the bed by entrainment in the uprising gas stream.



---

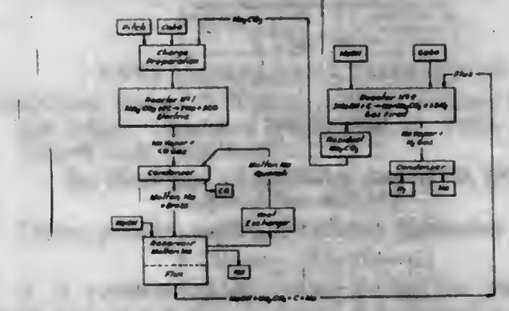
2,774,662

## REDUCTION AND FUSION OF METALS

Hugh S. Graham, Hellertown, and John E. Eberhardt, Bethlehem, Pa., assignors to Bethlehem Steel Company, a corporation of Pennsylvania

Application September 13, 1955, Serial No. 534,111
4 Claims. (Cl. 75—26)

1. A process of melting iron in a fluidized bed comprising maintaining a fluidized bed of carburized sponge iron, maintaining the temperature in the upper zone of the bed above the melting point of the iron but below the melting point of the gangue associated therewith, and maintaining the temperature in the lower zone of the bed below the melting point of iron, thereby forming globules of molten iron in said upper zone and cooling and solidifying said globules in said lower zone.



---

2,774,663

## PRODUCTION OF SODIUM

Roy C. Kirk, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

Application October 18, 1955, Serial No. 541,274
5 Claims. (Cl. 75—66)

1. In a process for producing sodium which comprises reducing sodium carbonate with carbon in a high temperature reactor to produce sodium vapor and carbon monoxide, condensing the sodium vapor to produce a mixture of molten sodium and a dross consisting principally of sodium carbonate and carbon, fluxing the dross from the molten sodium with sodium hydroxide and separating the flux from said molten sodium, the improvement which comprises the steps of heating said flux in a low temperature reactor along with added sodium hydroxide and carbon to produce sodium vapor, hydrogen and residual sodium carbonate, separating said sodium carbonate from the sodium vapor and hydrogen, and feeding said sodium carbonate and added carbon into the above-mentioned high temperature reactor to complete a cyclical process for making sodium.

---

2,774,664

## MAGNESIUM-BASE ALLOY

John C. McDonald, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application October 16, 1953, Serial No. 386,666
3 Claims. (Cl. 75—168)

1. A magnesium-base alloy comprising from 0.5 to 8 percent of thorium, from 0.2 to 2 percent of manganese, the balance being magnesium.

---

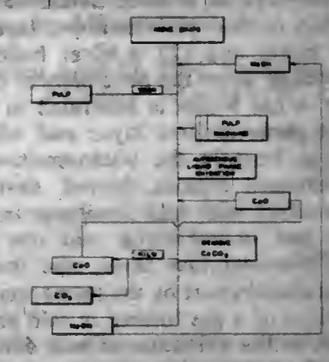
2,774,665

## PRODUCTION OF SOLUBLE SULFIDES

Eugene W. Schoeffel and Daniel M. Barton, Kronenwetter, Wis., assignors to Sterling Drug Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application November 12, 1953, Serial No. 391,753
3 Claims. (Cl. 92—2)

1. A process for regenerating an alkaline sulfide pulping liquor from black liquor containing sodium hydroxide, sodium sulfide, sodium sulfate and sodium carbonate which includes: oxidizing black liquor to destroy organic matter therein and convert the sodium salts substantially entirely to sodium sulfate and sodium carbonate by heating under a pressure sufficient to maintain at least part of the reaction mixture in the liquid phase, said black liquor at a temperature above about 240 degrees centigrade with sufficient oxygen to convert all the carbon to carbon dioxide and all the hydrogen to steam; liming the resulting oxidized liquor to convert a major proportion of the sodium carbonate therein to sodium hydroxide and form insoluble calcium carbonate; separating the insoluble calcium carbonate, thereby providing an alkaline filtrate; mixing said alkaline filtrate with an amount of barium sulfide chemically equivalent to a major proportion of the sodium sulfate therein; separating the insoluble barium sulfate; and, recovering and recycling a sulfide-enriched filtrate comprising sodium hydroxide, sodium carbonate, sodium sulfide and sodium sulfate suitable for use in digesting wood chips by an alkaline sulfide process.



---

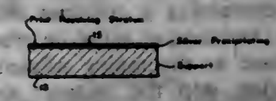
2,774,666

## RECOVERY OF COOKING LIQUOR FROM SPENT SODA PULPING LIQUORS

Daniel M. Barton and Eugene W. Schoeffel, Kronenwetter, Wis., assignors to Sterling Drug Inc., New York, N. Y., a corporation of Delaware

Application June 24, 1954, Serial No. 439,067
5 Claims. (Cl. 92—2)

1. A process for the recovery of soda base cooking liquor which comprises: digesting wood chips with soda base cooking liquor; separating a waste soda liquor and oxidizing, in the liquid phase, this liquor at a temperature of between 150 and 372 degrees centigrade and at least 400 pounds per square inch pressure with at least sufficient oxygen to convert all the carbon to carbon dioxide and all the hydrogen to steam; treating the liquid effluent containing sodium carbonate and bicarbonate with sufficient alkaline earth hydroxide to cause precipitation of substantially all of the carbonates and bicarbonates; separating the precipitated alkaline earth carbonates; and, recycling the filtrate containing sodium hydroxide to treat subsequent batches of wood chips.



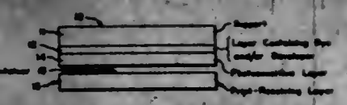
---

2,774,667

## PHOTOGRAPHIC SILVER HALIDE TRANSFER PROCESS

Edwin H. Land, Cambridge, and Meroe M. Morse, Boston, Mass., assignors to Polaroid Corporation, Cambridge, Mass., a corporation of Delaware

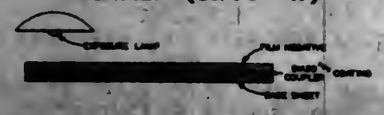
Application July 2, 1951, Serial No. 234,854
14 Claims. (Cl. 96—29)



1. The process of forming images in silver which comprises developing a latent image in a silver halide emulsion, reacting a silver halide solvent with part at least of the undeveloped silver halide of said emulsion, transferring at least part of said soluble silver complex to an image-receiving material comprising a silver precipitating agent dispersed in a silica matrix formed by the hardening in situ of a colloidal solution of hydrated silica whose silica particles have a particle size averaging less than 30

millimicrons, and precipitating the silver of said complex at said image-receiving material to form a print of said latent image among said hydrated silica.

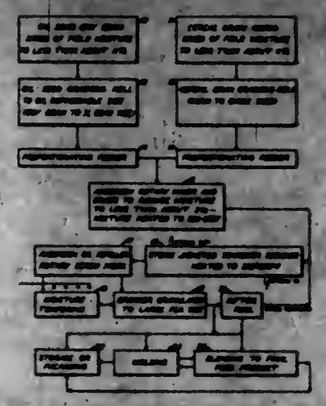
---



2,774,668
PROCESS AND PRODUCT FOR FORMING COLOR IMAGES FROM COMPLETE DYES
Howard G. Rogers, Weston, Mass., assignor to Polaroid Corporation, Cambridge, Mass., a corporation of Delaware
Application May 28, 1953, Serial No. 358,012
8 Claims. (Cl. 96—29)

1. A process of forming images in color which comprises absorbing a liquid into a photosensitive element including a photosensitive silver halide layer having a latent image therein and providing in solution in said layer a substantially uniform distribution of (1) a dye which possesses a coupling function and which is reactable with oxidized portions of a silver halide developer, said dye being mobile in said photosensitive layer when dissolved in said liquid and (2) a silver halide developer capable of providing, upon the development of said latent image to silver, a gas which is generated in the exposed regions of said photosensitive layer and which thereby forms bubbles at least in the photosensitive layer and adjacent said exposed regions thereof, developing said latent image to silver with said developer in said photosensitive layer and immobilizing said dye in exposed regions of said photosensitive layer, said immobilization being effected at least in part by the formation of a barrier comprising bubbles of a gas formed in said photosensitive layer as a result of the oxidation of said developer while providing in said photosensitive layer as a further result of development an imagewise distribution comprising mobile dye and unreacted developer and transferring from said photosensitive layer, by imbibition, at least part of said imagewise distribution of mobile dye to a print-receiving element located in superposed relation to said photosensitive element to impart to said print-receiving element an image in terms of said mobile dye.

---



2,774,669
DIAZOTYPE REPRODUCTION PROCESS
Thomas U. Marron, Franklin Park, and Clarence J. Shoemaker, Glenview, Ill., assignors to A. B. Dick Company, Niles, Ill., a corporation of Illinois
Application April 13, 1953, Serial No. 348,504
1 Claim. (Cl. 96—49)

A method for the production of copy comprising positioning a positive in surface contact with a copy sheet having a coating dried on the surface thereof formed with a composition containing a cellulose derivative selected from the group consisting of cellulose ethers and cellulose esters and acetone as the major solvent to prevent excessive penetration into the support and containing a diazo compound capable of coupling to form an azo dyestuff, a diazo coupling component and an acid medium present in sufficient amount to prevent a coupling reaction to form a dyestuff, exposing the coated support through the positive to destroy the diazo in the exposed areas leaving a latent image of the dye forming components in the unexposed areas, contacting the coated surface of the support containing the latent image with a sheet containing a chromium hexamino compound capable of releasing a base by volatilization at elevated temperature, heating the sheet during contact to cause volatilization of the base from the sheet to the coated surface of the copy sheet to adjust the pH in the coating forming the latent image whereby a coupling reaction takes place to develop the latent image on the support as an azo dyestuff.

---

2,774,670
CEREAL FOOD AND METHOD
Max Albert, Gallesburg, Ill.
Application September 28, 1953, Serial No. 382,679
16 Claims. (Cl. 99—2)

1. An empirically non-oily dry non-cellular and oil-distributing pressure fused food product comprising a substantially homogeneous non-cellular blend of a cereal grain and an oil seed, each adjusted in proportion to the other to impart an edible oil content to the blend in the range of about 3 to 6%, said product being formed by mixing the cereal grain and oil seed in said proportions and heating and pressing the mixture at a pressure exceeding about 3000 p. s. i. and a temperature exceeding about 250° F.

---

2,774,671
PRODUCING DRY VEGETABLE-MOLASSES PRODUCT
Robert H. Cotton, Harbor Beach, Mich., and Guy O. Rornabaugh, Colorado Springs, Colo., assignors to Holly Sugar Corporation, Colorado Springs, Colo., a corporation of New York
Application December 6, 1950, Serial No. 199,536
10 Claims. (Cl. 99—6)

1. A method of producing a relatively dry vegetable product having a substantial proportion of molasses solids, from vegetable matter having a high water content, which comprises pressing said vegetable matter to reduce the water content thereof; mixing a concentrated molasses with said pressed vegetable matter; permitting the mixture to stand for a sufficient period of time to cause moisture in the vegetable matter to dilute the molasses; pressing the mixed product to remove the dilute molasses; and drying the said pressed mixed product.

---

2,774,672
METAPHOSPHATE COMPOSITION
Edward J. Griffith, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware
Application March 18, 1955, Serial No. 495,317
13 Claims. (Cl. 99—95)

8. A leavening composition comprising from 20 weight percent to 75 weight percent of sodium bicarbonate and from 25 weight percent to 80 weight percent of a metaphosphate having the empirical formula,

$$Na_xH_y(PO_3)_{x+y}$$

wherein $x$ and $y$ are positive numbers and $x/y$ is between ½ and 9.

2,774,673
FOOD ADDITIVE
Robert H. Young, Wooster, Ohio
No Drawing. Application June 2, 1954, Serial No. 434,090
5 Claims. (Cl. 99—143)

1. A food additive for accenting the natural flavor of and for tenderizing foods comprising a proteolytic enzyme from vegetable sources within the range of 1½ to 3% by weight, monosodium glutamate within the range of 7½ to 12% by weight, purified maize carbohydrates within the range of 6 to 13½% by weight, anti-oxidant condiments within the range of 4 to 8% by weight, and salt the remainder.

---

2,774,674
ANTI-ADHESION COMPOSITIONS
Jean René Dumas, Venissieux, France, assignor to Societe des Usines Chimiques Rhone-Poulenc, Paris, France, a French body corporate
No Drawing. Application August 30, 1954, Serial No. 453,151
Claims priority, application France September 3, 1953
4 Claims. (Cl. 106—2)

1. A composition of matter having the property of imparting to a surface to which it is applied a resistance to the adhesion of other substances, which consists essentially of an aqueous dispersion of at least one organopolysiloxanic oil containing at least 15% by weight of water, finely divided silica in a proportion of 20–70% by weight of the total organo-polysiloxanic oil present, an emulsifier in a proportion of 15–55% by weight of the total of organo-polysiloxanic oil and the silica, and an alkali salt of an organo-silane-triol in a proportion of 0.5 to 20% by weight of the total of organo-polysiloxanic oil and silica.

---

2,774,675
GLASS COMPOSITION
Games Slayter, Newark, Ohio, assignor to Owens-Corning Fiberglas Corporation, a corporation of Delaware
No Drawing. Application February 25, 1953, Serial No. 338,913
8 Claims. (Cl. 106—50)

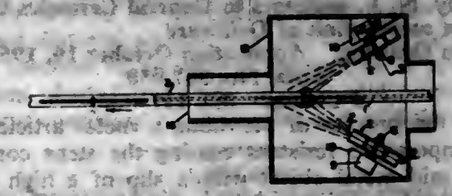
1. A glass composition consisting essentially of from 40 to 50 parts by weight alumina, from 35 to 50 parts by weight calcia, and from 5 to 20 parts by weight tin oxide.

2. The composition of claim 1 in fibrous form.

---

2,774,676
AQUEOUS BITUMEN DISPERSIONS AND A PROCESS OF MAKING THEM
Karl Meyer, Wanne-Eickel, Franz Eisenhut, Gelsenkirchen-Horst, and Adolf Siegl, Essen-Ruhr, Germany
No Drawing. Application December 23, 1952, Serial No. 327,682
Claims priority, application Germany December 31, 1951
7 Claims. (Cl. 106—277)

1. A stabilized aqueous bitumen dispersion, consisting essentially of a bitumen having a maximum Kraemer-Sarnow softening point of 60° C. dispersed in water by finely divided solid particles of at least one water-dispersible mineral, said bitumen and said mineral dispersed in said water having a tendency to settle; and between 0.5–4% by weight of at least one polycyclic condensed ring aromatic hydrocarbon having a maximum of three rings being added thereto, said polycyclic hydrocarbon stabilizing said dispersion and reducing the tendency of said bitumen and said mineral dispersed in said water to settle.



---

2,774,677
PHTHALOCYANINE LAKES
Robert E. Brookfield, Westfield, and Thomas D. Mutello, North Plainfield, N. J., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware
No Drawing. Application September 18, 1953, Serial No. 381,149
13 Claims. (Cl. 106—289)

1. In a process for the manufacture of a phthalocyanine lake in which a water-insoluble alkaline earth metal resinate is precipitated by reaction between a water soluble alkaline earth metal salt and a water soluble salt of a resin in acid in an aqueous medium in the presence of a water-insoluble phthalocyanine coloring matter, the improvement which comprises effecting the precipitation in the presence of about .01 to 0.2 part by weight per part of pigment of a 1-hydroxyethyl glyoxalidine containing a long chain hydrocarbon in the 2 position.

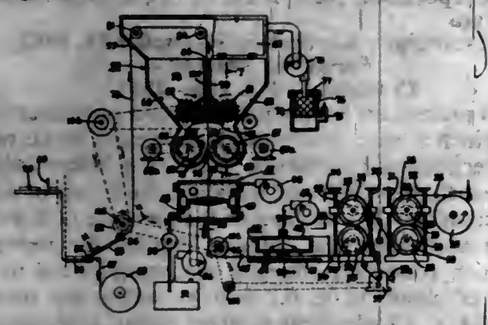
---

2,774,678
PREPARATION OF SHEET METAL FOR ENAMELING
Clarence J. Rodman, Alliance, Ohio, assignor, by mesne assignments, to AllianceWare, Inc., a corporation of Delaware
Application April 21, 1953, Serial No. 350,017
5 Claims. (Cl. 117—9)

1. The process which comprises working the surface of an iron sheet product by bombarding it with relatively fine metallic shot, the shot being high in the scale of hardness compared to the iron sheet, whereby the worked surface is covered with pock marks, and then porcelain-enameling the surface.

---

2,774,679
TREATING OF PLASTIC SURFACES
Robert K. Reuter, St. Charles, Ill., assignor to The Strathmore Company, Aurora, Ill., a copartnership
Application February 10, 1953, Serial No. 336,034
2 Claims. (Cl. 117—11)



1. The method of treating the surface of cellulose acetate film which comprises spraying a traveling web of said film with water containing finely divided abrasive, an alkali metal hydroxide and an anhydride of a lower alkyl dibasic acid.

---

2,774,680
PROCESS FOR MAKING AEROSOL FILTERS
Edward J. Hackney, Charles D. Faucette, and Frederick R. Durkis, Durham, N. C.
Original application October 7, 1953, Serial No. 384,684. Divided and this application July 6, 1954, Serial No. 444,882
14 Claims. (Cl. 117—17)

1. The process of making an aerosol filter which includes moving a flat band consisting of generally parallel filaments of textile material, all of said filaments bearing a similar electrical charge tending to separate the fila-

ments and a majority thereof being within the field of at least a neighboring filament, into and through an atmospheric suspension of rod-like fibers of diameter not exceeding about 40 microns or the diameter of the fila-

ments whichever is less, and gathering said filaments into a compact bundle in contiguous relation with gas flow passage spaces therebetween in longitudinal relation to said filaments and with said fibers extending across said passage spaces in spaced relation along said spaces.

---

2,774,681

## PROCESS OF COATING METAL WITH MICA AND ARTICLE

Paul Huppert, Plainfield, and Arthur F. Jakubczak, Perth Amboy, N. J., assignors to General Ceramics Corporation, a corporation of Delaware

No Drawing. Application October 19, 1953, Serial No. 387,050

4 Claims. (Cl. 117—33)

1. In the process of providing a metal article with a high temperature resistant coating the steps comprising coating said metal object with a slip of a high temperature resistant, ceramically maturable vitreous enamel composition, incorporating mica particles into the surface region of the coating of the thus coated metal object prior to completing the drying of the applied slip, drying the slip and firing the ceramic composition at a temperature of the order of 50° F. higher than the normal maturing temperature of such ceramic composition whereby to provide a vitreous enamel coating containing mica particles at least partially embedded therein.

---

2,774,682

## METHOD OF FORMING A PHOSPHOR SCREEN

Simon Larach, New Brunswick, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application October 15, 1952, Serial No. 314,925

3 Claims. (Cl. 117—33.5)

1. The method of forming a phosphor screen on a substrate, said method comprising the steps of preparing a water suspension of finely divided phosphor particles, introducing said suspension into a solution of an alkali halide to form a second suspension, thoroughly mixing the constituents of said second suspension in order to adsorb halide ions onto the surfaces of each of said phosphor particles, treating said phosphor particles and adsorbed halide ions with an alkali silicate to form a binder sheath around said phosphor particles, forming a suspension of said sheathed phosphor particles, introducing said last mentioned suspension over said substrate, and settling said sheathed particles onto said substrate through a neutral settling medium.

2,774,683

## METHOD OF PREPARING THE SURFACE OF ARTICLES OF MAGNESIUM AND MAGNESIUM BASE ALLOYS FOR THE RECEPTION OF NICKEL ELECTROPLATE

Herbert K. De Long, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application February 25, 1952, Serial No. 273,354

4 Claims. (Cl. 117—62)

1. In a method of treating the surface of an article of magnesium and the magnesium base alloys containing at least 85 percent of magnesium so as to render the surface receptive to electrodeposition of a uniform adherent plating of nickel, the steps which consist in subjecting the article to the action of an aqueous solution containing from 30 to 100 grams of copper sulfate ($CuSO_4$) and from 6 to 30 grams of chromium trioxide ($CrO_3$) per liter the pH of the solution being from 2 to 6, so as to form a copper containing coating on the article, rinsing the so treated article in water, and then subjecting the article to the action of an aqueous acid fluoride solution containing from about 17 to 280 grams of HF per liter of solution.

## METHOD AND APPARATUS FOR APPLYING LUBRICANTS TO SHEET METAL

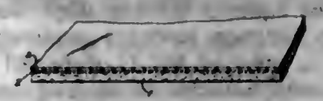
Angelo M. Fuciarri, Detroit, Mich., assignor to The H. A. Montgomery Company, Detroit, Mich., a corporation of Michigan

Application June 12, 1953, Serial No. 361,174

11 Claims. (Cl. 117—65)

1. A process for preparing a sheet of metal for subsequent drawing, comprising applying to the sheet a film of a lubricating composition having a melting point substantially above the initial temperature of the sheet, the temperature of the lubricating composition as applied being above its melting point, and applying pressure to said film by means of a rolling surface maintained at a finishing temperature between said melting point and said initial temperature of the sheet for reducing the thickness of the film and forcing it into more intimate contact with the sheet while chilling the film to accelerate setting to a non-tacky condition.

---



2,774,685

## FLEXIBLE FELT BASE COVERING

David Carnegie, Jr., Wallpack Center, N. J., assignor to Congoleum-Nairn Inc., a corporation of New York

Application September 18, 1953, Serial No. 380,893

3 Claims. (Cl. 117—76)

1. A flexible hard-surface covering which comprises a felt base sheet impregnated with bitumen constituting not more than about 85% of the kerosene value of the felt, a seal coat which is directly adherent to and formed on said impregnated felt and which consists essentially solely of tricresyl phosphate anl vinyl chloride polymer resin in the proportion of about twenty to about fifty parts by weight of said tricresyl phosphate to 100 parts by weight of said vinyl chloride polymer resin, and a layer of vinyl resin composition directly adherent to and formed on said seal coat.

---

2,774,686

## HOT DIP ALUMINUM COATING PROCESS

Allen W. Hodge, Columbus, Ohio, assignor, by mesne assignments, to Kaiser Aluminum & Chemical Corporation, Oakland, Calif., a corporation of Delaware

No Drawing. Application January 8, 1952, Serial No. 265,548

13 Claims. (Cl. 117—114)

1. In the art of hot dip coating of basis metals with a metal selected from the group consisting of aluminum and its alloys, the improvement which comprises introducing alkali metal into a bath of a molten metal selected from the group consisting of aluminum and its alloys and wherein no protective atmosphere is employed over said bath, and passing said basis metal through the melt to provide said basis metal with a coating of said molten metal, the alkali metal being at least one metal selected from the group consisting of sodium, potassium and mixtures thereof and being introduced in a minor amount sufficient to enable said basis metal to be coated at a faster rate and the resulting coating to be complete, even and smooth as compared to a similar bath which has not been treated with said alkali metal, and to increase drainage and to extend bath life.

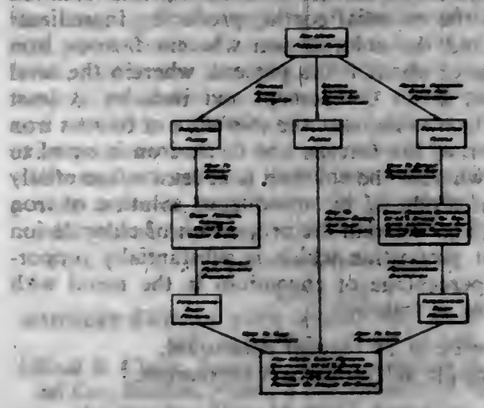
2,774,687



## PROCESS FOR THE MANUFACTURE OF POROUS FLEXIBLE SHEET MATERIAL

Carl Ludwig Nottebohm, Weinheim an der Bergstrasse, Germany, Werner Jacob, Lowell, Mass., and Wilhelm Laeppe and Robert Schubert, Weinheim an der Bergstrasse, Germany

Application September 1, 1953, Serial No. 377,979

Claims priority, application Germany September 3, 1952

9 Claims. (Cl. 117—120)

1. In the manufacture of porous sheet material similar to textile or leather and containing from about 25–65% by weight of rubber based on the combined weights of fibers and rubber, wherein a fleece of cardable polyposed fibers is impregnated with an aqueous dispersion of a rubber and the impregnated fleece is thereafter dried to deposit the rubber primarily at the crossing points of the fibers, the improvement which comprises introducing into the fibrous sheet material, in addition to the rubber, from 1 to 15 parts by weight per 100 parts by weight of rubber solids of a water-soluble condensation product of formaldehyde with a member of the group consisting of ureas, melamines and phenols, and thereafter converting said condensation product to water-insoluble form.

2,774,688

## NICKEL PLATING BY CHEMICAL REDUCTION

Robert J. Girard, Chicopee Falls, Mass.

No Drawing. Application June 1, 1954, Serial No. 433,824

2 Claims. (Cl. 117—130)

2. A method for nickel plating by chemical reduction comprising the step of immersing a metal article from the group consisting of iron, platinum, silver, gold, copper, palladium, brass, bronze and titanium into a controlled nickel sulphate solution including the following constituents in the following amounts per litre, nickel sulphate about 80 grams/l., sodium hypophosphite about 24 grams/l., sodium acetate about 12 grams/l., boric acid about 8 grams/l., and ammonium chloride about 6 grams/l., at a temperature of between 196° F. and 204° F.

---

2,774,689

## PROCESS FOR RENDERING FIBROUS MATERIAL WATER-REPELLENT

Ludwig Orthner and Martin Reuter, Frankfurt am Main, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning, Frankfurt am Main, Hoechst, Germany, a company of Germany

No Drawing. Application October 15, 1953, Serial No. 386,392

Claims priority, application Germany October 18, 1952

13 Claims. (Cl. 117—135.5)

1. The process of imparting hydrophobic properties to fibrous material which comprises treating the material with a solution in an organic solvent of a mixture of zirconium alcoholate and an organic acid selected from the group consisting of carboxylic and sulfinic acids.

---

2,774,690

## WATER REPELLENT TREATMENT UTILIZING A METHYLHYDROGENPOLYSILOXANE AND A TITANIUM COMPOUND

Sydney Russell Cockett, Halifax, John Gwynant Evans, Meanston-in-Wharfedale, and George Landells, Leeds, England, assignors to Bradford Dyers' Association Limited, Bradford, England

No Drawing. Application April 8, 1952, Serial No. 281,222

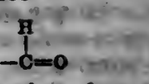
Claims priority, application Great Britain April 16, 1951

4 Claims. (Cl. 117—135.5)

3. The method of rendering textile material water repellent comprising contacting said material with both a methylhydrogenpolysiloxane containing between 1.0 and 1.5 methyl radicals and between 0.75 and 1.25 hydrogen atoms bonded to silicon per silicon atom, there being a total of between 2 and 2.25 methyl radicals plus hydrogen atoms per silicon atom, and a titanium compound selected from the group consisting of esters of titanic acid, titanium salts of fatty acids, titanium halides, and titanium sulfates.

---

2,774,691



## TREATMENT OF TEXTILE MATERIALS AND PRODUCT

Carl W. Schroeder, Orinda, and Robert W. Somers, Berkeley, Calif., assignors to Shell Development Company, New York, N. Y., a corporation of Delaware

No Drawing. Application September 21, 1954, Serial No. 457,530

18 Claims. (Cl. 117—139.4)

1. A process for rendering cellulosic textile fabrics crease and shrink resistant which comprises impregnating the cellulosic fabric with an aqueous solution containing a mixture of polyepoxide and an aliphatic polyaldehyde containing from 2 to 4 free

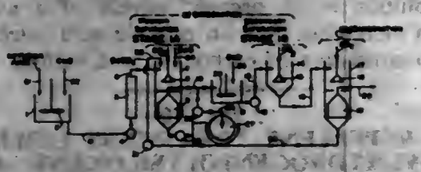
groups and a minor quantity of an acid-acting curing agent, and heating the resulting impregnated fabric to a relatively high temperature for a short period.

2,774,692

## COATED FIBROUS PRODUCTS AND METHODS OF MAKING THEM

James P. Shelley, Drexel Hill, and Earl M. Young, Jr., Philadelphia, Pa., assignors to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Application June 16, 1954, Serial No. 437,269
13 Claims. (Cl. 117—155)



1. A method for producing a coated paper product having high gloss comprising applying to the paper an aqueous dispersion containing a water-soluble high molecular weight condensate of a mixture comprising the dicarbamate of diethylene glycol and formaldehyde, in which the molar ratio of formaldehyde to the dicarbamate is from 2:1 to 3.5:1, said condensate having a viscosity, at a concentration of 60% in water at 25° C., of 2 to 25 poises, drying, and curing the coating to a water-insoluble condition.

2,774,693

## METHOD FOR PURIFYING SUGAR JUICES BY LIMING AND CARBONATION

Arne Vignad Brieghel-Müller, Gentofte, Denmark, assignor to Aktieselskabet de Danske Sukkerfabrikker, Copenhagen, Denmark, a corporation of Denmark

Application March 21, 1951, Serial No. 216,810
Claims priority, application Sweden March 24, 1950
9 Claims. (Cl. 127—50)

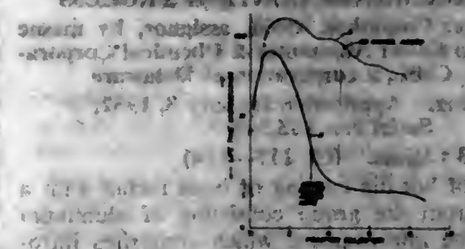
1. A method for the purification of sugar juice by liming and carbonation, comprising the steps of stabilizing the sugar juice by the addition thereto of a liming reagent, the alkalinity of which does not exceed 0.25 gram CaO per 100 ml., to an alkalinity above 0.00 gram CaO per 100 ml. but not exceeding 0.05 gram CaO per 100 ml., liming the juice thus stabilized by the addition of a liming reagent, subjecting the juice thus limed to carbonation in a primary saturation stage to an alkalinity of below 0.1 gram CaO per 100 ml., separating precipitates formed by said carbonation from the juice, further liming the thus separated juice by the addition of a liming reagent subjecting the thus further limed juice to carbonation in a secondary saturation stage to an alkalinity of about 0.08 gram CaO per 100 ml., and subjecting the thus carbonated juice to a further carbonation to an alkalinity of about 0.02 gram CaO per 100 ml.

2,774,694

## PROCESS FOR THE DESCALING OF SUGAR FACTORY EVAPORATORS AND OTHER HEAT TRANSFER EQUIPMENT

Leslie Frederick Wiggins, St. Augustine, Trinidad, British West Indies

No Drawing. Application September 30, 1954, Serial No. 459,529
Claims priority, application Great Britain October 15, 1953
9 Claims. (Cl. 134—13)



1. A process for the de-scaling of sugar factory evaporators and other heat transfer apparatus consisting in treating the apparatus with a hot alkaline solution of a sequestering agent consisting of the tetra-sodium salt of ethylene diamine tetra-acetic acid, and later recovering the said agent by bringing the pH value of the solution to about 2.5, removing the precipitate from the solution, and subsequently making the solution alkaline to about pH 11 with an alkali metal hydroxide.

2,774,695

## PROCESS OF FABRICATING GERMANIUM SINGLE CRYSTALS

Joseph A. Burton, Chatham, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application February 27, 1953, Serial No. 339,364
2 Claims. (Cl. 148—1.5)

1. The method of fabricating a single crystal body essentially of germanium of predetermined length, said body having a substantially uniform resistivity characteristic along said length, said body having a significantly higher injected carrier lifetime characteristic in one portion of said length than the injected carrier lifetime characteristic in the other portion of said length, that comprises adding an amount of nickel not in excess of .001 percent by weight to said other portion during fabrication.

2,774,696

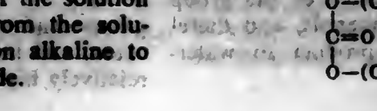
## METHOD OF FORMING OXALATE COATING ON CHROMIUM ALLOYS

Robert C. Gibson, Birmingham, Mich., assignor to Parker Rust Proof Company, Detroit, Mich., a corporation of Michigan

No Drawing. Application October 19, 1950, Serial No. 190,895
2 Claims. (Cl. 148—6.14)

1. The method of coating a metal of the class consisting of chromium and chromium-nickel-iron alloys in which the major content is a non-ferrous metal selected from the group consisting of nickel and chromium, said method comprising the step of contacting at a coating temperature the metal surface with an aqueous solution comprising as the essential coating-producing ingredients iron oxalate and the chloride ion wherein ferrous iron is in the range of about 0–0.8 percent, wherein the total iron is at least about 0.5 percent and includes at least enough ferric iron to increase the solubility of ferrous iron so that the sum of the ferrous and ferric iron is equal to at least .5%, wherein the solution is at least substantially as acid as that produced by an aqueous solution of iron oxalate alone, and wherein the proportion of chloride ion is at least that proportion which is substantially proportional to the percentage of chromium in the metal with reference points as follows:

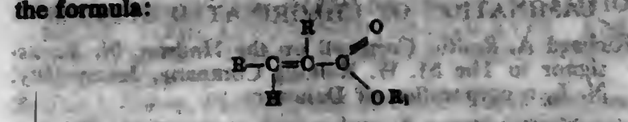
1 percent chloride at 15 percent chromium,
11 percent chloride at 100 percent chromium.



2,774,697

## ADHESIVE COMPRISING ALKENYL DIGLYCOL CARBONATE AND ARTICLES BONDED THEREWITH

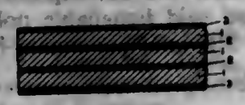
Francis F. Koblitz, Fitchburg, Wis., assignor to Bjorksten Research Laboratories, Inc., Madison, Wis., a corporation of Illinois



No Drawing. Application June 17, 1953, Serial No. 362,411
14 Claims. (Cl. 154—43)

1. As a composition of matter, a mixture of copolymer formed from a monomer having the formula:

wherein $n$ may be from 2 to 7, and a monomer having the formula:



wherein R is selected from —H, —Cl, —Br, and —$CH_3$ and $R_1$ is an aliphatic hydrocarbon radical containing from one to seven carbon atoms and vinyl polysiloxane in the amount of about .5% of the amount of said copolymer.

2,774,698

## COMPOSITE BOARD

Robert L. Jenk and John C. Redd, Chillicothe, Ohio

Application May 12, 1953, Serial No. 354,445
4 Claims. (Cl. 154—45.9)

1. A composite substantially rigid and dimensionally stable panel structure comprising in combination an integral internal fiber board assembly consisting of a plurality of laminae of board filler elements with a layer of water insoluble adhesive between adjacent laminae, each of said laminae having incorporated therein a water repellent material to render said laminae substantially water impervious and said water impervious laminae being joined into said integral fiber board assembly by said water insoluble adhesive layer between said laminae, and a water, water vapor proof and relatively high heat resistant continuous barrier film of resinous material adhered to and in direct contact with each of the outer surfaces of said fiber board assembly and substantially uniformly distributed over said surfaces to effectively prevent diffusion of water and water vapor into said fiber board assembly, said barrier film composed of polyethylene film forming material, said water repellent material substantially prohibiting penetration of said barrier film into the fiber structure of said board filler elements, said panel structure by reason of said water repellent material, said water insoluble adhesive and said barrier film having low moisture vapor, water transmission, sorption and relatively high temperature heat resistant characteristics whereby said composite panel structure is rendered stable against warping and dimensional change from exposure to water, conditions of high relative humidity and conditions of relatively high temperature heat treatment.

2,774,699

## RIBBED STRIPS FOR INSOLES, AND METHODS OF MAKING THE SAME

Alfred S. Clark, Beverly, Mass., assignor to B. B. Chemical Co., Boston, Mass., a corporation of Massachusetts

Application May 14, 1954, Serial No. 429,926
9 Claims. (Cl. 154—53.6)

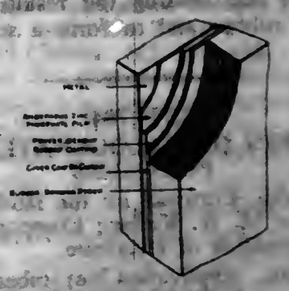
1. That improvement in methods of making composite strips for attachment to insoles to provide sewing ribs thereon, which comprises the steps of drawing from a source of supply simultaneously a fabric strip coated on at least one side with pressure-responsive cement and a strip of fibrous material narrower than the fabric strip and coated on one side with pressure-responsive cement, assembling the two strips in a manner such that an edge of one strip is substantially flush with the corresponding edge of the other strip, pressing the strips together progressively over a restricted area of their respective widths to form a two-ply rib portion and to leave portions of said strips unbonded and substantially free of each other, turning the unbonded portion of the strip of fibrous material away from the fabric strip, and bending the unbonded portions of both strips outward at substantially right angles to the two-ply rib portion to form oppositely extending flanges for attachment of the composite strip to an insole.

2,774,700

## MANUFACTURE OF TRIM PANELS

Albert Arthur Killington, Romford, England, assignor to Briggs Manufacturing Co., Detroit, Mich., a corporation of Michigan

Application March 5, 1953, Serial No. 340,467
4 Claims. (Cl. 154—126.5)



1. The method of manufacturing a laminated panel having a foundation sheet and a superimposed cover sheet, comprising the steps of arranging said sheets on the bed of a press in superimposed relation with a layer of resinous material therebetween in partially reacted condition, successively bonding said sheets together at predetermined sections of said panel by successively moving separate platens against said sections in turn to press the same against said bed, and simultaneously with the pressing of each section subjecting that section to a high frequency electric field to complete the reaction of the resinous material.

2,774,701

## METHOD OF BONDING RUBBER TO METAL AND THE RESULTING ARTICLE

Leonard D. Kocyba, Parma, Ohio, assignor to Richard C. Weiss, Cleveland, Ohio, as trustee

Application July 16, 1956, Serial No. 597,964
2 Claims. (Cl. 154—130)

2. The process comprising treating a steel object with a solution comprising zinc ions, phosphate ions, and a modifier which inhibits the formation of crystalline zinc phosphate, to form an amorphous coating on the steel which does not display crystalline structure at a magnification of 100 diameters and which consists principally of zinc phosphate, drying the object, coating the object with a rubber cement, placing the object thus prepared into a mold along with rubber to be applied to the object, heating the rubber and rubber cement at a sufficiently high temperature to melt the rubber and polymerize the rubber cement whereby the rubber is bonded to the object.

2,774,702

## LAMINATION OF PERFLUOROCHLOROOLEFINS AND POLYACRYLONITRILE

Richard A. Smith, Cornwall on the Hudson, N. Y., assignor to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application December 17, 1953, Serial No. 398,891

14 Claims. (Cl. 154—139)

1. A process for forming a laminated structure which comprises contacting a layer of a solid perfluorochloroolefin polymer with a layer of a solid polyacrylonitrile polymer; and maintaining said layers in contact at a temperature of at least 135° C. but below the decomposition temperature of said laminating materials and at a pressure of at least 5 pounds per square inch gage.

11. A laminated structure comprising a layer of a solid copolymer of a perfluorochloroolefin and another halogenated ethylene containing at least one halogen atom selected from the group consisting of chlorine and fluorine bonded to a layer of a solid polyacrylonitrile polymer.

2,774,703

## RUBBER-FABRIC LAMINATES AND BONDING AGENT THEREFOR

William B. Reynolds, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Application January 5, 1953, Serial No. 329,721

25 Claims. (Cl. 154—139)

5. As a bonding agent, for bonding rubber to fabric prepared from organic fibers an aqueous alkaline solution containing at least 0.5 weight per cent of a copolymer prepared by polymerizing a mixture consisting essentially of a conjugated diene and an acid selected from the group consisting of acrylic and methacrylic acid, said conjugated diene comprising at least 10 parts by weight per 100 parts of the monomeric mixture.

25. A process of preparing a rubber-fabric laminate comprising treating the fabric with an aqueous alkaline solution containing 0.5 to 15 percent by weight of a copolymer prepared by polymerizing a mixture of 10 to 80 parts by weight per 100 parts of monomers of a conjugated diene and 90 to 20 parts by weight of an acid selected from the group consisting of acrylic and methacrylic acid, contacting the thus treated fabric with an acid solution to precipitate the polymer in the fabric, applying a layer of rubber thereto, and heating the resulting laminate to vulcanize said rubber and to form a strong rubber-to-fabric bond.

2,774,704

## LAMINATION OF HALOGENATED OLEFIN POLYMERS

Richard A. Smith, Cornwall on the Hudson, N. Y., assignor to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application November 27, 1953, Serial No. 394,897

33 Claims. (Cl. 154—139)

1. A process for bonding a halogenated olefin polymer surface to another surface which comprises applying to at least one of the surfaces a coating comprising a normally solid copolymer of a perfluorochloroolefin and a halogenated olefin selected from the group consisting of vinyl chloride, vinylidene chloride, vinyl fluoride, vinylidene fluoride and 1,1-fluorochloroethylene, contacting the coated surface with the surface to which it is to be bonded and maintaining the surfaces in contact at a temperature of at least 135° C. and below the decomposition temperature of said surfaces and said copolymer and a pressure of at least 5 pounds per square inch gage.

2,774,705

## LAMINATION OF CHLORINATED OLEFINS

Richard A. Smith, Cornwall on the Hudson, N. Y., assignor to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application November 27, 1953, Serial No. 394,900

24 Claims. (Cl. 154—139)

1. A process for bonding a chlorinated olefin polymer surface to another surface which comprises applying to at least one of the surfaces a liquefiable polymer of trifluorochloroethylene selected from the group consisting of oils, greases and waxes having a softening point below about 150° C., contacting the coated surface with the surface to which it is to be bonded and maintaining the surfaces in contact at a temperature of at least 135° C. and below the decomposition temperature of said surfaces and said liquefiable polymer and a pressure of at least 5 pounds per square inch gage.

2,774,706

## FUNGICIDAL COMPOSITION COMPRISING S-HYDROCARBYL ISOTHIOUREA SALTS AND METHOD OF APPLYING THE SAME

Johannes Thomas Hackmann and Willem Albertus Pel, Amsterdam, Netherlands, assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware

No Drawing. Application September 16, 1953, Serial No. 380,606

Claims priority, application Germany September 20, 1952

9 Claims. (Cl. 167—22)

8. A fungicidal composition comprising an aqueous medium, a surface-active wetting agent and a fungicidal toxic amount of isothiourea salt, the isothiourea portion of said salt being chosen from the group consisting of S-alkyl isothiourea wherein said alkyl radical contains between 4 and 16 carbon atoms and S-phenylalkyl isothiourea wherein said phenyl alkyl radical contains between 1 and 16 carbon atoms, and the acid portion of said salt being an acid of an element selected from the group consisting of nitrogen, phosphorus, sulfur, selenium, tellurium, chromium, molybdenum, and tungsten.

2,774,707

## TRITHIANYLIUM SULFENYL CHLORIDES

Gail H. Birum, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application October 27, 1955, Serial No. 543,265

19 Claims. (Cl. 167—33)

1. An adduct in which one mole of trithiane is combined with from 1 to 3 moles of a sulfenyl chloride of the formula RSCl in which R is selected from the class consisting of hydrocarbon radicals of from 1 to 8 carbon atoms which are free of non-benzenoid unsaturation and which contain at least one substituent selected from the class consisting of halogen and the nitro radical.

17. A biological toxicant comprising an inert carrier and as the essential effective ingredient an adduct in which one mole of the trithiane is combined with from 1 to 3 moles of a sulfenyl chloride of the formula RSCl in which R is selected from the class consisting of hydrocarbon radicals of from 1 to 8 carbon atoms which are free of non-benzenoid unsaturation and which contain at least one substituent selected from the class consisting of halogen and the nitro radical.

2,774,708

## ALKYL DIMETHYL DICHLOROBENZYL AMMONIUM MERCAPTOBENZOTHIAZOLATES AND PESTICIDAL CONCENTRATES CONTAINING THE SAME

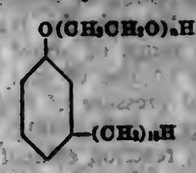
Sylvan I. Cohen, Flushing, and Martin S. Frant, Ossining, N. Y., assignors to Gallowhur Chemical Corporation, New York, N. Y., a corporation of New York

No Drawing. Application December 27, 1954, Serial No. 477,921

6 Claims. (Cl. 167—33)

1. An alkyl dimethyl dichlorobenzyl ammonium 2-mercaptobenzothiazolate, wherein alkyl means a mixture of radicals ranging from $C_8H_{17}$ to $C_{18}H_{37}$.

2,774,709



## POLYOXYETHYLATED ALKYL PHENOL EMULSIFICATION OF INSOLUBLE HYDROCARBON INSECTICIDES

Raymond L. Mayhew, Phillipsburg, Leslie G. Nunn, Plainfield, and Robert L. Sundberg, Alpha, N. J., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application November 16, 1953, Serial No. 392,509

18 Claims. (Cl. 167—42)

1. An emulsifiable mixture comprising a water-insoluble liquid hydrocarbon and about 1 to 60% by weight of the mixture of a compound having the formula

wherein $n$ has a value of from 3 to 15.

2,774,710

## PHARMACEUTICAL PREPARATION FOR THE TREATMENT OF HYPERACIDITY

Kenneth Wade Thompson, Montclair, and Anthony Matthew Corrente, East Orange, N. J., assignors to Organon Inc., Orange, N. J., a corporation of New Jersey

No Drawing. Application December 1, 1953, Serial No. 395,619

Claims priority, application Netherlands December 15, 1952

5 Claims. (Cl. 167—55)

1. A pharmaceutical preparation for the treatment of hyperacidity in tablet form, said preparation comprising, intimately mixed with each other, an antacid agent, guar gum in an amount from about 10% to about 30% by weight of said antacid agent, and oatmeal in an amount from about 5% to about 15% by weight of said antacid agent.

2,774,711

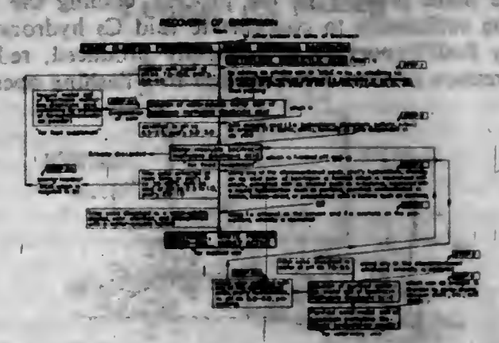
## SOLUBILIZED ADRENOCHROME HEMOSTATIC COMPOSITIONS

Desider Fleischhacker, New York, and Norman Barsel, Lawrelton, N. Y., assignors to International Hormones, Inc., Brooklyn, N. Y., a corporation of New York

No Drawing. Application July 23, 1953, Serial No. 369,958

8 Claims. (Cl. 167—65)

1. A haemostatic composition comprising at least 20 parts by weight of a non-toxic, water soluble salt of para naphthionic acid and 1 part by weight of an adrenochrome derivative selected from the group consisting of adrenochrome mono-oxime and adrenochrome mono-semicarbazone, said composition having water solubility greater than that of the adrenochrome derivatives per se.



2,774,712

## BACITRACIN COMPOUND AND RECOVERY OF BACITRACIN

Abraham Louis Baron, Bloomfield, N. J., assignor to S. B. Penick & Company, New York, N. Y.

Application November 14, 1955, Serial No. 546,330

13 Claims. (Cl. 167—65)

13. Bacitracin-containing compounds selected from the group consisting of the reaction product of bacitracin and methylene disalicylic acid and the alkali metal salts of said reaction product.

2,774,713

## PROCESS FOR THE RECOVERY OF SAPONINS AND SAPOGENINS FROM VEGETABLE MATTER

David H. Gould, Leonia, Emanuel B. Hershberg, West Orange, and Temple Clayton, Parsippany, N. J., assignors to Schering Corporation, Bloomfield, N. J., a corporation of New Jersey

No Drawing. Application October 6, 1952, Serial No. 313,368

7 Claims. (Cl. 195—32)

1. In a process for the recovery of dioscin saponin and diosgenin from dioscorea roots, the steps which comprise comminuting the roots, and subjecting the resulting pulp to auto-transformation in its natural state and in the absence of added inhibiting maetrial until the content of extractable saponin and diosgenin has markedly increased over the quantity obtainable from the fresh roots.

2,774,714

## PROCESS FOR THE EXTRACTION OF SAPOGENINS FROM PLANT MATERIALS

Emanuel B. Hershberg, West Orange, and David H. Gould, Leonia, N. J.

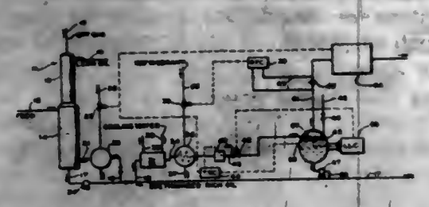
No Drawing. Application October 10, 1952, Serial No. 314,198

19 Claims. (Cl. 195—32)

1. Process for the extraction of steroid sapogenins from steroidal saponin-bearing plant material of a family of the group consisting of Liliaceae, Amerillidaceae, and Dioscoreaceae, which comprises subjecting the plant material to the action of aqueous non-oxidizing acid to effect hydrolysis of the saponins contained therein and form the water-insoluble steroidal sapogenin, subsequently separating the acid solution from the insoluble material containing the said sapogenin and the fibrous residue of the plant material, and extracting the said insoluble material with a substantially water-immiscible organic solvent for the sapogenin.

2,774,715

## AUTOMATIC CONTROL OF REBOILER ON DEETHANIZING ABSORBER



Forrest E. Gilmore, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

Application August 25, 1952, Serial No. 306,265

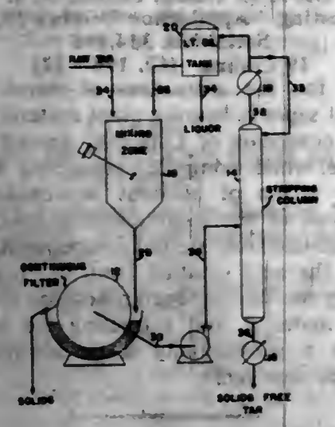
10 Claims. (Cl. 196—8)

1. A process for operating a deethanizing still comprising introducing a rich absorption oil comprising absorbed $C_3$ hydrocarbons, methane, $C_2$ and higher boiling

hydrocarbons into a deethanizing still, removing gaseous effluent overhead from said still as one product of the process, adding reboiling heat to the liquid contents of the kettle section of said still to promote deethanizing reboiling, withdrawing kettle product, dividing the withdrawn material into two portions, removing one portion as the main product of the process, cooling the other portion sufficiently to concentrate said $C_2$ hydrocarbons in the flash vapors as subsequently produced, reducing the pressure of the cooled portion in a flashing operation

whereby said flash vapors comprising ethane are evolved from residual liquid, controlling the degree of cooling of said other portion in direct response to the rate of evolution of the flashed gases and in an amount sufficient to produce the flashed gas at a constant rate, and regulating the addition of said reboiling heat to the liquid contents of the kettle section of the still in direct response to the $C_2$ hydrocarbon content of the evolved gas, the addition of said reboiling heat being sufficient to operate said deethanizing still.

---



2,774,716

## PROCESS FOR REMOVING FINELY DIVIDED SOLIDS FROM RAW LOW TEMPERATURE CARBONIZATION COAL TARS

Metro D. Kulik, Pittsburgh, Pa., assignor to Pittsburgh Consolidation Coal Company, Pittsburgh, Pa., a corporation of Pennsylvania

Application January 29, 1954, Serial No. 406,926

11 Claims. (Cl. 196—14.1)

1. A process for removing solids consisting essentially of finely divided solid particles from the class of coal and partially devolatilized coal from raw low temperature carbonization tar which comprises mixing the raw tar with 0.5 to 3.0 volumes of a predominantly nonaromatic low temperature carbonization tar distillate fraction containing at least 2 percent by volume of tar acids, separating rejected pitch and agglomerated solids, and recovering the liquids.

## REMOVAL OF CYCLIC SULFUR COMPOUNDS FROM A HIGHLY OLEFINIC GASOLINE

Paul W. Garbo, Freeport, N. Y., assignor to Hydrocarbon Research, Inc., New York, N. Y., a corporation of New Jersey

No Drawing. Application May 16, 1952, Serial No. 288,332

12 Claims. (Cl. 196—28)

1. A method of desulfurizing a highly olefinic hydrocarbon fraction, which comprises bringing hydrogen and a hydrocarbon fraction containing more than 1% by weight of sulfur in the form of cyclic sulfur compounds and a volume of olefins greater than the volume of paraffins and naphthenes therein, said volume of olefins being more than 20% by volume of said hydrocarbon fraction and imparting to said hydrocarbon fraction a high octane number into contact with a siliceous catalyst consisting essentially of a major weight proportion of silica and a minor weight proportion of at least one difficultly reducible metal oxide in a reaction zone maintained at a temperature in the range of 850 to 975° F., the contact of said hydrogen and said hydrocarbon fraction resulting in a net consumption of hydrogen, passing said hydrocarbon fraction through the reaction zone at a space velocity in the range of about 0.5 to 5.0 liquid volumes per hour per volume of said siliceous catalyst, maintaining the partial pressure of hydrogen in said reaction zone in the range of 100 to 400 p. s. i., and recovering from the resulting reaction effluent a highly olefinic hydrocarbon fraction containing less than 0.3% by weight of sulfur and a major portion of said olefins and having a high octane number.

---

2,774,718

## PROCESS FOR HYDROFINING A HIGHLY OLEFINIC GASOLINE

Clarence A. Johnson, Princeton, and Seymour C. Schuman, Titusville, N. J., assignors to Hydrocarbon Research, Inc., New York, N. Y., a corporation of New Jersey

No Drawing. Application February 19, 1952, Serial No. 272,512

13 Claims. (Cl. 196—28)

1. A method of desulfurizing a highly olefinic hydrocarbon fraction, which comprises bringing hydrogen and a hydrocarbon fraction containing more than 1% by weight of sulfur in the form of cyclic sulfur compounds and a volume of olefins greater than the volume of paraffins and naphthenes therein, said volume of olefins being more than 20% by volume of said hydrocarbon fraction and imparting to said hydrocarbon fraction a high octane number into contact with an alumina of high surface area containing a catalyst promoter comprising an element selected from the class consisting of the metallic elements of groups VA, VIA and VIII of the periodic table in a reaction zone maintained at a temperature in the range of 825 to 975° F., the contact of said hydrogen and said hydrocarbon fraction resulting in a net consumption of hydrogen, passing said hydrocarbon fraction through the reaction zone at a space velocity in the range of about 0.5 to 5 liquid volumes per hour per volume of said alumina, maintaining the partial pressure of hydrogen in said reaction zone in the range of 20 to 100 p. s. i., and recovering from the resulting reaction effluent a highly olefinic hydrocarbon fraction containing less than 0.3% by weight of sulfur and a major portion of said olefins and having a high octane number.

2,774,719

## HYDRODESULFURIZING A HIGHLY OLEFINIC GASOLINE CONTAINING CYCLIC SULFUR COMPOUNDS

Edwin S. Johanson, Trenton, N. J., assignor to Hydrocarbon Research, Inc., New York, N. Y., a corporation of New Jersey

No Drawing. Application May 16, 1952, Serial No. 288,337

16 Claims. (Cl. 196—28)

1. A method of desulfurizing a highly olefinic hydrocarbon fraction, which comprises bringing hydrogen and a hydrocarbon fraction containing more than 1% by weight of sulfur in the form of cyclic sulfur compounds and a volume of olefins greater than the volume of paraffins and naphthenes therein, said volume of olefins being more than 20% by volume of said hydrocarbon fraction and imparting to said hydrocarbon fraction a high octane number into contact with a promoted siliceous catalyst consisting essentially of a major weight proportion of silica, a minor weight proportion of at least one difficultly reducible metal oxide and a catalyst promoter comprising an element selected from the class consisting of the metallic elements of groups VA, VIA and VIII of the periodic table in a reaction zone maintained at a temperature in the range of 775 to 925° F., the contact of said hydrogen and said hydrocarbon fraction resulting in a net consumption of hydrogen, passing said hydrocarbon fraction through the reaction zone at a space velocity in the range of about 0.5 to 5 liquid volumes per hour per volume of said promoted siliceous catalyst, maintaining the partial pressure of hydrogen in said reaction zone in the range of 20 to 100 p. s. i., and recovering from the resulting reaction effluent a highly olefinic hydrocarbon fraction containing less than 0.3% by weight of sulfur and a major portion of said olefins and having a high octane number.

---

2,774,720

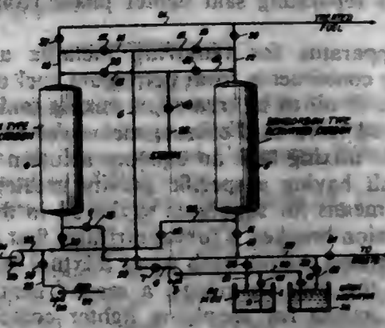
## STABILIZATION OF A HIGHLY OLEFINIC GASOLINE

Paul W. Garbo, Freeport, N. Y., assignor to Hydrocarbon Research, Inc., New York, N. Y., a corporation of New Jersey

No Drawing. Application May 16, 1952, Serial No. 288,331

10 Claims. (Cl. 196—36)

1. A method of eliminating gum-forming constituents from a highly olefinic hydrocarbon fraction, which comprises bringing hydrogen and a hydrocarbon fraction containing gum-forming constituents and a volume of olefins greater than the volume of paraffins and naphthenes therein, said volume of olefins being more than 20% by volume of said hydrocarbon fraction and imparting to said hydrocarbon fraction a high octane number into contact with a siliceous catalyst consisting essentially of a major weight proportion of silica and a minor weight proportion of at least one difficultly reducible metal oxide in a reaction zone maintained at a temperature in the range of 750 to 875° F., the contact of said hydrogen and said hydrocarbon fraction resulting in a net consumption of hydrogen, passing said hydrocarbon fraction through the reaction zone at a space velocity in the range of about 0.5 to 5 liquid volumes per hour per volume of said siliceous catalyst, maintaining the partial pressure of hydrogen in said reaction zone in the range of 50 to 325 p. s. i., and recovering from the resulting reaction effluent a highly olefinic hydrocarbon fraction with a substantially decreased content of gum-forming constituents and containing a major portion of said olefins and having a high octane number.



2,774,721

## STABILIZING FUEL OIL BY OXIDATION IN THE PRESENCE OF ACTIVE CARBON IMPREGNATED WITH ALKALI

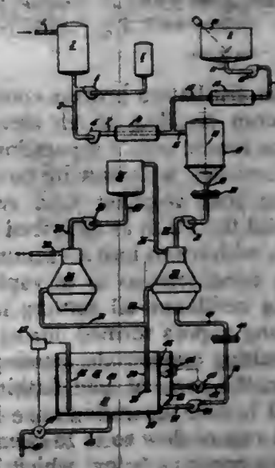
Max G. Siebert and Herbert Taube, Bremen, Germany, assignors, by mesne assignments, to Socony Mobil Oil Company, Inc., a corporation of New York

Application July 13, 1954, Serial No. 443,124

2 Claims. (Cl. 196—42)

1. A method of stabilizing fuel fractions of petroleum oil which comprises contacting in the presence of free molecular oxygen a fuel fraction of petroleum oil boiling above the gasoline range and being unstable with respect to the formation of sediment and color with a bed of a reagent consisting essentially of activated carbon containing about 5 to about 15 percent alkali metal hydroxide and at a rate not exceeding about 160 barrels of said fuel per hour per ton of said activated carbon until the lead corrosion test exceeds 3 milligrams per 100 cubic centimeters of treated oil, stopping the flow of said fuel, washing said carbon with a solvent for contaminants and steaming said carbon to regenerate the same and impregnating said regenerated carbon with about 5 to about 15 weight percent alkali metal hydroxide, said activated carbon being an activated carbon having a bulk density (dried at 220° F.) of about 18.53 pounds per cubic foot, a true density (voids filled with helium) of about 118 pounds per cubic foot, a surface area of at least about 1485 square meters per gram, and an average pore diameter of 41 angstroms.

---



2,774,722

## PROCESS FOR REMOVING ASH-FORMING IMPURITIES FROM PETROLEUM RESIDUAL OILS

Bruce O. Buckland, Donald G. Sanders, and Cecil M. Gardiner, Schenectady, N. Y., assignors to General Electric Company, a corporation of New York

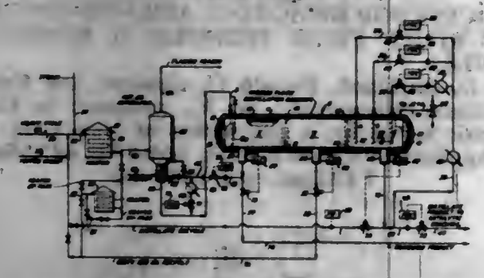
Application August 5, 1954, Serial No. 447,954

7 Claims. (Cl. 196—44)

1. A process for treating petroleum residual oil which contains at least one impurity selected from the class consisting of sodium, vanadium, and calcium salts, which

process consists of the steps of (1) washing said oil with an aqueous solution having a magnesium salt dissolved therein in sufficient concentration to provide a solution having a specific gravity greater than that of said oil, whereby magnesium ions replace a large portion of the sodium and calcium ions in said oil and whereby a two-phase mixture is obtained with said oil as the lighter phase and with an aqueous solution as the heavier phase and (2) separating said lighter phase from said heavier phase.

6. Apparatus for removing metallic and other ash forming constituents from petroleum fuel oils comprising a source of oil to be treated, a mixing tank connected to receive oil from said source, means for supplying to the oil in the mixing tank an aqueous solution of an alkaline earth salt having a specific gravity greater than that of the oil, means for supplying to the oil in the mixing tank an emulsion breaker, a first centrifuge, first conduit means for supplying the oil-wash water mixture from the mixing tank to the first centrifuge, a second centrifuge, second conduit means for supplying lighter components of the mixture from the first centrifuge to the second centrifuge, a settling tank, a chamber adjacent the settling tank having an outlet at the top thereof for decanting oil into the chamber, third conduit means for returning lighter components of the mixture from the bottom of the chamber to the first centrifuge, fourth conduit means for removing wash solution and impurities from the bottom of the settling tank, regulating means for maintaining at a preselected intremediate level in the settling tank the interface zone separating the lighter oil-containing components of the mixture in the upper part of the settling tank from the heavier wash solution in the lower part of the settling tank, and fifth conduit means for receiving the heavier components of the mixture separated in both said centrifuges and including means for discharging said heavier components into the settling tank at a level just below said interface zone.



---

2,774,723

## VACUUM DISTILLATION OF OILS

Golden A. Meyer, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

Application October 23, 1952, Serial No. 316,411
8 Claims. (Cl. 196—77)

3. A vacuum distillation process comprising heating an oil to be vacuum distilled, to an elevated temperature; passing oil thus heated into a separation zone to separate any vapors therefrom; withdrawing unvaporized oil from said separation zone together with residual distillation product admixed therewith as described hereinafter; introducing oil thus withdrawn into a vacuum distillation zone under flashing conditions so as to vaporize a portion of same, resulting residuum oil settling in said distillation zone; condensing vapors formed during said flashing and recovering resulting condensate; passing a portion of oil residuum from the zone of said flashing into admixture with heated oil in said separation zone in an amount and at a controlled rate of flow so as to quench said heated oil therein to a temperature below which incipient cracking of same takes place, and to act as a heat carrier during said flashing; and recovering a remaining portion of said residuum.

2,774,724

## AIR-BLOWN ASPHALT-RESIN COMPOSITION AND PROCESS OF MAKING SAME

William B. Watson, Park Forest, Ill., assignor to Sinclair Refining Company, New York, N. Y., a corporation of Maine

No Drawing. Application April 7, 1953, Serial No. 347,393
5 Claims. (Cl. 196—142)

1. A molding compound consisting essentially of an air-blown mixture of an asphalt whose air blowing characteristics are such that when air-blown to about a 300° F. softening point at an elevated temperature its needle penetration at 77° F. will not be more than about 5, and a paraffinic petroleum resin fraction having a Saybolt Universal viscosity at 210° F. of about 2500 to 8000 seconds, said resin fraction being about 30 to 70 weight percent of said mixture.

3. A method of manufacturing a molding compound which comprises mixing an asphalt whose air blowing characteristics are such that when air-blown to about a 300° F. softening point at an elevated temperature its needle penetration at 77° F. will not be more than about 5, and a paraffinic petroleum resin fraction having a Saybolt Universal viscosity at 210° F. of about 2500 to 8000 seconds to obtain a mixture in which said resin fraction is about 30 to 70 weight percent of said mixture, and introducing air into said mixture while maintaining the mixture at an elevated temperature.

---

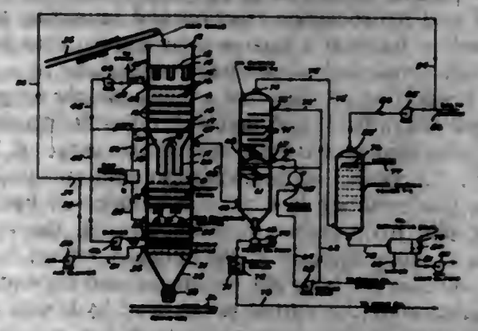
2,774,725

## METHOD OF CONCENTRATING AQUEOUS HYDRAZINE

Oscar J. Swenson, Crystal Lake, and Don W. Ryker, Alton, Ill., assignors to Olin Mathieson Chemical Corporation, a corporation of Virginia

No Drawing. Application April 2, 1953, Serial No. 346,513
18 Claims. (Cl. 202—57)

1. In the process of concentrating aqueous hydrazine, the step which comprises distilling said hydrazine in contact with a dehydrating agent and a saturated hydrocarbon whose boiling temperature at atmospheric pressure is within the range of about 90° C. to 175° C., said hydrocarbon being present in an amount sufficient to maintain the vapor of said hydrocarbon in intimate contact with the evolved hydrazine vapor throughout the distillation.



---

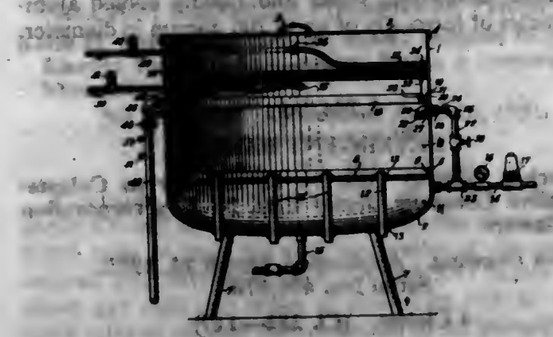
2,774,726

## APPARATUS FOR THE RECOVERY OF OIL AND GASEOUS PRODUCTS FROM SHALE

James R. Eichna, Cedar Grove, N. J., assignor to Foster Wheeler Corporation, New York, N. Y., a corporation of New York

Application August 22, 1950, Serial No. 180,768
8 Claims. (Cl. 202—93)

1. In apparatus for the recovery of oil from shale, a retorting tower having a hopper space at its top into which raw shale is introduced periodically, a partition at the bottom of the hopper space having openings, seal legs connected with said opening and in communication with the tower space below said partition and through which raw shale may move downwardly continuously from the hopper space, shale distributing grates positioned at different levels below said partition, a gas distributor below said grates, a hopper-like partition extending transversely of said tower below the gas distributor and with the first-named partition defining a preheating and drying section in said tower, said hopper-like partition having openings, seal legs connected with said openings and providing passage for downward movement of shale from the preheating and drying section, shale distributing grates positioned at different levels below said last-named seal legs, gas collecting grates below the last-named distributing grates, said gas collecting grates defining the lower boundary of a retorting zone in said tower whose upper boundary is the hopper-like partition, gas withdrawal pipes positioned below the gas collecting grates, shale distributing grates at different levels below said pipes, gas distributing means positioned between various of the last-named grates, air introducing means below the gas distributing means and defining the lower boundary of a combustion zone whose upper boundary lies substantially at the level of said pipes, burnt shale discharge means below said air introducing means, means for withdrawing effluent gases from the tower adjacent the upper boundary of the retorting zone, means for withdrawing spent gases from the drying and preheating section, means for withdrawing gaseous products of combustion through said pipes and means for recycling both spent gases withdrawn from the preheating and drying section and gaseous products of combustion withdrawn through said pipes to the combustion zone.



---

2,774,727

## STILL FOR RECLAIMING SOLVENTS

Russell B. Hobson, Jr., Montclair, N. J., assignor to Par Corporation, Montclair, N. J., a corporation of New Jersey

Application October 21, 1954, Serial No. 463,636
1 Claim. (Cl. 202—187)

A still for reclaiming a liquid solvent comprising a hollow cylindrical body open at the top and having means at its bottom to set on a floor, a steam chest at the lower end of said hollow cylindrical body including an approximately flat plate extending transversely of said cylindrical body throughout the cross-sectional area thereof, said plate and the wall of said body forming a vaporizing and condensing chamber having a diameter substantially greater than the height thereof above said plate, a condensate collector trough disposed above said plate and spaced downwardly from the top of said body and extending along the inner surface of the side wall of said cylindrical body, a condenser coil above said condensate collector trough and closely adjacent the side wall of said body, an outlet pipe extending from said condensate collector trough outwardly from said body, a cover for said open top to provide for easy and quick dumping of liquid or sludge through said open top onto said plate in a layer below said condensate collector trough and for removal of said liquid or sludge from the body, and a steam inlet pipe below said condensate collector trough and above the level of the top surface of such layer having an outlet extending circumferentially of the body adjacent the side wall of the body and downwardly toward said plate to provide a blanket cloud of steam swirling or rotating circumferentially of said body over the top surface of the layer of sludge or liquid on said plate.

---

2,774,728

## ADDITION AGENT FOR COPPER PLATING

Christian J. Wernlund, Niagara Falls, N. Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application September 29, 1955, Serial No. 537,256
10 Claims. (Cl. 204—52)

1. An aqueous copper cyanide bath for electrodepositing a bright, ductile, copper electroplate, said bath containing about 5–20 oz./gal. of copper cyanide, about 0.006–0.06 oz./gal. of potassium antimonyl tartrate and methylene-bis(naphthalene sulfonic acid).

2. An aqueous copper cyanide bath for electrodepositing a bright, ductile copper electroplate, said bath containing about 5–20 oz./gal. of copper cyanide, about 0.05–10 oz./gal. of an alkali metal thiocyanate and about 0.006–0.6 oz./gal. of potassium antimonyl tartrate.

---

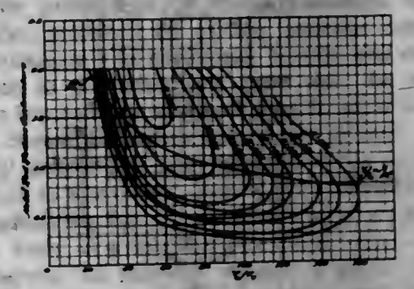
2,774,729

## RECOVERY OF URANIUM BY ELECTROLYSIS OF A FUSED BATH

George Meister, Newark, N. J., assignor to the United States of America as represented by the United States Atomic Energy Commission

No Drawing. Application January 31, 1944, Serial No. 520,550
3 Claims. (Cl. 204—64)

1. The method of recovering metallic uranium from uranium halides which comprises the steps of providing a fused electrolyte consisting essentially of barium fluoride and barium chloride, adding a uranium fluoride to said fused electrolyte and electrolyzing said mixture at a temperature of approximately 1150° C. to electrodeposit uranium therefrom in coalescent form.



---

2,774,730

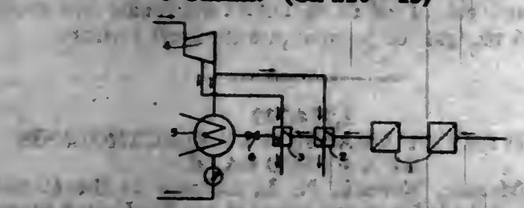
## NEUTRONIC REACTOR HAVING A FLATTENED ACTIVITY CURVE

Gale J. Young, Chicago, Ill., assignor to the United States of America as represented by the United States Atomic Energy Commission

Application September 5, 1944, Serial No. 552,730
1 Claim. (Cl. 204—193)

An air-cooled neutronic reactor which comprises a moderator of graphite, there being channels extending horizontally entirely therethrough, said channels being spaced 7 inches apart, said channels being square in cross section with one of the diagonals vertical and 1.75 inches on a side, natural uranium rods of one diameter disposed in the channels in a central zone of the reactor, natural uranium rods of another diameter disposed in the channels in an outer zone of the re-

actor, the diameter of the rods being such that a lower neutron reproduction factor exists in the central zone than in the outer zone the neutron reproduction factor in both zones being greater than one, the diameter of the rods in both central and outer zones being determined by Fig. 17 of the drawing, the intersection of curve A with the curve for the desired K factor for each zone specifying the diameter of rod required to obtain the desired K factor, the neutron density within the reactor thereby being substantially the same throughout a large volume of the reactor so that a more uniform distribution of heat throughout the reactor is obtained than would be obtained if the neutron reproduction factor were uniform throughout the reactor, the purity of the graphite and the uranium and the total mass thereof being sufficient to sustain a chain reaction.



---

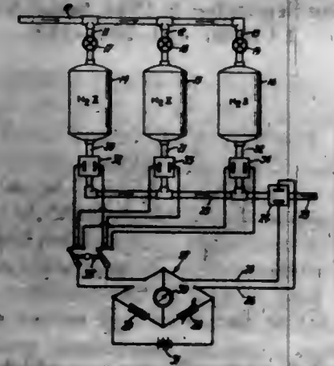
2,774,731

## METHOD FOR DEGASIFYING WATER

Paul Profos, Winterthur, Switzerland, assignor to Sulzer Freres, Societe Anonyme, Winterthur, Switzerland, a corporation of Switzerland

Application December 10, 1953, Serial No. 397,382
Claims priority, application Switzerland December 18, 1952
3 Claims. (Cl. 210—15)

1. A method of degasifying water, particularly boiler feed water in a steam power plant, which water has been purified by ion exchange, comprising transferring heat to the water in at least two consecutive heating stages by heat carriers having different specific heat contents and expanding the so heated water for releasing undesired gases, the amount of heat which is transferred to the water being determined by the expansion pressure and by the amount and type of gas to be removed from the water.



---

2,774,732

## OPERATION OF CATION EXCHANGE UNITS

Frank Charles Blight, Hanworth, England, assignor to The Permutit Company, New York, N. Y., a corporation of Delaware

Application June 14, 1951, Serial No. 231,570
Claims priority, application Great Britain June 14, 1950
3 Claims. (Cl. 210—24)

1. A process of determining when any one of at least two hydrogen cation exchange units operating in parallel requires regeneration which comprises, comparing the conductivity of the combined effluents from said units, with the conductivity of the effluent from said one unit, and regenerating said one unit when the conductivity of its effluent becomes substantially lower than the conductivity of the combined effluents.

2,774,733

## LUBRICATING COMPOSITION

Paul H. Williams, Orinda, and Lawrence B. Scott, Lafayette, Calif., assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware

No Drawing. Original application May 12, 1953, Serial No. 354,622, now Patent No. 2,744,871, dated May 8, 1956. Divided and this application February 6, 1956, Serial No. 563,617
11 Claims. (Cl. 252—56)

1. A lubricating composition adapted for extreme pressure use comprising a major amount of a water-miscible mixture of monohydroxy oxyethylene oxy-1,2-propylene aliphatic monoethers in which the ethylene oxide and 1,2-propylene oxide are combined therein as oxyethylene and oxy-1,2-propylene groups in a ratio which is at least one-third part of 1,2-propylene oxide for each part of ethylene oxide by weight, said mixture having an average molecular weight of at least 300 attributable to said groups, the aliphatic monoethers of said mixture containing in a single molecule both the oxyethylene and oxy-1,2-propylene groups, and a minor amount, sufficient to improve the extreme pressure properties thereof, of citric acid.

---

2,774,734

## FLUID FOR GRAVITY SEPARATION

Franz Rodis and Friedrich Thomas, Knapsack, Kreis Koln, Germany, assignors to Knapsack-Griesheim Aktiengesellschaft für Stickstoffdünger und Autogentechnik, Knapsack, Bezirk Koln, Germany, a manufacturing and trading organization under the laws of the Allied Control Council and Allied High Commission of Germany

No Drawing. Application September 23, 1952, Serial No. 311,148
Claims priority, application Germany October 2, 1951
5 Claims. (Cl. 252—60)

1. A composition of matter useful for gravity separation of gangue from comminuted mineral matter, said composition comprising water and rapidly cooled atomized particles of ferro-ally of up to 200 micron in diameter.

---

2,774,735

## DETERGENT BARS

Paul Becher, Murray Hill, N. J., assignor to Colgate-Palmolive Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application March 22, 1955, Serial No. 496,070
4 Claims. (Cl. 252—117)

1. A detergent composition in the form of bars or cakes having improved processing properties and reduced tendency to slough, said composition consisting essentially of at least about 50% by weight of higher fatty acid water soluble soap; about 5 to 12% by weight moisture; about 5 to 30% by weight of water soluble salt of higher fatty acid monoglyceride monosulfate; about 3 to 7% by weight of non-ionic detergent comprising hydrophobic polyoxypropylene glycol of molecular weight at least 900 condensed with sufficient ethylene oxide to prepare a water soluble product; and about 0.5% to 3% by weight, sufficient to improve the physical processing characteristics and sloughing resistance of said bars or cakes but insufficient to deleteriously affect the foaming properties thereof, of polymeric material prepared by adding propylene oxide to ethylene diamine until a condensation product having a molecular weight of about 2,000 to 6,000 is obtained, and then adding ethylene oxide to said condensation product until said ethylene oxide constitutes about 10 to 80% of the final polymer.

2,774,736

## METHOD OF APPLYING METAL AND METAL VAPOR DECONTAMINANTS

William M. Sisli, Teaneck, N. J., assignor to William M. Sisli & Co., Inc., Teaneck, N. J., a corporation of New Jersey

No Drawing. Original application December 5, 1950, Serial No. 199,371. Divided and this application September 21, 1953, Serial No. 381,504
4 Claims. (Cl. 252—192)

1. The method of decontaminating an area exposed to metallic mercury which consists of the steps of mixing at least 5% and not more than 20% of ethylene diamine tetra acetic acid with at least 80% and not more than 95% of sodium thiosulphate, slowly dissolving the mixture in water to form a milky solution, applying the said solution in the form of a wash to the contaminated surfaces and allowing the said solution to dry in contact with the metallic mercury.

---

2,774,737

## COMPOSITION FOR COATING ELECTRO-LUMINESCENT LAMPS

Eric L. Mager, Peabody, Mass., assignor to Sylvania Electric Products Inc., Salem, Mass., a corporation of Massachusetts

No Drawing. Application July 2, 1953, Serial No. 365,781
1 Claim. (Cl. 252—301.3)

A suspension for coating electroluminescent lamps, said suspension being in the proportion of about 100 grams of ceramic powder, about 60 grams of electroluminescent phosphor powder, about 15 grams of ethyl cellulose, about 54 grams of mineral oil, about 15 cubic centimeters of butanol, about 435 cubic centimeters of xylol, about 75 grams of a plasticizer, and about 2100 cubic centimeters of chloroform.

---

2,774,738

## CALCIUM CADMIUM PHOSPHATE PHOSPHOR

Keith H. Butler, Marblehead, Mass., assignor to Sylvania Electric Products Inc., Salem, Mass., a corporation of Massachusetts

No Drawing. Application April 10, 1951, Serial No. 220,357
1 Claim. (Cl. 252—301.6)

A calcium cadmium phosphate phosphor activated by about 0.1 mol of manganese and between about 0.01 and 0.025 mole of lead, for each two moles of the phosphate radical, and having between 0.6 and 2.17 moles of cadmium per each two moles of phosphate radical, with the mole ratio of calcium plus cadmium to the phosphate radical between about 2.95/2.00 and 2.60/2.00.

---

2,774,739

## METHOD OF MAKING AN ELECTROLUMINESCENT PHOSPHOR

Keith H. Butler, Marblehead, and Richard M. Rulon, Salem, Mass., assignors to Sylvania Electric Products, Inc., Salem, Mass., a corporation of Massachusetts

No Drawing. Application July 22, 1952, Serial No. 300,358
2 Claims. (Cl. 252—301.6)

1. The method of making an electroluminescent phosphor which comprises; firing a mixture of zinc sulfide with between about 0.0004 to about 0.0015 gram atom of copper for each mole of zinc sulfide; then mixing the resultant material with between about 0.0002 and about 0.0012 gram atom of lead per mole of zinc sulfide and a small amount of zinc oxide, and firing the mixture.

2,774,740

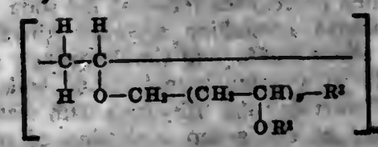
## GEL BREAKERS OF HEAVY METAL SOAP GELS

Sidney J. Magram, Baltimore, Md.

No Drawing. Application February 12, 1954, Serial No. 410,052
19 Claims. (Cl. 252—326)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A process for the breaking of gels composed of a polyvalent metal soap and a liquid hydrocarbon which comprises adding to said gel a chelating agent of the group consisting of beta-di-oxo compounds, 8-hydroxyquinoline, and orthohydroxy aromatic aldehydes in a quantity sufficient to liquefy the gel.

---



2,774,741

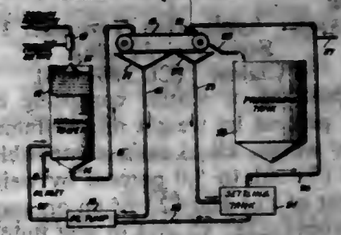
## PROCESS FOR BREAKING EMULSIONS

Anthony J. Martinelli, Easton, Pa., assignor to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application December 3, 1954, Serial No. 473,041
3 Claims. (Cl. 252—331)

1. A process for breaking a water-in-oil type emulsion comprising subjecting such emulsion to the action of a polymeric vinyl ether characterized by the formula

wherein $R^2$ and $R^3$ are lower alkyl radicals; $y$ has a value of from 1 to 7; and $n$ has a value of at least 5.



---

2,774,742

## DEOILING OF SPHEROIDAL CHROMIA-ALUMINA HYDROGEL PARTICLES

William A. Stover, Pitman, and Robert C. Wilson, Jr., Woodbury, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

Application November 19, 1954, Serial No. 469,963
7 Claims. (Cl. 252—448)

1. In the production of chromia-alumina spheroidal gel particles prepared by mixing aqueous solutions of sodium aluminate and chromium acetate and controlling the sodium to aluminum ion ratio and the acetate to chromium ion ratio in said solutions to yield a hydrosol having a chromia-alumina content of at least about 10 percent by weight and characterized by an inherent capacity to set to a hydrogel upon lapse of a suitable period of time, admitting said sol in the form of separate globules to a body of a liquid substantially immiscible with water wherein the globules assume a spheroidal shape and set to hydrogel, aging, washing, and drying the spheroidal hydrogel, the improvement which comprises removing adherent substantially water-immiscible liquid from the freshly formed hydrogel particles after separation thereof from said body of liquid, but prior to said aging, by washing said particles with an aqueous ammonium salt solution having a pH of between about 8.0 and about 9.5 and an ammonium salt concentration of between about 5 and about 20 percent by weight.

2,774,743

## PROCESS FOR PRODUCING SPHEROIDAL ALUMINA

James Hoekstra, Evergreen Park, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

No Drawing. Application November 21, 1951, Serial No. 257,633
5 Claims. (Cl. 252—448)

1. A process for producing a platinum-on-alumina catalyst in which the alumina has an apparent bulk density below about 0.5 gm. per cc., which comprises aging alumina gel first in oil at a temperature of at least 125° F. for at least 10 hours and then in ammonium hydroxide solution at a temperature of at least 125° F. for at least 10 hours, and subsequently compositing platinum with the alumina gel.

2,774,744

## METHOD OF PREPARING LOW SODA-CONTENT ALUMINA CATALYST

Wayne T. Barrett, Baltimore, Md., and Charles E. Welling, Pittsburgh, Pa., assignors to W. R. Grace & Co., New York, N. Y., a corporation of Connecticut

No Drawing. Application November 6, 1950, Serial No. 194,394
16 Claims. (Cl. 252—465)

1. A one-step process for reducing the soda content of soda-contaminated crystalline alumina trihydrate to a value below about 0.05% and simultaneously converting the trihydrate to alumina monohydrate, which consists essentially of slurrying the trihydrate with water and an acidic material of the group consisting of nitric acid, hydrochloric acid, acetic acid, the aluminum salts of said acids and mixtures thereof, autoclaving the slurry at a temperature above 350° F. thereby effecting substantially complete conversion to the monohydrate and thereby solubilizing soda as a result of the conversion, and filtering and water washing the thus treated alumina.

2,774,745

## HIGH-SLIP NITROCELLULOSE LACQUERS

Robert C. Hedlund, Midland, Mich., assignor to Dow Corning Corporation, Midland, Mich., a corporation of Michigan

No Drawing. Application November 17, 1952, Serial No. 321,061
4 Claims. (Cl. 260—16)

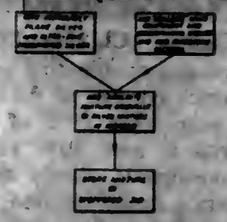
1. A composition of matter consisting essentially of (1) 25 to 90 percent by weight nitrocellulose, (2) 10 to 75 percent by weight alkyd resin compatible with nitrocellulose and (3) .01 to 5.0 percent by weight based on the total weight of (1) and (2) of an organopolysiloxane fluid boiling above 225° C. and in said fluid, the organic radicals are monovalent hydrocarbon radicals which are bonded to silicon atoms by Si-C bonds.

2,774,746

## DIETHYLENE GLYCOL BIS-CARBAMATE-FORMALDEHYDE CONDENSATES

James P. Shelley, Drexel Hill, Pa., assignor to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Application June 16, 1954, Serial No. 437,268
19 Claims. (Cl. 260—29.4)



1. A composition comprising a water-soluble high molecular weight condensate of a mixture comprising the dicarbamate of diethylene glycol and formaldehyde, in which the molar ratio of formaldehyde to the dicarbamate is from 2:1 to 3.5:1, said condensate having been prepared in an aqueous medium at a pH of 2.3 to 3.5 and at a temperature of at least 70° C. and having a viscosity, at a concentration of 60% in water at 25° C., of 2 to 25 poises.

2,774,747

## ELECTRICALLY CONDUCTING CEMENTS CONTAINING EPOXY RESINS AND SILVER

Henry Wolfson and George Elliott, London, England, assignors to International Standard Electric Corporation, New York, N. Y.

Application March 25, 1952, Serial No. 278,527
Claims priority, application Great Britain April 5, 1951
1 Claim. (Cl. 260—32.8)

An electrically conducting cement, comprising 27% fine flake silver, 46% ultra fine precipitated silver, 24.5% hardenable resinous reaction product of epichlorohydrin with a diphenol and 2.5% diacetone alcohol.

2,774,748

## COMPOSITION CONTAINING GLYCIDYL POLYETHER OF A POLYHYDRIC PHENOL AND A METHYLOL SUBSTITUTED 2-ALKENYLOXYBENZENE

Harry W. Howard, South Orange, and Clifford V. Wittenwyler, Roselle, N. J., assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware

No Drawing. Application April 14, 1952, Serial No. 282,274
10 Claims. (Cl. 260—45.5)

9. A composition comprising a mixture of (1) an epoxide resin, which is a condensate of epichlorohydrin and a dihydric phenol, (2) an alkenyloxybenzene from the group consisting of allyloxybenzene and methallyloxybenzene, said alkenyloxybenzene containing 3 methylol groups linked singly at the 2, 4 and 6 positions on the benzene ring, in proportions of 1 to 9 parts of (1) to 9 to 1 parts by weight of (2), and (3) phosphoric acid in an amount of from 0.2% to 5% by weight based on the total composition as a curing catalyst.

2,774,749

## PRODUCTION OF DICYANDIAMIDE-FORMALDEHYDE CONDENSATION PRODUCTS

Lester N. Stanley, Brookview, and Alois C. Roggenstoss, Delmar, N. Y., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application November 15, 1952, Serial No. 320,813
3 Claims. (Cl. 260—69)

2. A process for condensing paraformaldehyde ammonium chloride and dicyandiamide comprising mixing said substances in dry form and in molar proportions respectively of about 1–3:0.5–1:1 and heating the mixture at a temperature of about 70 to 150° C. under anhydrous conditions for a sufficient time to produce an acidic condensation product which, in the form of its hydrochloride, is soluble in dilute aqueous acid media.

2,774,750

## MONOMERIC COMPOUNDS COMPRISING A PLURALITY OF VINYL GROUPS

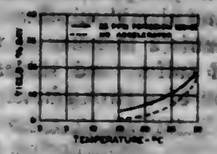
Sidney Melamed, Philadelphia, Pa., assignor to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Application December 8, 1954, Serial No. 474,003
19 Claims. (Cl. 260—78)

1. As a new composition, a compound having the structure of Formula I.

I $(H_2C{=}CHOANRCO{-})_nY$

where A is an alkylene group of 2 to 18 carbon atoms of which at least two carbon atoms thereof separate the adjoining O and N atoms, R is selected from the group consisting of H, cyclohexyl, benzyl, and alkyl groups of 1 to 12 carbon atoms, Y is selected from the group consisting of alkylene, alkenylene, phenylene, oxa-alkylene, and thia-alkylene groups, tri- and tetravalent saturated aliphatic hydrocarbon groups, tri- and tetravalent saturated aliphatic hydroxyl-substituted hydrocarbon groups, and tri-, tetra-, and hexavalent monocyclic aromatic hydrocarbon groups, and $n$ is an integer having a value of 2 to 4.

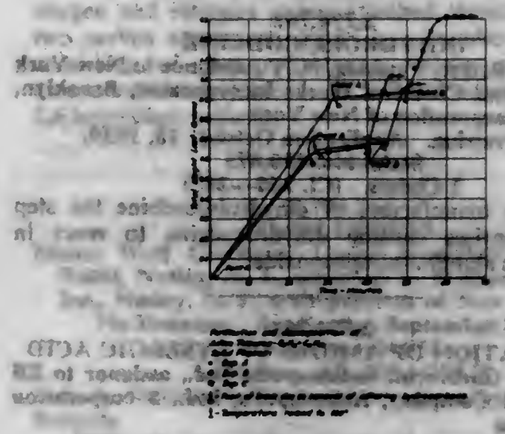


2,774,751

## MANUFACTURE OF FLUORINE CONTAINING POLYMERS

Herbert J. Passino, Englewood, and Albert L. Dittman, North Bergen, N. J., and John M. Wrightson, Whittier, Calif., assignors to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

Application June 11, 1953, Serial No. 360,893
12 Claims. (Cl. 260—87.5)



1. A process for the production of a normally solid fluorine-containing polymer which comprises polymerizing a substituted ethylene compound having at least 2 fluorine atoms in the molecule at a temperature above about 0° C. and below 40° C. in the presence of an aqueous-suspension medium having a water-soluble inorganic peroxide as a polymerization promoter, a water-soluble reducing agent as an activator, selected from the group consisting of alkali bisulfites, alkali hydrosulfites, alkali thiosulfates and trimethylamine and an amount of a water-soluble iodide as an accelerator within a range between about 1 and 1000 p. p. m. calculated as iodine.

2,774,752

## PROCESS FOR TREATING HYDROCARBONS WITH THIOUREA

Manuel H. Gorin and Ludwig Rosenstein, San Francisco, Calif.

Application January 31, 1951, Serial No. 208,816
11 Claims. (Cl. 260—96.5)

1. A process for forming an adduct with expanded thiourea characterized by a bulk density of substantially 0.45 gram per cc. and also characterized by reactivity which enables complete adduct formation when said thiourea is used as the sole reagent with liquid cyclohexane in a contact period at room temperature not exceeding one hour, comprising passing a gas stream, containing at least one hydrocarbon capable of forming an adduct with thiourea, over a mass of said expanded thiourea as the sole reagent at a temperature below approximately 60° C. and for a contact time of less than one hour to form an adduct of thiourea and said hydrocarbon.

2,774,753

## COMBINED SOLVENT AND ADSORBENT PROCESS FOR REFINING ROSIN

Edwin C. Howard, Hattiesburg, Miss., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application November 15, 1954, Serial No. 468,989
10 Claims. (Cl. 260—107)

1. The process for refining dark rosin which comprises separating dark rosin into a crude pale rosin fraction and a fraction containing primarily naphtha-insoluble material by partitioning the dark rosin between an adsorbent refining solvent and acetonitrile, the amount of acetonitrile being in the range of 0.1 to 5 parts per part of said naphtha-insoluble material, and contacting the resultant solution of crude pale rosin with a solid adsorbent.

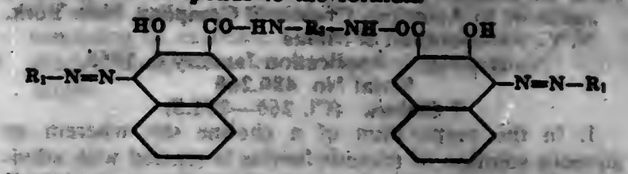
2,774,754

## METHOD OF DISPOSING AND UTILIZATION OF SULFITE WASTE LIQUOR

Albert Schmid, Zurich, Switzerland

No Drawing. Application December 10, 1953, Serial No. 397,486
Claims priority, application Switzerland December 15, 1952
1 Claim. (Cl. 260—124)

In a method of disposing of and utilising sulfite waste liquid obtained from sulfite cellulose plants, the steps of reducing the water content of the crude sulfite waste liquor down to about 20–40% by multi-stage vacuum evaporation of the crude liquor in a first concentration stage, then further reducing the water content of the so-concentrated liquor down to 10–20% by film evaporation under atmospheric pressure in a second concentration stage, the pH of the liquor in both said concentration stages being at a value within the range of 5–6, and bringing the pH of the final liquid concentrate to a value in the range of about 7.2–8 by mixing it intimately with carbide sludge while maintaining intimate contact with air at a temperature of about 70–100° C. whereby polymerization of the concentrate takes place.



2,774,755

## ACID AMIDE DERIVATIVES OF AZO-DYESTUFFS

Max Schmid, Riehen, and Eduard Meyer and Christoph Frey, Basel, Switzerland, assignors to Ciba Limited, Basel, Switzerland, a Swiss firm

No Drawing. Application December 14, 1953, Serial No. 398,226
Claims priority, application Switzerland December 24, 1952
5 Claims. (Cl. 260—174)

1. An acid amide derivative of an azo compound which derivative is free from groups imparting solubility in water and corresponds to the formula

in which $R_1$ represents a member selected from the group consisting of mononuclear aromatic radicals of the benzene series and binuclear aromatic radicals of the naphthalene series and contains a carboxylic acid ester group in vicinal position to the azo linkage, and $R_2$ represents

an aromatic hydrocarbon radical containing 6n ring carbon atoms, *n* representing a whole number of at the most 2.

---

2,774,756

## NEW TRIAZINE COMPOUNDS AND PROCESS OF MAKING THEM

Hermann Bretschneider and Wilhelm Kleter, Innsbruck, Austria, assignors to Österreichische Stickstoffwerke Aktiengesellschaft, Linz (Donaubo), Austria, an Austrian joint-stock company

No Drawing. Application March 28, 1953, Serial No. 343,892
Claims priority, application Austria March 28, 1952
7 Claims. (Cl. 260—239.7)

1. A 2-(benzenesulfonamido)-1,3,5-triazine selected from the group consisting of 2-(4'-aminobenzenesulfonamido)-4,6-dimethoxy-s-triazine and its salts.

---

2,774,757

## PROCESS FOR THE PRODUCTION OF THIOACYLHYDRAZONES

Engelbert Kühle and Richard Wegler, Leverkusen, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Application July 26, 1955, Serial No. 524,581
Claims priority, application Germany August 19, 1954
7 Claims. (Cl. 260—240)

1. The process of producing thioacylhydrazones which comprises heating to temperatures of between about 120 to about 180° C. a mixture of sulfur and a heterocyclic compound containing a reactive methyl group said compound being selected from the group consisting of 2- and 4-methylpyridine, quinaldine, 2-methylbenzothiazole, 2-methylthiophene, 2,4-dimethylpyridine, 2,5-dimethylpyridine, and an organic carboxylic acid hydrazide selected from the class consisting of benzoic acid hydrazide, the hydrazides of halogen-substituted-, nitro-substituted- and alkyl-substituted benzoic acids, naphthoic acid hydrazide, diphenylcarboxylic acid hydrazide, the pyridine carboxylic acid hydrazides, the quinoline carboxylic acid hydrazides, pyromucic acid hydrazide and thiophenecarboxylic acid hydrazide, and recovering the thioacylhydrazones formed from the reaction mixture.

---

2,774,758

## MORPHOLINE DERIVATIVE

William H. Yanko, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application August 5, 1954, Serial No. 448,143
3 Claims. (Cl. 260—247)

1. The method which comprises contacting morpholine with fumaronitrile and recovering 4-morpholinesuccinonitrile from the resulting reaction product.

---

2,774,759

## PREPARATION OF CHOLINE BASE AND CHOLINE SALTS

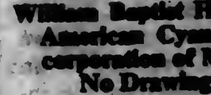
Eben G. Blackett and Arnold J. Selkday, Marietta, Ohio, assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application January 6, 1955, Serial No. 480,268
7 Claims. (Cl. 260—251.5)

1. In the preparation of a choline salt wherein an aqueous solution of trimethylamine is reacted with ethylene oxide to form choline base, the improvement which comprises first partially neutralizing the aqueous solution of choline base with an acid, distilling off the unreacted trimethylamine under vacuum, and completely neutralizing the remaining choline base.

2,774,760

## PROCESS FOR PRODUCTION OF PYRIMIDINES



Calvert W. Whitehead, Indianapolis, Ind., assignor to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana

No Drawing. Application October 14, 1953, Serial No. 386,136
6 Claims. (Cl. 260—256.4)

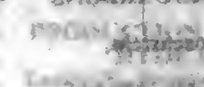
1. The process for the preparation of substituted pyrimidines which comprises heating together a compound represented by the formula

Y—$CH_2$—Z

wherein Y and Z represent radicals of the group consisting of cyano, carbamyl, carboxyl, lower carbalkoxy, lower aliphatic carboxyacyl and lower alkoxyoxalyl radicals; an alkyl orthoformate, and a compound represented by the formula

wherein R represents a member of the group consisting of hydrogen, lower alkyl, cyclohexyl, lower hydroxyalkyl, lower alkoxyalkyl and phenyl-substituted lower alkyl radicals, and X represents a member of the group consisting of oxygen and sulfur; and subjecting the product thereof to the action of a strong base.

---



2,774,761

## PREPARATION OF SULFURIC ACID HALF ESTERS OF LEUCO VAT DYES

William Baptist Hardy, Bound Brook, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application September 1, 1953, Serial No. 377,980
13 Claims. (Cl. 260—274)

1. The process of preparing sulfuric acid half esters of leuco vat dyes which comprises subjecting a vat dye to treatment with a metal selected from the class consisting of metals of group II-B of the periodic table having an atomic number less than 50 and metals of group VIII of the periodic table having an atomic number less than 30, and with a sulfur trioxide addition product of a dialkylcyanamide of the formula:

in which $R_1$ and $R_2$ represent alkyl groups of less than 4 carbon atoms.

---

2,774,762

## DIHYDROISOCODEINE

Manuel M. Balzer, Flushing, N. Y., assignor to New York Quinine and Chemical Works Incorporated, Brooklyn, N. Y., a corporation of New York

No Drawing. Application October 18, 1950, Serial No. 190,573
2 Claims. (Cl. 260—285)

1. In the manufacture of dihydroisocodeine the step which comprises causing dihydrocodeine to react in toluene with aluminumisopropoxide.

---

2,774,763

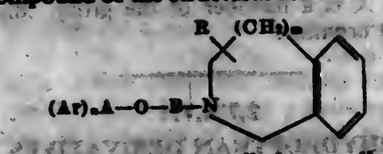
## PREPARATION OF AMIDES OF LYSERGIC ACID

William L. Garbrecht, Indianapolis, Ind., assignor to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana

No Drawing. Application November 21, 1955, Serial No. 548,242
13 Claims. (Cl. 260—285.5)

1. The method which comprises reacting sulfur trioxide with a member of the group consisting of lysergic acid and basic salts thereof at a temperature not substantially exceeding room temperature to produce a mixed anhydride of lysergic and sulfuric acids, and reacting said mixed anhydride with a nitrogenous base having at least one hydrogen linked to nitrogen, thereby to produce a lysergic acid amide, and isolating said amide.

---



2,774,764

## 2-(ARALKOXYALKYL) DERIVATIVES OF TETRAHYDROISOQUINOLINE AND ISOINDOLINE

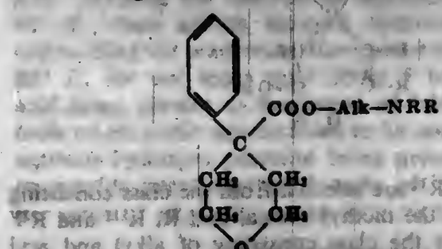
John W. Cusic, Skokie, Ill., assignor, by mesne assignments, to G. D. Searle & Co., Skokie, Ill., a corporation of Delaware

No Drawing. Application October 21, 1953, Serial No. 387,505
15 Claims. (Cl. 260—289)

1. A compound of the structural formula

wherein A and B are lower alkylene radicals, *m* is an integer selected from the group consisting of zero and one, *n* is a positive integer less than three, R is a member of the class consisting of hydrogen, lower alkyl and pheayl radicals and Ar is a member of the class consisting of methoxypheayl, aryl hydrocarbon, and haloaryl radicals, the total number of carbon atoms in $(Ar)_n$ being between 6 and 16 carbon atoms, inclusive.

---



2,774,765

## ESTERS OF 4-PHENYL-4-TETRAHYDROPYRANCARBOXYLIC ACID AND THEIR SALTS

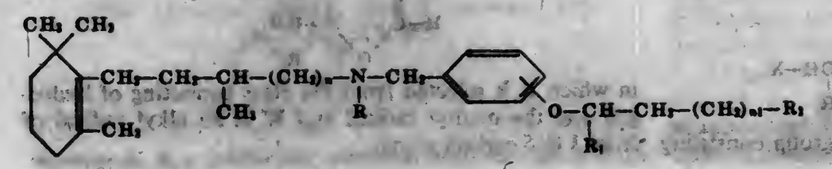
William W. Jenkins, Morton Grove, Ill., assignor, by mesne assignments, to G. D. Searle & Co., Skokie, Ill., a corporation of Delaware

No Drawing. Application May 10, 1954, Serial No. 428,846
6 Claims. (Cl. 260—294.3)

1. A compound of the structural formula

wherein Alk is a lower alkylene radical separating the oxygen and nitrogen atoms attached thereto by at least two carbon atoms and NRR' is a member of the class consisting of di-n-propylamino, diisopropylamino, di-(secondary butyl)amino, 2,5-dimethylpyrrolidino and 2,6-lupetidino radicals.

---



2,774,766

## BASIC ETHERS

Moses Wolf Goldberg, Upper Montclair, and Sidney Teitel, Nutley, N. J., assignors to Hoffmann-La Roche Inc., Nutley, N. J., a corporation of New Jersey

No Drawing. Application September 8, 1954, Serial No. 454,826
6 Claims. (Cl. 260—294.7)

1. A compound selected from the group having the formula

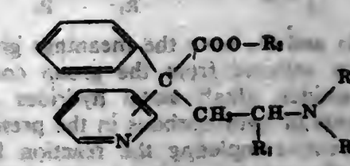
wherein

R and $R_4$ are members of the group consisting of hydrogen and lower alkyl,

$R_3$ is a member of the group consisting of the radicals dilowеralkylamino, piperidino, morpholino and pyrrolidino, and

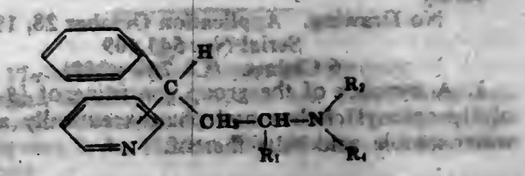
*n* and $n_1$ are members of the group consisting of 0 and 1, and salts thereof.

---



2,774,767

## PROCESS OF PREPARING 2-PHENYL-2-PYRIDYL-(4')-4-DILOWERALKYL AMINO BUTYRIC LOWER ALKYL ESTERS



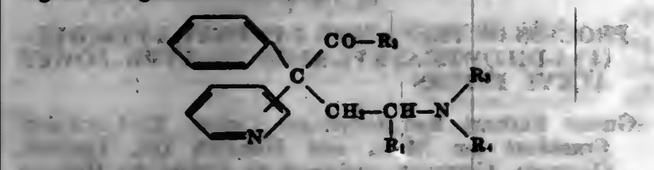
Gustav Ehrhart, Bad Soden am Taunus, Karl Schmitt, Frankfurt am Main, and Heinrich Ott, Eppstein (Taunus), Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Application April 22, 1955, Serial No. 503,337
Claims priority, application Germany May 3, 1954
4 Claims. (Cl. 260—295)

1. The process of preparing basic esters of the general formula:

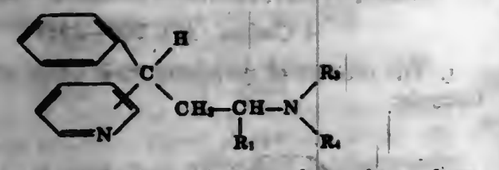
wherein $R_1$ represents a member of the group consisting of hydrogen and methyl, $R_3$ represents an alkyl radical having at most 4 carbon atoms and $R_5$ and $R_6$ represent alkyl radicals having at most 3 carbon atoms and taken together with —N< form a saturated heterocyclic ring system, which comprises reacting compounds of the general formula:

wherein $R_1$, $R_3$ and $R_4$ have the meanings given above, with a member selected from the group consisting of alkali metal amides, alkali metal hydrides and alkali metal compounds of hydrocarbons in the presence of an indifferent solvent, completing the reaction by heating, and then adding to the reaction mixture without isolation of the alkali metal compound formed, an ester of the group consisting of carbonic acid and chlorocarbonic acid, the alcohol components of which contain at most 3 carbon atoms.



2,774,768

## PROCESS OF PREPARING BASIC KETONES



Gustav Ehrhart, Bad Soden am Taunus, Karl Schmitt, Frankfurt am Main, and Heinrich Ott, Eppstein (Taunus), Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Application April 26, 1955, Serial No. 504,094
Claims priority, application Germany May 3, 1954
5 Claims. (Cl. 260—296)

1. The process of preparing basic ketones corresponding to the general formula:

wherein $R_1$ represents a member of the group consisting of hydrogen and methyl, $R_2$ represents an alkyl radical having at most 4 carbon atoms, and $R_3$ and $R_4$ represent alkyl radicals having at most 3 carbon atoms and taken together with—N< form a saturated heterocyclic ring system, which comprises reacting compounds of the general formula:

wherein $R_1$, $R_2$ and $R_4$ have the meanings given above, with a member selected from the group consisting of alkali metal amides, alkali metal hydrides and alkali metal compounds of hydrocarbons in the presence of an indifferent solvent, completing the reaction by heating and adding to the reaction mixture, without isolation of the alkali metal compound formed, a member of the group consisting of esters and halides of lower aliphatic carboxylic acids, the alcohol components of the said esters containing at most 3 carbon atoms.

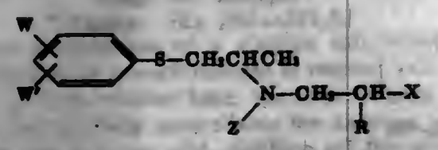
2,774,769

## IMIDAZOLYLPROPIONYL CHOLINE SALTS

Arthur Stempel, River Edge, N. J., assignor to Hoffmann-La Roche Inc., Nutley, N. J., a corporation of New Jersey

No Drawing. Application October 28, 1955, Serial No. 543,609
6 Claims. (Cl. 260—309)

1. A member of the group consisting of [β-(4-imidazolyl)propionyl]choline and pharmaceutically acceptable, water-soluble acid salts thereof.



2,774,770

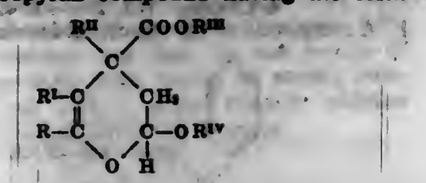
## SULFUR-CONTAINING AMINES

James F. Kerwin and Glenn E. Ullyot, Philadelphia, Pa., assignors to Smith, Kline & French Laboratories, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Application September 20, 1951, Serial No. 247,553
6 Claims. (Cl. 260—332.5)

1. A compound of the class consisting of a free base and its acid addition salts, the free base having the formula:

in which W and W' are members of the group consisting of hydrogen, alkyl containing not more than four carbon atoms, alkoxy containing not more than four carbon atoms, fluorine, chlorine and bromine; Z is a member of the group consisting of alkyl containing not more than eight carbon atoms, alkenyl containing not more than eight carbon atoms, benzyl, benzyl substituted in the phenyl portion by methyl, methoxy, fluorine, chlorine and bromine, phenoxyalkyl the alkyl portion containing not more than four carbon atoms and phenoxyalkyl substituted in the phenyl portion by methyl, methoxy, fluorine, bromine and chlorine, and thenyl and thenyl substituted in the thiophene portion by alkyl containing not more than four carbon atoms, fluorine, chlorine and bromine; R is a member of the group consisting of hydrogen and methyl; and X is a member of the group consisting of chlorine and bromine.



2,774,771

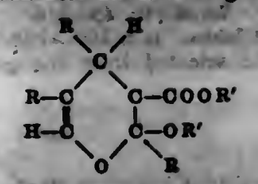
## DIHYDROPYRAN DERIVATIVES

Raymond I. Longley, Jr., Springfield, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application August 11, 1955, Serial No. 527,869
3 Claims. (Cl. 260—345.8)

1. The process which comprises heating, at a temperature of from 100° C. to 300° C. a keto-ester having the formula $RCOCR^{I}{:}CR^{II}COOR^{III}$ in which $R^{I}$ and $R^{II}$ are selected from the class consisting of hydrogen and the methyl radical and R and $R^{III}$ are selected from the class consisting of alkyl and aryl radicals of from 1 to 18 carbon atoms, with a vinyl ether having the formula $CH_2{:}CHOR^{IV}$ in which $R^{IV}$ is selected from the class consisting of alkyl and aryl radicals of from 1 to 18 carbon atoms, and recovering from the resulting reaction product a dihydropyran compound having the formula

in which $R^{I}$ and $R^{II}$ are selected from the class consisting of hydrogen and the methyl radical and R, $R^{III}$ and $R^{IV}$ are selected from the class consisting of alkyl and aryl radicals of from 1 to 18 carbon atoms.



2,774,772

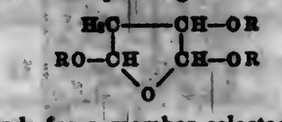
## DIHYDROPYRAN DERIVATIVES

Raymond I. Longley, Jr., Springfield, Mass., William S. Emerson, Glendale, Mo., and Theodore C. Shafer, Lafayette, Ind., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application August 15, 1955, Serial No. 528,344
8 Claims. (Cl. 260—345.8)

8. Dihydropyran derivatives having the formula

in which R is selected from the class consisting of hydrogen and the methyl radical and R' is an alkyl radical of from 1 to 5 carbon atoms.



2,774,773

## PROCESS FOR THE PRODUCTION OF 2,3,5-TRIALKOXY-TETRAHYDROFURANES

Arthur Stoll, Arlesheim, Ernst Jucker, Binningen, and Adolf Lindenmann, Basel, Switzerland, assignors to Sandoz A. G., Basel, Switzerland

No Drawing. Application June 21, 1954, Serial No. 438,332
Claims priority, application Switzerland June 24, 1953
5 Claims. (Cl. 260—347.8)

1. A process for the preparation of a 2,3,5-trialkoxy-tetrahydrofurane corresponding to the formula

wherein R stands for a member selected from the group consisting of $CH_3$, $—CH_2CH_3$, $—CH_2CH_2CH_3$ and $—CH(CH_3)_2$, which comprises treating furane with a member selected from the group consisting of chlorine and bromine in an excess of an alcohol of the formula

R.OH

wherein R has the aforesaid significance, in the absence of a hydrogen halide-binding agent, at a temperature of −20° to −2° C., whereby trialkoxylation results.

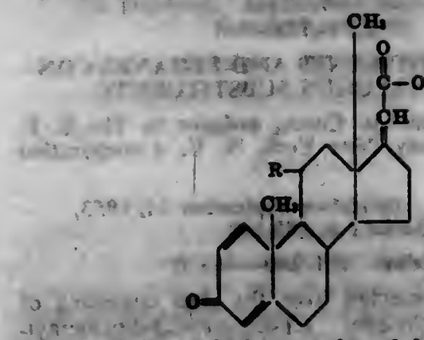
2,774,774

## IN SITU EPOXIDATION OF OLEIC ACID USING FORMIC ACID

Frank P. Greenspan and Ralph J. Gall, Buffalo, N. Y., assignors, by mesne assignments, to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware

No Drawing. Application March 26, 1954, Serial No. 419,102
3 Claims. (Cl. 260—348.5)

1. The method of epoxidizing an ethylenic unsaturated higher fatty acid containing oleic acid which comprises adding to said acid an inert organic solvent and formic acid, warming the mixture to approximately 50° C. to 80° C., then adding aqueous hydrogen peroxide and maintaining the reaction mixture at substantially 50° C. to 80° C. for not more than about 5 hours, said formic acid being present to the extent of 0.25 to 1.0 mole per mole of ethylenic unsaturation to be epoxidized, and said aqueous hydrogen peroxide being present in an amount to provide approximately 1 mole of hydrogen peroxide per mole of ethylenic unsaturation to be epoxidized.



2,774,775

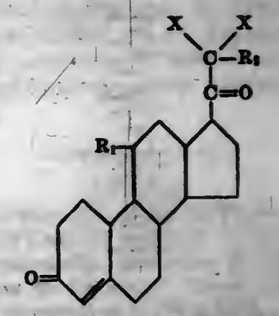
## CARBONYLOXY STEROIDS

Jerome Korman, Portage Township, Kalamazoo County, and John A. Hogg, Kalamazoo Township, Kalamazoo County, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application January 26, 1954, Serial No. 406,364
9 Claims. (Cl. 260—397.1)

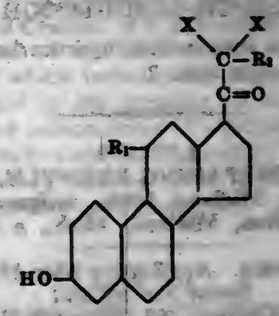
1. 3 - keto - 1,4,17(20) - pregnatriene - 21 - carbonyloxy steroid represented by the following formula:

wherein R is a substituent selected from the group consisting of hydrogen, α-hydroxy, β-hydroxy, α-lower-hydrocarbonyloxy and ketonic oxygen and wherein R' is a radical selected from the group consisting of hydrogen and lower-alkyl.



2,774,776

## DIHALOSTEROIDS



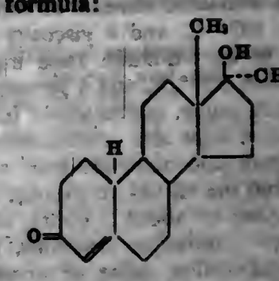
John A. Hogg, Philip F. Beal, and Frank H. Lincoln, Jr., Kalamazoo, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application August 30, 1952, Serial No. 307,385
37 Claims. (Cl. 260—397.1)

1. A compound selected from the group consisting of (1) a compound represented by the formula:

and (2) a compound represented by the formula:

wherein $R_1$ is a member of the group consisting of hydrogen, α-hydroxy, β-hydroxy and keto, $R_2$ is a member of the group consisting of formyl and alkoxyoxalyl wherein the alkyl group contains from one to eight carbon atoms, inclusive, and X is a member of the group consisting of chlorine, bromine and iodine.



2,774,777

## 17α-METHYL-19-NORTESTERONE

Carl Djerassi, Birmingham, Mich., and Luis Miramontes and George Rosenkranz, Mexico City, Mexico, assignors to Syntex S. A., Mexico City, Mexico, a corporation of Mexico

No Drawing. Original application November 12, 1952, Serial No. 320,154, now Patent No. 2,744,122, dated May 1, 1956. Divided and this application April 10, 1956, Serial No. 582,900
4 Claims. (Cl. 260—397.4)

1. A process for the production of a compound having the following formula:

which comprises reducing a lower alkyl ether of estrone with an alkali metal in liquid ammonia followed by hydrol-

yais with a mineral acid and oxidation with chromic acid to form $\Delta^4$-19-norandrosten-3,17-dione, selectively forming a 3-enol ether of said dione and treating said ether with a methyl Grignard reagent, followed by hydrolysis with a mineral acid.

## TRIORGANOSILYL AMINO ACIDS

Leo H. Sommer, State College, Pa., assignor to Dow Corning Corporation, Midland, Mich., a corporation of Michigan

Application June 15, 1954, Serial No. 436,771
3 Claims. (Cl. 260—448.2)

1. A compound of the formula

$$R_3Si(CH_2)_nCHNH_2COOH$$

in which R is a monovalent hydrocarbon radical and *n* is an integer other than 2.

---

2,774,779

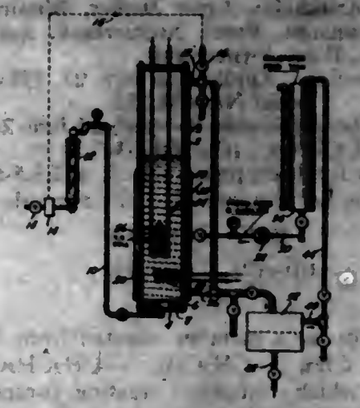
## METHOD OF PREPARING PHENYLHALOSILANES

John W. Gilkey, Midland, Mich., assignor to Dow Corning Corporation, Midland, Mich., a corporation of Michigan

No Drawing. Application May 27, 1953, Serial No. 357,921
3 Claims. (Cl. 260—448.2)

1. A process of preparing monomeric phenylsilanes which comprises heating a silcarbane in which the silicon atoms are connected by phenylene links, the remaining valences of the silicon being satisfied by a radical selected from the group consisting of halogen atoms and monovalent hydrocarbon radicals, with benzene in the presence of a catalyst of the group consisting of boron and aluminum halides, at a temperature of from 150 to 450° C., in a closed system.

---



2,774,780

## OXIDIZED OIL PRODUCT AND PROCESS FOR THE PRODUCTION THEREOF

Joseph J. Saube, Warrensville, and David Frazier, Cleveland Heights, Ohio, assignors to The Standard Oil Company, Cleveland, Ohio, a corporation of Ohio

Application September 11, 1952, Serial No. 309,888
1 Claim. (Cl. 260—452)

The method of forming a soluble oil which comprises oxidizing a solvent-extracted mineral oil having an aniline number of about 107° C. and a viscosity of about 115 SSU at 100° F. in an oxidation zone maintained at a temperature of about 320° F. and a pressure of about 57 lbs. per square inch gauge, continuously introducing said oil into the oxidation zone and continuously withdrawing the oxidized oil from said oxidation zone at substantially the same rate so that the oil has an average residence time in the oxidation zone of about 2 hours, said withdrawn oil comprising two immiscible fractions, the lighter of which has a saponification value of about 81 and the heavier of which has a saponification value of about 250, permitting the oxidized product to separate into two layers, separating the highly oxidized lower layer from the lesser oxidized upper layer, and neutralizing the highly

oxidized lower layer with potassium hydroxide to form a soluble oil miscible with water as a stable emulsion.

---

2,774,781

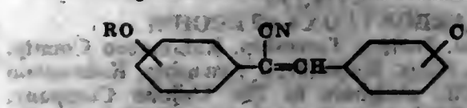
## METHOD FOR THE PREPARATION OF BENZYLMALONONITRILE

Jerome C. Westfahl, Cuyahoga Falls, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York

No Drawing. Application September 14, 1953, Serial No. 380,124
8 Claims. (Cl. 260—465)

1. A method of preparing benzylmalononitrile which comprises reacting benzene with 1,1-dicyano ethylene in the presence of aluminum chloride under anhydrous conditions and hydrolyzing the aluminum chloride-benzylmalononitrile complex.

---



2,774,782

## o-HYDROXYPHENYL-β-ALKANOYLPHENYL AND β-GLYCOLYLPHENYL ACRYLONITRILES AND DERIVATIVES THEREOF

Kurt J. Rorig, Evanston, Ill., assignor, by mesne assignments, to G. D. Searle & Co., Skokie, Ill., a corporation of Delaware

No Drawing. Application June 7, 1954, Serial No. 435,072
9 Claims. (Cl. 260—465)

1. A compound of the structural formula

wherein R is a member of the class consisting of hydrogen and lower alkylcarbonyl radicals and R' is a member of the class consisting of lower alkyl, hydroxymethyl and lower alkylcarbonyloxymethyl radicals.

---

2,774,783

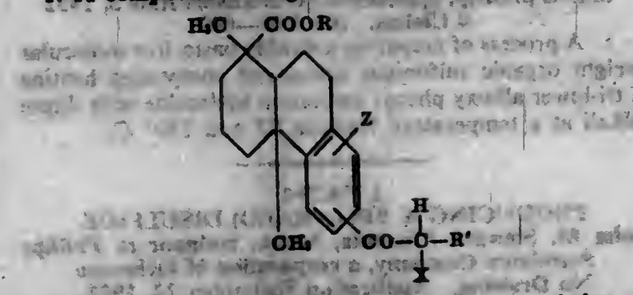
## 1,1-DICYANO ETHYLENES AND ETHANES CONTAINING HALOGEN SUBSTITUENTS

Alan E. Ardis, Hamden, Conn., assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York

No Drawing. Application September 24, 1953, Serial No. 382,189
20 Claims. (Cl. 260—465.7)

15. A chemical selected from the class consisting of 1,1-dicyano-2-haloethylene, 1,1-dicyano-2,2-dihaloethylene, 1,1-dicyano-1,2-dihaloethane, 1,1-dicyano-1,2,2-trihaloethane, and 1,1-dicyano-1,2,2,2-tetrahaloethane in which the halogen is selected from the class consisting of chlorine and bromine.

---



2,774,784

## HALOALKANOYL RESIN ACID DERIVATIVES

George M. Picha, Skokie, Ill., assignor, by mesne assignments, to G. D. Searle & Co., Skokie, Ill., a corporation of Delaware

No Drawing. Application August 30, 1954, Serial No. 453,147
15 Claims. (Cl. 260—469)

1. A compound having the structural formula

wherein R and R' are members of the group consisting of hydrogen and lower alkyl radicals, Z is a member of the group consisting of 6-hydroxy, 6-(lower)alkoxy and 7-isopropyl radicals, and X is a halogen atom.

---

2,774,785

## ADDITION OF HYDROGEN CHLORIDE OR HYDROGEN BROMIDE TO MALEIC, FUMARIC, OR ACRYLIC ACIDS OR THEIR ESTERS

Vernon P. Wystrach, Stamford, Conn., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application February 23, 1954, Serial No. 412,067
3 Claims. (Cl. 260—485)

1. A process for hydrohalogenation which comprises bringing into reactive contact at ambient temperatures and atmospheric pressure an alpha-beta unsaturated compound selected from the group consisting of acrylic, maleic and fumaric acids, their lower alkyl esters and the lower alkyl diesters of maleic and fumaric acid, dimethyl formamide, and a gaseous hydrogen halide selected from HCl and HBr, and maintaining the mixture at from about 18° to about 60° C., until reaction substantially ceases.

---

2,774,786

## PHOSPHONO-AMMONIUM SURFACE ACTIVE AGENTS

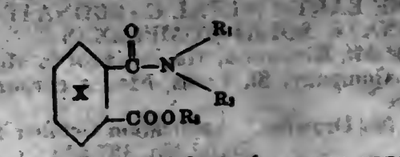
John G. Erickson, Minneapolis, Minn., assignor to General Mills, Inc., a corporation of Delaware

No Drawing. Application August 10, 1953, Serial No. 373,459
4 Claims. (Cl. 260—501)

1. Compounds having the formula

in which R is an aliphatic hydrocarbon group containing from 8–22 carbon atoms, $R^1$ and $R^2$ are aliphatic groups containing from 1–4 carbon atoms, $R^3$ is a divalent aliphatic hydrocarbon group containing from 2–6 carbon atoms, and M is selected from the group consisting of sodium, potassium and ammonium.

---



2,774,787

## POLYHYDROPHTHALAMIC ACID VISCERAL SMOOTH MUSCLE RELAXANTS

Charles F. Geschickter, Kensington, and Leonard M. Rice, Baltimore, Md.

No Drawing. Application September 3, 1953, Serial No. 378,417
5 Claims. (Cl. 260—514)

1. A new composition of matter having the formula

in which the ring X is selected from the group consisting of cyclohexene and cyclohexane, $R_1$ is selected from the group consisting of methyl and ethyl groups, $R_2$ is selected from the group consisting of methyl and ethyl groups, and $R_3$ is selected from the group consisting of hydrogen and magnesium.

---

2,774,788

## PREPARATION OF 2-METHYL-4-CHLOROPHENOXYACETIC ACID

Alex Hlynsky, Painesville, and John W. Jenney, Madison, Ohio, assignors to Diamond Alkali Company, Cleveland, Ohio, a corporation of Delaware

No Drawing. Application February 6, 1953, Serial No. 335,685
4 Claims. (Cl. 260—521)

1. The method of synthesizing 2-methyl-4-chlorophenoxyacetic acid which includes the steps of chlorinating cresoxyacetic acid in the presence of an aliphatic acid having less than 4 carbon atoms at a temperature sufficient to preclude crystallization of the product or solidification of said aliphatic acid, and thereafter recovering 2-methyl-4-chlorophenoxyacetic acid therefrom.

---

2,774,789

## l-ARTERENOL AND ITS ACID-ADDITION SALTS AND PREPARATION THEREOF

Benjamin F. Tuller, East Greenbush, N. Y., assignor to Sterling Drug Inc., Wilmington, Del., a corporation of Delaware

No Drawing. Application October 24, 1947, Serial No. 782,012
10 Claims. (Cl. 260—570.6)

1. A substance selected from tthe group consisting of l-arterenol and its acid-addition salts, said substance being in crystalline and substantially pure form and being substantially free from its optical antipode.

---

2,774,790

## CONVERTING OXAZINE COMPOUNDS TO GAMMA-HYDROXY AMINES

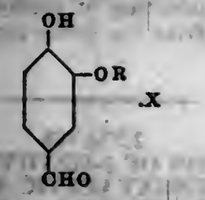
Howard D. Hartough, Wilmington, Del., and Joseph J. Dickert, Jr., Westville, and Seymour L. Meisel, West Deptford Township, Gloucester County, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

No Drawing. Original application June 17, 1950, Serial No. 168,852. Divided and this application October 24, 1952, Serial No. 316,777
3 Claims. (Cl. 260—584)

1. A method for converting a nitrogen-containing product selected from the group consisting of 1,3-oxazines and bis-(1,3-oxazino)methanes at least one carbon atom of the heterocyclic nucleus of said oxazines and oxazino radicals having at least one substituent radical selected from the group consisting of lower alkyl radicals and phenyl radical and being otherwise unsubstituted into gamma-hydroxy amines, which comprises reacting said

nitrogen-containing product with dilute aqueous mineral acid at reflux temperature, neutralizing with an aqueous solution of an alkali-metal-hydroxide, and separating the gamma-hydroxy amine from the neutralized product.

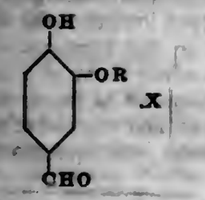
---



2,774,791

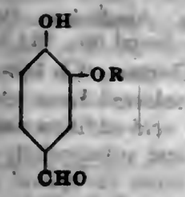
## WATER SOLUBLE SUBSTITUTED p-HYDROXYBENZALDEHYDE-ALKALI METAL AND ALKALINE EARTH METAL CARBONATE AND BICARBONATE SOLID COMPLEXES

Arthur Alt, Kirkwood, Mo., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware



No Drawing. Application October 19, 1953, Serial No. 387,034
15 Claims. (Cl. 260—600)

1. As compositions of matter, water-soluble solid complexes having the following formula



wherein R represents an organic radical and X represents a compound selected from the group consisting of the alkali metal and alkaline earth metal carbonates and bicarbonates.

7. A process for the preparation of water-soluble solid complexes having the formula

wherein R represents an organic radical and X represents a compound selected from the group consisting of the alkali metal and alkaline earth metal carbonates and bicarbonates, which comprises admixing in an inert organic solvent under substantially anhydrous conditions a substituted para-hydroxybenzaldehyde having the formula

wherein R represents an organic radical with an anhydrous compound selected from the group consisting of the alkali metal and alkaline earth metal carbonates and bicarbonates.

---

2,774,792

## PROCESS FOR DRYING CARBONYLIC COMPOUNDS

George J. Carlson, Berkeley, George W. Gaertner, Oakland, and Frank B. West, Berkeley, Calif., assignors to Shell Development Company, New York, N. Y., a corporation of Delaware

Application September 3, 1954, Serial No. 454,012
9 Claims. (Cl. 260—601)

1. A method of drying a lower molecular weight, normally liquid, monocarbonyl-substituted hydrocarbon which comprises contacting said carbonyl compound with an aluminum alcoholate of a monohydroxy-substituted hydrocarbon alcohol having one to ten carbon atoms per molecule in an amount between about the stoichiometric requirement for reaction with the water present to form aluminum hydroxide and an excess over such stoichiometric amount not greater than 0.02 mole per mole of carbonyl-substituted hydrocarbon at a temperature of about 0° C. to 45° C. whereby reaction of the aluminum alcoholate with the water takes place and aluminum hydroxide is formed without substantial conversion of said carbonylic hydrocarbon.

---

2,774,793

## WEAKLY BASIC ORGANIC SULFONIUM COMPOUNDS

Geert J. De Jong and Johannes A. Zoogers, Geleen, Netherlands, assignors to Stamicarbon N. V., Heerlen, Netherlands

No Drawing. Application May 28, 1953, Serial No. 358,175
Claims priority, application Netherlands June 5, 1952
4 Claims. (Cl. 260—607)

1. A process of preparing a weakly basic, low molecular weight organic sulfonium compound comprising heating a tri-lower alkoxy phenyl sulfonium hydroxide with dilute alkali at a temperature between 75 and 150° C.

---

2,774,794

## PRODUCING A BIS (β-HALO) DISULFIDE

John M. Stewart, Missoula, Mont., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Application September 22, 1952, Serial No. 310,914
8 Claims. (Cl. 260—608)

1. The method of producing a bis (β-halo) disulfide which comprises reacting, in the absence of water, a halogen selected from the group consisting of chlorine and bromine with an olefin sulfide containing the structure

and containing from 2 to 18 carbon atoms the amounts of halogen and olefin sulfide present being sufficient to produce said bis (β-halo) disulfide.

---

2,774,795

## METHOD OF DECOMPOSING LIGNIN AND LIGNIN-CONTAINING MATERIALS

Johann Giesen, Haldenstein, Chur, Graubunden, Switzerland, assignor to Inventa A.-G. für Forschung und Patentverwertung Luzern, Lucerne, Switzerland

No Drawing. Application March 3, 1953, Serial No. 340,135
Claims priority, application Switzerland March 5, 1952
6 Claims. (Cl. 260—619)

1. A process of decomposing lignin and lignin-containing material which comprises subjecting an aqueous suspension of the lignin-containing material to a hydrogen pressure of 500–1000 atmospheres at a temperature of about 300° C. in the presence of copper oxide-chromium oxide as a hydrogenating catalyst to effect hydrogenation and hydrolysis and to produce phenol products.

---

2,774,796

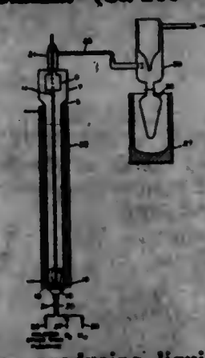
## METHOD FOR PREPARATION OF NITROPHENOLS

Joshua C. Conner, Jr., Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Original application October 5, 1950, Serial No. 188,645, now Patent No. 2,718,530, dated September 20, 1955. Divided and this application June 9, 1954, Serial No. 435,625
9 Claims. (Cl. 260—622)

1. The process of preparing a nitrophenol from an organic compound containing an aromatic hydrocarbon nucleus having attached to the ring thereof at least one nitro group and at least one alkyl group having at least two carbon atoms and at least one hydrogen atom on the carbon atom alpha to the aromatic ring, which comprises passing an oxygen-containing gas through said organic compound in liquid phase under noncatalytic conditions

to obtain the corresponding hydroperoxide, and contacting said hydroperoxide under acidic conditions with an acidic condensation catalyst to obtain said nitrophenol.



---

2,774,797

## METHOD OF PRODUCING FLUOROHALOCARBONS BY REACTING CARBON WITH FLUORINE AND ANOTHER HALOGEN

Russell M. Mantell, Orange, Herbert J. Pasino, Englewood, and Wilbur O. Teeters, River Edge, N. J., assignors to The M. W. Kellogg Company, Jersey City, N. J., a corporation of New Jersey

Application April 2, 1954, Serial No. 420,656
6 Claims. (Cl. 260—653)

1. A process for producing liquid fluorohalocarbons which comprises reacting elemental fluorine with a fluidized mass of finely divided carbon particles in a reaction zone maintained at a temperature between about 500° F. and about 800° F. to which zone there is charged an elemental halogen selected from the group consisting of chlorine, bromine, and mixtures thereof such that the relative quantities of reactants charged to the conversion zone are between about 0.50 and about 20 parts of fluorine per part of halogen other than fluorine by volume.

---

2,774,798

## PROCESS FOR DEHALOGENATION OF ORGANIC COMPOUNDS IN THE PRESENCE OF A DETERGENT

Horace R. Davis, Cedar Grove, and Stanley Hal Kwei Chiang, Jersey City, N. J., assignors to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application November 23, 1954, Serial No. 470,809
18 Claims. (Cl. 260—653)

1. A process for dehalogenating a halogen-containing organic compound which comprises dehalogenating a dehalogenatable fluorine-containing alkane which contains at least one halogen of the group consisting of fluorine and chlorine on a carbon atom and at least one chlorine atom on an adjacent carbon atom and in which all other substituents are selected from the group consisting of alkyl, aryl, halogen and hydrogen substituents with a metal dehalogenating agent in the presence of water containing a detergent which does not react with the halide of the metal dehalogenating agent to form a water insoluble compound.

---

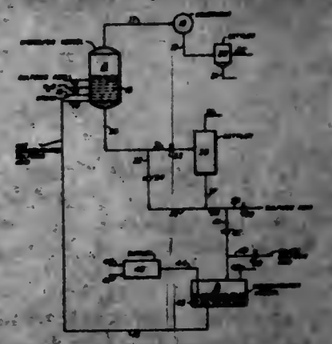
2,774,799

## SELECTIVE DEHYDROHALOGENATION OF FLUOROHALOALKANES USING A COPPER CATALYST

Russell M. Mantell, Orange, and William S. Barnhart, Cranford, N. J., assignors to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application April 1, 1954, Serial No. 420,451
6 Claims. (Cl. 260—653)

1. A process for producing vinylidene fluoride which comprises heating a 1,1-difluorochlorethane at a temperature between about 500° C. and about 730° C. for a period of time between about 1 and about 60 seconds in the presence of a copper catalyst selected from the group consisting of metallic copper, alloys of copper with noncatalytic metals and copper salts.



---

2,774,800

## METHOD FOR HYDROLYZING SULFONIC ACIDS

Albert J. Stumbl, Crosby, and James L. Walker, Baytown, Tex., assignors, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware

Application August 23, 1954, Serial No. 451,456
4 Claims. (Cl. 260—668)

1. In a continuous method for hydrolyzing aromatic hydrocarbon sulfonic acids wherein said sulfonic acids, water and a stream of concentrated sulfuric acid are continuously charged to a hydrolysis zone having a temperature within the range from about 280° to 310° F. in amounts sufficient to cause hydrolysis of said sulfonic acids to form an aromatic hydrocarbon fraction and a dilute sulfuric acid fraction and wherein the said hydrocarbon fraction and the said dilute sulfuric acid fraction are continuously withdrawn from said hydrolysis zone, the improvement which comprises the steps of passing said dilute sulfuric acid fraction into an acid concentration zone and there discharging a high temperature inert gas through said sulfuric acid fraction to concentrate the sulfuric acid and to heat the same to a temperature above the temperature of said hydrolysis zone and continuously recycling at least a portion of the said heated concentrated sulfuric acid to said hydrolysis zone as the concentrated sulfuric acid charge stream, said recycled portion of said heated concentrated sulfuric acid being introduced into said hydrolysis zone at a temperature above the temperature of said hydrolysis zone in an amount sufficient to maintain the temperature of said hydrolysis zone within said range of about 280° to 310° F.

---

2,774,801

## CONVERSION OF METHYLNAPHTHALENES

Harry L. Coonradt, Woodbury, and Wilbur K. Lewman, Pitman, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

No Drawing. Application September 16, 1952, Serial No. 309,931
8 Claims. (Cl. 260—672)

1. A process for converting methyl-substituted naphthalenes into other valuable aromatic hydrocarbons, which comprises contacting the methyl-substituted naphthalene with a catalyst selected from the group consisting of (1) chromia supported on alumina and containing between about 4 weight percent and about 12 weight percent chromia, (2) chromia cogelled with alumina and containing between about 18 mole percent and about 80 mole percent chromia, and (3) molybdenum oxide-alumina containing between about 5 weight percent and about 20 weight percent molybdenum oxide, at a temperature of between about 1000° F. and about 1150° F., for a contact time of between about one second and about 1000 seconds, and in the presence of hydrogen gas under pressures of between about 50 pounds per square inch gauge and about 200 pounds per square inch gauge.

2,774,802

**SEPARATION OF ALKYL BENZENES BY SELECTIVE CLATHRATION OF THE PARA-ISOMER WITH A 4-ALKYL PYRIDINE WERNER COMPLEX IN THE PRESENCE OF A 3-SUBSTITUTED PYRIDINE**

Curtis G. Christian, Anaheim, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Application November 8, 1954, Serial No. 467,655
8 Claims. (Cl. 260—674)

1. A method for resolving a mixture of alkyl benzene hydrocarbons, said mixture containing at least one para-dialkyl benzene and a monoalkyl benzene, which comprises contacting said mixture with a solid Werner complex, said Werner complex being composed of a salt of a divalent transitional metal coordinated wtih a 4-alkyl pyridine, said contacting being carried out in the presence of a 3-substituted pyridine base selected from the group consisting of nicotinamide, lower alkyl 3-pyridyl ketones, lower alkyl esters of nicotinic acid, thionicotinamide and nicotinonitrile, whereby said para-dialkyl benzene is integrated into the crystal structure of said complex in stronger preference to said mono-alkyl benzene than would be the case in the absence of said 3-substituted pyridine.

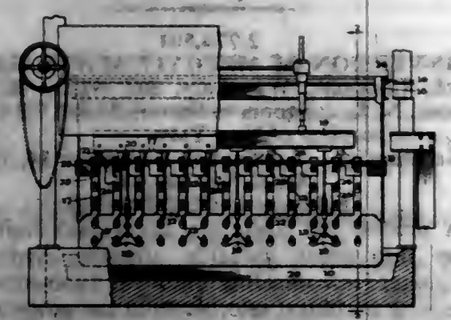
# ELECTRICAL

2,774,803

**INDUCTIVE STIRRING DEVICE FOR METALLURGICAL FURNACE**

Ludwig Dreyfus, Vasteras, Sweden, assignor to Allmanna Svenska Elektriska Aktiebolaget, Vasteras, Sweden, a Swedish corporation

Application September 8, 1953, Serial No. 378,940
Claims priority, application Sweden September 20, 1952
7 Claims. (Cl. 13—9)



1. Inductive stirring means for metallurgical furnaces, comprising at least two two-pole magnet wheel systems mounted below the furnace, substantially parallel and horizontal shafts carrying said wheel systems, and means whereby the wheel systems are synchronously rotated in the same direction, the pole axes of said magnet wheel systems being substantially parallel and in an angular relationship no greater than 45°, and the polarities of said systems being opposed.

2,774,804

**STUD POSITIONING JIG WITH CONTINUOUS SELF-BAKING ELECTRODE AND METHOD OF POSITIONING CONTACT STUDS THEREIN**

Delmer W. Dow, Tacoma, and Thomas Tregoning, Puyallup, Wash., assignors to Kaiser Aluminum & Chemical Corporation, Oakland, Calif., a corporation of Delaware

Application November 20, 1952, Serial No. 321,646
17 Claims. (Cl. 13—18)

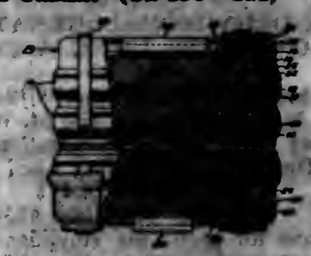
1. A continuous self-baking electrode of the channelless horizontal stud type having a lower baked portion and an upper unbaked portion and provided with contact studs partially embedded in the electrode and arranged in substantial horizontal and vertical alignment along the side surfaces of the electrode, in combination with a contact stud positioning jig provided with guiding surfaces positioned to retain each respective contact stud partially embedded in the unbaked portion of the electrode in a relative position of substantially fixed vertical spacing and alignment with a contact stud partially embedded in the baked portion of the electrode.

2,774,805

**BATTERY STRUCTURE**

John B. Harrison and Garth A. Rowis, Muncie, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application October 22, 1952, Serial No. 316,191
6 Claims. (Cl. 136—79)



1. A heavy duty type storage battery adapted to withstand continued overcharging comprising in combination; a container adapted to receive a cover having a plurality of openings therein; a plurality of plates within the container, said plates consisting of positive plates, and negative plates; separators between the plates; positive and negative terminal posts attached to the respective plates and extending through apertures in said cover; a support rib within the container adapted to have certain of said plates and separators rest therein; wire-like members forming the frame of the positive plates; a lug integral with the wire-like members of the positive plate adapted to contact the support rib and thereby position the positive plate; and a wire-like support means for the positive plate connected to the lug and the frame wire, said support means being of relative less cross sectional area than the frame wire of the positive plate so as to be permanently deformed upon the distortion of the positive plate due to overcharging whereby said means only functions as a support during initial use of said battery.

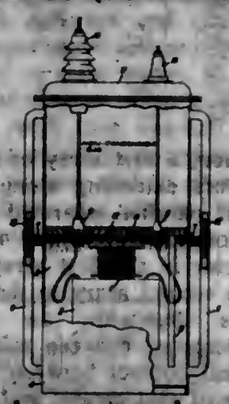
2,774,806

**PRIMARY BATTERY**

George T. Jobe, Cleveland, Fredrick J. Weber, Parma, and Albert F. Visel, Shaker Heights, Ohio, assignors to Union Carbide and Carbon Corporation, a corporation of New York

Application June 12, 1953, Serial No. 361,318
2 Claims. (Cl. 136—111)

1. In a low temperature primary galvanic battery with a high electrolyte content comprising a plurality of cells arranged in series stacked relation, each of said cells comprising a carbon electrode, an immobilized aqueous electrolyte, an electrolyte-wet depolarizer mix wherein the moisture contained is over 58 percent by volume of said mix, and a zinc electrode, the combination of non-rigid, plastic envelopes, each including cell components which when grouped, form a battery and a rigid, non-absorbent, plastic depolarizer-mix-retaining collar within each of said envelopes, said collar confining said wet mix and serving to prevent movement of said mix and distortion of said non-rigid envelope when said battery is assembled, said envelope completely enclosing the marginal portions of the carbon electrode of one cell and the zinc electrode, electrolyte and depolarizer mix of the adjoining cell, a separator blanket having a bibulous portion separating said mix from said electrode and a portion separating the outer walls of said collar from the inner walls of said envelope.



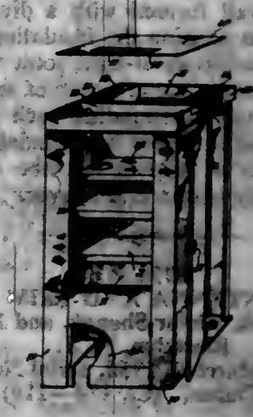
2,774,807

**VAPORIZATION-FORCED LIQUID COOLED TRANSFORMER**

Lawrence C. Whitmore, Pittsfield, Mass., assignor to General Electric Company, a corporation of New York

Application February 19, 1953, Serial No. 337,801
4 Claims. (Cl. 174—15)

2. In an electrical apparatus submerged within a dielectric cooling liquid within a closed tank, said tank having a noncondensable gas therein above the surface of said liquid and vertical cooling radiators connected at opposite ends thereof adjacent the top and bottom of said tank, said liquid having a boiling point temperature within the normal operating temperature range of said apparatus whereby a substantial quantity of vapors are formed from said liquid during normal operation of said apparatus, means for segregating said vapors and non-condensable gas and causing said vapors to accelerate circulation of said liquid through said radiators comprising a horizontal baffle extending to all side walls of said tank and dividing said tank into approximately equal isolated upper and lower halves, said lower half and said radiators connected by horizontal ducts extending from substantially immediately below said baffle to central portions of said radiators, said lower half completely filled with said liquid and said upper half having a minimum of said liquid therein whereby approximately only the lower halves of said radiators are filled with said liquid, a drain extending from said baffle to adjacent the bottom of said tank, and said apparatus positioned in said lower half.



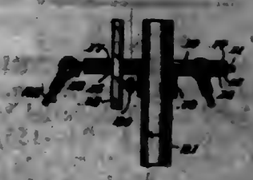
2,774,808

**ELECTRICAL EQUIPMENT CABINETS**

Mark W. Bullock, Dallas, Tex., assignor to Continental Electronics Manufacturing Company, Dallas, Tex., a corporation of Texas

Application April 9, 1952, Serial No. 281,444
1 Claim. (Cl. 174—16)

A cabinet adapted for the enclosure of a plurality of items of heat dissipating electrical apparatus requiring electrostatic and electromagnetic shielding from each other, said cabinet being constructed of sheet metal and having air intake and air exhaust openings therein, said cabinet having a body composed essentially of top and bottom horizontal members and three one-piece vertical members all extending substantially the full height of the cabinet, the vertical members consisting of a vertical transverse partition member and two vertical angle members, said vertical angle members comprising front, intermediate and rear horizontally spaced parallel walls, said front parallel wall and intermediate parallel wall being joined together at their outer edges by a first lateral wall and the intermediate parallel wall and rear parallel wall being joined together at their inner edges by a second lateral parallel wall, said vertical transverse partition being secured to each of said angle members at their intermediate parallel walls, thereby forming a main front compartment that extends the full width of the cabinet,



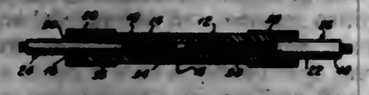
two rear corner compartments, and an intermediate rear compartment, and hinged access doors for each of the compartments, the vertical members being bent along their vertically extending free edges to provide supporting means to lend rigidity to said cabinet, and said main compartment being provided with vertically spaced shelve members which occupy a substantial portion of the cross sectional area of said main cabinet, whereby heat dissipating apparatus may be arranged vertically upon the cabinet members without the necessity for special vertical chassis mountings, said vertical, horizontal and shelve members having electrical conductivity and magnetic permeability to provide shielding action, and said vertical members being apertured to permit flow of air from one of said compartments which constitutes a plenum compartment into each of the other compartments, all of the latter compartments being in communication with the exhaust opening.

2,774,809

**TV ANTENNA GUY WIRE ATTACHING RING**

Ernest E. Burkhart, Gleason, Ind.

Application November 18, 1952, Serial No. 321,255
5 Claims. (Cl. 174—45)



3. In a supporting device, a post, a disc having an annular groove in the periphery fixedly mounted on said post, a ring having spaced eyes therein slidably mounted in the groove of the disc, said disc having an opening therein, a grommet positioned in the opening through the disc, a lead-in wire extended through said grommet, and guy wires extended from the eyes of said ring.

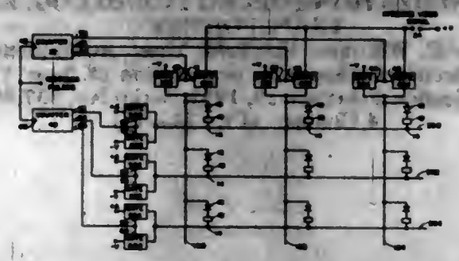
occurring in a given sequence, a photo-cathode sensitive, operating from said source of alternating current, means

2,774,810
ELECTRICAL CONNECTOR
George T. Ritter, Harrisburg, Pa., assignor to Aircraft-Marine Products, Inc., Harrisburg, Pa., a corporation of New Jersey
Application August 21, 1951, Serial No. 242,850
4 Claims. (Cl. 174—84)

1. An electrical connector adapted to receive the stripped ends of insulated electrical conductors of different sizes and to be crimped to provide a water-tight electrically conductive joint between said conductors, said connector comprising a tube made of an electrically conductive metal and formed to receive said stripped ends, a plastic tube surrounding said metal tube and extending substantially beyond the ends thereof, said plastic tube having an inner wall formed with a diverging taper at each end thereof to position the insulating layers of said conductors to insure a water-tight joint when said connector is crimped, and a metal sleeve of substantially uniform diameter snugly surrounding each tapered end of said plastic tube, said sleeves being axially spaced from the proximate ends of said metal tube and said tapers being located wholly within said sleeves.

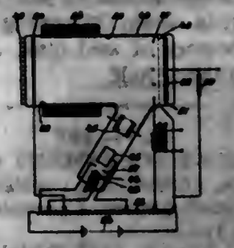
2,774,811
ANTENNA AND TRIM
Abraham Shanok, Victor Shanok, and Jesse Shanok, Brooklyn, N. Y.
Application March 2, 1954, Serial No. 413,524
2 Claims. (Cl. 174—110)

1. A radio antenna for a motor vehicle including a relatively thin projecting lip member comprising an elongated channel-shaped body portion of substantially U-shaped cross-section, said body portion including opposed sides and an enclosed end and being formed of an electrically insulating synthetic resin, a metal foil ribbon extending longitudinally through said strip and enveloped thereby, said enclosed end being substantially semi-circular in cross-section, said opposed sides converging toward each other along their free ends, said free ends being positioned in substantial contiguity to form a longitudinally extending opening for said body whereby said projecting lip is adapted to be received between said opposed sides and to be resiliently gripped therebetween and means for electrically connecting said metal foil to the input terminal of radio equipment within said vehicle.



2,774,812
HERMETICALLY SEALED ELECTRIC TERMINAL
Richard U. Clark, West Acton, Mass.
Application April 27, 1953, Serial No. 351,317
6 Claims. (Cl. 174—153)

2. An electrical terminal comprising a metallic electrode having a transverse flange, a tubular insert having a transverse flange, said insert formed from plastic material having cold flow properties, an outer metallic shell having a transverse flange and a knife edge spaced therefrom, said electrode having an enlargement thereon remotely spaced from said flange, said insert disposed within said outer shell with said flanges adjacently disposed, said electrode disposed within said insert with said flanges adjacently disposed, and said insert distorted around the knife edge at the end of said shell remote

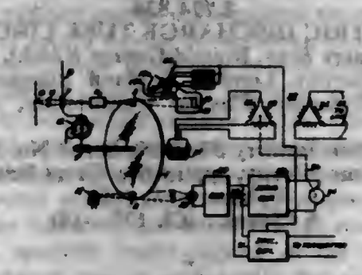


from said flanges by the said enlargement of said electrode.

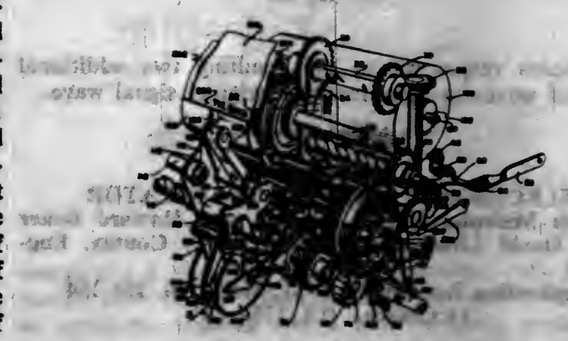
2,774,813
ELECTROLUMINESCENT TELEVISION PANEL
Donald C. Livingston, Bayside, N. Y., assignor to Sylvania Electric Products Inc., a corporation of Massachusetts
Application November 1, 1955, Serial No. 544,152
11 Claims. (Cl. 178—5.4)

1. In combination, a first array of parallel, separated electrical conductors extending along a first direction; a second array of parallel separated electrical conductors extending along a second and non-parallel direction, each conductor in the first array passing over all conductors in the second arary to define a plurality of cross-over points therewith; an electroluminescent phosphor film interposed between said arrays to establish direct electrical contact between said film and the conductors in one of said arrays; and a rectifying layer of the barrier type deposited on said film and connected to the conductors in the other array, said layer being divided into a like plurality of insulatedly separated barrier layer elements respectively positioned at each cross-over point, each element together with its corresponding other array conductor constituting a rectifier, whereby each conductor in said first array is electrically connected through a rectifier and said film to each conductor in said second array.

2,774,814
POST-DEFLECTION HORIZONTAL COLOR STRIPE PICK-UP TUBE
Jean Robert Perlboa and Johan Lodewijk Hendrik Jonker, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application April 15, 1952, Serial No. 282,332
Claims priority, application Netherlands May 2, 1951
7 Claims. (Cl. 178—5.4)



2. A color television camera device comprising a color filter constituted by a plurality of parallel strips having *n*-different color absorption properties and periodically

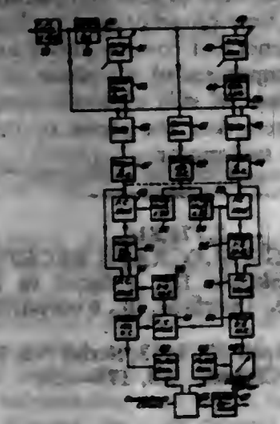


occurring in a given sequence, a photo-cathode sensitive to light rays passing through said filter, a target plate, a field electrode interposed between said photo-cathode and said target plate, means to apply a given potential to said field electrode, electron-optical means interposed between said photo-cathode and said target plate to cause the electrons being emitted from a given area of said photo-cathode to impinge upon a corresponding area of said target plate to produce thereon an image of said color strips, an electron gun including a cathode for producing an electron beam to impinge on the image on said target plate, means to apply a potential to said cathode which is less than said given potential, a grid comprising parallel wires mounted parallel to said strips and between said field electrode and said photo-cathode and between said field electrode and said electron gun, *n*-strips of said filter being associated with each aperture defined by two adjacent wires of said grid, means to apply a potential intermediate the potential of said cathode and said field electrode to said grid whereby a potential gradient and electrostatic lines of force are produced between said grid and said field electrode, said grid potential having a value lower than that which would prevail at its position in its absence, deflection means interposed between said grid and said electron gun for scanning said target plate whereby the electron beam is caused to intercept the direction of the lines of force at an angle at which the beam is deflected and concentrated in the direction of the target plate and at which the width of the beam measured at right angles to the direction of the grid wires at the area at which the beam strikes the target plate is not more than one-half of the width of the beam at the area of the grid, and means to apply an alternating voltage to said grid to change the potential gradient existing between said grid and said field electrode and to thereby change the image on said target plate struck by said beam.

2,774,815
FILM TO VIDEO TRANSLATION APPARATUS
Frank N. Gillette, Pleasantville, N. Y., assignor to General Precision Laboratory Incorporated, a corporation of New York
Application September 13, 1952, Serial No. 309,535
3 Claims. (Cl. 178—7.2)

1. In film to video translating apparatus, a video camera pickup tube having a photosensitive mosaic screen and means for producing a focused electron beam for scanning said screen to translate images thereon into electrical video signals, a source of alternative current, means synchronously operated by said alternating current source for cyclically scanning said electron beam over said screen at a horizontal frequency which is high as compared to the vertical scanning frequency to thereby give successive picture fields separated by fly-back intervals at one picture rate, motion picture projection means including means for intermittently advancing a motion picture film strip at a second picture rate, means for projecting images from said film strip on to said camera screen including a source of light and light-interrupting means, means for operating said intermittent means and said light-interrupting means in synchronism including a synchronous motor operating from said source of alternating current, means responsive to the operation of said light-interrupting means for generating electrical control pulses at a frequency which is a function of said first picture rate, means for comparing the time phase of said cyclically scanning means with said generated control pulses and means responsive to the comparison of the phase of said control pulses with the phase of said cyclically scanning means for advancing or retarding the phase of the alternating current supplied to said motor.

2,774,816
PRINTING TELEGRAPH RECEIVER
Kermit D. Yost, Skokie, Ill., assignor to Kleinschmidt Laboratories, Inc., Deerfield, Ill., a corporation of Delaware
Application April 27, 1953, Serial No. 351,285
11 Claims. (Cl. 178—29)



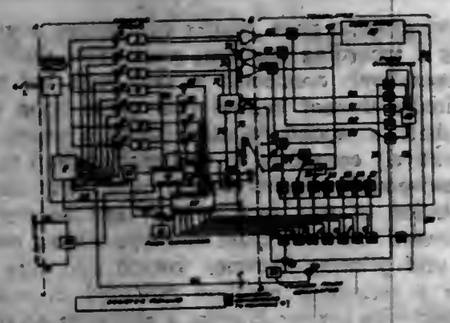
1. A telegraphic page printer comprising a guide for mounting a recording medium; a rotatable shaft; a type carrier operatively connected to said shaft and movable longitudinally thereof behind said guide upon rotation of said shaft; a second rotatable shaft; a printing hammer operatively connected to said second shaft for longitudinal movement relative thereto in front of said guide upon rotation of said second shaft and adapted to be moved toward and away from said type carrier; means for moving said printing hammer toward said type carrier to strike a recording medium mounted in said guide against said type carrier to print a character on the front of said recording medium; means responsive to predetermined type carrier positions for preventing the printing hammer from moving to strike a recording medium when no character is to be printed; and means to simultaneously rotate said shafts to move said type carrier and printing hammer longitudinally of their respective shafts to effect spacing between characters to be printed upon the recording medium.

2,774,817
RECEIVERS FOR PULSED FREQUENCY MODULATION CARRIER SYSTEMS
Charles William Earp, London, England, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware
Application November 23, 1951, Serial No. 257,809
Claims priority, application Great Britain December 1, 1950
13 Claims. (Cl. 179—15)

1. A receiving arrangement for an electric communication system of the kind in which a signal wave is periodically sampled and in which each signal sample is represented by at least one transmitted train of waves, the frequency of which indicates the amplitude of the signal sample, comprising means for producing two sets of two differently phased wave trains at least one set from each transmitted wave train, means for combining the two trains of each set to produce an additional train of waves corresponding to each set and having a phase

which varies in accordance with the difference between the phases of the waves of the respective combined trains,

and means responsive to the resulting two additional trains of waves to reproduce the original signal wave.



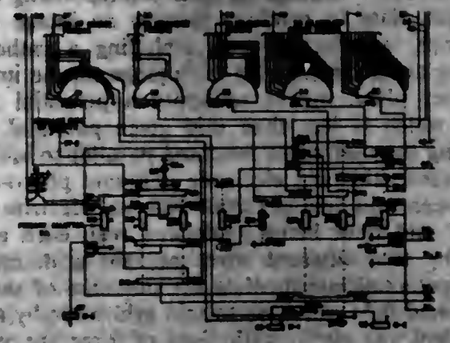
---

2,774,818

## ELECTRONIC REGISTER TRANSLATOR

Kenneth Malcolm Heron, London, and Howard Baker and David Livingstone Benson, Surrey County, England

Application January 29, 1951, Serial No. 208,284
14 Claims. (Cl. 179—18)



1. In an automatic telephone exchange apparatus, at least two electronic registers, an electronic translator, and common connecting means between said translator and said registers; said registers each comprising means for electronically storing signals representing dialled in codes and digits; said translator comprising code circuit means constituted by electronic elements each corresponding to a code for which a translation is to be supplied to a register by said translator, a code field comprising a plurality of electronic switching elements related to the codes for which translations are to be supplied, code identification leads, and means for connecting said electronic switching elements to said code circuit means and to said code identification leads; said translator further comprising a translation field comprising a plurality of electronic switch means and translation leads related translationwise to the codes for which translations are to be supplied, and means for connecting said electronic switch means to said code circuit means and to said translation leads; said translator further comprising a source of pulses, a pulse distributor circuit, means for applying pulses from said source to said pulse distributor circuit, means for connecting said pulse distributor circuit to said switching elements for rendering said switching elements sequentially operative and for effecting sequential connection of the distributed pulses to said code identifying leads, and means for signalling to said registers translations from said translation field.

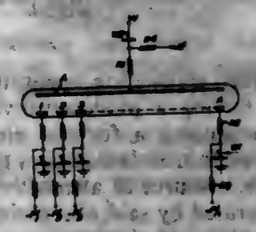
2,774,819

## FINDER ARRANGEMENT IN TELEPHONE SYSTEMS

Clarence E. Lemer, Chicago, Ill., assignor to Automatic Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware

Application February 1, 1954, Serial No. 407,263
33 Claims. (Cl. 179—18)

1. In a telephone system, a number of groups of line circuits, a corresponding number of groups of primary line finders having access to said line circuits, a group of secondary finders each having access to finders of different ones of said primary groups, a primary allotter for each of said primary groups, a plurality of secondary allotters for said secondary group, each of said secondary finders having a plurality of sets of test bank contacts each set for use with a different one of said secondary allotters, each of said primary allotters having means operative in response to the origination of a call in a line circuit of the associated primary group for starting an idle one of said primary finders on a searching operation, seizing an idle one of said secondary allotters and causing said primary finder to be marked as calling in the set of test bank contacts of the secondary finders which corresponds to the secondary allotter seized by said primary allotter, said secondary allotter being operative in response to said seizure for starting an idle one of said secondary finders in search of a calling primary finder in the set of bank contacts only that corresponds to the last-mentioned secondary allotter.



---

2,774,820

## ELECTRIC DISCHARGE TUBE CIRCUITS

Frederick Harry Bray, Ronald George Knight, and George Clifford Hartley, London, England, assignors to International Standard Electric Corporation, New York, N. Y.

Application January 30, 1953, Serial No. 334,192
Claims priority, application Great Britain
February 13, 1952
6 Claims. (Cl. 179—18)

1. A static electrical switch comprising a plurality of groups of cold cathode gas discharge gaps having anode and cathode electrodes, an equal plurality of circuits constituting a first group each circuit multiplied to one electrode of a respective group of gaps, a number of circuits constituting a second group each circuit multiplied to the other electrode in each of said groups of gaps, the circuits of both said first and second groups of circuits being individually adapted to assume any one of three different electrical conditions in respect of said gaps: the

first condition representing non-availability, a second condition representing availability, and a third condition representing that the line is busy, means for biasing said anode and cathode electrodes of said gaps so that no gap will fire unless the connected circuits are simultaneously in the electrical condition representing availability, means for changing the electrical conditions of said first group of circuits from a condition representing non-availability to one representing availability in turn in a first cycle of time positions, means for changing the electrical conditions of said second group of circuits from a condition representing non-availability to one representing availability in turn in a second cycle of time position, said first and second cycle of time positions being such that pairs of circuits each consisting of a circuit of the first group and a circuit of the second group can be offered to one another in a condition representing availability in time positions individual to each pair, whereby a circuit of the first group can be connected to a circuit of the second group to the exclusion of all other circuits by firing of the gap individual to said pair of circuits in the time position individual thereto, and means for automatically changing the electrical condition of a pair of circuits to one representing that the circuits are busy when the respective gap is fired.

2,774,821

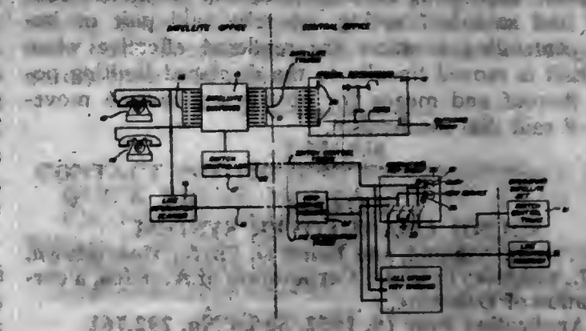
## CARD TRANSLATOR

Clayton B. Brown, Bellspage, Leon N. Hampton, Pleasantville, and Felix A. Thiel, Jr., Brooklyn, N. Y., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application May 6, 1952, Serial No. 286,374
17 Claims. (Cl. 179—18)

15. In a radiant energy information selecting device, a plurality of media having coded areas including signal areas, radiant energy producing means, radiant energy responsive means, means for selectively displacing a single one of said media relative to the others whereby a number of said radiant energy responsive means are selected for response in accordance with the coded areas of said selected media, other energy responsive means, circuit means including said other radiant energy responsive means operable under control of the signal areas of said displaced one of said media for modifying the condition of said circuit means, and means responsive to said circuit means when so modified for enabling the said selected number of said selected radiant energy responsive means to respond.

---



2,774,822

## COMMUNICATION SYSTEM

Kermit S. Dunlap, Madison, and Clarence A. Lovell, Summit, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application August 2, 1952, Serial No. 302,371
4 Claims. (Cl. 179—18)

1. A telephone system comprising a plurality of subscriber telephones, a satellite office, a subscriber line connecting each of said telephones to said satellite office, a central office remote from said satellite office, a plurality of trunks connecting said satellite office to said central office, a plurality of switching means within said satellite office for connecting said trunks to any of said subscriber lines, one of said switching means being associated with each of said trunks, switch controller means within said satellite office common to all of said switching means for controlling the operation of said switching means, and transmitting means within said central office for sending to said switch controller means coded information corresponding to the code designation of a particular one of said subscriber lines, said switch controller means comprising a plurality of marking buses and means for receiving said coded information from said central office and for translating said information to apply marking potentials to particular ones of said buses in accordance with said information, and each of said switching means

comprising a plurality of relays, operating coils for actuating each of said relays, each of said coils comprising an operating winding and a hold winding, means for completing a plurality of circuits each including a certain operating winding of one of said switching means and said marking buses common to all of said switching means on choice in said central office of the trunk associated with said one switching means to actuate the operating windings of certain of said relays dependent on the potentials applied to said marking buses by said switch controller, means for passing current through said hold windings of said relays common to said certain operating windings on operation of said certain operating windings, and means for preventing subsequent operation of said operating windings while said hold windings are being actuated.

---

2,774,823

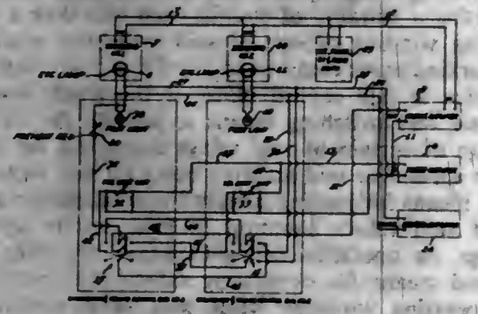
## SELECTIVE ELECTRICAL DIALING SYSTEM

Pedro Salinas Maynez, Mexico City, Mexico

Application December 21, 1951, Serial No. 262,692
7 Claims. (Cl. 179—90)

1. In an automatic telephone system, a unidirectionally rotatable finger actuated dial mechanism movable through selected permutation and combination positions, a pair of impulse-controlling contacts comprising a sequence contactor, means driven by said dial mechanism for selectively controlling the opening and closing of said contacts through a successive series according to selections effected by said finger actuated dial mechanism, a gear driven by said dial mechanism, a shaft extending in a direction substantially tangential to said gear, a worm wheel carried by said shaft and meshing with said gear, means for mounting said shaft for both rotative and translatory movement in an axial direction from an initial limiting position to a displaced limiting position, a leaf

spring extending across the path of said shaft normal to the axis thereof and flexed for normally exerting a force against the end of said shaft for biasing said shaft to the initial limiting position thereof, a pair of opposed contacts carried by said leaf spring in a position displaced from the position at which the end of said shaft engages said leaf spring, a pair of aligned contactors co-acting with said contacts, means for mounting one of said pair of opposed contacts for establishing contacting connection with one of the aligned contactors when said shaft is biased to the initial limiting position thereof, means for mounting the other of said opposed contacts for establishing contacting connection with the other of said contactors in the displaced limiting position of said shaft and circuit connections between said pair of impulse controlling contacts, said first mentioned contactor and said leaf spring, whereby said pair of impulse controlling contacts are rendered effective when said shaft is moved lineally to the displaced limiting position thereof and means for obstructing reverse movement of said dial mechanism.



---

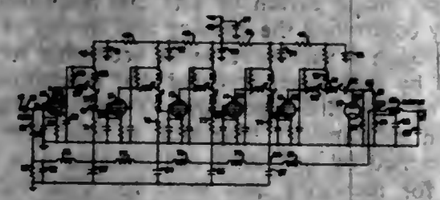
2,774,824

## SOUND CHANGEOVER SYSTEM

John F. Byrd, Ashland, and James D. Phyfe, Moorestown, N. J., assignors to Radio Corporation of America, a corporation of Delaware

Application June 10, 1952, Serial No. 292,762
The terminal fifteen years of the term of the patent to be granted has been disclaimed
7 Claims. (Cl. 179—100.3)

1. A system for switching between a plurality of sound film reproducers comprising a plurality of sound film reproducers, an exciter lamp in each of said reproducers adapted to illuminate sound film therein, a common energy supply for said exciter lamps, a double throw switch for each of said reproducers, a resistor, a fixed circuit between said exciter lamp supply and said exciter lamps in series, and a circuit between said exciter lamp supply, said resistor, and one of said exciter lamps in one position of said switches, said one exciter lamp being energized to normal operating condition and said other lamp being partially energized.



---

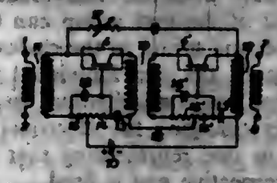
2,774,825

## LOGARITHMIC AMPLIFIER

Solomon Sherr, Tuckahoe, N. Y., assignor to General Precision Laboratory Incorporated, a corporation of New York

Application February 17, 1953, Serial No. 337,291
4 Claims. (Cl. 179—171)

1. A logarithmic amplifier comprising, a plurality of electronic amplifying stages connected in cascade, a rectifier connected to the amplifier output producing a rectified signal at the output of said rectifier, a rectifier circuit including a resistor interconnecting the control grid and cathode of at least the latter of said amplifier stages forming a diode circuit for signals above a preselected level whereby signals above said preselected level initiate grid current flow and are rectified by the control grid-cathode circuit thereof, and a time delay network interconnecting said rectifier circuit and the output of said rectifier whereby signals rectified in said amplifier stage are added to said rectifier output in phase therewith.



---

2,774,826

## STABILIZED TRANSISTOR AMPLIFIER

Jean-Marie Moulon, Paris, France

Application April 10, 1953, Serial No. 348,089
Claims priority, application France June 23, 1952
4 Claims. (Cl. 179—171)

1. A stabilized two-stage transistor amplifier, adapted to be power-supplied from a single direct-current source, comprising an input circuit and a two winding interstage transformer, first and second amplifying stages each including a transistor having a base electrode, an emitter electrode and a collector electrode, each of said stages further including a potentiometer having an adjustable sliding contact and two fixed terminals and first and second condensers both of low impedance at the frequencies of the currents to be amplified by said amplifier, said first condenser being connected across said two fixed terminals, each of said stages further comprising a direct connection between one of said fixed terminals and the base electrode of the transistor of said stage, means in said first stage for connecting the emitter electrode of the transistor thereof to the other of said fixed terminals of the potentiometer thereof through said input circuit, means for connecting the collector electrode of the transistor of said first stage through a first winding of said transformer in series with said second condenser of said first stage to the base electrode of the transistor of said first stage, means in said second stage for connecting the emitter electrode of the transistor thereof to the fixed terminal of the potentiometer thereof other than that connected to the base electrode of the same said transistor through the second winding of said transformer, means for connecting the collector electrode of the transistor of said second stage through said output circuit in series with said second condenser of said second stage to the base electrode of the transistor of said second stage, means for connecting the positive terminal of said direct current source to the sliding contact of the potentiometer of said first stage, means for connecting the negative terminal of said source to the collector electrode of the transistor of said second stage through said output circuit and a direct connection between the sliding contact of the potentiometer of said second stage and said first winding of said transformer.

---

2,774,827

## ORGAN COUPLER STACKS

Samuel G. Bowman, Mount Lebanon Township, Allegheny County, Pa., assignor of one-half to Anna H. Bowman, Mount Lebanon Township, Allegheny County, and one-half to James M. Guthrie, Crafton Borough, Pa.

Application May 28, 1954, Serial No. 433,147
7 Claims. (Cl. 200—5)

1. An organ coupler stack comprising a support, a row of fixed elongate electrical contact members mounted in said support and each including a series of V-shaped recesses, electrical insulating barriers secured between and extending longitudinally of the successive contact members and adjacent to the apexes of the V-shaped recesses in such members, a longitudinally reciprocable elongate trace mounted adjacent to and extending trans-

versely of the contact members of the row, and a plurality of electrical contact fingers secured to said trace and extending laterally therefrom severally into a plurality of the recesses in said contact members for electrical engagement with and disengagement from said contact members within and at the apexes of the V-shaped recesses therein when said trace is reciprocated.

---

2,774,828

## CONTROL SYSTEM FOR AUTOMOBILE HEADLIGHTS

Anthony Arnejo, Detroit, Mich.

Application October 9, 1952, Serial No. 313,939
1 Claim. (Cl. 200—11)

A device of the character described comprising, in combination with an automobile instrument panel, the provision of a switch including a switch board mounted on the rear of said panel, a plurality of fixed contacts mounted on said switch board, a shaft extending through said panel and said switch board, a contact arm radially affixed to one end of said shaft and adapted to selectively contact said fixed contacts, a handle carried at the other end of said shaft, and tension means for maintaining said contact arm in contact with said fixed contacts, said means including a thin arcuate plate of dielectric material, and a pair of posts of dielectric material interconnecting the outer face of said board and the respective end portions of said thin arcuate plate, said contact arm being positioned between said board and said plate and in slidable engagement with said thin arcuate plate.

---

2,774,829

## STARTER SWITCH FOR CONTROL SWITCH SYSTEM FOR AUTOMOBILE LIGHTING AND IGNITION SYSTEM

Anthony Arnejo, Detroit, Mich.

Application November 20, 1952, Serial No. 321,641
1 Claim. (Cl. 200—16)

A device of the character described comprising in combination with a casing, a forward partition, a central partition and a rear partition defining recesses therebetween, a reciprocal shaft extending through said forward and central partitions and terminating at its rear end in the recess between the central and rear partitions, a circular block affixed to the rear end of said reciprocal shaft, a plate of electrically conductive material affixed to the rear face of said circular block, a pair of fixed contact members extending through the rear partition, and means in the recess between said forward and central partitions for normally urging said shaft and its attached elements in a forward direction, said means comprising a collar of dielectric material affixed to said reciprocal shaft, a flange formed integrally with the forward side of said collar, a washer loosely mounted on said reciprocal shaft rearwardly of said collar, and a compression spring surrounding said reciprocal shaft and bearing against said flange and said washer, said partitions being formed integrally with and extending outwardly from said casing.

---

2,774,830

## CONTACT POSITIONING ARRANGEMENT FOR QUICK BREAK MECHANISM OF LOAD TAP CHANGING TRANSFORMER

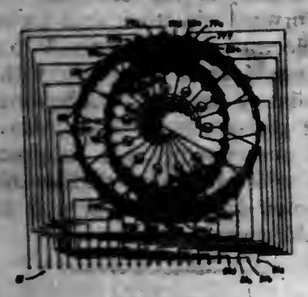
William C. Sealey, Wauwatosa, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.

Application September 20, 1955, Serial No. 535,419
5 Claims. (Cl. 200—17)

1. A load tap changing transformer comprising a tap changing switch having a plurality of spaced stationary contacts and a pair of correspondingly spaced movable contacts cooperating with said stationary contact members to define operating positions for said transformer, detent means for switching one of said movable contacts from one of said stationary contacts to the next with a snap action to cause said one movable contact to be rapidly separated from said one stationary contact, said means including a stationary index plate provided with a plurality of main notches, and a latch device movable in accordance with the movement of said movable contacts and engageable with said main notches to accurately position said movable contacts with respect to said stationary contacts at said operating positions, and an auxiliary notch adapted to receive said latch device to momentarily stop said movable contacts at a point between said operating positions which disposes said one movable contact further from said one stationary contact than said next stationary contact, said auxiliary notch disposed between said main notches with the latch engaging portion of said auxiliary notch extended in the direction of movement of said latch device.

---

2,774,831



## MULTIPLE SLIP RING JOINT

Edward C. Lafferty and William O. Yeazell, Springfield, Ohio, assignors, by mesne assignments, to Kelsey-Hayes Wheel Company, Detroit, Mich., a corporation of Delaware

Application November 20, 1953, Serial No. 393,396
10 Claims. (Cl. 200—24)

1. A multiple slip ring joint for transferring a large number of electric circuits between a stationary base and

a rotary member, comprising two sets of contact elements mounted on said base in stationary relation with each other and in rotatable relation with both said base and said rotary member, said contact elements in each said set being arranged in angularly spaced relation to form a discontinuous ring, a plurality of brushes fixed in stationary relation on said base and in electric contact with the first set of said contact elements respectively, a plurality of brushes mounted on said rotary member in

electric contact with the second said set of contact elements respectively and in rotatable relation therewith, means connecting successive said contact elements in said first set with separate successive said contact elements in said second set, and means for rotating said contact elements and said rotary member at different speeds with respect to each other and to said base such that a circuit between each stationary brush and the same associated rotating brush is maintained at all times by successive said connected pairs of contact elements in rotation.

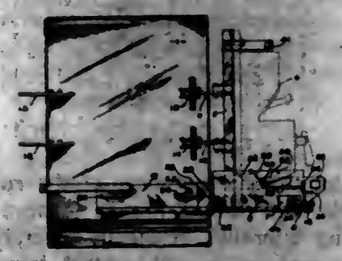
---

2,774,832

## HIGH TENSION DISCONNECTING SWITCH

Joseph Albert Turgeon, Toronto, Ontario, Canada, assignor to Eastern Power Devices Limited, Toronto, Ontario, Canada

Application February 16, 1956, Serial No. 565,970
5 Claims. (Cl. 200—48)



1. A high tension disconnecting switch comprising a single supporting post, an insulator column mounted on said post, a second insulator column having a shaft rotatably carried by said first column, manually operable means for rotating said shaft, a switch blade having a pair of pivotally connecting arms, a contact assembly having a pair of jaws for reception of one of said arms, said arms being swingable into colinear relation for reception by said jaws and into angular relation with each other for withdrawal from said jaws, and gear and chain means connecting said shaft with said arms and responsive to rotation of said shaft in one direction to swing said arms from said angular relation to colinear relation and thereafter to rotate said colinear arms into twisting contact with said jaws, said means being responsive to rotation of said shaft in the reverse direction to initially rotate said colinear arms out of twisting contact with said jaws and thereafter to swing said arms into said angular relation.

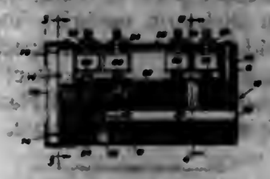
2,774,833

## CIRCUIT BREAKER DRAWOUT

Thomas R. Sheep and John J. Espey, Baltimore County, Md., assignor to The Wolfe & Mann Mfg. Co., Baltimore, Md., a corporation of Maryland

Application June 29, 1954, Serial No. 440,884
7 Claims. (Cl. 200—50)

1. A circuit breaker carrier comprising a movable frame assembly for supporting the breaker, stationary terminals of a lead-in circuit, electrical connecting elements fixedly secured to said frame assembly and adapted to move therewith, tracks for supporting said frame assembly along each side thereof, each of the tracks being formed in two sections, an inner fixed section and a pivotal outer section, the inner section of the tracks supporting the frame assembly in inner breaker connected and outer breaker test positions, the movement of the frame assembly between said positions moving the connecting elements carried by the frame assembly into and out of engagement with the said stationary terminals and lever means for positively moving the frame between said positions, said lever means comprising the outer section of the tracks, said section having one end pivotally mounted on and adjacent the outer ends of the fixed tracks and movable between a vertical and a horizontal position, and forming a continuation of the fixed track sections when horizontal and releasable means between said movable sections and the breaker supporting frame, said frame being movable onto the horizontal track sections upon the release of the releasable means.



---

2,774,834

## BREATH OPERATED SWITCH FOR MUSICAL INSTRUMENTS

Edward H. Kenworthy, Pasatc, Calif.

Application May 24, 1955, Serial No. 510,603
4 Claims. (Cl. 200—52)

1. A breath operated switch for use in combination with a musical instrument comprising a main block having an air inlet communicating with a transverse air cell, a first bore in said block communicating with said air cell, a blow contact member movably positioned in said first bore, first contact means positioned for engagement by said blow contact member upon application of breath into said air inlet, a second bore in said block communicating with said air cell, a draw contact member movably positioned in said second bore, and second contact means positioned for engagement by said draw contact member upon application of suction on said air inlet, and heater means adjacent said block for evaporating moisture in said air cell and said bores.

2,774,835

## CONTROL FOR OFF-THE-ROAD VEHICLES

William F. Staley, Botetourt County, Va.

Application February 7, 1955, Serial No. 486,356
6 Claims. (Cl. 200—61.47)

1. In combination with a self-propelled vehicle having an ignition circuit, a control for said ignition circuit, which control comprises an elongated body portion removably fast to said vehicle, said body portion having therein a single, generally pistol-shaped recess extending substantially the full length of said body portion, the barrel portion of said recess comprising a well which is closed at its leading or bottom end, remote from the broadened, trailing or butt end of said recess, said well being flared intermediate its said leading end and said butt portion of said recess; paired and spaced, generally L-shaped electrodes provided in said body portion and adapted for connection in the ignition circuit of the related vehicle, and extending in spaced relation both to each other and to said body portion, into said recess to a point just short of the bottom thereof; and a body of mercury in the bottom of said well, of depth sufficient to cover the contact ends of the spaced electrodes when the associated vehicle is in repose, the flare of the intermediate extent of said well portion being such that when said control, which is fast to the vehicle, is rocked bodily through a sufficient angular extent, the mercury thereupon flows out of the bottom of the well into the flared portion, thereby breaking contact between the paired electrodes.

---

2,774,836

## SNAP SWITCH

Donald W. Powers, Glen Cove, N. Y., assignor to Roanwell Corporation, Brooklyn, N. Y., a corporation of New York

Application July 1, 1954, Serial No. 440,789
7 Claims. (Cl. 200—67)

1. Switch actuating means comprising a frame member, an elongated bar supported on said frame member for movement toward and away from the frame member, a lever mounted on said bar for pivotal movement about an axis extending transversely of the bar substantially at its center, said lever having two opposed arms, a switch, an actuator for said switch mounted on said frame member in alignment with one arm of said lever and movable toward and away from said one arm of the lever, means biasing said actuator into engagement with the lever and tending to rotate the lever about said axis to bring its other arm into engagement with the frame member and thereafter to rotate said lever about the point of engagement of the other arm and the frame member as a fulcrum and thereby to move said bar bodily away from the frame member, means limiting the movement of the bar away from the frame member, said bar and lever cooperating upon movement of any point along said bar toward said frame member to move said actuator against said biasing means.

2,774,837

## SNAP SWITCH

Philip D. Grover, Chicago, Ill., assignor to Grover Products Corporation, a corporation of Illinois

Application August 22, 1955, Serial No. 529,719
6 Claims. (Cl. 200—67)

6. A snap switch comprising, in combination; a base having at least one contact supported thereon, a resilient switch blade member having one end secured to the base and a free end normally spaced from said contact, a first wire secured to the free end of the switch blade member forming one part of a first pivot joint, a second wire having portions forming parts of a second fixed pivot joint adjacent the secured end of the switch blade member and a third pivot joint normally parallel to said first pivot joint and above a plane between said first and second pivot joints, resilient wire means mounted between said first and third pivot joints, actuating means for pivoting said second wire member downwardly whereupon said switch blade member is moved with a snap action into engagement with said contact, and means for returning the switch blade member to its normal position.

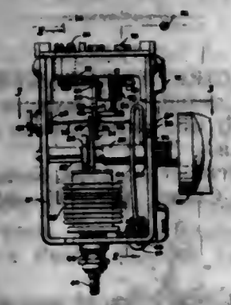
2,774,838

## CIRCUIT BREAKER

Irvin Bertrand, Lawtell, La., assignor of one-fourth to Mildred B. Lally and one-fourth to John F. Lally, Jr., New Orleans, La.

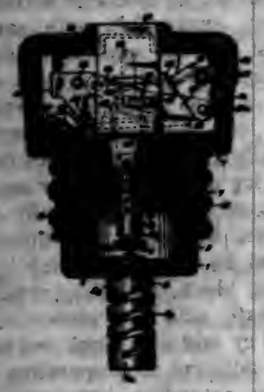
Application October 14, 1954, Serial No. 462,136
1 Claim. (Cl. 200—81)



A switch mechanism for use on a vehicle having an internal combustion engine system including a battery ignition system, said switch mechanism comprising a mounting bracket securable on the vehicle chassis, said mounting bracket including an elongated horizontally mounted leg and shorter vertically positioned leg, a first mounting block on said horizontal leg remote from said vertical leg, an insulated housing carried by said first mounting block, a pair of opposed insulated terminals carried by said housing in spaced relation, said terminals extending transversely of said mounting bracket, an operating shaft reciprocably supported by said housing, said operating shaft having on one end a transverse bridging contact selectively engageable with said terminals to complete a circuit between said terminals to permit current to flow through the ignition system, a pair of spaced blocks mounted on said horizontal leg intermediate the ends thereof, a lever positioned between said spaced blocks and pivotally connected thereto, said lever including an elongated leg depending below said horizontal leg and having connected thereto a manually operable control member, said lever including a relatively short leg, a stop block carried by said horizontal leg remote from said first mounting block, a shaft generally aligned with said operating shaft, said last mentioned shaft having one end anchored by said stop block and having the opposite end disposed adjacent said operating shaft, pivotally connected linkage extending between and connecting together said operating shaft and said last mentioned shaft, a spring element carried by said last mentioned

shaft for urging said last mentioned shaft and said operating shaft toward said terminal whereby said bridging contact engages said terminals, a positioning block mounted on said last mentioned shaft intermediate its ends, said short leg of said lever engaging said positioning block and positioning said last mentioned shaft in said operating shaft, a second mounting block secured to said vertical leg, a latch member, a pivot pivotally connected at intermediate portions of said latch member, a mounting plate carried by said second mounting block, a vacuum motor mounted on said mounting plate, said vacuum motor including a communicating conduit connectable to the vehicle engine and an extensible plunger engaged with said latch member for moving said latch member into latching engagement with said last mentioned shaft in response to the operation of the vehicle engine to maintain a complete electrical circuit in the electrical system when the engine is running.

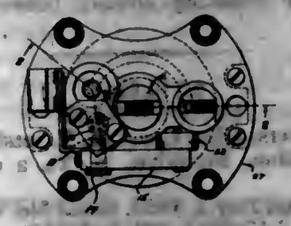
---



2,774,839
ELECTRICAL APPARATUS
Albert O. Greene, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware
Application October 10, 1951, Serial No. 250,693
2 Claims. (Cl. 200—83)

1. A control arrangement comprising a support, a reciprocal actuator mounted upon said support, switch means connected to and operated by said actuator, a spring-loaded toggle connecting said actuator and said support, a first cam movably mounted on said support to adjustably limit actuator movement in one direction, a second cam movably mounted on said support to adjustably limit actuator movement in the other direction, and a control knob operably connected to both cams for simultaneous operation of said cams.

---

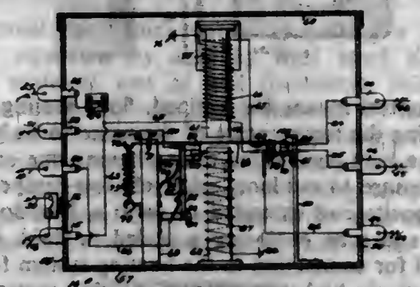


2,774,840
AUTOMATIC SWITCHES
Wilhelm Leyhausen, Nuremberg, Germany
Application April 6, 1953, Serial No. 347,090
Claims priority, application Germany September 1, 1952
3 Claims. (Cl. 200—87)

1. In an automatic electric switch comprising a casing, a magnet coil in said casing spaced from the bottom thereof to define a contact chamber below it, and a fixed contact in said contact chamber intersected by the axis of the magnet coil, the combination of a contact rod having a contact thereon for co-operation with said fixed contact and displaceable axially within the magnet coil from a circuit closing position in which the contact on the contact rod bears against said fixed contact, into a circuit breaking position in which the contact rod is retracted from the fixed contact with the contact on said rod located within the interior of the magnet coil, so that the switch air gap between said contacts, in the circuit breaking position, is located partly within the magnet coil, with switch operating mechanism in said casing above the magnet coil and comprising a switch lever articulated to said contact rod for displacing said rod axially of the magnet, a spring biasing said switch lever to urge the contact rod to circuit breaking position, a manually operable switch slide displaceable verticaly in the switch casing and having a horizontal slot therein, a horizontal toggle comprising a pair of toggle members with a connecting pin slidable in said horizontal slot, one of said toggle members articulated to said switch lever, a locking member pivoted in the switch casing and articulated to the other toggle member, a latch member biased to normally engage said locking member and means on the movable core for displacing said latch member to release the locking member on the core being drawn into the magnet under the action of an overload current.

---

2,774,841
CIRCUIT INTERRUPTER WITH THERMAL COMPENSATED TIME DELAY
William J. Weisfurt, Wauwatosa, Wis., assignor to McGraw Electric Company, Milwaukee, Wis., a corporation of Delaware
Application October 22, 1952, Serial No. 316,151
1 Claim. (Cl. 200—97)



In a circuit interrupter, the combination of switch means, an electromagnetically operated plunger for operating said switch means, hydraulic means for controlling the rate of travel of said plunger, said hydraulic means including a cylinder for said plunger and a hydraulic medium, and temperature control means submerged in said hydraulic medium and having a body portion provided with an outlet vent communicating with said cylinder, a cylindrical rotary valve extending through said body portion and provided with means for controlling said vent and projecting at one end from said body portion, a cup shaped member adjustably secured to said body portion and surrounding the projecting portion of said cylindrical valve, and a spirally arranged bimetal member surrounding said projecting portion and positioned within said cup shaped member and having its inner end secured to said projecting portion and its outer end secured to said cup shaped member.

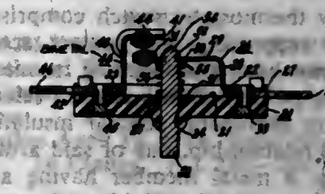
---

2,774,842
AUTO ELECTRIC FIRE STOPPER SWITCH
Frank A. Shrader, Reseda, Calif.
Application April 27, 1954, Serial No. 425,813
1 Claim. (Cl. 200—102)

In a safety switch, a housing, a first, second, third, fourth, fifth, sixth, and seventh terminal extending from said housing, an upper and lower solenoid core positioned in said housing and spaced from each other, a support member secured to said housing and provided with a slot in its upper end, an armature movably mounted between said cores and including a guide pin positioned in said slot, a clip secured to said support member, resilient means extending between said clip and armature, a wire connecting said armature to said seventh terminal, a bracket mounted in said housing, an insulated shelf secured to said bracket, a first and second lower contact secured to said shelf, a wire connecting said first contact to said sixth terminal, a fine winding surrounding said upper core and having one end connected to said second contact and its other end grounded, a wire connecting said second contact to said fifth terminal, a third and fourth spaced apart contact carried by said armature and mounted for movement into and out of engagement with said first and second contact, a heavy winding surrounding said upper core and connected to said fourth contact, a wire connecting said heavy winding to said first terminal and to an eighth terminal, a fine winding surrounding said lower core, a lower contact member

connected to the winding on said lower core, an upper contact member connected to said armature and to said third terminal, a body member secured to said support member, an insulated arm having its lower end pivotally connected to said body member and having its upper end adapted to engage said upper contact member, a conducting strip secured to one side of said arm and electrically connected to said fourth terminal, and a spring member secured to said support member and arranged in engagement with said conducting strip, the magnetic attraction of said lower solenoid core being greater than the magnetic attraction of the upper solenoid core until a short circuit occurs whereby the magnetic pull of the upper solenoid core will then be greater than the magnetic pull of the lower solenoid core to thereby cause said armature to move upwardly, whereby when said armature is lifted upwardly, said spring member will force said insulated arm away from said support member so that the upper end of said conducting strip will engage said upper contact member which is connected to the armature.

---



2,774,843
SENSITIVE RELAY
Walter B. Kenick, Skokie, Ill., assignor to W. M. Welch Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application February 17, 1953, Serial No. 337,360
4 Claims. (Cl. 200—110)

1. A sensitive construction of the type described, comprising a primary magnet unit including permanent magnet means of substantial strength, an armature rotatable between pole pieces of said unit, a magnetic contact carrying arm secured to said armature for swinging movement therewith, magnetic contact holding means positioned for engagement by said arm, assisted by a secondary, relatively weak magnetic field between the arm and said contact holding means, upon rotation of said armature, and a shield of magnetic material interposed between said primary magnet unit and said contact holding means, said magnet unit comprising a pair of magnet members between which said armature rotates and a member of highly permeable magnetic material in bridging contact with the ends of said respective magnet members remote from said armature, said shield being fixedly positioned across said secondary field and between the same and said permeable bridging member to afford a shielded zone at the latter at which stray flux of said primary magnet unit is localized.

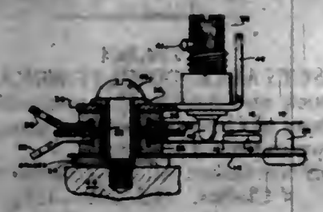
---

2,774,844
RESETTABLE CIRCUIT BREAKER
Charles E. Buck and Argyle G. Lautzenhiser, Anderson, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application November 12, 1952, Serial No. 319,858
4 Claims. (Cl. 200—116)

1. An automatic circuit breaker, comprising in combination; a bimetallic strip member having a freely moveable end and a fixed end mounted to a support, a flexible strip member having one end fixed to said support and having the other end free to move and normally spaced from said bimetallic member, a moveable plunger movable relative to and adopted to move the free end of said flexible member into contacting engagement with said bimetallic member, and a means on said plunger engageable with the free end of said bimetal member for maintaining said members in said contacting engagement until the bimetallic member thermally responds to a predetermined current passing therethrough and causes said means to be released.

---

2,774,845
ELECTRIC LIGHT FLASHER
Noel J. Lisschy, New York, N. Y.
Application February 15, 1955, Serial No. 488,341
9 Claims. (Cl. 200—122)



1. An electric light bulb flasher device for insertion in a light cord comprising a casing having cord inlet and exit openings, two spaced chambers and a chamber connecting opening, a stationary conductor strip mounted in the casing in the chambers and extending through the chamber connecting opening, a movable conductor strip mounted in the casing in the chambers and extending through the chamber connecting opening and spaced from said stationary conductor strip, said strips having opposed contacts at one end disposed for contacting one another and terminals at the other end, said movable conductor strip being of bimetallic material, a heating coil mounted adjacent the bimetallic movable conductor strip to heat said

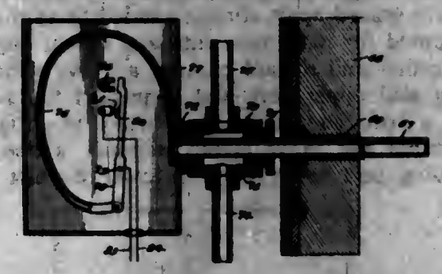
strip for movement thereof relative to said stationary strip, said heating coil having one end connected with the movable conductor strip, said stationary conductor strip having an offset portion with two brackets thereon, and an insulated wrapper around a portion of said movable conductor strip, said wrapper being held by said brackets, said strips extending through the same chamber connecting opening in the casing.

---

2,774,846
THERMOSTAT APPARATUS
Paul R. Lee, Mansfield, Ohio, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application April 12, 1954, Serial No. 422,427
4 Claims. (Cl. 200—138)

4. A unitary thermostatic switch comprising a plurality of contact supporting and contact actuating arms, each of said arms having an opening in one end thereof, said arms being positioned in a stacked relationship with said openings in alignment, annular insulating members in said stacked relationship, one of said arms comprising a bimetal strip, a metal member having a flat surface adjacent said one end of said bimetal arm, said metal member and a portion of said bimetal arm adjacent the opening therein being brazed together, and a post extending through said openings and through said insulating members to rigidly clamp said arms, said insulating members and said metal member in said stacked relationship, the brazed portion of said bimetal arm and said member extending at least to the edge, nearest the deflectible contact actuating end of the bimetal, of that area of said bimetal that may be subjected to variable clamping forces in said stack, said bimetal strip being stiffened over the brazed portion so that its effective deflective length is constant regardless of changes in the clamping forces in said stack during or subsequent to manufacture of said switch.

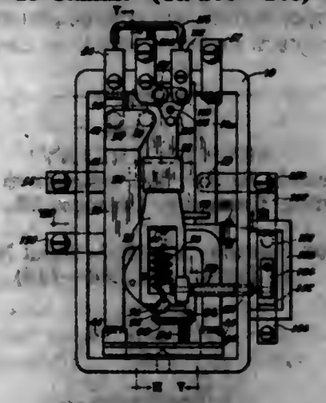
---



2,774,847
CIRCUIT CONTROLLER FOR AIR HEATING CONTROL SYSTEM
William A. Ray, North Hollywood, Evan J. Davidson, Glendale, William F. Keller, Covina, and Arthur P. Swift, Woodland Hills, Calif., assignors to General Controls Co., Glendale, Calif., a corporation of California
Application February 7, 1955, Serial No. 486,538
14 Claims. (Cl. 200—139)

10. In a control mechanism: a pivoted rocker; means angularly positioning the rocker as a function of a condition; a pair of snap switches; operating members respectively for the snap switches; range screws cooperating with the members for determining the positions of the rocker corresponding to snap-over of the respective switches; a manually operable movable setting arm for each range screw; and connections between the setting arms and the respective range screws for positioning the range screws respectively in accordance with the positions of the setting arms.

---



2,774,848
CONTROL MEANS FOR A HEATING SYSTEM
Edwin B. Tidd, Mount Prospect, Ill., assignor to Bell & Gossett Company, Morton Grove, Ill., a corporation of Illinois
Original application June 24, 1947, Serial No. 756,615, now Patent No. 2,626,755, dated January 27, 1953. Divided and this application January 16, 1953, Serial No. 331,646
3 Claims. (Cl. 200—140)

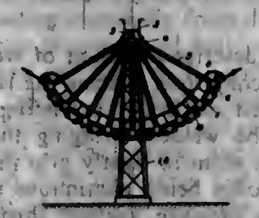
2. Control means for a piped, fluid heating system for regulating the temperature of the space to be heated comprising a heat conducting casing having one end arranged for exposure to outdoor, relatively low temperatures and the opposite end extended to form a Bourdon tube, the casing and tube enclosing a sealed in fluid, pipe means adapted for connection to the heating system for directing the relatively high temperature, heating system fluid into heat exchange relation with the casing fluid in and for applying heat to a relatively concentrated area of the opposite end of the casing adjacent its connection with the tube, movements of the free end of the tube being occasioned by pressure variations in the casing fluid effected by the mutually modifying actions of the relatively high and low temperatures, and electrical switch means operably related to the free end of the tube for determining the supply of heat to the space.

---

2,774,849
CONTROL DEVICE FOR ELECTRICALLY HEATED APPLIANCES
Victor Weber, Greensburg, and Hugh J. Tyler, Pittsburgh, Pa., assignors to Robertshaw-Fulton Controls Company, Greensburg, Pa., a corporation of Delaware
Application January 5, 1954, Serial No. 402,374
13 Claims. (Cl. 200—140)

1. In a control device for clothes driers having means for producing heat and heat distributing means, the combination of means for controlling the rate of heat output of the heat producing means, switching means movable between open and closed positions for controlling said heat distributing means, means for setting said control means to maintain a first heat output rate, means responsive to a temperature condition to be controlled, means for setting said control means to maintain a second heat output rate lower than said first rate upon a change in said temperature condition affecting said temperature responsive means, means for setting said control means to terminate the heat output of the heat producing means upon a further change in said temperature condition affecting said temperature responsive means, and means for moving said switching means between said positions upon an additional further change in said temperature condition affecting said temperature responsive means.

---

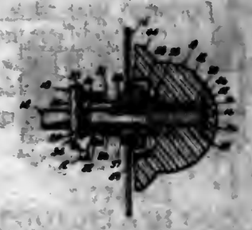


2,774,850
FIRE DETECTION CONDUCTORS
John J. Ziccardi, Jr., Pittsburgh, Pa.
Application September 28, 1954, Serial No. 458,914
5 Claims. (Cl. 200—143)

3. A current controlling cable comprising a pair of conductors separated by a bulky steel wool electrical conducting material, one of said conductors being separated from said bulky conducting material by insulating material of a relatively low melting temperature to establish an electrical circuit between said conductors through said bulky material in response to rising temperature above normal ambient temperatures in the area of installation and an outer wall covering for said cable.

---

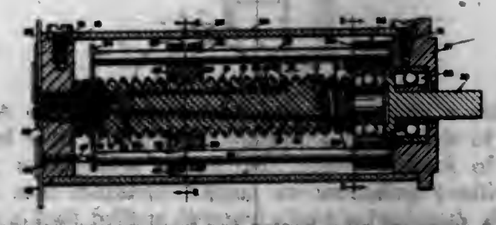
2,774,851
ELECTRIC HIGH TENSION CIRCUIT BREAKERS
Haakon Forwald, Ludvika, Sweden, assignor to Allmanna Svenska Elektriska Aktiebolaget, Vasteras, Sweden, a corporation of Sweden
Application August 17, 1954, Serial No. 450,355
Claims priority, application Sweden August 31, 1953
5 Claims. (Cl. 200—148)



1. An electric high tension circuit breaker comprising a plurality of containers spaced from each other and arranged in the arc of a circle and enclosing series connected breaking gaps, a valve located at the center of said arc for controlling the delivery of operating air to the different gaps simultaneously, and separate tubular members of equal length for conveying the operating air from said valve to the said breaking gaps.

---

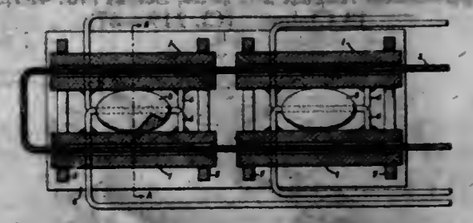
2,774,852
ELECTRIC SWITCH
Raymond H. Boardman, Hartford, Conn., assignor to The Hart Manufacturing Company, Hartford, Conn., a corporation of Connecticut
Application November 13, 1953, Serial No. 391,856
8 Claims. (Cl. 200—172)



1. In an electric switch having a switch operating member provided with a recess and surrounded by a casing having an opening opposite the recess, the combination of a switch operating spindle projecting through said opening and having one end disposed in said recess, one wall of said recess having a longitudinal groove parallel to said spindle, said spindle having a longitudinal channel and a transverse groove adjacent said one end, a leaf spring supported in said channel extending through said opening, said spring having an inturned portion at one end in engagement with said transverse groove to prevent relative longitudinal movement of said spring and spindle, a transversely extending U-shaped portion on said spring in frictional engagement with said longitudinal groove and

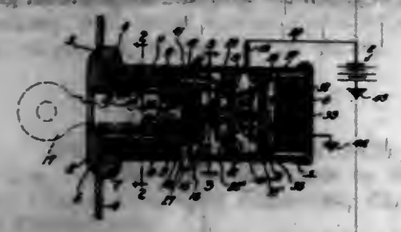
engageable with the inner side of said casing to prevent withdrawal of said spindle therefrom, a longitudinally extending outwardly convex bow in said spring at its other end, and a knob having a recess embracing the other end of said spindle and frictionally engaging said bow to retain the knob on the spindle.

---



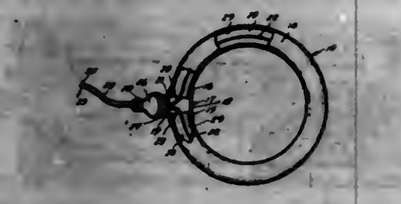
2,774,853
VARIABLE RESISTANCE INSTRUMENT
Elmer C. Anthony, Rutherford, N. J., assignor to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware
Application April 19, 1954, Serial No. 423,909
16 Claims. (Cl. 201—56)

1. A variable electrical resistance instrument, comprising a support including a continuous screw thread, a resistance element extending along the apex of and insulated from the thread, a follower, including a screw thread meshing with the support thread and rotatable thereon, and a contact element mounted on the follower and slidably engaging the outer face of the resistance element.



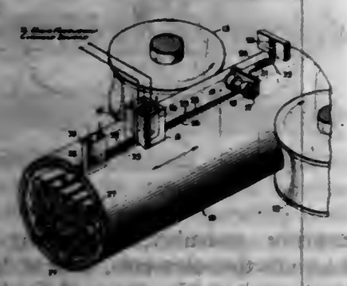
---

2,774,854
THERMISTOR ASSEMBLY
Sydney S. Stack, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application August 31, 1954, Serial No. 453,381
10 Claims. (Cl. 201—63)



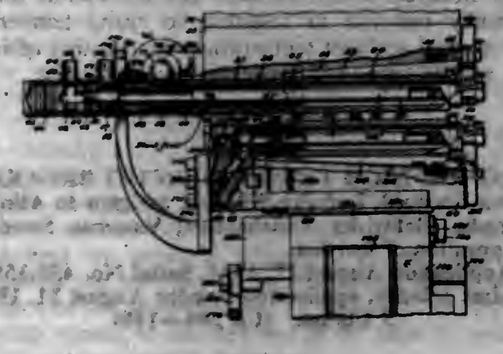
1. A thermistor assembly, comprising at least one pair of heat conductive elements, and at least one thermistor element contactably disposed in heat exchange relationship between said heat conductive elements and supported thereby.

2,774,855
**THERMOSTATICALLY CONTROLLED KEY LOCK HEATER**
Richmond R. Simmons, Columbus, Ohio
Application October 21, 1954, Serial No. 463,681
3 Claims. (Cl. 219—19)



3. In combination with a key-actuated lock; an electrically-actuated heating means disposed in close thermal proximity to said lock and energizable to heat said lock; a first normally open switch electrically connected in series with said heating means and having an actuator for closing said switch in response to the full insertion of a key within said lock; and a second, normally open, thermostatic switch electrically connected in series with said heating means and said first switch and arranged to establish an operating circuit for said heating means in response to a given low ambient temperature.

2,774,856
**BUOYANT RING HEATER FOR ICE FISHING**
Lloyd O. Paulson and Clarence O. Christenson, Isle, Minn.
Application July 7, 1955, Serial No. 520,548
4 Claims. (Cl. 219—41)

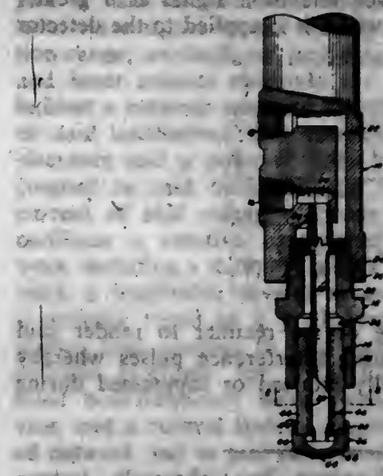


1. A buoyant ring heater for keeping ice fishing holes open comprising a ring-shaped tubular casing enclosing an annular chamber, a snout being in fixed water-tight relationship with said casing and projecting generally upwardly and outwardly therefrom to define an inlet into said chamber, and a heater comprising a resistance-wire loop disposed in said chamber and lead-in wires extending through said snout and in electrical connection with said loop, said ring heater including said casing and snout and heater being buoyant in water with said casing being adapted to float at the surface of the water.

2,774,857
**TUBE WELDING**
Wallace C. Rudd, Larchmont, and Robert J. Stanton, Brooklyn, N. Y., assignors to Magnetic Heating Corp., New Rochelle, N. Y., a corporation of New York
Application August 23, 1954, Serial No. 451,536
13 Claims. (Cl. 219—67)

1. Method for welding together the edges of a longitudinal gap in metal tubing which comprises: longitudinally advancing the tubing while subjecting same to pressure from opposite sides thereof to bring the gap edges together adjacent a welding point, while heating said edges to welding temperature by applying contacts connected to a source of radio frequency current to points on the tubing at opposite sides of the gap at a position in advance of said welding point, and while also applying an electrical connection between opposite sides of the gap at a position shortly in advance of the welding point, said current being of such radio frequency that because of its frequency, a low impedance path therefor in the metal of the tubing between the contacts is provided along on the approaching gap edges from the contacts to and from said connection, the resulting current flow and consequent resistance heating being concentrated at such edges, and acting to continue to increase the temperature thereof until same reach said connection.

2,774,858
**METHOD OF AND APPARATUS FOR WELDING LAP SEAMS**
Richard D. Hellsborn, Chicago, Ill., assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York
Application May 10, 1954, Serial No. 428,592
33 Claims. (Cl. 219—78)



1. The herein described method of welding elongated lap seams which comprises, placing the lap seam between opposing elongated electrodes extending the full length of the seam to be welded, bringing the electrodes together against the seam to tightly grip the seam between them, said electrodes being continuous so as to present an uninterrupted pressure surface throughout the full length of the seam and being deformable upon application of welding pressure and resilient so as to be adapted by reason of their inherent quality of returning after each pressure deformation to their normal cross section for applying follow up pressure as fusion of the seam takes place, and while so applying pressure to the seam, passing electric current through the electrodes and the gripped seam to provide a one shot fusing and welding of the metal in the lap seam throughout the full length thereof.

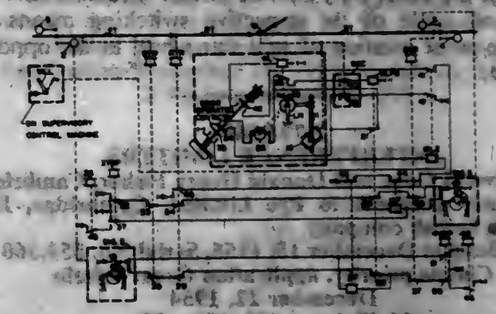
2,774,859
**ELECTRODE**
Fred H. Johnson, Detroit, Mich., assignor, by mesne assignments, to Warren Alloy, Warren, Mich., a copartnership
Application July 12, 1951, Serial No. 236,350
10 Claims. (Cl. 219—120)

8. A welding electrode comprising an elongate body having a cylindrical end portion and provided with a removable cap at said cylindrical end portion, said cap having a cylindrical opening at one end for slidable telescopic engagement over said end of said body, the mouth of said opening being slightly larger than the external diameter of said end of said body to facilitate insertion of the cap over said cylindrical end of said body and the cylindrical portion of said opening spaced inwardly of and adjacent said mouth portion being dimensioned slightly smaller than the external diameter of said end portion of said body prior to assembly.

2,774,860
**LUGGAGE ILLUMINATOR**
Evelyn Probol and Theodore J. Probol, Lincoln, Nebr.
Application July 24, 1953, Serial No. 370,132
1 Claim. (Cl. 240—6.45)

In a luggage lighter, a tubular battery casing, a pluality of clip means mounted on said battery casing and adapted to secure said battery casing to one of the lips of a luggage piece and internally thereof, a pair of lamps positioned one at each end of the casing, a plurality of batteries within said casing, a plunger-like light switch having a shaft projecting outwardly from the wall of the casing and positioned between said batteries, contact points on the inner end of said shaft, sliding contact pins mounted in the battery casing and cooperating with said contact points to provide an electrical circuit between said batteries and said lamps, spring means on said switch shaft to bias said shaft outwardly and move said sliding contact pins into engagement with the batteries to energize the lamps, another clip adapted to be mounted on the other lip of the luggage piece, said last mentioned clip being adapted to engage said switch when the baggage piece is in closed position to deenergize the lamps.

2,774,861
**REPEATING FLASHGUN**
Robert E. Shaw, Beverly, and Frank H. Walliw, Salem, Mass., assignors to Sylvania Electric Products Inc., Salem, Mass., a corporation of Massachusetts
Application February 19, 1954, Serial No. 411,452
1 Claim. (Cl. 240—37)

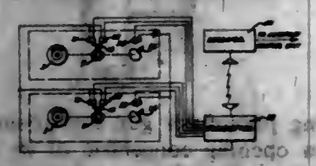


A repeating photoflash gun for glass photoflash bulbs having a contact base comprising a reflector having a central opening, a hollow chamber fixed to said reflector, said chamber having an opening in register with the opening in the reflector to permit passage of a bulb from the chamber to the reflector, a rotatable annular cylinder extending around said chamber and being concentric therewith and having longitudinal bulb-receiving grooves in its inner surface, said chamber having a longitudinal opening through which a bulb can pass from said cylinder to said chamber when the cylinder is rotated to bring a bulb into register with said opening, means for grasping a bulb by said contact base and means for moving said grasping means longitudinally through said chamber into said reflector to hold said bulb in said reflector solely by the grasping of said contact base.

2,774,862
**PHOTOFLASH GUN**
John J. Zwald, Rochester, N. Y., assignor to Sylvania Electric Products Inc., a corporation of Massachusetts
Application September 30, 1953, Serial No. 383,361
3 Claims. (Cl. 240—37)

1. A repeating photoflash gun comprising a reflector formed with an opening concentric of its axis of symmetry, a magazine adapted to receive a stack of flash bulbs, said magazine having an unloading position in which a flash bulb is disposed along a feed path aligned with said axis of symmetry, a bulb holder supported within said reflector along said axis of symmetry and retractible along said feed path into said magazine to receive successive bulbs from said magazine, and feed means extensible along said feed path to advance a flash bulb from said unloading position through a predetermined linear thrust toward said reflector for endwise insertion into said bulb holder.

2,774,863
**RAILWAY SWITCH LOCK CONTROL SYSTEM**
George J. Johanek, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.
Application November 12, 1952, Serial No. 320,066
3 Claims. (Cl. 246—146)

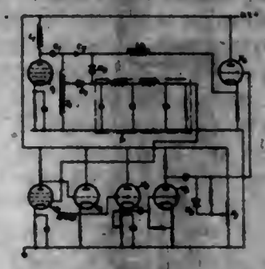


1. In a signal control system having a signal governing traffic through a hand throw switch, an electric lock mechanism connected to said hand operated track switch, said electric lock mechanism having a lock plunger oper-

able between a full normal locking position and a releasing position by manually operable lock control handle, said electric lock having an electromagnet operating a locking dog and effective when the electromagnet is deenergized to permit only limited movement of said lock control handle away from said full normal position, a lock circuit controller operated by said lock control handle having a normal contact closed only when said handle is in said full normal position, a switch circuit controller connected to said track switch having a normal contact closed only when the switch points are in their full normal positions, a switch and lock repeater relay, a pickup circuit for said switch and lock repeater relay including in series said normal contact of said lock circuit controller and said normal contact of said switch circuit controller, stick circuit means for maintaining said switch and lock repeater relay energized, said stick circuit means being effective to maintain said switch and lock repeater relay picked up irrespective of said normal contact of said lock circuit controller, and said stick circuit means being subject to deenergization upon the energization of said electromagnet, and signal control means for governing said signal including contacts of said switch and lock repeater relay.

---

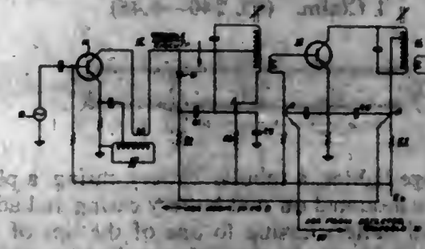
2,774,864
**REMOTE CONTROL KEYER**
Jacob J. Hagopian, Los Angeles, and Norman Meadowcroft, Santa Monica, Calif., assignors to Northrop Aircraft, Inc., Hawthorne, Calif., a corporation of California
Application March 27, 1950, Serial No. 152,042
28 Claims. (Cl. 250—2)



1. A switch controller comprising a rotatable knob, a star wheel connected to be rotated by said knob, a toggle pivotally mounted in the same plane of rotation as said star wheel, a wheel follower attached to said toggle, said follower being located between two adjacent wheel points and on a straight line between the pivot of said toggle and the rotational center of said wheel when said toggle is in a central position, two oppositely extending rocker arms formed on said toggle, a pair of spring-loaded on-off switching means each having an adjustable actuator positioned adjacent and in the path of motion of one of said rocker arms, respectively, when said star wheel is rotated in either direction, one of said rocker arms thereby operating one only of said switch actuators through one on-off cycle of its respective switching means for each one-point rotation of said star wheel in one direction, and the other of said rocker arms thereby operating the other only of said switch actuators through one on-off cycle of its respective switching means for each one-point rotation of said star wheel in the opposite direction.

---

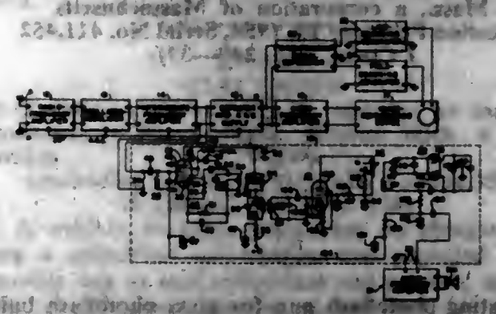
2,774,865
**INTERFERENCE LIMITERS**
John Edward Cope and Donald Henry Fisher, Cambridge, England, assignors to Pye Limited, Cambridge, England, a British company
Application December 15, 1955, Serial No. 553,360
Claims priority, application Great Britain December 22, 1954
11 Claims. (Cl. 250—20)



1. An interference limiting circuit comprising an interference limiting rectifier having two electrodes, means for feeding the detected video signal to one electrode of said rectifier, means for applying a bias to the other electrode of said rectifier so that said rectifier is normally held non-conducting during the video signal, and means for applying the received television signal at a greater amplitude than that at which it is applied to the detector

to said other electrode of the rectifier to render said rectifier conducting during interference pulses whereby the signal is substantially reduced or suppressed during the interference pulses.

---

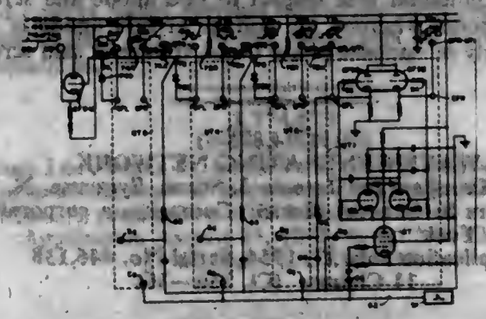


2,774,866
**AUTOMATIC GAIN AND BAND WIDTH CONTROL FOR TRANSISTOR CIRCUITS**
Francis J. Berger, Lecnia, N. J., assignor to Emerson Radio & Phonograph Corporation, Jersey City, N. J., a corporation of New York
Application January 30, 1956, Serial No. 562,072
6 Claims. (Cl. 250—20)

6. The combination with a transistor radio receiver comprising a converter stage, an intermediate frequency amplifying stage, a transformer for coupling said stages, and an automatic gain control voltage connected to said amplifier stage, of varibale damping means connected between the primary of said transformer and the output circuit of said amplifier stage consisting of a diode and capacitor in series across the portion of the primary of said transformer and an impedance connection from the common point of said diode and capacitor to the output circuit of said amplifier stage.

---

2,774,867
**FREQUENCY MODULATION DETECTOR HAVING FIXED OUTPUT FREQUENCY CONVERTER**
Bernard D. Loughlin, Lynbrook, N. Y., assignor to Hazeltine Research, Inc., Chicago, Ill., a corporation of Illinois
Application June 14, 1952, Serial No. 293,600
10 Claims. (Cl. 250—20)

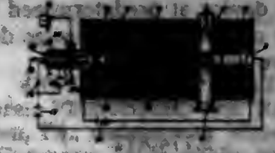


7. A frequency-conversion apparatus comprising: an electron-discharge device having an output electrode and a cathode electrode and a plurality of intermediate

electrodes including an inner control electrode and an outer control electrode; an input circuit coupled to a pair of said electrodes for applying a frequency-modulated wave signal thereto having a predetermined deviation range; an oscillator including said cathode electrode and inner control electrode for developing local oscillations; a network tuned to approximately the frequency of said oscillations and coupled between said output electrode and a point of fixed reference potential and coupled to said oscillator and responsive only to the current of said output electrode for supplying to said oscillator a reactive component of current, said network including a damping means providing for said network a bandwidth several times said deviation range; a network tuned to a predetermined intermediate frequency and coupled to said output electrode and said cathode electrode for translating a frequency-modulated beat-frequency wave signal derived by said device; and a control system coupled to said last-mentioned network and to said cathode electrode and said outer control electrode and responsive to the frequency modulation of said beat-frequency signal for deriving and applying between said last-mentioned electrodes a control signal exerting a first order control effect on said output electrode current flowing to said tuned network and on said reactive component of current for varying the operating frequency of said oscillator to maintain the center frequency of said beat-frequency signal at substantially said predetermined frequency.

---

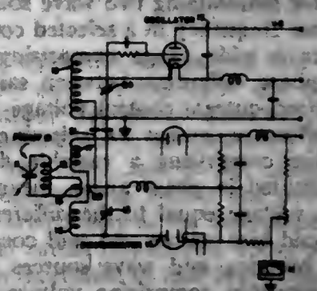
2,774,868
**BINARY-DECADE COUNTER**
Byron L. Havens, Chester, N. J., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application December 21, 1951, Serial No. 262,734
14 Claims. (Cl. 250—27)



10. A decade counter including, four counting elements each having two electrical conditions alternately assumed in response to pulses to be counted; a source of pulses to be counted; circuit means coupling each of said counting elements to said source so that each pulse present at said source is applied simultaneously to each of said counting elements; and coincidence circuit means selectively interconnecting said counting elements to condition said counting elements to be responsive to pulses from said source in a preselected fashion.

---

2,774,869
**ELECTRON DISCHARGE APPARATUS**
Peter Francis Conway Burke, London, England, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware
Application November 7, 1950, Serial No. 194,540
Claims priority, application Great Britain November 8, 1949
4 Claims. (Cl. 250—27)



1. Electron discharge apparatus comprising an electromagnetic waveguide in the form of a helical conductor, for propagating waves of a given frequency with a phase velocity a fraction that of light, the mean radius a of the helix and the propagation constant $\gamma$ of the waves being such that the product $\gamma a$ lies between 0.6 and 1.4, an electron beam source positioned to project a beam of electrons along the said guide to progressively amplify waves of the said frequency, the dispersion of the waveguide being such that the amplification is selective for

that frequency with respect to sub-multiples and multiples thereof, a source of waves of a submultiple frequency of said given frequency positioned intermediate said beam source and said guide and means for modulating the charge density along the beam with energy from said wave source.

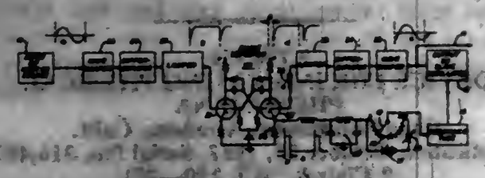
---

2,774,870
**DEVICE FOR INDICATING PHYSICAL PHENOMENA**
Hans Rutishauser, Altadena, Calif.
Application October 23, 1952, Serial No. 316,487
2 Claims. (Cl. 250—27)

1. A device for indicating physical phenomena comprising a pickup, said pickup comprising a variable capacitor and a pickup coil connected across said variable capacitor, a detector coil connected across said pickup coil; a discriminator, a tuned circuit in said discriminator comprising a capacitor and a pair of discriminator coils, said coils being serially connected with each other across said adjustable capacitor; said detector coil being disposed between and linked to both of said discriminator coils, an oscillator, a tank circuit in said oscillator comprising a tank coil and an adjustable tank capacitor, a lead interconnecting said tank coil and a point in the tuned circuit between the discriminator coils, whereby the oscillator supplies high frequency energy to the discriminator coils, and changes in reactance of the pick-up modulate the frequency of said high frequency energy.

---

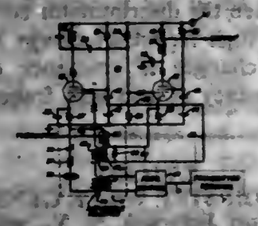
2,774,871
**COUNTER OR STEP WAVE GENERATOR**
Orville E. Dow, Port Jefferson, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application September 18, 1952, Serial No. 310,342
2 Claims. (Cl. 250—27)



1. A step wave generator receptive to a pulse input, comprising: an amplifier for said pulse input, a storage device, a first electron discharge device receptive to the pulse input and operative to add an increment of charge

to the storage device for every pulse received, a cathode follower also receptive to said pulse input, a delay line receptive to the output of said cathode follower, a second electron discharge device coupled to said storage device and biased by the voltage on the storage device and the delayed pulses from the delay line so that the second electron discharge device is rendered conductive to discharge the storage device at predetermined intervals, and a cathode follower coupled to the storage device for providing a step wave output.

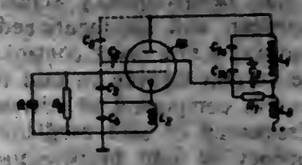
---



2,774,872
PHASE SHIFTING CIRCUIT
Louis Hovagn, Bloomfield, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application December 17, 1952, Serial No. 326,541
4 Claims. (Cl. 250—36)

1. A system for maintaining two wave sources of substantially the same frequency in a selected constant phase relationship over a wide range comprising means for translating the phase difference between said two wave sources into a direct-current control voltage proportional to said phase difference, means for selecting the desired phase relationship comprising a variable direct-current bias source calibrated in phase angle, means for deriving a difference voltage equal to the difference between the voltage of said bias source and said control voltage, and means for bringing said wave sources into the desired phase relationship comprising voltage-actuated reactance means for one of said wave sources and means for applying said difference voltage to said reactance means for shifting the phase of said one wave source.

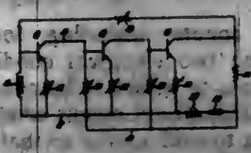
---



2,774,873
BRIDGE STABILIZED OSCILLATOR
John W. Ehrke, Basking Ridge, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application August 15, 1955, Serial No. 528,369
7 Claims. (Cl. 250—36)

1. In a carrier communication system having a receiver terminal and a transmitter terminal at the respective ends of each section of a transmission medium, separate bridge stabilized oscillators for generating carrier frequency energy at the receiver terminal and at the transmitter terminal, respectively, each of said oscillators comprising an amplifying device including at least one electron discharge device having a cathode and a screen grid, a feedback circuit connecting the output of said amplifying device to the input thereof, an impedance bridge connected in said feedback path, a temperature sensitive resistance, a separate capacitive voltage divider connected between the screen grid of each of said discharge devices and direct current ground, means connecting a point on said bridge above direct current ground to an intermediate point on each of said voltage dividers, a saturable reactor connected in one arm of said receiver terminal oscillator bridge circuit, frequency sensitive means including said saturable reactor for adjusting the frequency of said receiver terminal oscillator to correspond with the frequency of the said transmitter terminal oscillator, a resistor, and oscillator power output stabilizing means including said resistor and connected in said receiver terminal oscillator feedback loop between the output of said amplifier and the input of said bridge.

---



2,774,874
CIRCUIT ARRANGEMENT TO NEUTRALIZE THE GRID-TO-ANODE CAPACITY IN SCREEN-GRID TUBES
Erich Heinecke, Berlin-Tempelhof, Germany, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware
Application August 20, 1954, Serial No. 451,189
Claims priority, application Germany August 21, 1953
4 Claims. (Cl. 250—36)

1. A neutralizing arrangement for an oscillator circuit, comprising an electron discharge device having cathode, grid, screen grid and anode electrodes, an L-C oscillatory circuit coupled across said anode and screen grid electrodes; and means for neutralizing the stray capacities between said anode-grid electrodes and said screen grid-grid electrodes, characterized in that one of the reactances forming said L-C circuit comprises a pair of components, means coupling the junction of said components to a reference potential with respect to said anode and screen grid electrodes whereby the voltage at said anode is approximately of opposite phase to the voltage at said screen grid.

---

2,774,875
WAVE GENERATING NETWORK
Edward Keonjian and Jerome J. Suran, Syracuse, N. Y., assignors to General Electric Company, a corporation of New York
Application July 27, 1954, Serial No. 446,138
11 Claims. (Cl. 250—36)

1. In an active periodic wave generator, a re-entrant network comprising at least two transistor amplifiers connected in cascade, at least one of said amplifiers having the impressed signal applied to the base electrode thereof, an inductance connected between the base electrode of said one of said amplifiers and an emitter supply lead, a variable resistance connected between the emitter of said one of said amplifiers and said emitter supply lead, and means supplying electric energy to the operating electrodes of said transistor amplifiers.

---

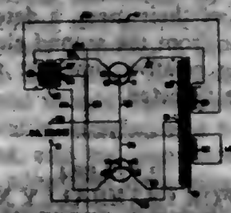
2,774,876
MOLECULAR RESONANCE GAS CELL
Robert H. Dicke, Princeton, N. J.
Application May 19, 1954, Serial No. 430,866
19 Claims. (Cl. 250—36)

1. A gas cell comprising, an envelope containing a gas of low pressure capable of exhibiting molecular resonance,

means for introducing microwave energy into said envelope at a frequency for which said gas is resonant,

and a plurality of conductive elements within said cell spaced one-half wavelength apart at said resonant frequency.

---

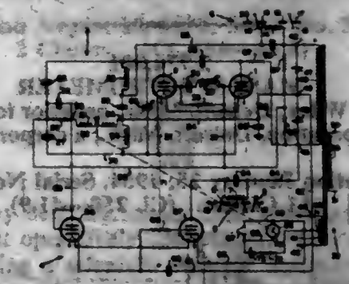


2,774,877
AUTOMATIC FREQUENCY CONTROL
Lowell E. Norton, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application July 1, 1955, Serial No. 519,371
19 Claims. (Cl. 250—36)

1. A frequency stabilization system comprising, a cell containing a molecularly resonant body of gas at low pressure, at least a pair of radio-frequency oscillators coupled to said gas cell, means coupled to said gas cell for deriving from said gas cell a separate frequency control signal for each of said oscillators, and means coupled to said control signal deriving means for applying said separate control signals to said oscillators to stabilize their frequencies.

---

2,774,878
OSCILLATORS
James Lee Jensen, St. Louis Park, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application August 29, 1955, Serial No. 530,981
10 Claims. (Cl. 250—36)



1. Electronic apparatus for converting a direct current to an alternating current, said apparatus comprising: electronic amplifying means, said amplifying means having control elements for varying the flow of current through said amplifying means; means for connecting the output circuit of said electronic amplifying means to a direct current source; means for connecting said output circuit to a load device; feedback means including inductive coupling means having its input connected to said output circuit by means additional to said means for connecting said output circuit to a load device and having its output connected to the control elements thereof, said feedback means being connected in such a manner as to initially tend to increase the flow of current through the output circuit of said electronic amplifying means and hence to further increase the signal applied to said control elements; said inductive coupling means of the feedback means including a saturable core for limiting the amount of signal transmitted to said control elements so that upon such limiting value being reached, the inductive coupling means is effective to decrease the signal transmitted to said control elements to result in said electronic amplifying means again becoming nonconductive.

---

2,774,879
CONTROL APPARATUS
Robert J. Elrod, Philadelphia, and Roger F. Wernlund, Southampton, Pa., assignors to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application March 26, 1952, Serial No. 278,609
12 Claims. (Cl. 250—36)

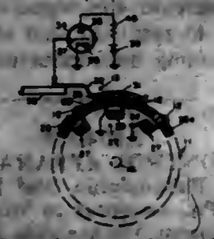
1. Control apparatus, comprising first and second electronic devices each having input and output circuits, a single adjustable impedance element common to said circuits and connected in an oscillatory feedback connection within the input and output circuits of said first device and operative to permit and prevent the oscillation thereof accordingly as the impedance of said element is adjusted to values respectively above and below a first critical value individual to said first device, an impedance device effectively connected in series with said element in an oscillatory feedback connection within the input and output circuits of solely said second device and operative to oppose the effect of said element with respect to said second device and hence to establish a second, higher critical value for the impedance of said element which is individual to said second device and above and below which the oscillation of the latter is respectively permitted and prevented, first and second responsive circuit portions of said apparatus, means adapted to connect energizing means to said first and second portions and to said first and second devices and operative to permit the oscillation of said first device but to prevent the oscillation of said second device during one half of each cycle of an alternating energizing voltage, and to prevent the oscillation of said first device but to permit the oscillation of said second device during the other half of each of said cycles, first and second electro-responsive means respectively individual to said first and second portions, and means operative to control the operative energization of each of said responsive means in accordance with the state of oscillation of the respective device and hence in accordance with the deviation of the impedance value of said element from the respective one of said critical values.

---

2,774,880
TELEVISION TUNING SYSTEM
Norman C. Fulmer, Montclair, N. J., assignor to Allen B. Du Mont Laboratories, Inc., Clifton, N. J., a corporation of Delaware
Application December 6, 1952, Serial No. 324,580
6 Claims. (Cl. 250—40)

1. An electrical tuning device comprising an element of a tuned circuit, a contact member connected to said element, an inductive elongated contact arm, an electrical circuit connected to a single point on said arm, means to

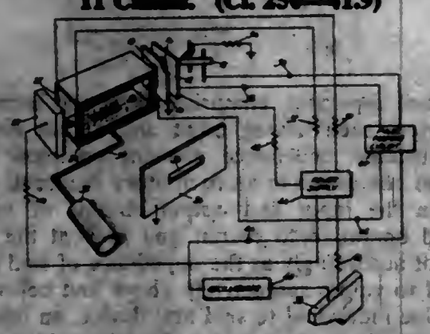
selectively connect said contact member to said contact



constant momentum on the ions in a first direction, a

is faced by said back rest panel, said extendable means

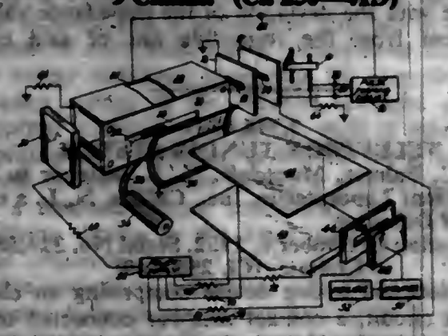
over said surface, removing from said surface all but a



selectively connect said contact member to said contact arm, means to slide said contact member along said arm to continuously vary the inductance between said element and said electrical circuit and a capacitor plate connected

to said tuned circuit, said capacitor plate positioned to move with respect to said contact arm when said contact is slid along said arm, whereby both the capacitance and inductance of said tuned circuit are varied.

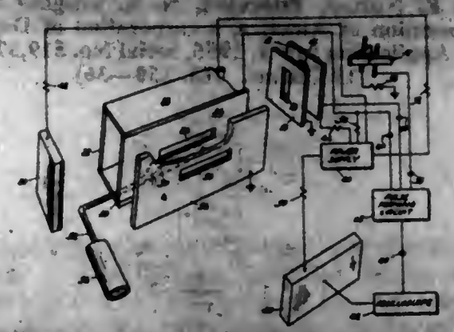
---



2,774,881
MASS SPECTROMETER
William C. Wiley, Detroit, Mich., assignor to Bendix Aviation Corporation, Detroit, Mich., a corporation of Delaware
Application January 25, 1954, Serial No. 405,767
11 Claims. (Cl. 250—41.9)

1. A mass spectrometer, including, means for providing a first region, means for providing a second region past the first region, means for providing a plurality of ions in the first region, means for initially applying a force of substantially zero magnitude in the first region to retain the ions in the region and for applying a force of considerable magnitude in the second region, means for adjusting the forces applied in the first and second regions to provide in the regions forces of uniform strength to accelerate individual ions of each particular mass through the regions at a substantially uniform rate, means disposed past the second region at a position of optimum focus for detecting the ions, and means for indicating the relative times at which the ions are detected.

---



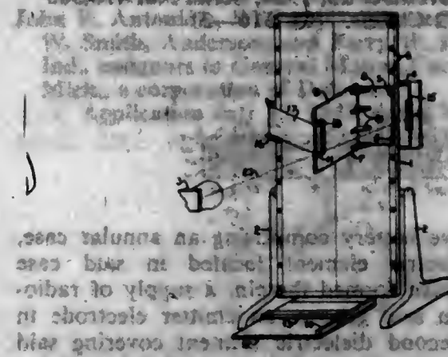
2,774,882
MASS SPECTROMETER
William H. Wells, Detroit, Mich., assignor to Bendix Aviation Corporation, Detroit, Mich., a corporation of Delaware
Application June 15, 1953, Serial No. 361,699
9 Claims. (Cl. 250—41.9)

1. A mass spectrometer, including, means for providing pulses of ions, means for imposing a substantially constant momentum on the ions in a first direction, a pair of plates positioned in substantially parallel relationship to each other, means for imposing a voltage difference on the plates so as to produce an electric field for separating the ions in the transverse direction on the basis of their mass, and means for determining the relative disposition of the ions of different mass in the transverse direction after their travel through a relatively great distance in a direction substantially parallel to the plates so as to provide an indication of the different ion masses.

---

2,774,883
MASS SPECTROMETER
William C. Wiley, Detroit, Mich., assignor to Bendix Aviation Corporation, Detroit, Mich., a corporation of Delaware
Application December 17, 1953, Serial No. 398,718
6 Claims. (Cl. 250—41.9)

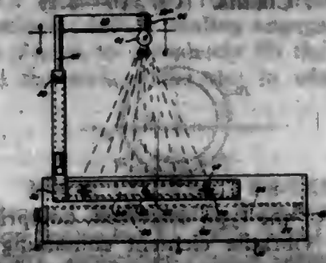
1. A mass spectrometer, including, a backing plate, a first electrode disposed at a particular distance from the backing plate, a second electrode disposed at a particular distance from the first electrode, means for biasing the backing plate and the first electrode with voltages having substantially equal and relatively large magnitudes to produce a substantially field-free region between the plate and the electrode and to produce a field of considerable intensity between the first and second electrodes, means for providing a plurality of ions for retention in the field-free region between the backing plate and the first electrode, means for adjusting the bias on only the first electrode to provide a field of moderate intensity between the backing plate and the first electrode and to maintain a field of considerable intensity between the first and second electrodes for producing a movement of the ions pass the electrodes and a separation of the ions on the basis of their mass, a detector disposed at a particular distance from the second electrode, and means for indicating the relative times at which the ions of different mass are detected.



---

2,774,884
APPARATUS FOR LATERALLY X-RAYING THE SPINAL COLUMN
Ernest A. Fee, Battle Creek, Mich.
Application June 22, 1953, Serial No. 363,261
8 Claims. (Cl. 250—69)

1. In an apparatus for taking lateral X-ray pictures of a patient or the like through the use of an X-ray emitter and a cassette carrying and supporting apparatus, the combination therewith of a support assembly, means for mounting said support assembly on said cassette carrying and supporting apparatus at the side of same facing said X-ray emitter, said support assembly having as part of same a back rest panel extending edgewise in the general direction toward said X-ray emitter, and in a plane substantially perpendicular to said cassette carrying and supporting apparatus, and means extendable between the outer edge of the edgewise extending portion of said back rest panel and the outer edge portion of said cassette carrying and supporting apparatus which



is faced by said back rest panel, said extendable means being of flexible X-ray pervious material with a disengageable fastening means attachable to the outer edge of said back rest panel and a take-up means on the outer edge of said cassette carrying and supporting apparatus for tightening said flexible X-ray pervious material against a patient to be X-rayed, whereby a patient with his back

up against the back rest panel and sidewise to said cassette carrying and supporting apparatus and held immobilized in that position with the aid of said means extending between said cassette carrying and supporting apparatus and the outer edge portion of said back rest panel will be in position to have satisfactory routine lateral X-ray pictures taken.

---

2,774,885
X-RAY APPARATUS
Howard J. Brown, Beloit, Kans.
Application January 22, 1954, Serial No. 405,635
1 Claim. (Cl. 250—62)

In an X-ray apparatus, a frame, a grid disposed in said frame, a supporting plate carried by said frame, spring hangers connecting said plate and said grid, means for imparting reciprocating movement to said grid in said frame, means for tilting said grid relative to the plane of said frame, said means including a pivotal mounting for said plate, slots in said plate in opposite sides of said mounting, bolts fixed to said frame entirely through said slots, means releasably securing said bolts in a selected position in said slot, said last-mentioned means comprising wing nuts, and adjustable supporting means carried by said plate for supporting a tube mounting, said means being movable in a direction perpendicular to said frame.

---

2,774,886
METHOD OF DETECTING SURFACE DISCONTINUITIES
Tabor de Forest, Northbrook, and Donald W. Parker, Jr., Chicago, Ill., assignors, by mesne assignments, to Switzer Brothers, Inc., Cleveland, Ohio, a corporation of Ohio
No Drawing. Application November 19, 1952, Serial No. 321,496
6 Claims. (Cl. 250—71)

1. The method of testing articles for surface discontinuities, which comprises applying to the surface of an article to be tested a noncorrosive miscible liquid penetrant containing coloring matter which is susceptible to fading upon exposure to high intensity short-wave ultraviolet light, forming a continuous layer of said penetrant over said surface, removing from said surface all but a residual adherent film of said colored penetrant, destroying the background color in said film by exposing said film to high intensity short wave ultra-violet light, terminating said exposure short of the time required to destroy the color of any penetrant lodged in a surface discontinuity, and finally inspecting said surface under a source of fluorescigenous irradiation of lesser intensity and of longer wave length that renders contrastingly visible the presence of any colored penetrant in a surface discontinuity.

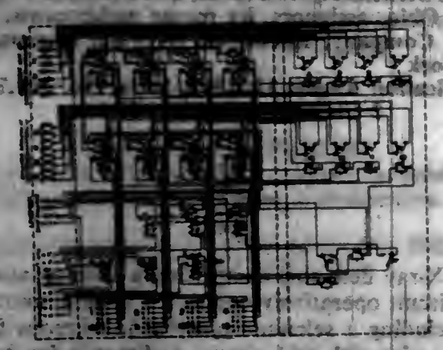
---

2,774,887
RADIATION SENSING DEVICE
Robert C. McMaster, Columbus, and Michael D. Phillips, Obetz, Ohio, assignors, by mesne assignments, to The Haloid Company, Rochester, N. Y., a corporation of New York
Application August 13, 1952, Serial No. 304,162
2 Claims. (Cl. 250—83.3)

1. An X-ray detector, comprising a voltage source, an electric circuit operatively connected to said source, said circuit including a selenium element in vitreous form in electrical series with said source, and means for detecting changes in the electrical resistance of said element, said vitreous form selenium being characterized by the property of varying in electrical resistance in response to irradiation by electromagnetic energy with preferential sensitivity to the X-ray region of the spectrum of said energy over the visible region thereof.

---

2,774,888
ELECTRONIC SWITCH
Robert B. Trousdale, Webster, N. Y., assignor to General Dynamics Corporation, a corporation of Delaware
Application August 23, 1955, Serial No. 530,089
6 Claims. (Cl. 307—88.5)



1. An electronic switch comprising a semi-conductive device having first and second emitter-collector junctions, and a control electrode, an input circuit connected to said first junction, an output circuit connected to said second junction, a control circuit connected to said control electrode, means associated with said control circuit for enabling said device to pass electrical signals with the instantaneous value of said signals determining which of said first and second junctions functions as an emitter junction and which of said first and second junctions functions as a collector junction, and means for maintaining the value of current in said control circuit substantially constant regardless of the instantaneous value of the signal passed by the switch.

---

2,774,889
CONTROL CIRCUIT FOR A SERIES OF ELECTRICAL UNITS
Fred J. Bucher, Library, Pa.
Application June 22, 1954, Serial No. 438,571
21 Claims. (Cl. 307—112)

20. A circuit connection for controlling a series of electrical units which operate in associated relation comprising a control relay for each electrical unit having elec-

trical unit control contacts and electrical unit interlocking contacts, one current supply line connected with one side of each control relay interlocking contact, an interlocking terminal board having two sets of interlocking terminal posts, one of a first set of interlocking terminal posts connected to the other side of each interlocking contact, one of a second set of interlocking terminal posts connected to one side of each control relay operating coil, independent connections for the other side of each control relay operating coil to the other current supply line, independent connections between selected of said interlocking terminal posts of each set to energize the op-

erating coils of the control relays in a predetermined sequence, circuit breaker means having its energizing current connected across said current supply lines and having contact means to interrupt the supply of current to said control relays, a trip relay having one side of its operating coil connected to one current supply line and the other side of its operating coil connected to said other supply line, a back contact of said trip relay interposed in the circuit of the operating coil of said circuit breaker and circuit closing means interposed in the circuit of the operating coil of the trip relay which when actuated will energize the trip relay and de-energize the operating coils of the circuit breaker.

---

2,774,890

**NONRECIPROCAL TRANSMITTING DEVICES**

Charles L. Semmelman, Chatham, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application August 30, 1952, Serial No. 307,263

18 Claims. (Cl. 307—149)

16. An arrangement for intercoupling first, second and third transmission paths for transmission from the first to the second, from the second to the third, and from the third to the first, while substantially suppressing transmission in the reverse direction, comprising a passive, non-reciprocal coupler with first, second and third external coupling facilities, said coupler being characterized by an internal transmission path from the first external coupling facility to the second, from the second external coupling facility to the third, and from the third external coupling facility to the first, at least two of said internal transmission paths being non-reciprocal, and the first-mentioned first, second and third transmission paths being connected respectively to the first, second and third external coupling facilities.

2,774,891

**MEANS FOR COLLECTING AND UTILIZING ELECTRICAL ENERGY OF NUCLEAR TRANSFORMATIONS**

Edward J. Danielsohn, Glendale, and Harry C. Lieb, Rockville Centre, N. Y., assignors to Universal Winding Company, Cranston, R. I., a corporation of Massachusetts

Application November 23, 1954, Serial No. 470,565

12 Claims. (Cl. 310—3)

1. A radioactive battery comprising an annular case, an annular dielectric element located in said case and having a groove formed therein, a supply of radioactive material in said groove, an emitter electrode in said groove, a second dielectric element covering said groove and electrode and bonded to said first mentioned dielectric element to thereby seal said radioactive material and electrode therebetween, and a cover closing said case, said case and cover forming a collector electrode to absorb charged particles emitted by said radioactive material.

---

2,774,892

**ANNULAR VIBRATOR WITH LUMPED LOADING**

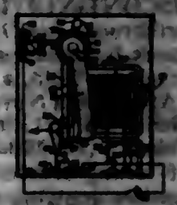
Leon W. Camp, Glendale, Calif., assignor to Bendix Aviation Corporation, North Hollywood, Calif., a corporation of Delaware

Application May 29, 1951, Serial No. 228,956

7 Claims. (Cl. 310—8.1)

1. A device of the type described, comprising: an annular, radially vibratile element containing electro-mechanically responsive material, and means for electrically coupling said element to an electric circuit; said element consisting of an even number of arcuate regions, alternate ones of which have substantially identical mass identically distributed along their arcuate dimensions and the intervening regions of which have substantially identical mass identically distributed along their arcuate dimensions, the mass of said alternate regions being greater than the mass of said intervening regions.

---



2,774,893

**IMPULSE MOTOR**

Donald A. Lace, Chicago, Ill., assignor to Time-O-Matic Company, Danville, Ill.

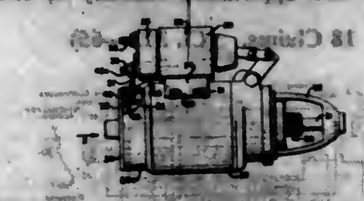
Application February 26, 1953, Serial No. 339,031

16 Claims. (Cl. 310—32)

1. In an impulse motor, an electromagnet, movable members comprising an armature for said magnet and a torque arm mounted for relative rotation, said torque arm being mounted in the path of movement of at least a

portion of said armature, and circuit means including one of said members and a pair of contacts, one being stationary and the other attached to one of said members for intermittently energizing said magnet to drive said torque arm.

---



2,774,894

**CONNECTOR FOR AN ELECTRIC MOTOR**

John E. Antonidis, William C. Edmondson, and Clayton W. Smith, Anderson, and Perry W. Hayes, Pendleton, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application July 13, 1953, Serial No. 367,484

4 Claims. (Cl. 310—71)

1. In an electric motor having a field frame in which a field winding is positioned and a motor control switch mounted on the outside of said frame, means for connecting a terminal of said control switch with the end of said field winding comprising a conductor bar adapted to be positioned in a slot formed in the end of the field frame and movable therein for connection with the field winding, said bar being connected at one end with a terminal of the control switch and at the other end with a lead extending from the field winding and of sufficient length to permit easy connection of the lead with the conductor bar when the latter is movable in said slot, and before it is secured in its final position of assembly therein, and a relatively soft rubber grommet surrounding said conductor bar in sealing engagement therewith and of such size as to completely fill the space between the bar and the wall of the slot in which said bar is received.

---

2,774,895

**EDDY CURRENT BRAKE**

Armand Zachermann, Paris, France

Application September 21, 1953, Serial No. 381,205

Claims priority, application France September 23, 1952

25 Claims. (Cl. 310—93)

1. An electrodynamic eddy current brake of the homopolor type comprising, in combination, a stator having two annular sets of circumerentially spaced teeth forming pole pieces, said two sets being spaced concentrically from each other so as to form an annular interval therebetween, a rotor comprising a rotary shaft, a hub provided with arms and secured to said shaft, and a cylindrical hollow body mounted in overhanging relationship on said arms and extending across said annular interval of said stator, said cylindrical hollow body consisting of ferromagnetic material and having a thickness materially greater than the gaps formed between said body and said two annular sets of teeth, a stationary annular winding mounted in said annular interval so as to register with the free end face of said cylindrical hollow body, whereby all the teeth of the same annular set act as poles having the same polarity when said winding is energized, means for simultaneously incrementing the reluctance of said cylindrical hollow body, increasing the heat transfer surface of said body, and circulating air drawn from the surrounding atmosphere across the spaces defined between the poles, and means for withstanding the effects of dilatation on said body.

2,774,896

**ELECTRICAL MACHINE, THE MAGNETIC CIRCUIT OF WHICH COMPRISES ONE OR MORE PERMANENT MAGNETS**

Maximilien Félix Reynst and Robert Henri de Boer, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

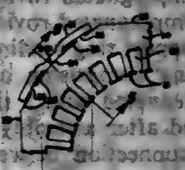
Application December 6, 1952, Serial No. 324,524

Claims priority, application Netherlands December 29, 1951

8 Claims. (Cl. 310—163)

1. Electrical apparatus comprising axially-arranged, axial air-gap spaced rotor and stator members, one of said members, including a flat permanent magnet portion mounted at right angles to the axes of the members and magnetized in its thickness direction and thus parallel to the axes of the members to produce pole surfaces, said permanent magnet portion being constituted of a high coercive force material and being substantially non-demagnetizable, the other of said members comprising a substantially flat member of soft ferromagnetic material mounted at right angles to the axes of said members and adjacent a pole surface of the permanent magnet portion, and a winding on a reduced portion of said soft ferromagnetic member, said soft ferromagnetic member having a portion intermediate said reduced portion and a portion remote therefrom of greater thickness than said reduced and remote portions, said rotor and stator members being rotatable relative to one another about their axes whereby interaction may occur between the field produced by the permanent magnet and the winding on the soft ferromagnetic member.

---



2,774,897

**STATOR AND METHOD OF MAKING SAME**

Milton C. Matthews, Rochester, N. Y., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application July 8, 1953, Serial No. 366,680

3 Claims. (Cl. 310—217)

1. A stator for a dynamoelectric machine comprising a stack of metal laminae having a plurality of pairs of peripheral tabs; said tabs extending outwardly beyond the general periphery of the laminae, said tabs of each pair being arranged in a straight line which are parallel to the axis of the stator; a plurality of metal binding members located adjacent each pair of tabs and retaining the stack in assembled relation; said tabs being mashed by the members by an electrical projecting welding operation which unites said tabs with the binding members whereby the laminae are held in assembled relationship.

---

2,774,898

**SLIP RING CONSTRUCTION**

Robert G. Le Tourneau, Longview, Tex.

Application June 15, 1953, Serial No. 361,642

3 Claims. (Cl. 310—232)

1. A slip ring arrangement for dynamo electric machines including a rotor shaft, comprising: a pair of radial face slip rings supported on the shaft, a pair of brush holders spaced from said slip rings, semicircular wearable brushes disposed between said slip rings and

said brush holders, common means operating between the brush holders to urge said brushes into contact with said slip rings, each of said brush holders including a pair of complementary elements, means disposed be-

tween said complementary elements and engageable with said brushes to limit rotative movement of the same, and quickly releasable means for fastening said complementary elements together.

---

2,774,899

## DUAL RING SUPPORT FOR END TURNS OF FORM WOUND COILS

Albert B. Zeinler, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application July 29, 1955, Serial No. 525,135

5 Claims. (Cl. 310—260)

1. A member for a dynamoelectric machine comprising a core formed of magnetic material and having coil receiving slots formed therein, form wound coils in said slots having end turns projecting beyond the ends of said slots, and means for supporting said coil end turns comprising a first support ring positioned concentrically around said end turns and a second support ring arranged in substantially the same radial plane as said first support ring between the inner and outer arms of said end turns formed of an impregnated roving, means comprising loops formed of impregnated roving formed integrally with said second support ring binding said end turns to said rings, said roving comprising an initially flexible fibrous material impregnated with a thermosetting resinous composition cured after assembly on said end turns to produce a rigid connection between said end turns and said rings.

---

2,774,900

## WEBBING OF ROTOR BAR EXTENSIONS

Jack C. Acton and Albert B. Zeinler, Schenectady, N. Y., assignors to General Electric Company, a corporation of New York

Application July 20, 1955, Serial No. 523,182

2 Claims. (Cl. 310—270)

1. In a dynamoelectric machine having a rotor member including coil receiving slots, bar wound coils having coil sides disposed in said slots and having end turn portions extending beyond the ends thereof, a plurality of connecting clips arranged at the axial extremities of the end turns for electrically connecting selected ends of individual bars together to form a winding, and means for reinforcing and securing the connecting clips in position comprising strips of fibrous roving impregnated with a thermosetting resin crisscrossed between adjacent pairs of connecting clips, said strips of roving being in contact at the points of crisscross and baked after assembly to form a unitary rigid network comprising a plurality of integral triangular braces spacing the connector clips from each other and reinforcing each connector clip against movement.

---

2,774,901

## TUBE FOR ELECTRO-MAGNETIC IMAGES

Edward Emanuel Shelton, New York, N. Y.

Original application July 8, 1947, Serial No. 759,531, now Patent No. 2,586,391, dated February 19, 1952. Divided and this application January 8, 1952, Serial No. 265,463

18 Claims. (Cl. 313—65)

1. A vacuum tube comprising in combination means for producing a beam of electrons and an imperforate screen for receiving said beam of electrons, said screen comprising in that order a continuous light reflecting and pervious to electrons layer, fluorescent means, said light reflecting layer having one side exposed and the opposite side facing said fluorescent means, adjacent to said fluorescent means and extending over a major portion of one side of said fluorescent means, said fluorescent means furthermore comprising a plurality of different phosphors emitting luminescent light, one of said phosphors being responsive to electrons and at least one of said phosphors being responsive to luminescent light emitted by said phosphor responsive to electrons, and a light transparent, continuous and electrically conducting layer mounted on the side of said fluorescent means opposite to the side which is adjacent to said light reflecting layer, outside of said fluorescent means and facing said fluorescent means and extending over a major portion of one side of said fluorescent means.

---

2,774,902

## ELECTROLUMINESCENT LAMP

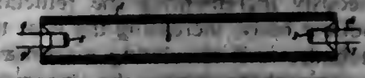
Lawrence Burns, Swampscott, Mass., assignor to Sylvania Electric Products Inc., Salem, Mass., a corporation of Massachusetts

No Drawing. Application August 18, 1953, Serial No. 375,055

3 Claims. (Cl. 313—108)

1. An electroluminescent lamp comprising two electrodes and a layer therebetween of a copper-activated zinc sulfide electroluminescent phosphor containing from about $10^{-4}$ to about $10^{-3}$ percent by weight of a substance selected from the group consisting of nickel, cobalt and iron, the copper activator being present in amount between 0.0002 and 0.0015 gram atoms per mole of zinc sulfide.

---



2,774,903

## NON-ACTINIC FLUORESCENT LAMP

Lawrence Burns, Swampscott, Mass., assignor to Sylvania Electric Products Inc., Salem, Mass., a corporation of Massachusetts

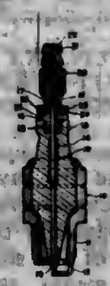
Application January 17, 1951, Serial No. 206,440

10 Claims. (Cl. 313—109)

1. A fluorescent lamp having an internal fluorescent coating and electric discharge emitting long-wavelength

ultraviolet radiations and visible radiations and an outer envelope of ultraviolet-absorbing light-transmitting glass containing a substance which absorbs long wavelength ultraviolet radiations and selected from the group consisting of: zinc oxide, titanium oxide, cerium oxide, said glass being selected from the group consisting of lead glass and lime glass.

---



2,774,904

## SPARK PLUG

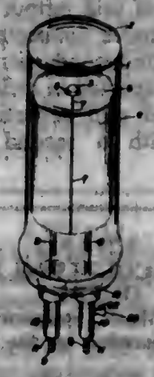
Frank A. Buchan, Cochrane, Ontario, Canada

Application February 9, 1953, Serial No. 335,753

3 Claims. (Cl. 313—125)

2. A spark plug for internal combustion engines, an insulator, an internally threaded axially bored longitudinally calibrated stud axially terminally secured to the said insulator, a central electrode having one end thereof externally threaded, extending through the said insulator and said stud and movable towards or away from a fixed second electrode, a peripherally calibrated metal cap terminally secured to the said central electrode, a pin slidably mounted radially in the said stud for locking engagement with said central electrode, and a ring encircling the said stud and pin and secured thereto for revolvable movement, the inner surface of the said ring being formed with an eccentric portion for the actuation of the said pin.

---



2,774,905

## INDUCTION LAMP

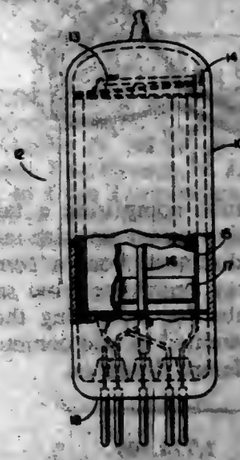
Fridtjof Niels Carl Hansen, Beverly Farms, Mass., assignor to Sylvania Electric Products Inc., Salem, Mass., a corporation of Massachusetts

Application July 8, 1955, Serial No. 520,767

10 Claims. (Cl. 313—161)

1. An electric induction lamp comprising a magnetic field concentrator; a refractory induction target in operative relation therewith to be heated by the magnetic field of said concentrator, the field in the immediate region of the concentrator deteriorating the surface thereof in said region during operation of the lamp, said target extending away from said concentrator for a distance greater than that over which appreciable deterioration occurs.

---



2,774,906

## VOLTAGE REGULATOR

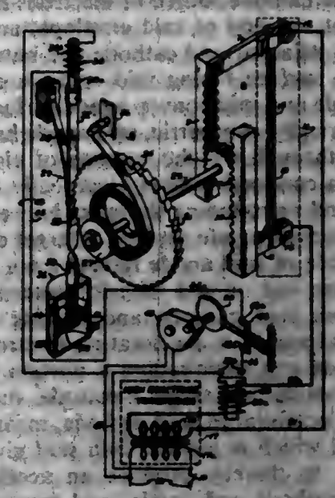
Russell R. Law, Wenham, Mass., assignor to Columbia Broadcasting System, Inc., a corporation of New York, doing business under the name CBS-Hytron, a Division of Columbia Broadcasting System, Inc., Danvers, Mass.

Application October 22, 1954, Serial No. 463,846

7 Claims. (Cl. 313—206)

5. A glow-discharge voltage regulator tube comprising, an envelope containing ionizable gas, an anode disposed centrally of said envelope, a cathode concentric with and surrounding said anode, a substantially conical insert within and connected at its large end to said cathode, said conical insert having an eccentric opening in the small end thereof, said anode passing through said opening.

---



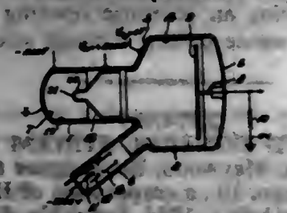
2,774,907

## ARC LAMP AND CONTROL SYSTEM THEREFOR

Harold R. Benson, Maywood, Ill., assignor to nuArc Co., Inc., Chicago, Ill., a corporation of Illinois

Application July 6, 1955, Serial No. 520,287

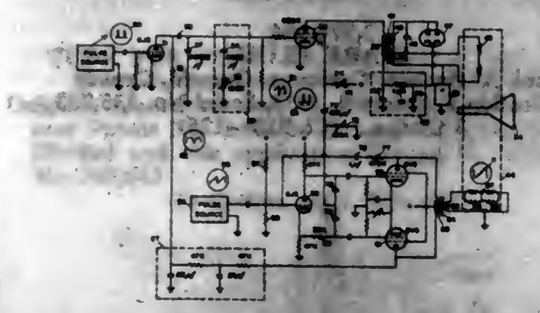
12 Claims. (Cl. 314—77)



1. In an arc lamp, the combination of a pair of electrodes mounted for relative movement toward and away from each other, biasing means for continually urging said electrodes into contacting engagement, means for producing a predetermined relative separation of said electrodes against the force of said biasing means to draw an arc of a predetermined length, and timing means for cyclically maintaining said last mentioned means effective for the major portion of the cycle but rendering it ineffective for a short instant during each cycle, thereby periodically adjusting the length of said arc to produce a substantially constant light intensity.

2,774,908
**CATHODE-RAY TUBES OF THE FEED-BACK VARIETY**
John T. Wallmark, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application March 30, 1955, Serial No. 497,946
4 Claims. (Cl. 315—10)

1. A cathode-ray tube comprising a target electrode having electron-sensitive signal-emissive areas arranged thereon at different distances from a common pick-up region for signal energy emanating from said areas; and means within said tube for equalizing the intensity of the signal energy transmitted to said common pick-up region through said different distances.



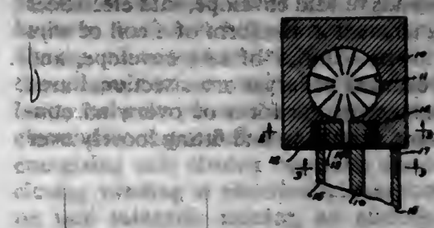
2,774,909
**TELEVISION PICK-UP TUBE COMPRISING ELECTROSTATIC ELECTRON-OPTICAL MEANS**
Jan Carel Francken, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, as trustee
Application July 8, 1952, Serial No. 297,702
Claims priority, application Netherlands August 9, 1951
5 Claims. (Cl. 315—11)

1. A television pick-up tube comprising an envelope, a photo-electric cathode source of electrons having a concave surface at one end of said envelope, an anode electrode disposed adjacent said cathode and having a convex hemi-spherical surface facing said concave cathode, said concave cathode and said convex anode surface being substantially spherically concentric, said anode having a small aperture therethrough for the passage of electrons from said cathode, a conductive layer electrically connected to said cathode and surrounding the space between said cathode and said convex anode surface, a target electrode disposed on the side of said anode remote from said cathode and at the other end of said tube for receiving electrons emanating from said cathode and passing through the aperture in said anode, a decelerating electrode insulated from said anode and surrounding a portion of the space between said anode and target electrode, means for applying a given potential to said cathode, means for applying a potential which is greater than said given potential to said anode to thereby produce an accelerating field between said cathode and anode, and means to apply a potential to said decelerating electrode which is less than the potential applied to said anode to thereby produce a decelerating field between said anode and target.

2,774,910
**CATHODE RAY SWEEP CORRECTION SYSTEM**
Emil Sanford, Clifton, N. J., assignor to Allen B. Du Mont Laboratories, Inc., Clifton, N. J., a corporation of Delaware
Application January 2, 1952, Serial No. 264,511
12 Claims. (Cl. 315—24)

10. A cathode ray tube electron beam deflecting system for correcting geometrical distortion resulting from the difference in center of curvature of the tube faceplate and of the sweep of the electron beam comprising, in combination, means for producing the first sawtooth deflecting signal, means for producing a second sawtooth deflecting signal, an integrating circuit, means including a connection between the output of said first sawtooth signal producing means and the input of said integrating

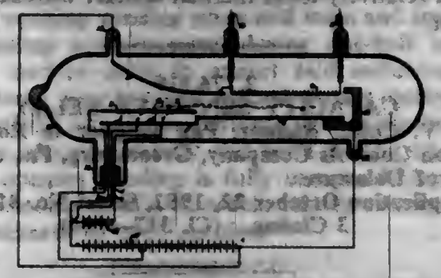
circuit for integrating said first sawtooth signal and providing a parabolic correcting-waveform and modulating means for causing said parabolic correcting-waveform to modulate the amplitude of the signal produced by said second sawtooth signal means, said modulating means including a connection between the output of said integrating circuit and the input of said second sawtooth signal producing means.



2,774,911
**CIRCUIT ARRANGEMENT FOR THE GENERATION OF SAW-TOOTH SHAPED DEFLECTING CURRENTS**
Rudolf Urtel, Pforzheim, Germany, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware
Application February 8, 1954, Serial No. 408,967
5 Claims. (Cl. 315—27)

1. A circuit for the generation of sawtooth currents in the deflecting coils of a cathode-ray tube, comprising an input tube having an anode, grid and cathode, a deflecting coil and storage condenser in series in the anode-cathode circuit of said output tube, a rectifier having an anode and cathodee connected in shunt with said series deflecting coil and condenser, and a transformer having one winding connected in series between the anode of said input tube and said deflecting coil and another winding in series with a second rectifier connected across said condenser.

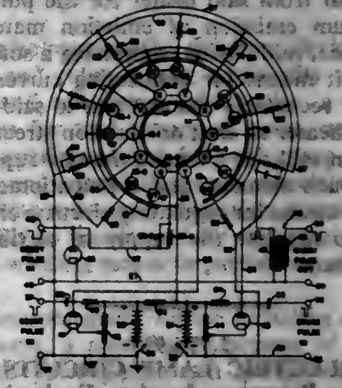
2,774,912
**H-GUIDE TYPE COUPLING FOR COAXIAL OUTPUT**
Jack Kline, Concord, Mass., assignor to the United States of America as represented by the Secretary of the Air Force
Application September 27, 1955, Serial No. 537,877
1 Claim. (Cl. 315—39)



A magnetron having an anode member and a plurality of resonant cavities formed within said anode, an annular recess in the outer surface of said anode, a block member mounted within said recess, said block member having a central slot communicating with one of the resonant cavities within said anode structure, an annular ring member surrounding said block within said recess, said ring member and said slotted block forming an H-type waveguide, a coaxial output cable, means to asymmetrically attach said coaxial cable to said H-type waveguide so as to asymmetrically excite the principal mode of said

cable from said waveguide whereby power is coupled from said resonant cavity to said coaxial cable.

2,774,913
**ELECTRON DISCHARGE TUBE WITH CROSSED ELECTRIC AND MAGNETIC FIELDS**
Daniel Charles, Paris, France, assignor to Compagnie Generale de Telegraphie Sans Fil, Paris, France, a French company
Application May 28, 1952, Serial No. 290,530
Claims priority, application France May 31, 1951
2 Claims. (Cl. 315—39.3)

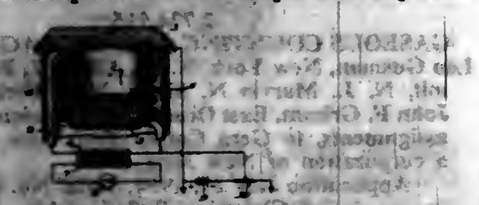


1. An electron discharge tube comprising a first substantially flat electrode extending parallel to the axis of the tube, a substantially flat emissive cathode situated in the same plane as the first flat electrode, means for applying a common potential to the cathode and first electrode, a second electrode comprising a first portion of hyperbolic profile having its convex surface facing the emissive surface of said cathode and a second portion of average rectilinear profile extending from the first portion, a grid separating the space between the first and second electrodes, said grid extending from a zone of the tube adjacent the cathode to a zone of the tube adjacent the junction between the first and second portions of the second electrode, means for applying a positive potential to the second electrode relatively to the first electrode, means for applying to the grid a potential intermediate those applied to the first and second electrodes, and means for producing a magnetic field having lines of force perpendicular to the axis of the tube and to the lines of force of the electric field resulting from the difference of potential between the first and second electrodes.

2,774,914
**MAGNETRONS**
Herbert Standish, Reading, England, assignor to English Electric Valve Company Limited, London, England, a British company
Application February 14, 1952, Serial No. 271,527
Claims priority, application Great Britain February 19, 1951
2 Claims. (Cl. 315—39.67)

1. A magnetron comprising a hollow cavity resonator, means for exciting a standing wave in said cavity resonator, said means comprising a plurality of split anode magnetron systems eccentrically mounted within said cavity resonator, each of said systems including a cathode and two anode segments, said segments consisting of semi-cylindrical members spaced at their opposite lineal edges along diametrical lines through said cavity resonator and means for effecting the withdrawal of useful power from said cavity resonator.

2,774,915
**GASEOUS COUNTING AND STORAGE DEVICE**
Leo Gussman, New York, N. Y., Albert V. Bazarian, Summit, N. J., Marvin N. Silver, New York, N. Y., and John F. Grimm, East Orange, N. J., assignors, by mesne assignments, to Gera Corporation, New York, N. Y., a corporation of New Jersey
Application July 19, 1954, Serial No. 444,198
8 Claims. (Cl. 315—84.6)



6. A gaseous storage device for storing a count made by a gaseous counting system comprising; an envelope filled with a gas at reduced pressure; a system for counting applied electrical pulses by the movement of a glow discharge positioned within the envelope; a first source of potential external of the envelope for supplying the current for said glow discharge; a plurality of storage cathodes within the envelope, each corresponding to a counting position within the counting system and positioned adjacent to a counting glow discharge; a plurality of storage transfer cathodes positioned between said counting glow discharges and the corresponding storage cathodes; each of said storage cathodes and storage transfer cathodes comprising a hollow cylinder enclosed in a common block of insulating material with an open end of a cylinder mounted adjacent to the surface of the block; a second source of potential external of the envelope for supplying the current for a glow discharge for a storage cathode; conductive means within the envelope which connects all of the storage transfer cathodes to a common lead-in conductor which is connected to an external circuit for receiving an electrical storage pulse; means for establishing a preferential path for transferring the discharge from a counting glow discharge to a storage cathode when an electrical storage pulse is received; and a common anode which is equally spaced from all the storage cathodes to comprise a common terminal for the storage discharges.

2,774,916
**CATHODES FOR ELECTRICAL DISCHARGE DEVICES**
Helmut Katz, Erlangen, Germany, assignor to Siemens & Halske Aktiengesellschaft, Munich and Berlin, Germany, a German corporation
Application June 9, 1952, Serial No. 292,433
Claims priority, application Germany June 9, 1951
5 Claims. (Cl. 315—94)

1. In an indirectly heated dispenser type cathode comprising a receptacle element containing a supply of emis-

sion material and an emissive element connected therewith through which emission material from said supply can migrate in operation to a surface formed thereby, said surface constituting the cathode emitting surface, and having an insulated heater and a current source for heating it so as to transfer heat to both said elements for the purpose of heating them to effect migration of emission material from said supply to said emitting surface; a device for selectively regulating the temperature of one of said elements independent of the temperature imparted

thereto by heat from said heater for the purpose of providing optimum emission of emission material at said emitting surface, said device comprising a source of direct current, circuit means for connecting current from said source to said receptacle element and to said heater so as to cause said heater to emit an electron stream impinging primarily upon said one element, thereby supplying auxiliary heat to such element, and a potentiometer included in said circuit means for regulating electron emission from said heater to regulate the supply of auxiliary heat to said one element.

---

2,774,917

## ELECTRIC LAMP CIRCUITS

Charles Rivers Pasmore, London, England, assignor to Thorn Electrical Industries Limited, London, England, a British company

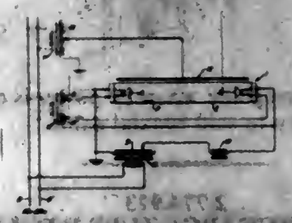
Original application February 23, 1951, Serial No. 212,212, now Patent No. 2,683,241, dated July 6, 1954. Divided and this application July 2, 1954, Serial No. 442,121

4 Claims. (Cl. 315—97)

1. An electric discharge lamp circuit including two or more low-pressure electric discharge lamps of the hot-cathode type having two electrodes, or two or more groups of such lamps, each lamp or group of lamps being connected between the terminals of the secondary winding of an associated matching transformer, the primary windings of the matching transformers being connected in series, means for supplying to the series-connected primary windings a potential difference which is progressively variable by a dimmer control while the lamps are operating, and means for supplying heating current continuously to each of the electrodes of the lamps at least over the lower part of the operating range of brightness of the lamps, the arrangement being such that both said means are supplied from the same source of power, and the circuit including ballast impedance for limiting the lighting current flowing in each lamp.

---

2,774,918



## ELECTRIC DISCHARGE DEVICE

Eugene Lemmers, Cleveland Heights, Ohio, assignor to General Electric Company, a corporation of New York

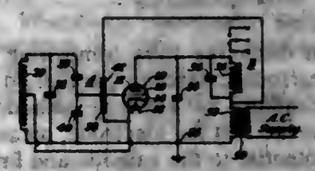
Application October 6, 1951, Serial No. 250,106

29 Claims. (Cl. 315—96)

1. An electric discharge device of the positive column type, comprising a closed envelope, an inert gas at a pressure of a few millimeters and a small quantity of mercury contained in said envelope, and a pair of filamentary electrodes sealed into the ends of said envelope, said electrodes comprising a heating element in the form of a coil of wire having connections to the exterior of said envelope, and an electron-emitting element of larger cross-sectional area than said heating element in the form of overwind convolutions of wire wound axially on and fitting loosely over

the turns of said coil, and having connections to the ends thereof, said overwind convolutions being coated with activated electron-emitting material, and said overwind convolutions having a diameter many times larger than the diameter of said wires and having a relatively high winding pitch in order to establish said electron-emitting element in relatively loose thermal contact with said heating element.

---



2,774,919

## CAPACITY SENSITIVE RELAY

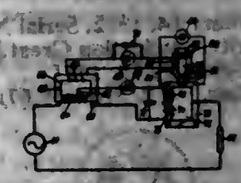
Ralph V. Coles, Radnor, Pa., assignor to Robertshaw-Fulton Controls Company, Greensburg, Pa., a corporation of Delaware

Application October 22, 1952, Serial No. 316,219

3 Claims. (Cl. 317—146)

1. An impedance sensitive device having a source of alternating voltage, comprising in combination, an oscillator circuit including an electron discharge device having an anode, a cathode and a grid, an oscillatory tank circuit connected between said grid and one side of the source, means for connecting the other side of the source to said anode, means for connecting the electrical center of said tank circuit to said cathode, means including a variable impedance associated with said oscillatory tank circuit for varying the amplitude of oscillation in said device, and a resistance connected to the anode side of the source and to said grid for applying a voltage to said grid in phase with the anode voltage.

---



2,774,920

## ELECTROMAGNETIC SWITCH ARRANGEMENT

Fritz Kesselring, Zollikon-Zurich, Switzerland, assignor to FKG Fritz Kesselring Gerätebau, Bachtobel-Wollfeldsen, Switzerland, a Swiss corporation

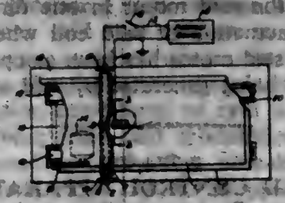
Application October 4, 1951, Serial No. 249,731

9 Claims. (Cl. 317—156)

1. An electromagnetic switch arrangement for the control of current flow from an alternating current source to a load comprising an electrical circuit closing magnetic system, an electrical circuit opening magnetic system, a switching element, a saturable reactor, and an

electronic device, said circuit closing magnetic system comprising a first and second pole piece electrically insulated from each other and having an air gap therebetween, said switching element electrically bridging said air gap when said switching element is moved to circuit closed position, a main closing winding wound on at least one pole piece of said closing magnetic system and electrically connected to one pole piece for magnetically energizing said closing magnetic system when said main closing winding is electrically energized, a main winding on said saturable reactor, an electrical circuit for connecting said electronic device to said pole pieces, an electrical circuit for connecting the load to the other of said pole pieces, said main winding and said main closing winding being electrically connected in series with said alternating current source and load through said pole pieces and electronic means, said switching element short circuiting said electronic means when moved to bridge said one air gap of said poles of said closing magnetic system, a secondary winding on said saturable reactor, an opening winding on said opening magnetic system for magnetically energizing said opening magnetic system when said opening winding is electrically energized, first means to prevent full energization of said opening winding when said main and auxiliary closing winding are energized during one-half of the alternating current cycle to attract said switching element to closed position and second means during the other half of the alternating current cycle to prevent full energization of said auxiliary and main closing windings when said opening winding is fully energized from said secondary winding of said saturable reactor to move said switching element to open position.

---



2,774,921

## APPARATUS FOR ELECTROSTATICALLY CHARGING INSULATING IMAGE SURFACES FOR ELECTROPHOTOGRAPHY

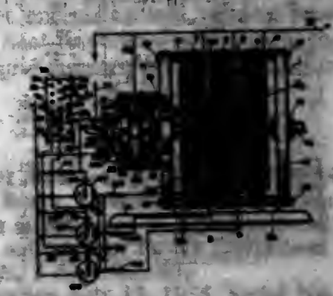
Lewis E. Walkup, Columbus, Ohio, assignor, by mesne assignments, to The Haloid Company, Rochester, N. Y., a corporation of New York

Application April 23, 1953, Serial No. 350,578

2 Claims. (Cl. 317—262)

1. Apparatus for charging a xerographic plate having a photoconductive insulating layer, said apparatus comprising support means for said plate, a high resistance pliable continuous layer charging electrode of substantially uniform resistance of at least $10^6$ ohms when measured between probes spaced one centimeter apart on a strip of material one centimeter wide positioned to engage the surface of said layer while the plate is positioned on said support means, a conductive contact spaced from and substantially parallel with said layer and secured in contact with the charging electrode across said layer, means for moving the electrode and plate with respect to each other and in a direction transverse to said electrode to bring the electrode progressively into contact with the working area of said layer, an electrical potential source to apply a potential in the range of about 200 to 2000 volts, and connectors to connect the terminals of the potential source to said conductive contact and to the plate when in position on said support means, respectively, whereby during the application of potential from said potential source charge is deposited and trapped on the surface of said layer by progressively withdrawing said charging electrode from the surface of said layer while the flow of electric charge through said charging electrode is restricted.

---



2,774,922

## STEP MOTOR AND CONTROL SYSTEM THEREFOR

Albert G. Thomas, Chattanooga, Tenn.

Application June 20, 1952, Serial No. 295,694

38 Claims. (Cl. 318—162)

1. In an electromagnetic stepping device including stator means and rotor means, a plurality of groups of stator poles and associated rotor poles, a plurality of winding means for said groups of poles, means for energizing said winding means for said group in predetermined order, and electrical means associated with said rotor for limiting movement thereof in direciton opposite to the direction as determined by the order of magnetization of said winding means to partial step displacements of said rotor.

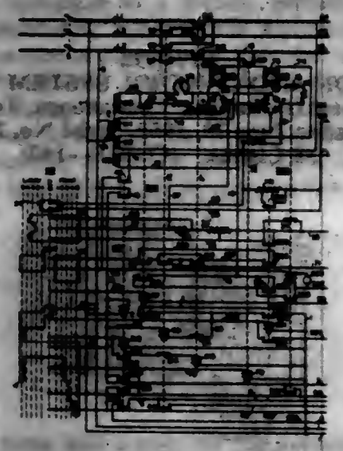
2. In an electromagnetic device including stator means and rotor means, a plurality of groups of stator poles and associated rotor poles, said groups of stator and rotor poles being relatively positionally phased, a plurality of winding means for said groups of poles, means including current control means for supplying current to said group winding means in predetermined order, means for limiting movement of said rotor means in a direction opposite to the direction as determined by the order of energization of said group winding means, and means for reversing effective direction of said rotor movement-limiting means.

38. In a machine tool system, a plurality of movable members, a plurality of three phase step motors for causing movement of said members, a plurality of electronic tubes for supplying current to the phases of said motors, a belt or tape having three rows of spaced characteristics for each said motor, means for sensing said characteristics, means associating said sensing means with said electronic tubes to control said tubes in accordance with said characteristics, means for moving said belt or tape, and biased locking means to permit only one way rotation of the rotors of said motors, and means for reversing the effective direction of braking of said brake means.

---

2,774,923

## ELECTRIC CONTROL FOR ALTERNATING-CURRENT MOTOR



William R. Wickersham, Buffalo, N. Y., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

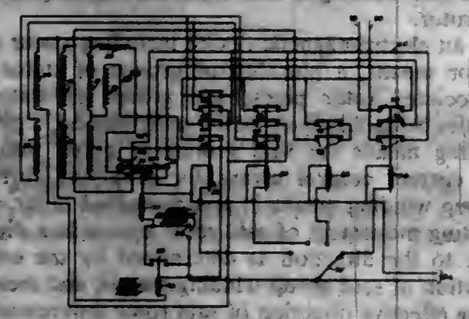
Application March 21, 1952, Serial No. 277,749

6 Claims. (Cl. 318—282)

1. In a system of control for an induction motor, in combination, an induction motor having a primary winding and a secondary winding, said motor being coupled to a machine having a moment arm of a selected length at the output end of the machine, first means responsive to the force at the end of the moment arm for producing a voltage proportional to such force, second means responsive to the speed of the motor for producing a voltage proportional to motor speed, voltage unbalancing control means for unbalancing the voltage of the energy

supply to the motor to change the torque characteristics of the motor, and means for modifying the operation

of said voltage unbalancing control means by the electrical voltages produced by said first and second means.



---

**2,774,924**

**MULTISPEED SINGLE PHASE MOTOR**

Stanley Wild, St. Louis, Mo., assignor to Century Electric Company, St. Louis, Mo., a corporation of Missouri

Application February 24, 1953, Serial No. 338,487
8 Claims. (Cl. 318—224)

1. A multispeed single phase motor comprising a primary winding arranged to selectively produce a first or a second predetermined number of poles, said primary winding including a tapped section comprising at least two poles selectively connectible in series to form alternate poles of like instantaneous polarity for producing said first predetermined number of poles or in parallel to form adjacent poles of opposite instantaneous polarity for producing said second predetermined number of poles, and an auxiliary winding wound in slots adjacent the slots occupied by said two poles of said tapped section and having polar axes coaxial with the polar axes of said two poles, said auxiliary winding being connected to the tap of said tapped section and energized in series with the windings of said tapped section only when said section is connected to produce said second predetermined number of poles.

---

**2,774,925**

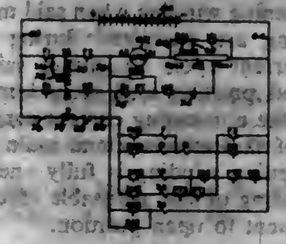
**ELECTRIC MOTOR SPEED CONTROL SYSTEM**

Edward J. Wagner, Berwyn, Ill., assignor to Dormeyer Corporation, Chicago, Ill., a corporation of Illinois

Application April 29, 1953, Serial No. 351,940
2 Claims. (Cl. 318—259)

1. In an electrical series wound motor having an armature winding, a field winding, and a set of brushes engaging the commutator, means for varying the speed of said motor including a fixed resistance, a shiftable rigging and two arcuate contacts concentric with the armature, contact members mounted on said rigging and movable therewith for engagement of said arcuate contacts, one of said arcuate contacts being bipartite and being divided by a space less than the width of the contact member, said resistance being connected between one section of said bipartite contact and the other of said

contacts, whereby said resistance is connected in parallel with the armature when one of said contact members bridges said gap.



---

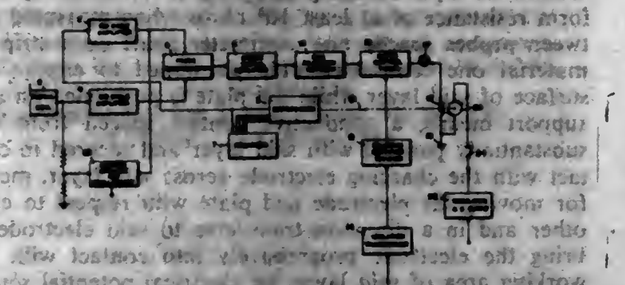
**2,774,926**

**CONTROL CIRCUITS FOR ELECTRIC TRUCKS**

Wilbert M. Gilman, Wellesley Hills, and Peter F. Gardella, Watertown, Mass., assignors to Lewis-Shepard Company, Watertown, Mass., a corporation of Massachusetts

Application August 29, 1952, Serial No. 307,016
6 Claims. (Cl. 318—284)

1. Controlling circuits for use with a direct current motor in an electric driven truck for causing said motor to run in either direction, said circuits including a reversible series field for said motor, a circuit shunted around said motor armature which includes a coil for actuating contactors for establishing circuits for varying the speed of the motor, said shunt circuit having therein a rectifier for preventing flow of current in said shunt in the direction the reverse of that in which current normally flows during acceleration of the said motor in one direction, thereby to prevent the actuation of said coil when said field is reversed before said motor has been stopped and while a counter EMF is being generated by said armature.



---

**2,774,927**

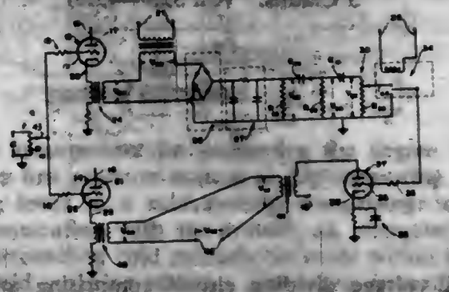
**SPEED CONTROL APPARATUS**

William T. Evans, Beaumont, Tex., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

Application August 25, 1953, Serial No. 376,369
3 Claims. (Cl. 318—314)

2. Apparatus for controlling the speed of a record driving motor during reproduction of a signal from a record driven thereby comprising means for reproducing a signal from a record driven by a record driving motor means for producing a signal related to the recorded signal as it existed at the time of its recording, means producing an output responsive to dissimilarities between the produced signal and the reproduced signal, and means supplying current to said record driving motor normally driving said motor at approximately operating speed and including a power tube having its grid connected to said output and its cathode connected to the record driving motor for regulating the speed of the motor in response to said output.

---



**2,774,928**

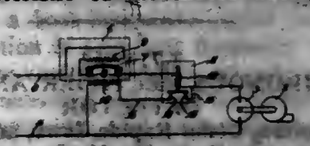
**LEAD NETWORK FOR SERVO-MECHANISMS WITH A. C. CARRIER VOLTAGE**

Thomas D. Johnson, Euclid, Ohio, and Martin G. Seteren, Forest, Pa., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

Application August 26, 1952, Serial No. 306,404
2 Claims. (Cl. 318—448)

1. A lead network for a servo system having displacement-error detecting means which is energized at predetermined carrier frequency and which operates to provide an error voltage, said error voltage being suppressed carrier modulated at displacement-error frequency and in accordance with the sense and magnitude of the displacement-error, said lead network comprising first and second cathode follower circuits, means for applying the error voltage to said cathode follower circuits, said cathode follower circuits operating as buffer means and respectively providing first and second voltages corresponding to said error voltage, means providing a reference voltage at said carrier frequency and of preselected magnitude exceeding the magnitudes of said first voltage, means for adding said reference voltage to the first voltage to produce a sum voltage, means for rectifying and filtering said sum voltage to produce a unipolar voltage having an amplitude modulation component corresponding to the displacement error, means for isolating the modulation component of said unipolar voltage, means for deriving from said modulation component a voltage corresponding to the first time-derivative of the displacement-error, a D. C.-A. C. chopper circuit, including buffer means having high input impedance, for converting the first time-derivative voltage to a third voltage having said carrier frequency and suppressed carrier modulated in accordance with said first time-derivative voltage, and means for adding said third voltage to said second voltage to produce a lead-modified error voltage.

---



**2,774,929**

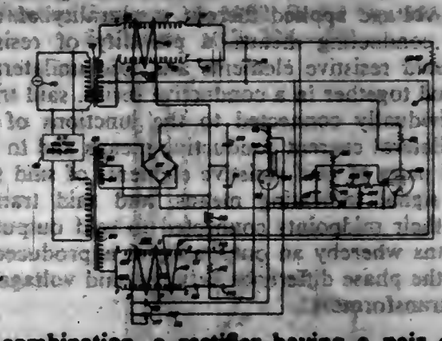
**UNDER LOAD PROTECTIVE SYSTEM FOR ELECTRIC MOTOR**

Edward J. Schaefer, Fort Wayne, Ind.

Application May 27, 1953, Serial No. 357,821
15 Claims. (Cl. 318—474)

1. In a pumping system of the type wherein the pump load decreases when the supply of working fluid for the pump is exhausted, the combination of an electric motor, a pump having a driving connection with the motor, a line for connecting the motor to a source of electrical energy, and a protective circuit for protecting the motor and pump against lack of working fluid comprising heat-responsive means interposed in the line for interrupting the supply of electrical energy to the motor, electric heating means disposed in operative relation adjacent said heat-responsive means, and relay means connected in circuit with the motor and responsive to an electrical characteristic of the motor during underload

operation for energizing said heating means whereby to actuate said heat-responsive means for stopping the motor when the liquid supply of working fluid for the pump is exhausted.



---

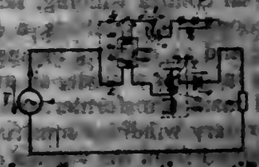
**2,774,930**

**REGULATED RECTIFYING APPARATUS**

William H. Bixby, Detroit, Mich., assignor to Donald R. Middleton and Stanley M. Hanley, doing business under the name and style of Power Equipment Company, Detroit, Mich., a copartnership

Application July 18, 1955, Serial No. 522,634
13 Claims. (Cl. 321—18)

7. In combination, a rectifier having a pair of input terminals and a pair of output terminals, means having resistance for supplying current from an alternating-current supply source to said rectifier input terminals, a constant voltage device, a current path comprising said constant voltage device connected to said rectifier output terminals, means comprising said constant voltage device for setting up a reference voltage which is substantially constant over an operating range of current including a predetermined minimum current supplied to said constant voltage device, a shunt current path connected across said rectifier input terminals, and means for reducing the impedance of said shunt current path to cause the current supplied to said constant voltage device to be reduced below said predetermined minimum current, thereby reducing said reference voltage below said substantially constant voltage.



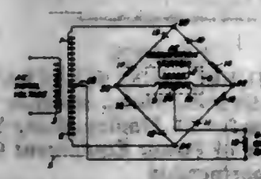
---

**2,774,931**

**ALTERNATING CURRENT SWITCHING DEVICE**

Fritz Kesselring, Zollikon-Zurich, Switzerland, assignor to FKG Fritz Kesselring Gerätebau A. G., Bachtobel-Weinfelden, Thurgau, Switzerland, a corporation of Switzerland

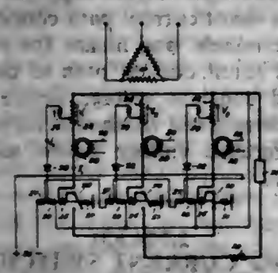
Application March 18, 1953, Serial No. 343,078
Claims priority, application Switzerland March 22, 1952
11 Claims. (Cl. 321—27)



1. In a parallel path magnetic rectifier comprising a first and a current path; a diode in said current path; a compensating means; said compensating means magnetically coupling said first path to said current path; electrical biasing means for said first path; said compensating means neutralizing the effect of said biasing means at a predetermined time within the conducting

cycle of said rectifier; said compensating means being a transformer; said electrically biasing means being a D. C. source.

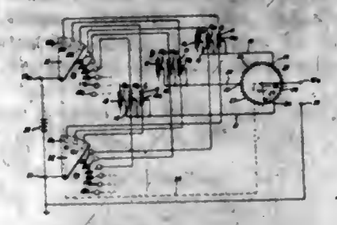
---



2,774,932
SYNCHRONOUS RECTIFIER AND PHASE DETECTOR
Henry W. Patton, Cedar Rapids, Iowa, assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa
Application December 8, 1954, Serial No. 473,994
4 Claims. (Cl. 321—47)

1. A phase detector and synchronous rectifier comprising a plurality of transformers each having an alternating current voltage applied thereto, a plurality of unilateral current conducting means, a plurality of resistive elements, said resistive elements and said unilateral means connected together in a conductive series, said transformers individually connected to the junctions of pairs of said unilateral current conducting means and to the junctions of pairs of said resistive elements of said series, an output signal indicating means, and said transformers having their midpoints connected to said output indicating means whereby an output signal is produced responsive to the phase difference between said voltages applied to said transformers.

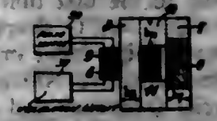
---



2,774,933
BY-PASS CIRCUIT FOR ELECTROMAGNETIC RECTIFIERS
Fritz Kesselring, Zollikon Zurich, and Ernst Egli, Aarau, Switzerland, assignors to FKG Fritz Kesselring Gerätebau, A. G., Bachtobel-Weinfelden, Switzerland, a corporation of Switzerland
Application January 13, 1955, Serial No. 481,678
8 Claims. (Cl. 321—48)

1. An electromagnetic rectifier supplying a D. C. load from a three phase A. C. source comprising a main transformer, commutating reactors, electromagnetic switches and by-pass circuits; said main transformer having a three phase primary winding and a three phase secondary winding; said commutating reactors having a main winding and a flux reversal control winding; said electromagnetic switch having cooperating contacts, a closing winding, a holding winding and an opening means; said by-pass circuits comprising in series a diode, an auxiliary secondary winding of said main transformer and said closing coil; each of said auxiliary windings constructed to have their voltage phase shifted from the voltage of the corresponding main secondary winding; each phase of said electromagnetic rectifier comprising in series one of said main transformer secondary windings, commutating reactor main windings, holding windings and electromagnetic switch cooperating contacts; each phase of said three phase transformer winding connected to deliver power to said D. C. load when said electromagnetic switch cooperating contacts are engaged; each main secondary winding of said main transformer connected in parallel with a by-pass circuit; said auxiliary secondary winding voltage and the impedance of said by-pass circuit constructed to energize said closing coil sufficiently to close said cooperating contacts when the voltage across said cooperating contacts is zero, said auxiliary winding voltage to maintain current in said by-pass circuit until the voltage of said auxiliary secondary winding reverses.

---

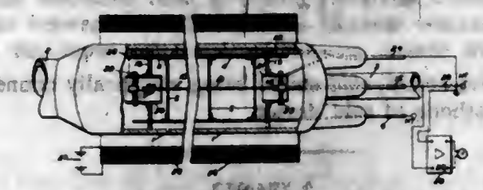


2,774,934
VOLTAGE DIVIDER WITH ADJUSTABLE OUTPUT CHARACTERISTIC
Louis G. Gitzendanner, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application June 5, 1953, Serial No. 359,796
3 Claims. (Cl. 323—43.5)

1. A voltage dividing circuit comprising a plurality of impedance elements each having an adjustable tap, an endless circular potentiometer having three spaced fixed taps and a movable output tap, switching means for consecutively connecting each fixed tap to the adjustable taps of different impedance elements, and a mechanical connection between said switching means and said movable output tap for correlating their movement and maintaining said output tap throughout its movement always in contact with a portion of said potentiometer between the fixed taps not being switched.

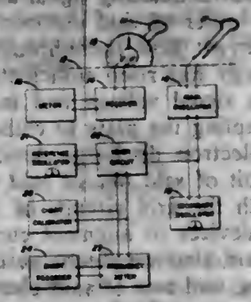
---

2,774,935
INDUCTANCE ASSEMBLY SUCH AS A TRANSFORMER FOR THE TRANSMISSION OF PULSES
Adriaan Rademakers and Hugo Georg Bruyning, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application May 29, 1953, Serial No. 358,312
Claims priority, application Netherlands June 3, 1952
4 Claims. (Cl. 323—56)



1. An inductive system comprising a highly permeable ferromagnetic core, said core having an air-gap therein bounded by core surfaces having given cross-sectional dimensions and a given length dimension, a permanent magnet disposed in said air-gap and defining with said core a closed magnetic circuit, said permanent magnet being magnetized in the direction of length of the air-gap and having cross-sectional dimensions parallel to said core surfaces which are smaller than the dimensions of said surfaces thereby producing a shunting air-gap, said magnet consisting of an electrically non-conductive permanent magnetic material having a ratio of remanence to coercive field strength of less than 4, primary and secondary windings on said core, and means for applying an alternating current varying between two extremes to said primary winding, said magnet having a field intensity at which said core is substantially saturated in one direction at one extreme of said alternating current, said other extreme of said alternating current having a polarity at which a field is produced in said core opposing the field of the permanent magnet and having a magnitude at which said core is saturated in the opposite direction to said one direction, said shunting air-gap cooperating to prevent said opposing field from substantially demagnetizing said magnet.

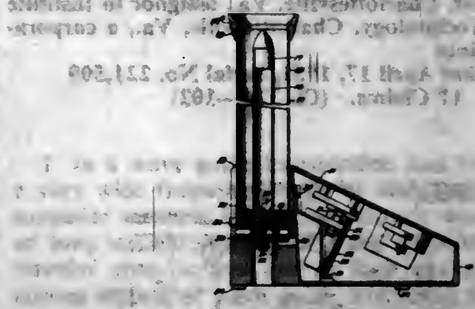
---



2,774,936
IONISATION MANOMETERS
Arnold Hugh William Beck and Alan Douglas Brisbane, London, England, assignors to International Standard Electric Corporation, New York, N. Y.
Application July 27, 1953, Serial No. 370,550
Claims priority, application Great Britain July 29, 1952
4 Claims. (Cl. 324—33)

2. An arrangement for estimating the degree of vacuum in a low pressure system or for measuring and/or detecting leaks in a said system, comprising: a vessel in communication with the system; an elongated anode and a surrounding cold cathode electrode within the said vessel; field emission surfaces protruding inwardly from the cathode electrode intermediate the ends thereof; means, including the provision of a magnetic field axially of the anode and cathode electrodes, for causing electrons emitted from the said surfaces to follow helicoidal paths about the said axis; and means for measuring changes of current flowing between the said anode and cathode electrodes, the measuring means comprising means for amplifying the voltage or voltage change across a load resistor, the said anodes being mounted by insulating means between a pair of guard electrodes and the guard electrodes being positioned by further insulating means locating the anode in respect to the cathode, the said guard electrodes being connected to one end of the said load resistor so as to by-pass leakage currents between anode and cathode.

---

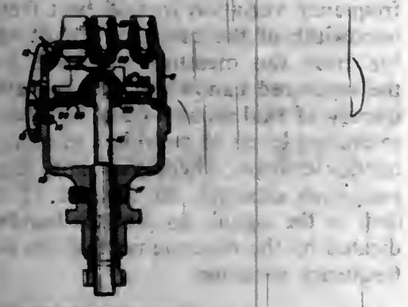


2,774,937
METHOD OF MEASURING Q
Mitchell H. Dunn, Palos Verdes Estates, Calif., assignor to the United States of America as represented by the United States Atomic Energy Commission
Application June 3, 1953, Serial No. 359,269
2 Claims. (Cl. 324—58)

2. A method of measuring the Q of a resonant cavity or circuit comprising the steps of measuring the excitation level in the cavity or circuit, energizing the circuit or cavity with a first signal and varying the frequency thereof to the maximum excitation level as indicated by the measuring step whereby said frequency is the resonant frequency, combining a second variable frequency signal with said first signal to produce an energizing signal having a frequency equal to the sum frequency of the first and second signals and varying the frequency of said second signal between the .707 maximum excitation levels as indicated by the measuring step, mixing with said second signal a reference signal having a constant frequency substantially equal to that of said second signal to produce a beat frequency signal, measuring the frequency variation in said beat frequency signal as the bandwidth of the cavity or circuit whereby Q is calculable from the measured resonant frequency divided by the measured bandwidth, and repeatedly varying the frequency of said second signal between the .707 maximum excitation levels to provide a plurality of measurable frequency changes whereby identity between the frequency variations establish the absence of non-linear frequency drift in the signals so that the bandwidth is properly indicated by the measurement of the beat frequency signal frequency variation.

---

2,774,938
ELECTRONIC MOISTURE METER
Julius A. Edinburgh, Houston, Tex., assignor to University of Wichita Foundation for Industrial Research, Wichita, Kans., a Kansas foundation
Application January 15, 1952, Serial No. 266,580
5 Claims. (Cl. 324—61)

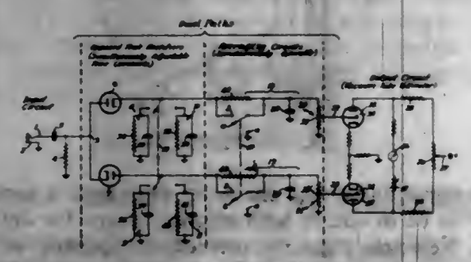


5. In apparatus of the character described, a condenser adapted to be in circuit with electric means for determining the dielectric capacity thereof, comprising an elongated inner cylindrical shell open at both ends and having a length substantially greater than its diameter, a cone-shaped plug mounted within the upper end of said inner shell and providing a closure therefor, an outer cylindrical shell having a diameter substantially greater than the diameter of said inner shell and a length exceeding the length of said inner shell and having an upper edge terminating in substantial alignment with the upper end of said plug, an insulating funnel carried by the upper end of said outer shell and extending thereabove, and insulating support means providing a bottom closure for said outer shell and providing also a support for said inner shell to hold the same in substantially coaxial relation within said outer shell, said condenser being adapted to receive a quantity of grain to an elevation above the end of said plug and above the upper edge of said outer shell so that a portion of grain being tested is operative to substantially eliminate the end capacitive effects of said condenser whereby the accuracy of the dielectric measurement is increased.

---

2,774,939
ELECTRIC TACHOMETER
Warren Walker Hastings, Rochester, N. Y., assignor to Rochester Manufacturing Company, Inc., Rochester, N. Y., a corporation of New York
Application May 18, 1955, Serial No. 509,305
5 Claims. (Cl. 324—70)

1. A tachometer comprising a rotary member, a wire-wound resistor comprising a core and a coil of wire wound about the axis of said core, a shaft mounted in said rotary member and having an eccentric bearing portion offset from its axis, and perpendicular to the axis of said core and on which said core is mounted to pivot about an axis parallel to the axis of said rotary member under centrifu-

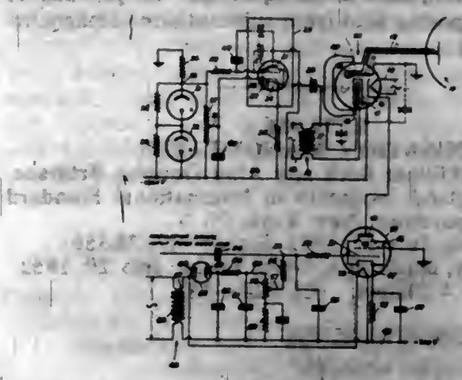


gal force as said rotary member rotates, and an electrically-conducting leaf spring having rolling contact with said resistor as said resistor pivots, and means connecting

said spring and one end of said coil electrically in circuit to actuate an indicator, said shaft being rotatably adjustable to calibrate the tachometer.

---

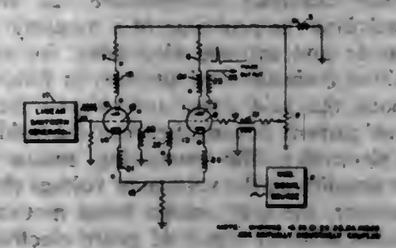
2,774,940
## AUTOMATIC EVALUATOR
Edwin J. Berset, Charlottesville, Va., assignor to Institute of Textile Technology, Charlottesville, Va., a corporation of Virginia
Application April 17, 1951, Serial No. 221,569
11 Claims. (Cl. 324—102)



7. A system for automatically and continuously evaluating uniformity of an electrical potential having random variations of amplitude and frequency of occurrence and therefore of constantly changing mean, which includes a plurality of rectifier means proportioned and arranged to be separately and selectively responsive to the outward and inward peaks of said variations but substantially unresponsive to frequency variations thereof, means for independently averaging the outward and inward peaks of said variations, means for deriving a first averaged potential from said outward peaks only, means for deriving a second, averaged potential from said inward peaks only, said averaged potentials being of opposite sign, means establishing two currents, a plurality of separate means respectively responsive to said first and second potentials for controlling said currents, respectively, and for establishing a potential from each controlled current and means for measuring the difference between said last-named potentials.

---

2,774,941
## COMMUNICATION SYSTEMS
David P. Kennedy, Cambridge, Mass., assignor to Raytheon Manufacturing Company, Newton, Mass., a corporation of Delaware
Application November 14, 1952, Serial No. 320,553
2 Claims. (Cl. 332—5)



1. An electron discharge system comprising a magnetron, said magnetron having a main cathode, said cathode having a heater substantially insulated therefrom and a power supply for said magnetron, said power supply comprising a degenerative feedback amplifier stage comprising a grid-controlled electron discharge device having a load impedance in the cathode circuit thereof, and the main cathode of said magnetron in the anode circuit of said device, said device being substantially surrounded by a

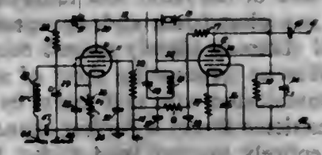
conductive shield, said shield being electrically connected to the cathode of said device.

---

2,774,942
## TIME MODULATORS
Irving F. Barditch, Baltimore, Md., assignor to Aircraft Armaments, Inc., Baltimore, Md., a corporation of Ohio
Application February 2, 1953, Serial No. 334,623
5 Claims. (Cl. 332—9)

1. A time modulator comprising, a pair of electron discharge devices, each including an anode, a cathode and a control grid electrode, a source of direct current potential connecting with each said anode, a modulating signal source connecting with the grid of one of said electron discharge devices for controlling current flow therethrough, the cathodes of said electron discharge devices being connected together for maintaining a common cathode voltage for both said pair of electron discharge devices which is proportional to said modulating signal voltage, a sawtooth wave generator, generating linear sawtooth wave energy at a frequency greater than the frequency of said modulating signal and connecting with the grid of the other of said electron discharge devices for effecting current flow therethrough when said sawtooth wave energy has risen sufficiently with respect to said modulating signal voltage and inductive means regeneratively coupling the plate to cathode circuit of said other of said electron discharge devices with the plate to cathode circuit of said one of said electron discharge devices and with the grid circuits of both of said electron discharge devices to augment current flow through said other of said electron discharge devices and simultaneously driving said one of said electron discharge devices beyond the cut-off when current flow is effected through said other of said electron discharge devices.

---



2,774,943
## FREQUENCY MODULATED OSCILLATOR
Robert H. Watson, Sunnyvale, Calif., assignor to Sierra Electronic Corporation, San Carlos, Calif., a corporation of California
Application June 30, 1952, Serial No. 296,365
1 Claim. (Cl. 332—28)

In an electronic oscillation generator, amplifying means

including a vacuum tube having plate, control grid and cathode elements, a reactive circuit having a resonant frequency higher than the frequency range of operation of the generator and including elements of inductance and capacitance, a variable reactance tube forming a part of said circuit and having plate, control grid and cathode elements, said inductive element being connected in shunt with the plate to cathode path of the reactance tube, means serving to supply plate current to said reactance tube, phase shifting means forming a part of said circuit and including a resistor in series with a condenser and coupled across the plate to cathode path of the variable reactance tube, a lead connecting the point of connection between said resistor and condenser to the control grid of the reactance tube, a crystal resonator connected in series between the plate of the variable reactance tube and the input of the amplifier, an output lead from

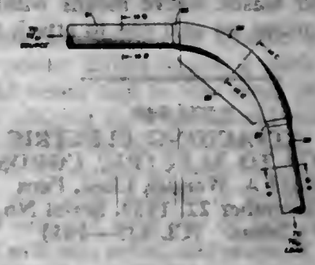
the amplifier connected to the plate of the variable reactance tube, said crystal resonator together with said reactive circuit forming a network connecting the output of the amplifier to the amplifier input, said reactive circuit having a resonant frequency higher than the frequency range of operation, the component values of reactance and resistance of the crystal resonator together with the component values of the amplifier input impedance being so proportioned with respect to the component reactance elements of said reactive circuit that the voltage developed across the reactive circuit leads the amplifier equivalent generator voltage and whereby the amplifier input voltage is in phase with the equivalent generator voltage, said generator serving to provide a frequency modulated signal output responsive to application of control voltage to the control grid of the variable reactance tube.

---

2,774,944
## SPACER DISK ARRANGEMENT FOR COAXIAL CABLES OR THE LIKE
Hermann Lintzel, Berlin-Siemensstadt, Germany, assignor to Siemens & Halske Aktiengesellschaft, Munich and Berlin, Germany, a corporation of Germany
Application May 28, 1955, Serial No. 510,004
In Germany October 1, 1948
Public Law 619, August 23, 1954
Patent expires October 1, 1968
8 Claims. (Cl. 333—96)

1. A spacing disk arrangement for high frequency lines comprising an inner and an outer conductor, a spacing disk for the inner conductor entering into an annular groove formed in at least one of said conductors and being held thereby, the ratio between the inner diameter D of the outer conductor and the outer diameter $d$ of the inner conductor corresponding to

$$\ln D/d = \frac{Z\sqrt{\epsilon}}{60}$$



wherein Z is the characteristic impedance of the adjoining line and $\epsilon$ the dielectric constant of the disk material, the diameter ratio $D/d$ being such as to satisfy with respect to the characteristic impedance of the adjoining line the requirement

$$Z = \frac{60 \ln D/d}{\sqrt{\epsilon}}$$

and wherein auxiliary recesses are formed in at least one of the coacting elements comprising the conductors and the spacing disk, to produce in operation in axial direction along the entire spacing disk a characteristic impedance which corresponds substantially to that of the adjoining line.

---

2,774,945
## METHODS AND APPARATUS FOR TRANSMITTING CIRCULAR ELECTRIC WAVES IN WAVE GUIDES
Stewart E. Miller, Middletown, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application November 10, 1951, Serial No. 255,835
4 Claims. (Cl. 333—98)

1. In a wave guide transmission line for transmitting a very wide frequency range of high frequency electromagnetic waves in the circular electric mode, a plurality of long straight sections of wave guide of substantially circular cross section and at least one relatively short curved section of wave guide interposed between consecutive ones of said straight sections, said curved section having a substantially elliptical cross section to substantially eliminate the tendency of the circular electric mode wave to degenerate into other modes of wave energy.

---

2,774,946
## CONTROLLER FOR WAVE GUIDE TUNER, PHASE SHIFTER, OR ATTENUATOR
Claire D. McGillem and Frank E. Hasseld, Jr., Indianapolis, Ind., assignors to the United States of America as represented by the Secretary of the Navy
Application March 12, 1954, Serial No. 415,987
10 Claims. (Cl. 333—98)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. In a waveguide a means for controlling the microwave energy therein comprising, a pair of circular openings through a wall of the waveguide in longitudinal relation, a pair of circular elements rotatably journaled in said circular openings respectively with the inner face of each flush with the inner surface of said waveguide and being coupled to rotate in unison, and an elongated microwave control element in said waveguide and lying longitudinally thereof, said control element being pivotally associated with said pair of circular elements at separate points whereby rotation of either circular element of said pair will shift said control element laterally in said waveguide.

---

2,774,947
## SEALING MEANS ON FIXTURES FOR FLUORESCENT TUBES
Otto Fresenius, Zurich, Switzerland
Application January 24, 1952, Serial No. 268,019
Claims priority, application Switzerland January 25, 1951
1 Claim. (Cl. 339—69)

A seal assembly for use in connection with the fixture of a fluorescent lighting tube comprising a cap having a

a shallow channel with a plane floor, parallel side walls, mitter and controlled by said pressure responsive means

passage-way for insertion of the tube, elastic sleeve means seated within a recess provided in said cap and including a sealing portion deformable in radial direction to said tube to thereby bring about tight contact of said sealing portion with the surface of said tube, spiral-shaped spring means enclosed within said sleeve means and engaging said sealing portion for deforming the latter into said

tight contact, means located within said cap and engaging said elastic sleeve means to retain the latter in said recess of said cap, said retaining means and said spring means being arranged spaced apart from each other and being embraced by said elastic sleeve means within said cap, and engageable means on said cap to attach the latter to a support.

---

2,774,948

## MEANS FOR ATTACHING ELECTRIC SOCKET PLUGS TO ELECTRIC CORDS

Clifford A. Wendel, Lima, Peru

Application November 22, 1954, Serial No. 470,264
5 Claims. (Cl. 339—101)

1. Means for attaching an electric socket plug to an electric cord comprising a handle forming sleeve adapted for attachment at one end to said plug and for extension of an electric cord therethrough, said sleeve having a hollow core of bendable material secured therein and adapted to surround said cord, said core being deformable by compression into permanently flattened shape for friction gripping engagement with said cord.

---

2,774,949

## INVERTIBLE SOCKETS OR RECEPTACLES

Charles P. Cardoni, South Hamilton, and Joseph Harrington, Jr., Wenham, Mass., assignors to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey

Application May 20, 1955, Serial No. 509,772
4 Claims. (Cl. 339—128)

4. The combination with a work support having a circular socket-receiving opening defined by walls formed with peripherally spaced slots and a cylindrical tube socket mounted in said opening having peripheral lands extending between its end faces and adapted to register with said slots when presented from either side of the support with either end face in up position, said socket having a plurality of peripheral grooves adapted to receive, respectively, the outer ends of pin-receiving contacts formed with axially spaced latching shoulders, the periphery of the socket being additionally formed with other lands spaced between said end faces and having stop surfaces parallel thereto for abutting either side of said support to fix the position of the socket therein in cooperation with said latching shoulders.

2,774,950

## ELECTRONIC SOCKET

Ervin J. Hobson, Chicago, Ill.

Application April 16, 1954, Serial No. 423,695
1 Claim. (Cl. 339—193)

A contact socket construction characterized by an insulating socket body having a plurality of contact recess formations arranged in a generally circular series, each of said formations including a contact receiving recess extending rearwardly from a forward face of said socket toward a rear face of the latter and terminating short of said rear face in a closed rear end, an opening generally paralleling said recess in closely spaced relation thereto, said opening likewise terminating short of said rear face and being communicated with said recess by an intervening, laterally restricted throat, a further channel-like opening extending entirely through said socket body in generally parallel relation to said recess and first named opening, an axially extending partition between said openings, said partition having a forward end adjacent but in rearwardly retracted relation to said forward socket body face, and a contact in said recess having a conducting lead secured thereto through said restricted throat, said lead extending rearwardly of the socket body through said further opening and being bent around said forward end of said partition, said further opening being internally enlarged therealong to a point just short of its end communication with the rear face of the socket body to provide a removable portion for allowing the introduction of a second lead therethrough.

---

2,774,951

## TERMINAL CLIP

Robert J. Kinkaid, Newville, and Kemper M. Hammell, Harrisburg, Pa., assignors to Aircraft-Marine Products, Inc., Harrisburg, Pa.

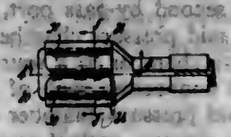
Application December 16, 1954, Serial No. 475,734
6 Claims. (Cl. 339—258)

1. In an electrical connector, a terminal clip having a substantially planar floor and overhanging spring members extending from opposed sides of said floor, a central contact area of said floor being elevated to raise a contact surface for the clip above the sides thereof, said central area being transversely bowed in a continuous curvature from side-to-side thereof to extend the elastic system of said members from the respective terminal edges thereof to the crown of said bow and to counteract substantially the tendency of said area to bow concavely upon insertion of a mating contact blade in said clip.

---

2,774,952

## CONNECTOR MEMBER WITH CURVED FLANGE EXTENSIONS



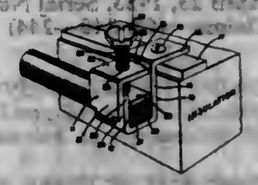
Hugh W. Batcheller, Newton Highlands, Mass., assignor to Kent Mfg. Corp., Newton, Mass., a corporation of Massachusetts

Application October 6, 1954, Serial No. 460,631
4 Claims. (Cl. 339—258)

1. A female electrical connector member consisting of a single piece of sheet metal bent into the form of

a shallow channel with a plane floor, parallel side walls at the sides of the floor, a narrow flange projecting inward from each wall parallel to the floor, and a resil-

ient extension on each said flange having its free end disposed above the middle portion of said floor and nearer thereto than are said flanges.



---

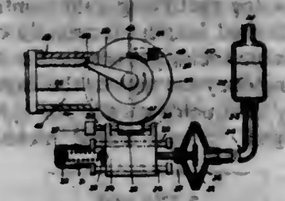
2,774,953

## SOLDERLESS LUG AND CONNECTOR FOR ELECTRICAL CABLES

Raymond T. Trier, Canton, Ohio, assignor to The Superior Switchboard & Devices Company, Canton, Ohio, a corporation of Ohio

Application March 11, 1954, Serial No. 415,631
2 Claims. (Cl. 339—272)

2. A solderless connector comprising a U-shaped member having a relatively long leg and a relatively short leg, an inverted L-shaped cap having a vertical leg overlying said relatively short leg and a horizontal leg overlying the open end of the U-shaped member, an extension lug upon the rear end of the horizontal leg, an inturned angular lug upon the lower end of the vertical leg, there being apertures complementary to said lugs in the upper portion of the long leg and the lower portion of the short leg respectively to prevent movement of the cap directly upwardly of the open top of the U-shaped member, and a binding screw threaded through the cap for entry into the open end of the U-shaped member, and a clamping plate swiveled upon the end of the screw for clamping inserted wires in the U-shaped member.



---

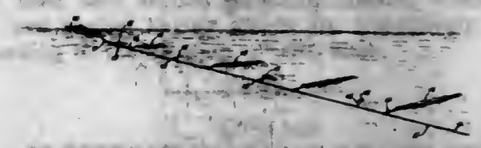
2,774,954

## ATTITUDE COMPENSATED ECHO SOUNDING DEVICE

Ito Yosuke, Minato-ku, Tokyo, Japan, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware

Application May 22, 1952, Serial No. 289,305
Claims priority, application Japan May 24, 1951
5 Claims. (Cl. 340—3)

1. An echo sounding device adapted for mounting on a vessel or the like comprising a pressure wave transmitter adapted to be completely submerged in a fluid supporting said vessel, means for actuating said transmitter to transmit periodically a signal wave for travel through said fluid and reflection from a surface, means submerged in said fluid for the detection of said reflected signal wave, means for producing a variable pressure related to the extent of displacement movements of said vessel, pressure responsive means, and means associated with said transmitter and controlled by said pressure responsive means for varying the time at which said signal waves are transmitted by such a time period as to compensate for said displacement movements.



---

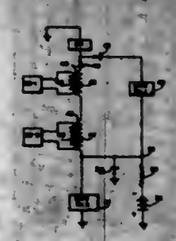
2,774,955

## APPARATUS FOR SUBMARINE SEISMIC PROSPECTING

Eugene James Toomey, Dallas, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware

Application October 29, 1952, Serial No. 317,505
4 Claims. (Cl. 340—7)

1. Apparatus for submarine seismic prospecting that comprises a power driven vessel, a cable adapted to be towed by said vessel and to tow other objects, float and cable means adapted to suspend said cable a short distance below the surface of the water as it is towed by the vessel, a series of elongated horizontally surface floating seismometer platforms, a series of connector cables, each connected at one end with one of said platforms and at its other end with said cable, said series of platforms being connected via said series of connector cables at spaced intervals along said cable, said connector cables being of a length to enable said platforms to float on the surface and swing freely in any direction when not being towed so that said platforms can orient themselves in conformity with wind, waves, and other surface disturbances, at least one seismometer carried by each seismometer platform, each said platform and seismometer combination having a specific gravity only slightly less than that of the water in which it is to operate whereby said platform and seismometer combination will ride in the water substantially awash, electrical connections from each seismometer to the towing vessel, and amplifying and recording equipment on the towing vessel for recording the outputs of the seismometers.



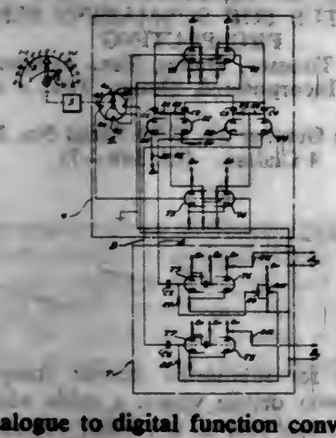
---

2,774,956

## MAGNETIC GATING CIRCUIT FOR CONTROLLING A PLURALITY OF LOADS

Theodore H. Bonn, Philadelphia, Pa., assignor, by mesne assignments, to Sperry Rand Corporation, New York, N. Y., a corporation of Delaware

Application February 28, 1955, Serial No. 490,850
23 Claims. (Cl. 340—174)



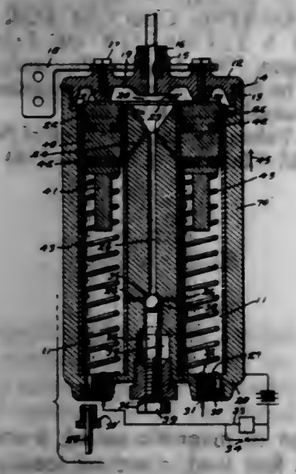
1. In a system of magnetic gating, a source of spaced power pulses, a first load, a second load, means shunted across the first load and in series with both the second load and said source for controlling the flow of current from said source to said loads, the last-named means including at least two magnetic amplifiers each having a control winding and a power winding, said power windings being connected to the source and to said loads to determine flow of current to the latter, and a signal source for each control winding for energizing the control winding during the spaces between power pulses.

2,774,957

## ANALOGUE TO DIGITAL FUNCTION CONVERTER

George H. Towner, San Diego, Calif., assignor to Northrop Aircraft, Inc., Hawthorne, Calif., a corporation of California

Application March 5, 1954, Serial No. 414,309
17 Claims. (Cl. 340—205)



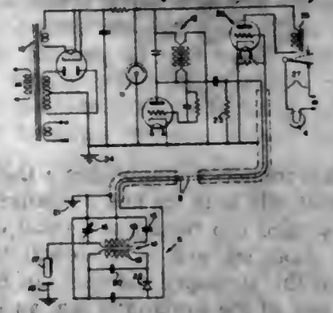
1. An analogue to digital function converter, comprising: an impulse flip-flop circuit having two inputs and two outputs; a gating control flip-flop circuit having two inputs and two outputs; impulse gating means, the outputs of said gating control flip-flop circuit connected thereto for control thereof; differentiating means for producing impulses from the outputs of said impulse flip-flop circuit connecting the impulse flip-flop outputs to the input of said gating means; and means connecting said flip-flop inputs for triggering said impulse and said gating control flip-flop circuits alternately in one sequence for an increasing analogue-represented function and in reversed sequence for a decreasing analogue-represented function, whereby impulses are provided to said gating means and passed therethrough according to the outputs of said gating control flip-flop circuit controlling said gating means.

2,774,958

## SAFETY VALVE AND SIGNAL MEANS FOR HYDRAULIC BRAKES

Eduardo Aldasoro, Mexico City, Mexico, assignor of one-half to Jose Alvarez Cuervo, Mexico City, Mexico

Application March 24, 1954, Serial No. 418,378
3 Claims. (Cl. 340—242)



3. A safety valve for hydraulic systems comprising a housing having at least one pair of spaced apart cylinders therein, said housing having a pressure chamber at one end thereof communicating with each of said cylinders, an imperforate free piston mounted for reciprocation in each of said cylinders, said housing having a by-pass port extending from said pressure chamber to said cylinder beyond the piston when said piston is at the pressure chamber end of said cylinder, said housing having a second by-pass port extending from said pressure chamber to each of said cylinders at the end opposite said pressure chamber, a manually controlled valve normally closing said second by-pass port, a spring biasing said piston toward said pressure chamber, a conduit connecting said pressure chamber to a source of fluid under pressure, a conduit connecting each of said cylinders at the end opposite said pressure chamber to a pressure responsive device, an electric contact mounted in the end wall of said cylinder electrically contacting said piston when said piston is in the lower end of said cylinder, an alarm, and an alarm circuit connected to said electric contact whereby said piston will actuate said alarm upon reaching the bottom of said cylinder.

2,774,959

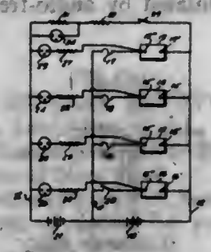
## LEVEL INDICATOR FOR SUPERVISING THE LEVEL OF AGGLOMERATE MATERIALS

Abraham Edelman, New York, and Robert M. Frank, Larchmont, N. Y., assignors to Photobell Company, New York, N. Y., a partnership composed of said Edelman and Johanna E. Edelman

Application April 23, 1953, Serial No. 350,716
8 Claims. (Cl. 340—244)

1. A level indicator for supervising the level of an agglomeration of material having abrasive and impact causing properties, the said indicator comprising two separate units, one of said units including impact sensitive electronic power supply means for generating a high frequency current and impact sensitive signal means and the other unit constituting a level detecting means and including an impact resistant closed casing for suspension in a level supervising position in which it is exposed to direct physical contact with the material to be supervised, capacitance bridge means disposed within said casing for protecting the bridge means from damage by said material, the said bridge means comprising as sensing means a single probe element protruding from the casing electrically insulated therefrom and forming together with its surroundings including said material a component of said bridge means the capacitance of which varies as a function of changes in the spatial relationship of said probe element relative to the material, the said changes in capacitance generating a control signal, and rectifying means for rectifying said control signal; and a cable of any desired length electrically connecting said two units, said cable including conductor means for feeding said high frequency current to the capacitance bridge means and other conductor means for returning the rectified control signal to said signal means.

2,774,960

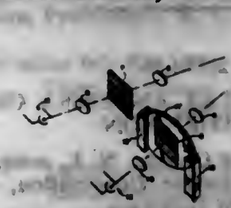


## CURRENT FAILURE INDICATOR

Howard I. Pedoll, Mamaroneck, N. Y.

Application January 6, 1954, Serial No. 402,425
10 Claims. (Cl. 340—250)

1. In an electrical power distribution system having a primary source of power, means for connecting at least one load therewith and current interrupting means in series with said load, an alarm for indicating failure of current in said load comprising an auxiliary power source having one terminal connected to one side of said primary power source, a cold cathode indicator lamp having an ionizing voltage greater than the voltage of said primary power source and greater than the voltage of said auxiliary power source and less than the combined voltage of the auxiliary power source and the primary voltage source, a connection between one terminal of said lamp and the other terminal of said auxiliary source and a connection between the other terminal of said lamp and the junction of said interrupting means and said load whereby opening of said interrupting means will apply a voltage to said lamp approximately equal to the sum of said power sources.

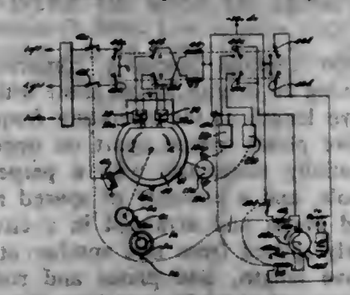


2,774,961

## MOVING OBJECT INDICATOR

Carl Orlando, Long Branch, N. J., assignor to the United States of America as represented by the Secretary of the Army

Application August 30, 1954, Serial No. 453,168
4 Claims. (Cl. 340—258)
(Granted under Title 35, U. S. Code (1952), sec. 266)



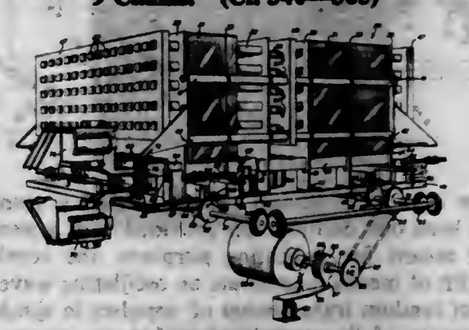
1. A moving object indicator comprising a lens system directable toward an area to be surveyed, a pair of light controlling density wedges each having a linear scale of values said wedges being positioned with their scales at 180° to each other and in position to transmit portions of the light from said lens system, separate photo-electric means for integrating the light transmitted by each wedge, alarm means connected to and controlled by said photo-electric means and nullifying means for canceling the difference in output of said photo-electric means when no change in light energy distribution incident on said wedges takes place whereby when a change in light energy occurs the alarm will be sounded.

2,774,962

## ELECTRICAL KEYER

Stuart Randall Hennies, Palo Alto, and Donald D. Keep, Inglewood, Calif., assignors to Northrop Aircraft, Inc., Hawthorne, Calif., a corporation of California

Application December 7, 1953, Serial No. 396,615
11 Claims. (Cl. 340—359)



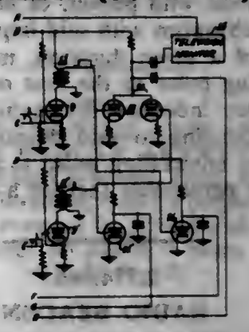
1. An electrical keyer, comprising: a knob having a calibrated dial thereon; fixed pointer, said dial indicating against said pointer; first switching means actuated by rotation of said knob in one direction; second switching means actuated by rotation of said knob in the other direction; first control means responsive to the actuation of said first switching means; second control means responsive to the actuation of said second switching means; first keying means; second keying means; and driving means for actuation of said keying means and resetting said first and second switching means, said driving means for actuating of said keying means and actuate said first keying means and reset said first switching means and said driving means controlled by said second control means to actuate said second keying means and reset said second switching means, whereby said first and second keying means are respectively actuated according to the rotation of said knob.

2,774,963

## ELECTROMECHANICAL TRANSLATOR

John M. Melick, Cranhill, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application March 6, 1953, Serial No. 340,717
9 Claims. (Cl. 340—365)



1. A card translator comprising a plurality of perforated metallic cards; a plurality of stationary contact members passing through said metallic cards; means for selecting any one of said metallic cards; and means for moving said selected card to cause said selected card to make electrical contact with an individual combination of some of said plurality of contact members.

2,774,964

## AUTOMATIC RADAR TARGET TRACKING SYSTEM

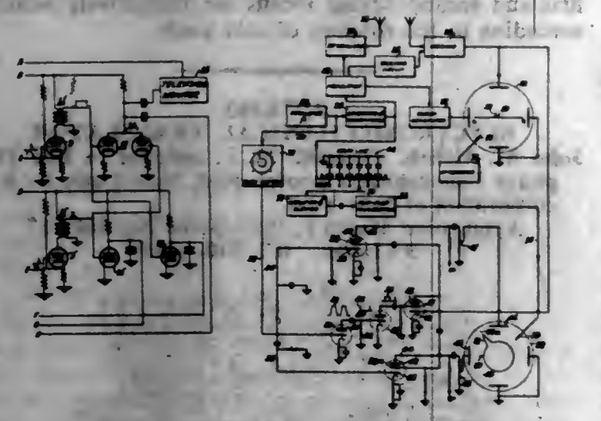
Richard E. Baker, Indianapolis, Ind., and Frank D. Covely, Collingswood, N. J., assignors to Radio Corporation of America, a corporation of Delaware

Application April 28, 1951, Serial No. 223,508
5 Claims. (Cl. 343—7.3)

1. A system for automatically tracking a moving radar target for use with a radar system which records the positional location of radar targets within its service area comprising, means for producing an electrical charge pattern representative of the ranges and azimuths of said radar targets, means coupled to said charge pattern producing means for generating signals for producing in said charge pattern an area of charge which surrounds an image in said charge pattern corresponding to a radar

target to be tracked, and means responsive to movement of said target for controlling said signal generating means to maintain said image positioned within said area of charge.

---



2,774,965

**RADIO DETECTION SYSTEM**

Louis A. De Rosa, Staten Island, N. Y., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland

Application February 6, 1943, Serial No. 474,967

10 Claims. (Cl. 343—13)

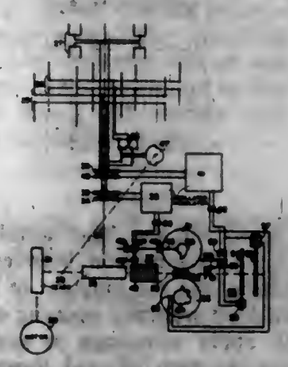
1. In a radio detection system having a transmitter, and at least one oscillograph provided with a sweep producing means for indicating purposes, the combination therewith of means to generate an oscillating wave, means to effect random transmission of impulses in synchronism with certain of the periods of said wave, means to synchronize the sweep of said oscillograph with periods of said wave, means to generate in synchronism with said impulses a sweep controlling pulse of duration equal approximately to a period of said wave, and means to apply said sweep controlling pulse to said oscillograph to control the perceptibility of the sweep thereof.

2. In a radio detection system having a transmitter, a receiver and first and second oscillographs for indicating an echo pulse, produced by an obstacle in response to a transmitted impulse, the combination therewith of means to generate an oscillating wave of a given frequency, means to synchronize transmission of impulses with certain of the periods of said wave, means to synchronize the sweep of the first oscillograph with the transmission of said impulses, means to synchronize the sweep of the second oscillograph with periods of said wave, means to generate in synchronism with said impulses a sweep controlling pulse of a given duration, means to apply the sweep controlling pulse to the first oscillograph to produce a reference indicator designating a time interval thereon corresponding to said duration, and means to apply the sweep controlling pulse to the second oscillograph to render perceptible thereon a sweep of the same duration.

---

2,774,966

**RADIO BEACON**



Carl-Erik Granqvist, Lidingo, Sweden, assignor to Hazeltine Research, Inc., Chicago, Ill., a corporation of Illinois

Application January 5, 1953, Serial No. 329,521

Claims priority, application Sweden February 23, 1952

10 Claims. (Cl. 343—106)

1. A radio beacon comprising: a radiating system having a first radiation pattern of the shape of a sharply concentrated beam and a second radiation pattern of the general shape of a figure eight disposed with its axis normal to the axis of said beam; driving means coupled to said system for simultaneously rotating said patterns; a circuit for supplying a first carrier-frequency wave signal intermittently modulated by audio-frequency bearing in-

formation at predetermined angles of rotation of said first pattern; a circuit for supplying a second carrier-frequency wave signal intermittently modulated by an audio-frequency signal coincident with said intermittent modulation of said first wave signal; and means coupled to said circuits for applying said wave signals to said radiating system.

---

2,774,967

**BALANCED DOUBLET ANTENNA OF SMALL DIMENSION**

Frank J. Landberg, East Orange, N. J., assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware

Application November 19, 1949, Serial No. 128,332

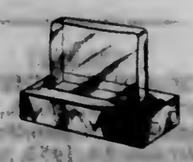
5 Claims. (Cl. 343—815)

3. A radio antenna assembly comprising a dipole radiator having an overall length short with respect to a quarter wave length at the operating frequency, a pair of conductive plates spaced apart on opposite sides of and substantially concentric with a perpendicular axis of said dipole, and a plurality of spaced rods interconnecting said plates and arranged in a circular pattern, and regularly spaced from one another at substantially a tenth wave length, said plates and rods forming a resonator cage substantially matching the impedance of said antenna to the radiation space at said operating frequency.

# DESIGNS

## DECEMBER 18, 1956

179,404



**TELEVISION RECEIVER**

William R. Aiken, Los Altos, Calif., assignor by mesne assignments, to Kaiser Aircraft & Electronics Corporation, a corporation of New York

Application January 21, 1955, Serial No. 34,118

Term of patent 14 years

(Cl. D56—4)

---

179,405

**EXPANSIBLE LINK CHAIN FOR A BRACELET OR SIMILAR ARTICLE**

Karl C. Augenstein, Cranston, R. I., assignor to Speidel Corporation, Providence, R. I., a corporation of Rhode Island

Application July 18, 1956, Serial No. 42,286

Term of patent 14 years

(Cl. D45—4)

---

179,406

**CHAIR GLIDE**

Philip D. Becker, Hingham, Mass.

Application January 24, 1956, Serial No. 39,889

Term of patent 14 years

(Cl. D10—6)

---

179,407

**CANISTER OR SIMILAR ARTICLE**

Charles O. Bliss, Los Angeles, Calif.

Application July 10, 1956, Serial No. 42,192

Term of patent 14 years

(Cl. D44—6)

179,408

**RUBBER FLOOR COVERING OR SIMILAR ARTICLE**

Alan Brown, Higganum, Conn., assignor to The Buxbaum Company, Canton, Ohio, a corporation of Ohio

Application December 21, 1955, Serial No. 39,413

Term of patent 3½ years

(Cl. D92—4)

---

179,409

**TOY STRUCTURE**

Bruno Prochera, Oyster Bay, N. Y.

Application March 29, 1956, Serial No. 40,830

Term of patent 14 years

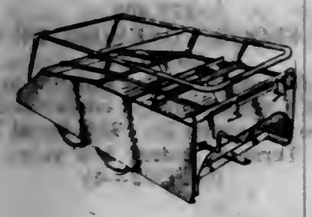
(Cl. D34—15)

---

179,410

**COMBINED COASTER AND ASH TRAY OR SIMILAR ARTICLE**

Donald J. Burke, East Cleveland, Ohio, assignor to Erico Products, Inc., Cleveland, Ohio, a corporation of Ohio



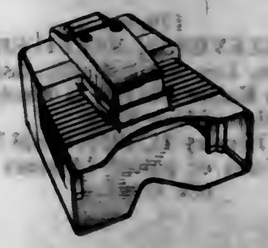
Application November 2, 1955, Serial No. 38,694

Term of patent 7 years

(Cl. D44—10)

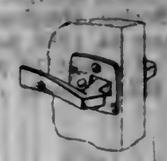
179,411
LAWN CULTURE TRAILER
Joseph Coopersmith, New York, N. Y., and Francis W. Ruzicka, Florham Park, N. J., assignors to Liquilawn, Inc., New York, N. Y., a corporation of New York
Application November 28, 1955, Serial No. 39,054
Term of patent 14 years
(Cl. D14—3)

179,412
LINE MEASURING DEVICE
Carlyle A. Crecelius, Cove, Wash.
Application May 27, 1955, Serial No. 36,251
Term of patent 3½ years
(Cl. D52—1)

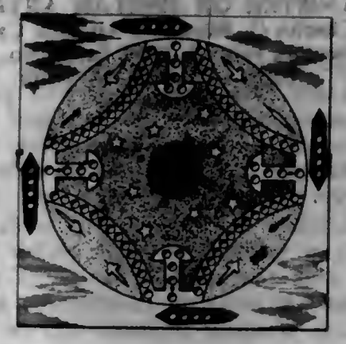


179,413
FLOWER TRELLIS
Carmen D'Amico, St. Louis, Mo.
Application January 3, 1956, Serial No. 39,579
Term of patent 14 years
(Cl. D35—3)

179,414
SEWING MACHINE CABINET
Robert C. Flynt, Sr., Kernersville, N. C.
Application February 1, 1956, Serial No. 40,000
Term of patent 3½ years
(Cl. D33—12)



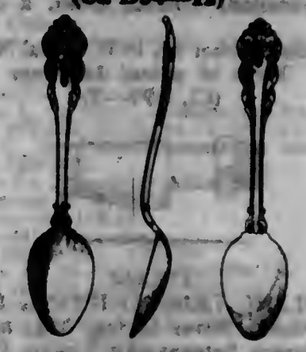
179,415
PHOTOGRAPHIC SLIDE VIEWER
Clarence Lee Folden, Downers Grove, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application May 29, 1956, Serial No. 41,694
Term of patent 14 years
(Cl. D61—1)



179,416
ROOM AIR CONDITIONER
Clarence F. Graser, Orange, Conn., assignor to General Electric Company, a corporation of New York
Application October 19, 1955, Serial No. 38,451
Term of patent 14 years
(Cl. D62—4)

179,417
PUSH-PULL SCREEN DOOR LATCH
Evelyn H. Greenwood, Buena Park, Calif., assignor to Kwikset Locks, Inc., Anaheim, Calif., a corporation of California
Application January 23, 1956, Serial No. 39,886
Term of patent 14 years
(Cl. D10—8)

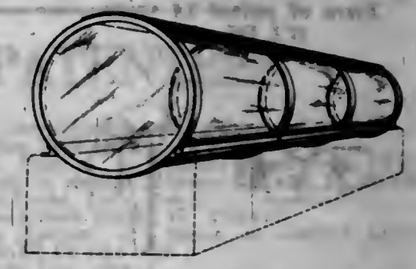
179,418
GAME BOARD
Percie W. Hopkins, Altadena, and Glenn B. Woodbury, Pasadena, Calif.
Application April 13, 1956, Serial No. 41,052
Term of patent 7 years
(Cl. D34—5)



179,419
STAND
Carlton A. Johnson, New Brunswick, N. J.
Application August 23, 1955, Serial No. 37,627
Term of patent 14 years
(Cl. D33—14)

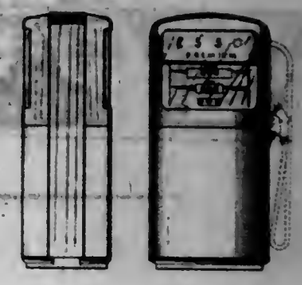
179,420
VERTICAL TAKE-OFF AIRCRAFT OR SIMILAR ARTICLE
Peter G. Kappus, Cincinnati, Ohio, assignor to General Electric Company, a corporation of New York
Application November 17, 1955, Serial No. 38,939
Term of patent 14 years
(Cl. D71—1)

179,421
SPOON OR SIMILAR ARTICLE
Isadore Albert Lipman, Meriden, Conn.
Application May 23, 1956, Serial No. 41,607
Term of patent 14 years
(Cl. D54—12)



179,422
TROPHY
Arthur J. Lordon, North Attleboro, Mass., assignor to the United States of America as represented by the Secretary of the Navy
Application November 1, 1955, Serial No. 38,682
Term of patent 14 years
(Cl. D29—23)

179,423
CHANUKAH TABLE PLACE MAT
Sara Rae Naiman, Milwaukee, Wis.
Application March 12, 1956, Serial No. 40,565
Term of patent 14 years
(Cl. D92—26)



179,424
DISPLAY CASE
Tadeusz S. Olejniczak, Trenton, N. J.
Application August 20, 1954, Serial No. 31,953
Term of patent 14 years
(Cl. D80—11)

179,425
CLOSURE CAP FOR A WRITING INSTRUMENT
Kenneth Parker, Janesville, Wis., assignor to The Parker Pen Company, Janesville, Wis., a corporation of Wisconsin
Application October 10, 1955, Serial No. 38,313
Term of patent 14 years
(Cl. D74—1)

179,426
GASOLINE DISPENSING PUMP
Edward D. Rapisarda, Agawam, Mass., assignor to Gilbert & Barker Manufacturing Company, West Springfield, Mass., a corporation of Massachusetts
Application October 4, 1954, Serial No. 32,519
Term of patent 14 years
(Cl. D52—2)

179,427
**BEDFRAME LEG**
Melvin E. Roche, Strongsville, Ohio, assignor to The Harvard Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application December 9, 1954, Serial No. 33,468
Term of patent 14 years
(Cl. D5—2)

179,428
**BEDFRAME SUPPORT LEG**
Melvin E. Roche, Strongsville, and Leslie K. Jackson, Lakewood, Ohio, assignors to The Harvard Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application October 19, 1954, Serial No. 32,716
Term of patent 14 years
(Cl. D5—2)

179,429
**BEDFRAME LEG**
Melvin E. Roche, Strongsville, and Leslie K. Jackson, Lakewood, Ohio, assignors to The Harvard Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application November 12, 1954, Serial No. 33,067
Term of patent 14 years
(Cl. D5—2)

179,430
**WALLET**
Abraham Radensky, Brooklyn, N. Y.
Application January 31, 1956, Serial No. 39,980
Term of patent 7 years
(Cl. D67—3)

179,431
**OUTDOOR STOVE**
Milton H. Sellborn, Northbrook, and Larry S. Henry and George F. Henry, Morton Grove, Ill., assignors to George Henry Company, Morton Grove, Ill., a corporation of Illinois
Application December 7, 1955, Serial No. 39,186
Term of patent 14 years
(Cl. D61—10)

179,432
**INDICATING DIAL**
De Witt T. Van Alen, Delavan, Wis., assignor to The George W. Borg Corporation, Chicago, Ill., a corporation of Delaware
Application July 20, 1955, Serial No. 37,042
Term of patent 14 years
(Cl. D52—1)

179,433
**FAUCET**
William D. Williams, Toledo, Ohio, assignor to Multi-Meter Corporation, Toledo, Ohio, a corporation of Ohio
Application October 14, 1955, Serial No. 38,377
Term of patent 14 years
(Cl. D91—3)

179,434
**OPHTHALMIC LENS CHIPPING CABINET**
Joseph A. Wycoski, Silver Spring, Md., and Thomas T. Matsuura, Setagaya-ku, Tokyo, Japan
Application March 2, 1956, Serial No. 40,442
Term of patent 14 years
(Cl. D67—1)

# LIST OF REISSUE PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 18TH DAY OF DECEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Kahn, Leo M. Combined washing and squeese drying machine. Re. 24,257, 12–18–56, Cl. 68—21.

# LIST OF PLANT PATENTEES

Boerner, Eugene S., to Jackson & Perkins Co. Rose plant. 1,540, 12–18–56, Cl. 47—61.

Boerner, Eugene S., to Jackson & Perkins Co. Rose plant. 1,541, 12–18–56, Cl. 47—61.

Casadaban, Rene. Camellia plant. 1,539, 12–18–56, Cl. 47—60.

Jackson & Perkins Co.: *See*—
Boerner, Eugene S. 1,540.
Boerner, Eugene S. 1,541.

# LIST OF DESIGN PATENTEES

Aiken, William R., to Kaiser Aircraft & Electronics Corp. Television receiver. 179,404, 12–18–56, Cl. D56—4.

Augenstein, Karl C., to Speidel Corp. Expansible link chain for a bracelet or similar article. 179,405, 12–18–56, Cl. D45—4.

Becker, Philip D. Chair glide. 179,406, 12–18–56, Cl. D10—6.

Bliss, Charles O. Canister or similar article. 179,407, 12–18–56, Cl. D44—6.

Borg, George W., Corp., The: *See*—
Van Alen, De Witt T. 179,432.

Brown, Alan, to The Buxbaum Co. Rubber floor covering or similar article. 179,408, 12–18–56, Cl. D32—4.

Burke, Donald J., to Erico Products, Inc. Combined coaster and ash tray or similar article. 179,410, 12–18–56, Cl. D44—10.

Buxbaum Co., The: *See*—
Brown, Alan. 179,408.

Coopersmith, Joseph, and F. W. Rusicka, to Liquilawn, Inc. Lawn culture trailer. 179,411, 12–18–56, Cl. D14—3.

Crecelius, Carlyle A. Line measuring device. 179,412, 12–18–56, Cl. D52—1.

D'Amico, Carmen. Flower trellis. 179,413, 12–18–56, Cl. D35—3.

Erico Products, Inc.: *See*—
Burke, Donald J. 179,410.

Foldes, Clarence L., to Sears, Roebuck and Co. Photographic slide viewer. 179,415, 12–18–56, Cl. D61—1.

Flynt, Robert C., Sr. Sewing machine cabinet. 179,414, 12–18–56, Cl. D32—12.

General Electric Co.: *See*—
Graser, Clarence F. 179,416.
Kappus, Peter G. 179,420.

Parker Pen Co., The: *See*—
Parker, Kenneth. 179,425.

Prochera, Bruno. Toy structure. 179,409, 12–18–56, Cl. D34—15.

Rapisarda, Edward D., to Gilbert & Barter Mfg. Co. Gasoline dispensing pump. 179,426, 12–18–56, Cl. D62—2.

Roche, Melvin E., to The Harvard Mfg. Co. Bedframe leg. 179,427, 12–18–56, Cl. D5—2.

Roche, Melvin E., and L. K. Jackson, to The Harvard Mfg. Co. Bedframe support leg. 179,428, 12–18–56, Cl. D5—2.

Roche, Melvin E., and L. K. Jackson, to The Harvard Mfg. Co. Bedframe leg. 179,429, 12–18–56, Cl. D5—2.

Rudensky, Abraham. Wallet. 179,430, 12–18–56, Cl. D67—3.

Rusicka, Francis W.: *See*—
Coopersmith, Joseph, and Rusicka. 179,411.

Sears, Roebuck and Co.: *See*—
Foldes, Clarence L. 179,415.

Selborn, Milton H., and L. S. and G. F. Henry, to George Henry Co. Outdoor stove. 179,431, 12–18–56, Cl. D61—10.

Speidel Corp.: *See*—
Augenstein, Karl C. 179,405.

Van Alen, De Witt T., to The George W. Borg Corp. Indicating dial. 179,432, 12–18–56, Cl. D52—1.

Williams, William D., to Multi-Meter Corp. Faucet. 179,433, 12–18–56, Cl. D91—3.

Woodbury, Glenn B.: *See*—
Hopkins, Percie W., and Woodbury. 179,418.

Wycoski, Joseph A., and T. T. Matsuura. Ophthalmic lens chipping cabinet. 179,434, 12–18–56, Cl. D67—1.

# LIST OF PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 18TH DAY OF DECEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

A. G. für Grundwasserbauten: *See*—
Fehlmann, Hans B. 2,774,240.

Abbott, William B.: *See*—
Escoutte, Louis, Hilgman, and Abbott. 2,774,443.

A'Beckett, William J. Apparatus for mixing liquids of different temperatures. 2,774,538, 12–18–56, Cl. 236—12.

Abel, Gerhard, and T. Volker, to Rohm & Haas G. m. b. H. Polymerization products of urea and alpha, beta unsaturated acids used as soil conditioner. 2,774,059, 12–18–56, Cl. 71—28.

Abrams, Walter J., and C. H. Jennings, to Fashion Frocks, Inc. Staple sealed corrugated box. 2,774,529, 12–18–56, Cl. 229—33.

Ackerson, Edwin L.: *See*—
Dahlquist, Oscar E. and Ackerson. 2,774,151.

Acton, Jack C., and A. B. Zeissler, to General Electric Co. Webbing of rotor bar extensions. 2,774,900, 12–18–56, Cl. 310—270.

Adamson, Norman: *See*—
Franklin, Edward, and Adamson. 2,774,319.

Aerojet-General Corp.: *See*—
Malina, Frank J., and Parsons. 2,774,214.

Agee, Thomas J. Window guard. 2,774,417, 12–18–56, Cl. 160—104.

Aghnides, Elie P. Gas and fluid mixing device. 2,774,584, 12–18–56, Cl. 261—76.

Aircraft Armaments, Inc.: *See*—
Barditch, Irving F. 2,774,942.

Aircraft-Marine Products, Inc.: *See*—
Dessler, Henry W., and Klingler. 2,774,269.
Folkenroth, Earl B. 2,774,180.
Kinkaid, Robert J., and Hammell. 2,774,951.
Ritter, George T. 2,774,810.
Sitz, Gilbert C. 2,774,133.

Air Force, United States of America as represented by the Secretary of the: *See*—
Kline, Jack C. 2,774,912.

Air Preheater Corp., The: *See*—
Holm, Sven. 2,774,573.

Aktiebolaget Svenska Kullagerfabriken: *See*—
Leufven, Axel G. E. 2,774,263.

Aktiebolaget de Danske Sukkerfabrikker: *See*—
Brinkhof-Müller, Arne V. 2,774,693.

Alber, Robert, to Alcosa-Etablissement. Article of footwear. 2,774,152, 12–18–56, Cl. 36—71.

Albert, Max. Cereal food and method. 2,774,670, 12–18–56, Cl. 99—2.

Alcosa-Etablissement: *See*—
Alber, Robert. 2,774,152.

Aldasoro, Eduardo, ½ to J. A. Cuervo. Safety valve and signal means for hydraulic brakes. 2,774,958, 12–18–56, Cl. 340—242.

Alderson, Rose C., to Minneapolis-Honeywell Regulator Co. Attack angle control apparatus for powered aircraft. 2,774,558, 12–18–56, Cl. 244—77.

Alderson, Winston T. Combination ball and slip joint for pipes. 2,774,618, 12–18–56, Cl. 285—223.

Aldred, Leslie, to Imperial Chemical Industries Ltd. Tablet feed hoppers. 2,774,519, 12–18–56, Cl. 222—310.

Allen, Charles S., Jr. Thread removing apparatus. 2,774,111, 12–18–56, Cl. 19—90.

Allen, Sidney, to Armstrong Siddeley Motors Ltd. Rocket motors. 2,774,216, 12–18–56, Cl. 60—35.6.

Alliance Ware, Inc.: *See*—
Rodman, Clarence J. 2,774,678.

Allinson, Neil. Gun cleaning rod. 2,774,090, 12–18–56, Cl. 15—104.165.

Allis-Chalmers Mfg. Co.: *See*—
Sealey, William C. 2,774,830.

Allmanna Svenska Elektriska Aktiebolaget: *See*—
Dreyfus, Ludwig. 2,774,503.
Forwald, Haakon. 2,774,351.

Alt, Arthur, to Monsanto Chemical Co. Water soluble substituted p-hydroxybenzaldehyde-alkali metal and alkaline earth metal carbonate and bicarbonate solid complexes. 2,774,701, 12–18–56, Cl. 260—600.

American Cyanamid Co.: *See*—
Blackett, Eben G., and Soliday. 2,774,759.
Hardy, William B. 2,774,761.
Mecco, Jerry M., and Creely. 2,774,647.
Mecco, Jerry M., and Creely. 2,774,648.
Mecco, Jerry M., and Creely. 2,774,649.
Strong, Allen K. 2,774,490.
Wystrach, Vernon P. 2,774,785.

American Deflector Inc.: *See*—
Messing, Hjalmar S. 2,774,491.

American Enka Corp.: *See*—
Baurman, Aart. 2,774,441.
Griset, Ernest J., Jr. 2,774,237.
Griset, Ernest J., Jr. 2,774,423.
Henry, William W. 2,774,202.

American Floor Surfacing Machine Co., The: *See*—
Becker, Anthony F. 2,774,568.

American Food Laboratories, Inc.: *See*—
Moser, Frank T. 2,774,514.

American Machine and Metals, Inc.: *See*—
Kagan, Benjamin S. 2,774,592.

American Viscose Corp.: *See*—
Sippey, Everett T. 2,774,211.
Williams, James E. 2,774,471.

Anderson, Lloyd D. Variable amplitude signal analyser. 2,774,535, 12–18–56, Cl. 235—92.

Anderson, Paul E.: *See*—
Ballash, Andrew, Stam, and Anderson. 2,774,282.

Anderson, Terry O., and J. E. Broaddus, to Halliburton Oil Well Cementing Co. Homogenizers for oil well liquids. 2,774,577, 12–18–56, Cl. 259—9.

Angovine, William H., Jr., to Cranston Print Works Co. Floating apparatus. 2,774,525, 12–18–56, Cl. 223—32.

Angus, Harvey L. Folding awning. 2,774,416, 12–18–56, Cl. 160—58.

Anthony, Elmer C., to Bendix Aviation Corp. Variable resistance instrument. 2,774,853, 12–18–56, Cl. 201—56.

Anthony, William T., to Bethlehem Steel Co. Rail splice. 2,774,642, 12–18–56, Cl. 238—251.

Antonidis, John E., W. C. Edmundson, C. W. Smith, and P. W. House, to General Motors Corp. Connector for an electric motor. 2,774,994, 12–18–56, Cl. 310—71.

Ardis, Alan E., to The B. F. Goodrich Co. 1,1-dicyano ethyleness and ethanes containing halogen substituents. 2,774,783, 12–18–56, Cl. 260—465.7.

Armco Steel Corp.: *See*—
Lewis, Robert D., and Wietzel. 2,774,593.

Armstrong Siddeley Motors Ltd.: *See*—
Allen, Sidney. 2,774,216.

Army, United States of America as represented by the Secretary of the: *See*—
Ballash, Andrew, Stam, and Anderson. 2,774,283.
Harvey, Earle M. 2,774,283.
Hurley, Charles W. 2,774,507.
Larsen, John B. 2,774,506.
Orlando, Carl. 2,774,961.

Arnejo, Anthony. Control system for automobile headlights. 2,774,828, 12–18–56, Cl. 200—11.

Arnejo, Anthony. Starter switch for control switch system for automobile lighting and ignition system. 2,774,829, 12–18–56, Cl. 200—16.

Ashton, Philip E. Thrust producing apparatus such as presses and the like. 2,774,217, 12–18–56, Cl. 60—54.5.

Ashwood, Peter F., and G. W. Crosse, to Power Jets (Research and Development) Ltd. Jet flow control for jet-sustained and jet-propelled aircraft. 2,774,554, 12–18–56, Cl. 244—23.

Askania Regulator Co.: *See*—
Jones, Sam H. 2,774,366.

Atkeson, Florian V., to Pittsburgh Plate Glass Co. Annealing glass. 2,774,190, 12–18–56, Cl. 49—89.

Atkin, Rupert L., to Kelsey-Hayes Wheel Co. Tire rim. 2,774,632, 12–18–56, Cl. 301—18.

Automatic Electric Laboratories, Inc.: *See*—
Lomax, Clarence H. 2,774,819.

B. B. Chemical Co.: *See*—
Clark, Alfred S. 2,774,699.

Babcock & Wilcox Co., The: *See*—
Junkermann, Wolfgang. 2,774,239.

Badalich, Frank C., to Bell & Howell Co. Slide carrying means. 2,774,472, 12–18–56, Cl. 206—62.

Basl, Philip F.: *See*—
Hogg, John A., Beal, and Lincoln. 2,774,776.

Baggenstoss, Alois C.: *See*—
Stanley, Lester N., and Baggenstoss. 2,774,749.

Baimer, Manuel M., to New York Quinine and Chemical Works Inc. Dihydrolsocodeine. 2,774,762, 12–18–56, Cl. 260—285.

Baker, Howard: *See*—
Heron, Kenneth M., Baker, and Benson. 2,774,818.

Baker-Raulang Co., The: *See*—
Remde, Edward H. 2,774,437.

Baker, Richard R., and F. D. Covely, to Radio Corp. of America. Automatic radar target tracking system. 2,774,964, 12–18–56, Cl. 343—7.3.

Baker, Trevor. Fish lure. 2,774,170, 12–18–56, Cl. 43—42.5.

Ballash, Andrew, S. A. Stam, and P. R. Anderson, to the United States of America as represented by the Secretary of the Army. Repeating rocket launcher. 2,774,282, 12–18–56, Cl. 89—1.7.

Banker, Oscar H., to New Products Corp. Automatic overdrive and transmission system. 2,774,356, 12–18–56, Cl. 74—760.

Barbulesco, Daniel J.: *See*—
Jacobs, James W., and Barbulesco. 2,774,222.

Barditch, Irving F., to Aircraft Armaments, Inc. Time modulators. 2,774,942, 12–18–56, Cl. 332—9.

Barnhart, William S.: *See*—
Mantell, Russell M., and Barnhart. 2,774,799.

Baron, Abraham L., to S. B. Penick & Co. Bacitracin compound and recovery of bacitracin. 2,774,712, 12–18–56, Cl. 167—65.

Barrett, Wayne T., and C. B. Welling, to W. R. Grace & Co. Method of preparing low soda-content alumina catalyst. 2,774,744, 12–18–56, Cl. 252—465.

Barsel, Norman: *See*—
Fleischhaker, Deedler, and Barsel. 2,774,711.

Barton, Daniel M.: *See*—
Scheoffel, Eugene W., and Barton. 2,774,665.

Barton, Daniel M., and E. W. Scheoffel, to Sterling Drug Inc. Recovery of cooking liquor from spent soda pulping liquors. 2,774,664, 12–18–56, Cl. 92—2.

Batcheller, Hugh W., to Kent Mfg. Corp. Connecter member with curved flange extensions. 2,774,982, 12–18–56, Cl. 339—258.

Batchelor, Joseph B., Jr., to W. R. Schum. Method for reactivating cathode ray tubes. 2,774,645, 12–18–56, Cl. 316—2.

Bauer, Anna M.: *See*—
Bauer, Fred R. 2,774,209.

Bauer, Benjamin B., to Shure Brothers Inc. Mechanical damping means for the diaphragms of microphones, speakers, and the like. 2,774,438, 12–18–56, Cl. 181—31.

Bauer, Fred R., 49% to N. B. and A. M. Bauer. Straw bunching attachment for combines. 2,774,209, 12–18–56, Cl. 56—122.

Bauer, Norbert B.: *See*—
Bauer, Fred R. 2,774,209.

Bayer, Frank C.: *See*—
Noon, T Cyril, and Bayer. 2,774,629.

Bayston, John E., to J. R. Bayston, trustee, Icecrafter (Liquidating) Trust. Ice cube making refrigerator. 2,774,224, 12–18–56, Cl. 62—7.

Bazarian, Albert V.: *See*—
Gusman, Leo, Bazarian, Silver, and Grimm. 2,774,915.

Beach, Edward J., to Beach-Russ Co. Vacuum pump. 2,774,532, 12–18–56, Cl. 230—153.

Beach-Russ Co.: *See*—
Beach, Edward J. 2,774,532.

Beaman, Robert W., and J. W. Hendricks, to Gem Crib and Cradle Co. Folding play-yard. 2,774,062, 12–18–56, Cl. 5—99.

Beare, Charles H., to General Motors Corp. Sealing strip for refrigerator door. 2,774,130, 12–18–56, Cl. 20—69.

Beaver Tool and Engineering Corp.: *See*—
Jackson, Robert O. 2,774,466.

Becher, Paul, to Colgate-Palmolive Co. Detergent bars. 2,774,735, 12–18–56, Cl. 252—117.

Beck, Arnold H. W., and A. D. Brisbane, to International Standard Electric Corp. Ionization manometers. 2,774,986, 12–18–56, Cl. 324—33.

Becker, Anthony F., to The American Floor Surfacing Machine Co. Floor scraping machine having floating scraper. 2,774,586, 12–18–56, Cl. 269—8.

Beder, Samuel L. Movable toy on rail. 2,774,182, 12–18–56, Cl. 46—32.

Belcher, Harold H., to Rodney Hunt Machine Co. Evaporator. 2,774,415, 12–18–56, Cl. 159—6.

Bell & Gossett Co.: *See*—
Tidd, Edwin B. 2,774,848.

Bell & Howell Co.: *See*—
Badalich, Frank C. 2,774,472.

Bell Telephone Laboratories, Inc.: *See*—
Brown, Clayton E., Hamilton, and Thiel. 2,774,821.
Burton, Joseph A. 2,774,695.
Dunlap, Kermit S., and Lovell. 2,774,822.
Howson, Louis. 2,774,872.
Mellick, John M. 2,774,963.
Miller, Stewart B. 2,774,945.
Rieke, John W. 2,774,573.
Semmelman, Charles L. 2,774,890.

Bell, Thomas B., to E. I. du Pont de Nemours and Co. Permanent hair waving neutralization by monopersulfate. 2,774,355, 12–18–56, Cl. 132—7.

Bendix Aviation Corp.: *See*—
Anthony, Elmer C. 2,774,853.
Camp, Leon W. 2,774,822.
Gerwig, Larry L. 2,774,226.
MacCallum, Alan M. 2,774,559.
MacDuff, Stanley I. 2,774,877.
Machlanski, Sigmund. 2,774,414.
McCombs, Howard L., Jr. 2,774,870.
Mock, Frank C., and Thompson. 2,774,215.
Pontius, George W., III. 2,774,445.
Price, Earl E. 2,774,251.
Schaffer, David J., and Dorland. 2,774,343.
Wells, William H. 2,774,882.
Wiley, William C. 2,774,881.
Wiley, William C. 2,774,885.
Wisman, Franklin O. 2,774,452.

Bennett, Lowell W., to the United States of America as represented by the Secretary of the Navy. Weight measuring, thrust determining apparatus. 2,774,241, 12–18–56, Cl. 73—116.

Benson, David L.: *See*—
Heron, Kenneth M., Baker, and Benson. 2,774,818.

Benson, Harold R., to Amarc Co., Inc. Arc lamp and control system therefor. 2,774,907, 12–18–56, Cl. 314—77.

Benson, N. F., Optical Co., Inc.: *See*—
Olson, Marshall S., and Lindmark. 2,774,279.

Bentley, James E., to Telefex Inc. Guiding conduit. 2,774,382, 12–18–56, Cl. 138—56.

Benzien, Fritz H. P., to Colgate-Palmolive Co. Valve operation. 2,774,362, 12–18–56, Cl. 137—1.

Berg, Sven M. Apparatus for treating hair with liquids. 2,774,095, 12–18–56, Cl. 15—137.

Bergstrom, Eric V., to Socony Mobil Oil Co., Inc. Gas disengager. 2,774,440, 12–18–56, Cl. 183—1.

Bergström, Ernst E., N. E. Fagerqvist, and A. O. M. Norrman, to Vibro-Plus Corp. Variable amplitude vibrator. 2,774,844, 12–18–56, Cl. 74—61.

Berlin, Dennis. Auxiliary automobile seat. 2,774,411, 12–18–56, Cl. 155—79.

Bernart, William F.: *See*—
Russell, Alva G., and Bernart. 2,774,537.

Bernat, Henri: *See*—
Bernat, Raoul and H. 2,774,375.

Bernat, Raoul, deceased, and H. Bernat; said H. Bernat, sole heir of said R. Bernat. Automatic shut-off valves. 2,774,575, 12–18–56, Cl. 137—516.19.

Bernot, Edwin J., to Institute of Textile Technology. Automatic evaluator. 2,774,940, 12–18–56, Cl. 234—102.

Bernhardt, Ernest C., to E. I. du Pont de Nemours and Co. Extraction-extrusion apparatus. 2,774,106, 12–18–56, Cl. 18—12.

Berry, Jack H. Construction of toy locomotive. 2,774,311, 12–18–56, Cl. 105—90.

Bertram, Francis C. to Reif-Bezoil, Inc. Device for forming wire handles. 2,774,391, 12–18–56, Cl. 140—75.

Bertrand, Irvin, ¾ to M. B. Lally and ¼ to J. F. Lally, Jr. Circuit breaker. 2,774,823, 12–18–56, Cl. 200—87.

Bethe, Eugene J., to United States Rubber Co. Method of and apparatus for forming a sheet of latex foam. 2,774,106, 12–18–56, Cl. 18—12.

Bethlehem Steel Co.: *See*—
Anthony, William T. 2,774,642.
Graham, Hugh S., and Eberhardt. 2,774,662.

Biggie, Laurence C., to General Controls Co. Electromagnetically operated controller for valves or the like. 2,774,564, 12–18–56, Cl. 251—30.

Biram, Gail H., to Monsanto Chemical Co. Trithianylium sulfenyl chlorides. 2,774,707, 12–18–56, Cl. 167—33.

Bischof, Dorothy L.: *See*—
Halliburton, Erle P. 2,774,346.

Bixby, William H., to D. R. Middleton and S. M. Hanley, d. b. a. Power Equipment Co. Regulated rectifying apparatus. 2,774,930, 12–18–56, Cl. 321—18.

Bjorksten Research Laboratories, Inc.: *See*—
Koblitz, Francis F. 2,774,697.

Blackett, Eben G., and A. J. Soliday, to American Cyanamid Co. Preparation of choline base and choline salts. 2,774,759, 12–18–56, Cl. 260—251.5.

Blaisdell, George G., and L. Flickinger, to Zippo Mfg. Co. Table lighter. 2,774,234, 12–18–56, Cl. 67—4.1.

Blanchard, Doan C., to Stanley Building Specialties Co. Mechanical operator for awning type windows. 2,774,590, 12–18–56, Cl. 268—23.

Blasek, William J., to Lempco Products, Inc. Latching means for die set retainers. 2,774,490, 12–18–56, Cl. 164—118.

Blight, Frank C., to The Permutit Co. Operation of cation exchange units. 2,774,732, 12–18–56, Cl. 210—24.

Bloch, Monroe P.: *See*—
Harris, Frederic R. 2,774,322.

Block, Aleck. Abrasive polishing device. 2,774,200, 12–18–56, Cl. 51—194.

Boardman, Raymond H., to The Hart Mfg. Co. Electric switch. 2,774,852, 12–18–56, Cl. 200—172.

Bogge, George D.: *See*—
Henry, Thomas W., and Bogge. 2,774,630.

Bolding, Hubert V., and H. G. Gowens, to The Bradley & Gilbert Co. Cell wall carton. 2,774,530, 12–18–56, Cl. 229—24.

Bonn, Theodore H., to Sperry Rand Corp. Magnetic gating circuit for controlling a plurality of loads. 2,774,956, 12–18–56, Cl. 340—174.

Bonner, Joseph. Cutting torch machine having revolving template mounts. 2,774,539, 12–18–56, Cl. 266—23.

Borders, Robert L., Jr., and G. Sitz. Automobile serving tray holder. 2,774,641, 12–18–56, Cl. 311—22.

Borg-Warner Corp.: *See*—
Gemmel, Dewey H. 2,774,266.
Young, Richard E. 2,774,376.

Bostick, Charles R. Pipe and rod bender. 2,774,267, 12–18–56, Cl. 51—15.

Bouchez, Jean H. M. J. Cutting machine. 2,774,191, 12–18–56, Cl. 51—34.

Bourcier de Carbon, Christian M. L. L. Shock absorbers. 2,774,446, 12–18–56, Cl. 188—88.

Bourcier de Carbon, Christian M. L. L. Shock absorber. 2,774,447, 12–18–56, Cl. 188—88.

Bowersox, Marvin W. Evaporative cooler. 2,774,581, 12–18–56, Cl. 261—24.

Bowman, Anna H.: *See*—
Bowman, Samuel G. 2,774,827.

Bowman, Paul F., to Continental Paper Co. Patch end machine. 2,774,204, 12–18–56, Cl. 53—137.

Bowman, Samuel G., ½ to A. H. Bowman, and ½ to J. M. Guthrie. Organ coupler stacks. 2,774,827, 12–18–56, Cl. 200—5.

Boyd, Thomas J., to C. H. Manion, and T. J. Boyd. Metal roof seam forming machine. 2,774,220, 12–18–56, Cl. 113—58.

Bozza, Joseph D., to Jo-An Shoe Mfg. Co., Inc. Method for securing together moccasin vamps and plugs. 2,774,067, 12–18–56, Cl. 12—142.

Bracke, Robert F., to Mall Tool Co. Carburetor. 2,774,582, 12–18–56, Cl. 261—41.

Bradford Dyers' Association Ltd.: *See*—
Cockett, Sydney E., Evans, and Landells. 2,774,690.

Bradley, Dan T.: *See*—
Thiry, Leon F., and Bradley. 2,774,620.

Bradley & Gilbert Co., The: *See*—
Bolding, Hubert V., and Gowens. 2,774,530.

Brady, Philip. Clip. 2,774,124, 12–18–56, Cl. 24—66.

Bray, Frederick H., R. G. Knight, and G. C. Hartley, to International Standard Electric Corp. Electric discharge tube circuits. 2,774,830, 12–18–56, Cl. 179—18.

Bredenberg, Henrik N. Hockey stick. 2,774,596, 12–18–56, Cl. 273—67.

Breese, Myron. Automatic fishhook jerking device. 2,774,166, 12–18–56, Cl. 43—15.

Bretschger, Otto, to Gesellschaft der Ludw. von Roll'schen Eisenwerke AG. Means for feeding a grinding wheel of a peripheral grinding attachment into a workpiece. 2,774,197, 12–18–56, Cl. 51—165.

Bretschneider, Hermann, and W. Kletzer, to Osterreichische Stickstoffwerke Aktiengesellschaft. New triazine compounds and process of making them. 2,774,756, 12–18–56, Cl. 260—239.7.

Brieghel-Müller, Arne V., to Aktieselskabet de Danske Sukkerfabrikker. Method for purifying sugar juices by liming and carbonation. 2,774,693, 12–18–56, Cl. 127—50.

Briggs Mfg. Co.: *See*—
Killington, Albert A. 2,774,700.

Brisbane, Alan D.: *See*—
Beck, Arnold H. W., and Brisbane. 2,774,936.

Broaddus, James E.: *See*—
Andersen, Terry O., and Broaddus. 2,774,577.

Brobell, Carl K., deceased: O. S. Brobell administratrix. Proportioning and dispensing means. 2,774,364, 12–18–56, Cl. 137—3.

Brobell, Olga S.: *See*—
Brobell, Carl K. 2,774,364.

Brostoff, Theodore M. Tubular necktie and mode of making same. 2,774,076, 12–18–56, Cl. 2—146.

Brotheridge, John E.: *See*—
Brown, Le Roy A., and Brotheridge. 2,774,579.

Brouillard, Robert E., and T. D. Mutaffis, to General Aniline & Film Corp. Phthalocyanine lakes. 2,774,677, 12–18–56, Cl. 106—289.

Browall, Bert H., to Svenska Aktiebolaget Bromsregulator. Double-acting type slack adjuster for brakes. 2,774,449, 12–18–56, Cl. 188—196.

Brown, Clayton B., L. N. Hampton, and F. A. Thiel, Jr., to Bell Telephone Laboratories, Inc. Card translator. 2,774,821, 12–18–56, Cl. 179—18.

Brown, Howard J. X-ray apparatus. 2,774,885, 12–18–56, Cl. 250—62.

Brown, Le Roy A., and J. E. Brotheridge, to Prince Castle Mfg. Division, Inc. Multiple drink mixing machine. 2,774,579, 12–18–56, Cl. 259—131.

Brown, Lester H. Automatic floor mop. 2,774,089, 12–18–56, Cl. 15—98.

Browne, Eugene V.: *See*—
Crawford, James E., Browne, Glenn, and Pigford. 2,774,555.

Bruyning, Hugo G.: *See*—
Rademakers, Adriaan, and Bruyning. 2,774,935.

Bryant Chucking Grinder Co.: *See*—
Grobey, Paul A. 2,774,192.

Bryant, Stuart G. Bottle cap remover with magnetic cap retainer. 2,774,264, 12–18–56, Cl. 81—3.1.

Buchan, Frank A. Spark plug. 2,774,904, 12–18–56, Cl. 313—125.

Bucher, Fred J. Control circuit for a series of electrical units. 2,774,889, 12–18–56, Cl. 307—112.

Buck, Charles R., and A. G. Lautzenhiser, to General Motors Corp. Resettable circuit breaker. 2,774,844, 12–18–56, Cl. 200—116.

Buckland, Bruce O., D. G. Sanders, and C. M. Gardiner, to General Electric Co. Process for removing ash-forming impurities from petroleum residual oils. 2,774,722, 12–18–56, Cl. 196—44.

Budde, Charles H. Bridge warning device. 2,774,325, 12–18–56, Cl. 116—114.

Budiani, Dane J. Infant nursing device. 2,774,500, 12–18–56, Cl. 215—11.

Buerger, Herbert. Beverage and snack dispenser for automobiles. 2,774,480, 12–18–56, Cl. 211—86.

Bullock, Mark W., to Continental Electronics Mfg. Co. Electrical equipment cabinets. 2,774,806, 12–18–56, Cl. 174—16.

Burby, Philip B., to United Shoe Machinery Corp. Heel rest mechanisms. 2,774,086, 12–18–56, Cl. 12—12.4.

Burger, Francis J., to Emerson Radio & Phonograph Corp. Automatic gain and band width control for transistor circuits. 2,774,866, 12–18–56, Cl. 250—20.

Buri, Alfred, to Sulzer Freres, Societe Anonyme. Device for reducing pressure increments in a pipeline carrying a fluid under pulsating pressure. 2,774,381, 12–18–56, Cl. 138—31.

Burke, Peter F. C., to International Standard Electric Corp. Electron discharge apparatus. 2,774,809, 12–18–56, Cl. 250—27.

Burkhart, Ernest B. TV antenna guy wire attaching ring. 2,774,809, 12–18–56, Cl. 174—45.

Burns, Laurence, to Sylvania Electric Products Inc. Electroluminescent lamp. 2,774,902, 12–18–56, Cl. 313—108.

Burns, Laurence, to Sylvania Electric Products Inc. Nonactinic fluorescent lamp. 2,774,903, 12–18–56, Cl. 313—109.

Burton, Joseph A., to Bell Telephone Laboratories, Inc. Process of fabricating germanium single crystals. 2,774,695, 12–18–56, Cl. 148—1.5.

Burweger, Lorenz, and P. E. Kreker. Trailer with elevatable bed. 2,774,606, 12–18–56, Cl. 280—44.

Butler, Ernest L., and O. M. Holmes, to United Shoe Machinery Corp. Heel end assembling machines. 2,774,085, 12–18–56, Cl. 12—1.

Butler, Hugh H. J., to Hall Telephone Accessories Ltd. Apparatus for separating stacked flat articles. 2,774,595, 12–18–56, Cl. 271—12.

Butler, Keith H., to Sylvania Electric Products Inc. Calcium cadmium phosphate phosphor. 2,774,738, 12–18–56, Cl. 252—301.6.

Butler, Keith H., and R. M. Ruion, to Sylvania Electric Products Inc. Method of making an electroluminescent phosphor. 2,774,739, 12–18–56, Cl. 252—301.6.

Buurman, Aart, to American Enka Corp. Process and apparatus for the degassing of viscose. 2,774,441, 12–18–56, Cl. 183—2.5.

Byrd, John F., and J. D. Phyfe, to Radio Corp. of America. Sound changeover system. 2,774,824, 12–18–56, Cl. 179—100.2.

CBS-Hytron, a division of Columbia Broadcasting System, Inc.: *See*—
Law, Russell R. 2,774,906.

Cabot, Godfrey L., Inc.: *See*—
Loftman, Kenneth A. 2,774,651.

Callery Chemical Co.: *See*—
Schechter, William H. 2,774,136.

Camp, Leon W., to Bendix Aviation Corp. Annular vibrator with lumped loading. 2,774,892, 12–18–56, Cl. 310—8.1.

Campbell, Jackson L., to General Electric Co. Bead setting method and apparatus. 2,774,102, 12–18–56, Cl. 18—1.

Canada Machine Works: *See*—
McCoy, Thomas A. 2,774,406.

Cardani, Charles P., and J. Harrington, Jr., to United Shoe Machinery Corp. Invertible sockets or receptacles. 2,774,949, 12–18–56, Cl. 339—128.

Carding Specialists (Canada), Ltd.: *See*—
Hopkinson, Harold. 2,774,112.

Carlin, Benson: *See*—
Thatcher, Charles J., and Carlin. 2,774,193.

Carlson, George J., G. W. Gaertner, and F. B. West, to Shell Development Co. Process for drying carbonylic compounds. 2,774,792, 12–18–56, Cl. 260—601.

Carnegie, David, Jr., to Congoleum-Nairn Inc. Flexible felt base covering. 2,774,685, 12–18–56, Cl. 117—76.

Carroll Chain Co., The: *See*—
Gantz, Ray D. 2,774,213.

Caulkins, Frank T. Method of making box wrenches. 2,774,259, 12–18–56, Cl. 76—114.

Century Electric Co.: *See*—
Witt, Stanley. 2,774,924.

Chall, Harold J., to Friden Calculating Machine Co., Inc. Calculating machine. 2,774,536, 12–18–56, Cl. 235—194.

Chambers, Roy L. Fishing reel. 2,774,545, 12–18–56, Cl. 242—84.4.

Chapman, John L., Jr., and W. R. Yeich, to Western Electric Co., Inc. Downfeed for machine tools. 2,774,196, 12–18–56, Cl. 51—92.

Charles, Daniel, to Compagnie Generale de Telegraphie Sans Fil. Electron discharge tube with crossed electric and magnetic fields. 2,774,913, 12–18–56, Cl. 315—39.3.

Charron, Wilfred: *See*—
Sheppard, Donald. 2,774,514.

Chase, Corson W., to The Goss Printing Press Co. Socket for ink cylinder. 2,774,299, 12–18–56, Cl. 101—348.

Chase, Corson W., to The Goss Printing Press Co. Socket for ink roller. 2,774,300, 12–18–56, Cl. 101—348.

Chemical Construction Corp.: *See*—
Cook, Lucien H., Hodge, and Colonias. 2,774,660.

Chesser, Cecil E., to Sears, Roebuck and Co. Muffler for lawn mower. 2,774,439, 12–18–56, Cl. 181—66.

Chiang, Stanley H. K.: *See*—
Davis, Horace R., and Chiang. 2,774,798.

Chicago Railway Equipment Co.: *See*—
Soddy, Thomas C. 2,774,444.

Christensen, Clarence O.: *See*—
Paulsen, Lloyd O., and Christensen. 2,774,856.

Christian, Curtis G., to Union Oil Co. of California. Separation of alkyl benzenes by selective clathration of the para-isomer with a 4-alkyl pyridine Werner complex in the presence of a 3-substituted pyridine. 2,774,802, 12–18–56, Cl. 260—674.

Chrysler Corp.: *See*—
Heym, Raymond S. 2,774,220.
Thomas, Gerald R. 2,774,090.

Chute, Curtis. Ice fishing apparatus. 2,774,168, 12–18–56, Cl. 43—17.

Ciba Ltd.: *See*—
Schmid, Max, Moser, and Frey. 2,774,755.

Cincinnati Milling Machine Co., The: *See*—
Waller, Campbell E. 2,774,642.

Claff, Clarence L., and C. A. Moeller, to M. B. Claff & Sons, Inc. Automatic actuating means for box setting-up machines. 2,774,285, 12–18–56, Cl. 93—36.3.

Claff, M. B., & Sons, Inc.: *See*—
Claff, Clarence L., and Moeller. 2,774,285.

Clark, Alfred S., to B. B. Chemical Co. Ribbed strips for insoles, and methods of making the same. 2,774,600, 12–18–56, Cl. 154—53.6.

Clark, Richard U. Hermetically sealed electric terminal. 2,774,812, 12–18–56, Cl. 174—152.

Clayton, Temple: *See*—
Gould, David H., Hershberg, and Clayton. 2,774,713.

Cleveland, Carl S., Jr. Spinal clamp or splint. 2,774,350, 12–18–56, Cl. 128—92.

Cline, William H., Jr., to Hughes Tool Co. Reciprocating prime mover. 2,774,334, 12–18–56, Cl. 121—28.

Coats & Clark Inc.: *See*—
Morin, Louis H. 2,774,396.

Cockett, Sydney R., J. G. Evans, and G. Landells, to Bradford Dyers' Assn. Ltd. Water repellent treatment utilising a methylhydrogenpolysiloxane and a titanium compound. 2,774,630, 12–18–56, Cl. 117—135.5.

Cohen, Sidney B.: *See*—
Garman, Raymond L., Dres, and Cohen. 2,774,149.

Cohen, Sylvan L., and M. S. Frant, to Gallowhur Chemical Corp. Alkyl dimethyl dichlorobenzyl ammonium mercaptobenzothiazolates and pesticidal concentrates containing the same. 2,774,708, 12–18–56, Cl. 167—33.

Coles, Ralph V., to Robertshaw-Fulton Controls Co. Capacity sensitive relay. 2,774,919, 12–18–56, Cl. 317—146.

Colgate-Palmolive Co.: *See*—
Becher, Paul. 2,774,735.
Bensien, Fritz E. P. 2,774,363.

Collins, Carroll B., to Peerless Photo Products, Inc. Printing device. 2,774,289, 12–18–56, Cl. 95—76.

Collins Radio Co.: *See*—
Patton, Henry W. 2,774,932.

Gilmore, Forrest E., to Phillips Petroleum Co. Automatic control of reboiler on deethanizing absorber. 2,774,715, 12–18–56 Cl. 196—8.

Gilson, Robert J. Perpetual calendars. 2,774,160, 12–18–56, Cl. 40—112.

Girard, Robert J. Nickel plating by chemical reduction. 2,774,668, 12–18–56, Cl. 117—130.

Gitlin, Jacob. Device for dyeing human hair. 2,774,357, 12–18–56, Cl. 132—9.

Gitsendanner, Louis G., to General Electric Co. Voltage divider with adjustable output characteristic. 2,774,934, 12–18–56, Cl. 323—43.5.

Glacius, George, to Einson-Freeman Co., Inc. Animated display device. 2,774,157, 12–18–56, Cl. 40—68.

Glad, Nicholas C., to United Aircraft Corp. Helicopter air circulating system. 2,774,552, 12–18–56, Cl. 244—17.11.

Gladeden, David and L. Folding table legs with gravity lock. 2,774,643, 12–18–56, Cl. 311—56.

Gladeden, Lester: *See*—
Gladeden, David and L. 2,774,643.

Glasser, Leo G., and D. J. Troy, Jr., to E. I. du Pont de Nemours & Co. Colorimeter. 2,774,276, 12–18–56, Cl. 88—14.

Glenn, John R.: *See*—
Crawford, James E., Browne, Glenn, and Pigford. 2,774,555.

Geertz, Raymond C., R. G. Schmitt, Jr., R. A. Olson, and R. R. Wehle, to the United States of America as represented by the United States Atomic Energy Commission. Remote-control manipulator. 2,774,486, 12-18-56, Cl. 214—1.

Geiger, Peter P., and R. J. Gall, to Food Machinery and Chemical Corp. Fin size cyclodation of oleic acid vapor. 2,774,402, 12-18-56, Cl. 260—348.8.

Gelbfish, Edward J., to Monsanto Chemical Co. Mercaptoplastic compositions. 2,774,672, 12-18-56, Cl. 99—95.

Gelfand, Harry, Jr., and Jerome Lemkowitz, to Bell Telephone Laboratories, Inc. Electrical contact. 2,774,680, 12-18-56, Cl. 200—166.

Gelfand, Morris A., and Sidney Gelfand, to Gelfand Mfg. Corp. Sewing machine. 2,774,915, 12-18-56, Cl. 112—2.

Gelfand, Sidney, and Morris A. Gelfand, to Gelfand Mfg. Corp. Sewing machine. 2,774,916, 12-18-56, Cl. 112—2.

Gelfand, Sidney, and Morris A. Gelfand, to Gelfand Mfg. Corp. Sewing machine. 2,774,917, 12-18-56, Cl. 112—2.

Gelfand, Sidney, and Morris A. Gelfand, to Gelfand Mfg. Corp. Sewing machine.

Jankowski, Henry J., to Foster Wheeler Corp. Vapor generator. 2,774,340, 12–18–56, Cl. 122—510.

Jansen, William J. E. Methods of and machines for winding spiral springs. 2,774,607, 12–18–56, Cl. 153—65.

Jarman, Vincent G.: *See*—
Smathers, Henry A. 2,774,203.

Jarman-Williamson Co.: *See*—
Williamson, Norman B. 2,774,403.

Jendrisak, Joseph E., to Libbey-Owens-Ford Glass Co. Apparatus for bending glass sheets or plates. 2,774,189, 12–18–56, Cl. 49—67.

Jenk, Robert L., and J. C. Redd. Composite board. 2,774,698, 12–18–56, Cl. 154—45.9.

Jenkins, William W., to G. D. Searle & Co. Esters of 4-phenyl-4-tetrahydropyrancarboxylic acid and their salts. 2,774,765, 12–18–56, Cl. 260—294.3.

Jens, Louis J. Roof exhauster. 2,774,293, 12–18–56, Cl. 98—43.

Jenney, John W.: *See*—
Hlynsky, Alex, and Jenney. 2,774,788.

Jennings, Charles H.: *See*—
Abrams, Walter J., and Jennings. 2,774,529.

Jensen, Ejler, to F. L. Smidth & Co. Apparatus for weighing and packaging powder or granular material. 2,774,516, 12–18–56, Cl. 222—195.

Jensen, Harry T., to United Aircraft Corp. Damper by-pass for lag-lead control of helicopter rotor blades. 2,774,553, 12–18–56, Cl. 244—17.17.

Jensen, James L., to Minneapolis-Honeywell Regulator Co. Oscillators. 2,774,878, 12–18–56, Cl. 250—36.

Jervan, Jerome S.: *See*—
Kelley, Clarence A., and Jervan. 2,774,303.

Jewett, Deane N., to Detroit Hardware Mfg. Co. Window operator. 2,774,591, 12–18–56, Cl. 268—105.

Jo-An Shoe Mfg. Co., Inc.: *See*—
Bossa, Joseph D. 2,774,087.

Jobe, George T., F. J. Weber, and A. F. Vinal, to Union Carbide and Carbon Corp. Primary battery. 2,774,806, 12–18–56, Cl. 136—111.

Johanek, George J., to General Railway Signal Co. Railway switch lock control system. 2,774,863, 12–18–56, Cl. 246—146.

Johann Vaillant Kommandit Gesellschaft: *See*—
Klemp, Siegfried, and Donges. 2,774,565.

Johansson, Bertil, to SKF Kugellagerfabriken Gesellschaft mit beschränkter Haftung. Top roll support for drawing mechanisms of textile machines. 2,774,113, 12–18–56, Cl. 19—142.

Johanson, Edwin S., to Hydrocarbon Research, Inc. Hydrodesulfurizing a highly olefinic gasoline containing cyclic sulfur compounds. 2,774,719, 12–18–56, Cl. 196—28.

Johansson, Carl E., and A. S. Noble, to The Youngstown Steel Door Co. Transportation containers for bulk materials. 2,774,515, 12–18–56, Cl. 222—185.

Johnson, Arthur C.: *See*—
Milliken, Owen J. 2,774,435.

Johnson, Clarence A., and S. C. Schuman, to Hydrocarbon Research, Inc. Process for hydrofining a highly olefinic gasoline. 2,774,718, 12–18–56, Cl. 196—28.

Johnson, Clarence J. Side dressing fertilizer spreader. 2,774,318, 12–18–56, Cl. 111—59.

Johnson, Felix J. Shower cone. 2,774,627, 12–18–56, Cl. 299—83.

Johnson, Francis B., to Lockheed Aircraft Corp. Aerial delivery platform. 2,774,560, 12–18–56, Cl. 244—138.

Johnson, Fred H., to Warren Alloy. Electrode. 2,774,859, 12–18–56, Cl. 219—120.

Johnson, Thomas D., and M. G. Sateren, to the United States of America as represented by the Secretary of the Navy. Lead network for servo-mechanisms with A. C. carrier voltage. 2,774,928, 12–18–56, Cl. 318—448.

Johnson, William H.: *See*—
Ulander, Per H. N., and Johnson. 2,774,308.

Jones, G. Lester: *See*—
Hefferan, Albert, and Jones. 2,774,184.

Jones, George L.: *See*—
Hefferan, Albert, and Jones. 2,774,184.

Jones, Glen H. Post hole digger and driving means thereof. 2,774,568, 12–18–56, Cl. 255—19.

Jones, Sam H., to Askania Regulator Co. Blast furnace wind distribution control. 2,774,868, 12–18–56, Cl. 137—100.

Jonker, Johan L. H.: *See*—
Perilhou, Jean E., and Jonker. 2,774,814.

Jordan, Charles M., Jr. Chipping attachment for lens cutting machine. 2,774,188, 12–18–56, Cl. 49—48.

Joseph, Joe G. Holder for phonograph album records. 2,774,615, 12–18–56, Cl. 281—20.

Jucker, Ernst: *See*—
Steil, Arthur, Jucker, and Lindenmann. 2,774,773.

Judovich, Bernard D. Bed with lumbar traction apparatus. 2,774,249, 12–18–56, Cl. 128—71.

Junkermann, Wolfgang, to The Babcock & Wilcox Co. Fluid heater furnace. 2,774,339, 12–18–56, Cl. 122—240.

Kagan, Abraham, to The Lionel Corp. Plier-like tools for use with toy railroad track. 2,774,268, 12–18–56, Cl. 81—15.

Kagan, Benjamin S., deceased, by E. E. and Z. S. Kagan, heirs, to American Machine and Metals, Inc. Timing mechanism to divide sheets proportionately. 2,774,592, 12–18–56, Cl. 270—81.

Kagan, Esther E.: *See*—
Kagan, Benjamin S. 2,774,592.

Kagan, Zena S.: *See*—
Kagan, Benjamin S. 2,774,592.

Kahle, Max O. K. Rain cover for chimneys. 2,774,294, 12–18–56, Cl. 98—76.

Kahn, David, to David Kahn, Inc. Fountain pen with improved feed construction. 2,774,333, 12–18–56, Cl. 120—52.

Kahn, David, Inc.: *See*—
Kahn, David. 2,774,333.

Wisconsin Alumni Research Foundation: *See*—
Fitzgerald, Edwin R. 2,774,230.

Wisman, Franklin O., to Bendix Aviation Corp. Magnetic clutch and control therefor. 2,774,452, 12–18–56, Cl. 192—84.

Witt, Stanley, to Century Electric Co. Multispeed single phase motor. 2,774,924, 12–18–56, Cl. 318—234.

Wittenwyler Clifford V.: *See*—
Howard, Harry W., and Wittenwyler. 2,774,748.

Wolfe & Mann Mfg. Co., The: *See*—
Shopp, Thomas R., and Espey. 2,774,833.

Wolfson, Henry, and G. Elliott, to International Standard Electric Corp. Electrically conducting cements containing epoxy resins and silver. 2,774,747, 12–18–56, Cl. 260—32.8.

Wolverton, Percy B. Double acting relief valve. 2,774,116, 12–18–56, Cl. 20—18.

Word, James C., Jr., to Phillips Petroleum Co. Pump. 2,774,310, 12–18–56, Cl. 103—234.

Worlidge, Ronald F.: *See*—
Latimer-Needham, Cecil H., and Worlidge. 2,774,547.

Worth, William E. Portable clothes dryer. 2,774,148, 12–18–56, Cl. 34—133.

Worthington Corp.: *See*—
Walter, Hellmuth. 2,774,575.

Worthington, Emory W., to R. Hoe & Co., Inc. Ink roller mounting for printing machines. 2,774,301, 12–18–56, Cl. 101—352.

Worsel, John L., to the United States of America as represented by the Secretary of the Navy. Bottom firing detonator. 2,774,304, 12–18–56, Cl. 102—7.

Wright, Harold H., to Gulf Oil Corp. Gas separator. 2,774,442, 12–18–56, Cl. 183—2.7.

Wright, John S. B., to Transmart Aktiebolag. Display devices. 2,774,159, 12–18–56, Cl. 40—102.

Wrightson, John M.: *See*—
Passino, Herbert J., Dittman, and Wrightson. 2,774,751.

Wyllie, Malcolm R. J., to Gulf Research & Development Co. Method of making low-resistance ion-exchange membranes. 2,774,108, 12–18–56, Cl. 18—47.5.

Wystrach, Vernon P., to American Cyanamid Co. Addition of hydrogen chloride or hydrogen bromide to maleic, fumaric, or acrylic acids or their esters. 2,774,786, 12–18–56, Cl. 260—485.

Yanko, William H., to Monsanto Chemical Co. Morpholine derivative. 2,774,758, 12–18–56, Cl. 260—247.

Yarow, Max. Method and flux for soldering aluminum. 2,774,137, 12–18–56, Cl. 29—495.

Yeasell, William O.: *See*—
Lafferty, Edward C., and Yeasell. 2,774,831.

Yeich, William R.: *See*—
Chapman, John L., Jr., and Yeich. 2,774,195.

Yoeano, Iku, to International Standard Electric Corp. Attitude compensated echo sounding device. 2,774,954, 12–18–56, Cl. 340—3.

Yost, Kermit D., to Kleinschmidt Laboratories, Inc. Printing telegraph receiver. 2,774,816, 12–18–56, Cl. 178—29.

Young, Earl M., Jr.: *See*—
Shelley, James P., and Young. 2,774,692.

Young, Frank L.: *See*—
Moline, Elliott. 2,774,249.

Young, Gale J., to the United States of America as represented by the United States Atomic Energy Commission. Neutronic reactor having a flattened activity curve. 2,774,730, 12–18–56, Cl. 204—193.

Young, Richard E., to Borg-Warner Corp. Transmission control. 2,774,376, 12–18–56, Cl. 137—620.

Young, Robert H. Food additive. 2,774,673, 12–18–56, Cl. 99—143.

Young, Stanley O. Tobacco elevator. 2,774,461, 12–18–56, Cl. 198—139.

Youngstown Steel Door Co., The: *See*—
Johansson, Carl E., and Noble. 2,774,515.

Zachary, Alexis. Hair treating device. 2,774,358, 12–18–56, Cl. 132—34.

Zalkind, Albert M. Pounding toy. 2,774,179, 12–18–56, Cl. 46—1.

Zeegers, Johannes A.: *See*—
De Jong, Geert J., and Zeegers. 2,774,793.

Zeisler, Albert B.: *See*—
Acton, Jack C. and Zeisler. 2,774,900.

Zeisler, Albert B., to General Electric Co. Dual ring support for end turns of form wound coils. 2,774,899, 12–18–56, Cl. 310—260.

Zell Products Corp., The: *See*—
Tomoschat, William. 2,774,158.

Zepp, Emil, ½ to H. Schlox. Rotary pump. 2,774,307, 12–18–56, Cl. 103—93.

Ziccardi, John J., Jr. Fire detection conductors. 2,774,850, 12–18–56, Cl. 200—143.

Zippo Mfg. Co.: *See*—
Blaisdell, George G., and Flickinger. 2,774,234.

Zuckermann, Armand. Eddy current brake. 2,774,895, 12–18–56, Cl. 310—93.

Zwald, John J., to Sylvania Electric Products Inc. Photoflash gun. 2,774,862, 12–18–56, Cl. 240—37.

# CLASSIFICATION OF PATENTS

## ISSUED DECEMBER 18, 1956

NOTE.—First number=class, second number=subclass, third number=patent number

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 2— | 36: 2,774,073 | 87— | 43: 2,774,163 | 71— | 2.7: 2,774,658 | 100— | 2: 2,774,674 | 128— | 31: 2,774,821 | 180— | 6.3: 2,774,434 |

## NOTICES

### Trademark Suits

Notices under 15 U. S. C. 1116; Trademark Act of July 5, 1946

TM 239,284 (V. P. D.), Joshua Meier, Inc., Transparent envelopes; TM 564,225 (SPRL-BINDER), same, Display albums and loose leaf binders, appeal filed Oct. 31, 1955, C. C. A., 2nd Cir., Dec. 22268, *Joshua Meier Co., Inc.* v. *Albany Novelty Mfg. Co.* Judgment affirmed in part and reversed in part July 30, 1956.

TM 515,282 (DIMENSIONAL), Lares Textiles Co., Hosiery; TM 622,748, same, Women's slips and nightgowns, filed Oct. 10, 1956, D. C., S. D. N. Y., Doc. 113/362, *Lares Inc.* v. *The American Maid Co., Inc.* Consent judgment for injunction Nov. 9, 1956.

TM 564,225. (See TM 239,284.)

TM 622,748. (See TM 515,282.)

### Amendment to Trademark Rule 2.12

TITLE 37—PATENTS, TRADEMARKS, AND COPYRIGHTS

CHAPTER I—PATENT OFFICE, DEPARTMENT OF COMMERCE

*Part 2—Rules of Practice in Trademark Cases*

PERSONS WHO MAY PRACTICE BEFORE PATENT OFFICE IN TRADEMARK CASES

The following amendment is made to take effect on publication in the Federal Register. The purpose of the amendment is to conform the rule which is amended to a recent court decision.

Paragraph (b) of § 2.12 is amended to read as follows:

§ 2.12 *Persons who may practice before the Patent Office in trademark cases.* * * *

(b) Non-lawyers: Persons who are not attorneys at law as specified in paragraph (a) of this section are not recognized to practice before the Patent Office in trademark cases, except that persons not attorneys at law who were recognized to practice before the Patent Office under this Chapter prior to January 1, 1957, will be recognized as agents to continue practice in trademark cases in the Patent Office.

(Sec. 41, 60 Stat. 440, sec. 1, 66 Stat. 795; 15 U. S. C. 1123, 35 U. S. C. 31)

Dated: November 16, 1956.

[SEAL] ROBERT C. WATSON,
*Commissioner of Patents.*

Approved:

SINCLAIR WEEKS,
*Secretary of Commerce.*

[F. R. Doc. 56—9616; Filed, Nov. 23, 1956; 8:47 a. m.]

*(Published in the Federal Register for November 24, 1956, 21 F. R. 9132)*

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington 25, D. C., to whom all subscriptions should be made payable, and all communications addressed; subscription price, $10.50 per annum, foreign mailing $5.50 additional; single copies, 20 cents each.

# MARKS PUBLISHED FOR OPPOSITION

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Notice of opposition under section 13 may be filed within thirty days of this publication. See Rules 20.1 to 20.5.
As provided by section 31 of said act, a fee of twenty-five dollars must accompany each notice of opposition.

## CLASS 1

## RAW OR PARTLY PREPARED MATERIALS

SN 682,886. Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main Hochst, Germany. Filed Mar. 7, 1955.

The mark consists of a bridge and tower design. Owner of German Reg. No. 617,606, dated Mar. 7, 1952.
For Synthetic Resins in the Form of Sheets, Rods, Tubes, Filaments, Etc. for Further Manufacture in the Industrial Arts; Textile Fibres, Superpolyamide Fibres, Filaments, Strands, Bristles and Wires for Use in the Fabrication of Threads, Yarns, Textile Fabrics, Brushes, Strings, Fishing Lines, and the Like.

SN 694,043. Blaney Farms, Inc., Madison, Wis. Filed Sept. 1, 1953.

No claim is made to the representation of the outline of the State of Wisconsin and the ear of corn apart from the mark as shown.
For Agricultural Seeds—Namely, Corn, Wheat, Oats, and Barley.
First use in the year 1945.

SN 10,542. Lamiseal Plastics Corp., Richmond Hill, N. Y. Filed June 19, 1956.

LAMISEAL

For Plastic Sheet Materials of Vinyl Resin, Polyethylene Resin, and Other Synthetic Plastic and Resinous Materials.
First use Aug. 1, 1953.

## CLASS 2

## RECEPTACLES

SN 6,796. Continental Can Company, Inc., New York, N. Y. Filed Apr. 20, 1956.

Lanafoil

Owner of Reg. Nos. 389,688 and 390,204.
For Empty Bags Produced From Laminated Sheet Materials Wholly or in Part From Foil, Plastic Film Materials, and Paper.
First use Sept. 1, 1955.

SN 7,205. Magnolia Paper Company, Houston, Tex. Filed Apr. 26, 1956.

TUFFY

For Plastic Bags.
First use about January 1950.

SN 7,238. J. S. Carr, Deland, Fla. Filed Apr. 27, 1956.

Sunshine Crates

The term "Crates" is disclaimed apart from the mark as shown.
For Miniature Crates for Packaging Prepared Food Products, Fruits, and Nuts.
First use Feb. 26, 1951.

SN 9,360. Marathon Corporation, Menasha, Wis. Filed June 4, 1956.

ADVAC

For Paper Trays for Meat Products.
First use May 21, 1956.

SN 9,804. Master Metal Products, Incorporated, Buffalo, N. Y. Filed June 7, 1956.

CHROME QUEEN

For Bread Boxes, Kitchen Canisters for Foodstuffs, Step-On Cans, and Waste Baskets and Waste Cans.
First use Feb. 27, 1956.

SN 10,858. The Diamond Match Company, New York, N. Y. Filed June 25, 1956.

SARANAC

For Molded Pulp Pie Plates.
First use June 19, 1953.

SN 10,862. Wallace Container Company, Santa Ana, Calif. Filed June 25, 1956.

VYNITE

For Flexible Plastic Containers.
First use on or about Oct. 1, 1953.

SN 12,593. Continental Can Company, Inc., New York, N. Y. Filed July 23, 1956.

Snow Blast!

For Paper Cups.
First use June 4, 1956.

SN 12,708. Continental Paper Company, Ridgefield Park, N. J. Filed July 24, 1956. Sec. 2(f).

ALFORD

For Cartons, Containers, Carriers, and Folding Boxes of Paper Board.
First use about 1946.

## CLASS 3

## BAGGAGE, ANIMAL EQUIPMENTS, PORTFOLIOS, AND POCKETBOOKS

SN 700,796. Henry L. Kotkins, Seattle, Wash. Filed Dec. 29, 1955.

MISS SKYWAY

Owner of Reg. Nos. 358,373, 503,005, and 513,863.
For Ladies' Luggage.
First use Nov. 18, 1955.

## CLASS 4

## ABRASIVES AND POLISHING MATERIALS

SN 682,887. Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main Hochst, Germany. Filed Mar. 7, 1955.

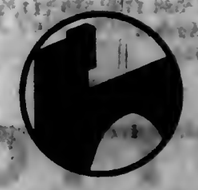
The mark consists of a bridge and tower design. Owner of German Reg. No. 617,606, dated Mar. 7, 1952.
For Polishing Paste, Polishing Agents, Polishing, Cleaning, and Preservative Preparations for Treating Leather and Floor Polish.

SN 9,352. Finishine Laboratories, Inc., Syracuse, N. Y. Filed May 31, 1956. Sec. 2(f).

QUICKLEEN

For Polish for Furniture, Automobiles, and Hardwood Floors.
First use December 1932.

SN 9,633. The Gauf Corporation, New York, N. Y. Filed June 5, 1956.



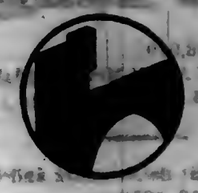
ALLEGRO

For Furniture Polish.
First use May 1, 1956.

## CLASS 5

## ADHESIVES

SN 682,888. Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main Hochst, Germany. Filed Mar. 7, 1955.



The mark consists of a bridge and tower design. Owner of German Reg. No. 617,606, dated Mar. 7, 1952.
For Synthetic Adhesives.

## CLASS 6

## CHEMICALS AND CHEMICAL COMPOSITIONS

SN 682,889. Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main Hochst, Germany. Filed Mar. 7, 1955.

The mark consists of a bridge and tower design. Owner of German Reg. No. 617,606, dated Mar. 7, 1952.
For Photographic Fixers and Developing Compositions, Finishing and Bleaching Agents for Textiles, Leather Preservatives, Flux and Welding Chemicals, Cement Curing and Hardening Compositions, Synthetic Resins in the Form of Compositions, Granules, Powder Etc., Dyes and Dyestuffs, Bleaching Preparations, Mordants, Chemical Covered Preservatives, Fire Extinguishing Agents, Insecticides and Fungicides, Chemical Refrigerants and Liquified Gases for Use as Propelling Agents in the Formations of Aerosols.

SN 695,016. R. S. Parker Associates, Cranford, N. J. Filed Sept. 20, 1955.

PAR-CONE 15

For Silicone Treatment Which Softens Leather and Imparts Waterproofing Properties Thereto.
First use June 1, 1955.

SN 695,068. American Aniline Products, Inc., New York, N. Y. Filed Sept. 21, 1955.

## AMAQUEST

For Sequestering Agents for Textiles.
First use Aug. 24, 1955.

SN 697,871. United States Rubber Company, New York, N. Y. Filed Nov. 7, 1955.

## VIBRATHANE

For Synthetic Resins—Namely, Polyester Resins.
First use Aug. 8, 1955.

SN 698,092. Ultra Chemical Works, Inc., Paterson, N. J. Filed Nov. 10, 1955.

## SULFRAMIDL

Owner of Reg. Nos. 584,173, 589,111, and others.
For Surface Active Agents.
First use July 14, 1955.

SN 105. Texize Chemicals Inc., Greenville, S. C. Filed Jan. 3, 1956. Sec. 2(f).

## THE MAID IN A BOTTLE

For Plastic Starch, Pine Oil Disinfectant, Foaming Action Bleach, Laundry Starch, Transparent Starch.
First use October 1948 for laundry starch.

SN 5,507. Columbia-Southern Chemical Corporation, Pittsburgh, Pa. Filed Mar. 30, 1956.

## PITTABS

Owner of Reg. No. 426,919.
For Hypochlorites of Alkali Metals and Alkali Earth Metals.
First use Jan. 9, 1956.

SN 6,240. E. I. du Pont de Nemours and Company, Wilmington, Del. Filed Apr. 12, 1956.

## TERACOL

For Polyalkylene Ether Glycols.
First use on or before Jan. 26, 1956.

SN 6,525. Hydroponic Chemical Company, Inc., Copley, Ohio. Filed Apr. 17, 1956.

## ONEX

For Rat and Mouse Killer Bait.
First use Mar. 22, 1956.

SN 9,395. Reichhold Chemicals, Inc., Detroit, Mich. Filed May 31, 1956.

## EPOXIDOL

For Epoxidised Oil Plasticisers.
First use Apr. 27, 1956.

SN 9,639. Philip A. Hunt Company, Palisades Park, N. J. Filed June 5, 1956.

## GRAPH-O-FAX

For Photographic Developing Powder.
First use May 17, 1956.

SN 9,671. Sandoz Chemical Works, Inc., New York, N. Y. Filed June 5, 1956.

## LEVANA

For Chemical Preparations Used as Dyeing Assistants and Leveling and Protecting Agents for Dyeing Textiles.
First use 1930.

### CLASS 7

### CORDAGE

SN 682,890. Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main Hochst, Germany. Filed Mar. 7, 1955.

The mark consists of a bridge and tower design. Owner of German Reg. No. 617,606, dated Mar. 7, 1952.
For Ropes, Strings, Cables, Tape, Twine, Wire, and Braids, for Tying Purposes.

### CLASS 10

### FERTILIZERS

SN 682,891. Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main Hochst, Germany. Filed Mar. 7, 1955.

The mark consists of a bridge and tower design. Owner of German Reg. No. 617,606, dated Mar. 7, 1952.
For Fertilizers.

SN 696,507. Crown Zellerbach Corporation, San Francisco, Calif. Filed Oct. 17, 1955.

Owner of Reg. Nos. 247,811, 601,509, and others.
For Solids of Waste Sulfite Liquor, for Use as a Fertilizer and Soil Conditioner.
First use September 1954.

### CLASS 11

### INKS AND INKING MATERIALS

SN 682,892. Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main Hochst, Germany. Filed Mar. 7, 1955.

The mark consists of a bridge and tower design. Owner of German Reg. No. 617,606, dated Mar. 7, 1952.
For Inks, Ingredients of Inks and Resinous Materials for Use in Inks.

### CLASS 12

### CONSTRUCTION MATERIALS

SN 663,484. Martin Bros., Los Angeles, Calif. Filed Mar. 29, 1954.

## MARTRACK

For Stud Fastening Bases and Plaster Grounds Incorporated in Walls During Their Construction.
First use Mar. 26, 1954.

SN 687,044. Barber-Colman Company, Rockford, Ill. Filed May 9, 1955.

## WEATHER-KING

For Building Doors and Panels Therefor.
First use October 1954.

SN 692,456. Dalmine S. p. A. Milan, Italy. Filed Aug. 4, 1955.

Owner of Italian Reg. No. 100,766, dated Feb. 16, 1951.
For Construction Materials—Namely, Piles, Pillars, Asbestos Cement Tubes With or Without Steel Reinforcement, and Asbestos Cement Layers Cast on Steel Tubes.

SN 692,457. Dalmine S. p. A. Milan, Italy. Filed Aug. 4, 1955

Owner of Italian Reg. No. 99,025, dated Nov. 18, 1950.
For Construction Materials—Namely, Piles, Pillars, Asbestos Cement Tubes With or Without Steel Reinforcement, and Asbestos Cement Layers Cast on Steel Tubes.

SN 693,821. Kay M. Grier, d. b. a. The Softop Corporation, North Hollywood, Calif. Filed Aug. 29, 1955.

PLACON

## SOFTOP

For Resilient Surfacing Composed of Canvas, Rubber, and Plastics and Used To Cover Playground Surfacing To Prevent Injuries From Falls.
First use July 15, 1955.

SN 697,713. Style-Rite Homes Corporation, Columbus, Ohio. Filed Nov. 4, 1955.

## Style-rite

For Prefabricated Houses.
First use Sept. 11, 1952.

SN 699,830. Reflectal Corporation, Chicago, Ill. Filed Dec. 12, 1955.

## REFLECTAL

For Aluminum Foil Insulation, Wire Fabric Screening, and Pre-Fabricated Roofing.
First use June 2, 1955, on aluminum foil insulation.

SN 813. Metal Decking Corporation, Indianapolis, Ind. Filed Jan. 16, 1956.

## ALUMADEK

For Prefabricated Aluminum Paneling for Use in Construction of Roof Decks and Siding.
First use July 26, 1955.

SN 831. Reflectal Corporation, Chicago, Ill. Filed Jan. 16, 1956.

Owner of Reg. Nos. 513,546, 607,849, and others.
For Aluminum Foil Insulation, Wire Fabric Screening, and Pre-Fabricated Roofing and Parts Thereof for Replacement and Repair.
First use June 2, 1955, on aluminum foil insulation.

SN 1,471. Pont Electric Co., Inc., Detroit, Mich. Filed Jan. 25, 1956.

JEFCO

For Building Brick.
First use Jan. 3, 1956.

SN 2,188. Pricemetal Corporation, San Francisco, Calif. Filed Feb. 6, 1956.

Pricemetal

For Metal Building Partitions, Doors, and Door Frames for Industrial and Marine Use, Shelving, and Metal Window Frames.
First use Sept. 1, 1948.

SN 2,265. Simplex Forms System, Inc., Rockford, Ill. Filed Feb. 7, 1956.

Simplex

For Concrete Forms and Tie Wires, Wall Braces, Tie Bars, and Combined Tie Bars and Scaffold Brackets, and Other Hardware Used in Connection With Concrete Forms and Sold Therewith.
First use July 30, 1954.

SN 2,745. The Burns and Russell Company, Baltimore, Md. Filed Feb. 16, 1956.

Spectra-Flor

Owner of Reg. Nos. 584,145, 615,720, and others.
For Molded Masonry Building Blocks and Bricks.
First use Feb. 2, 1956.

SN 3,968. Veerman International Company, New York, N. Y. Filed Mar. 6, 1956.

VICO

For Ceramic Wall and Floor Tile.
First use May 19, 1953.

SN 4,751. Harry L. Acomb, Wayne, Pa. Filed Mar. 19, 1956.

"POLYWOOD"

For Molded Wood Products Consisting of Particulate Wood and a Resin Binder.
First use Mar. 7, 1956.

SN 5,569. Western Mineral Products Company, Minneapolis, Minn. Filed Mar. 30, 1956.

spra-vyt

The drawing is lined for yellow but no claim is made to a specific color.
For Dry Pre-Mixed Granular Mineral Material That When Mixed With Water Becomes a White Texture Finish Coating for Application to Interior Surfaces and Having a Property of Acoustical Correction.
First use Mar. 2, 1956.

SN 5,668. The Proko Company, Dallas, Tex. Filed Apr. 2, 1956.

TRIKO PRODUCTS

The word "Products" is disclaimed apart from the mark as shown.
For Spachtling and Patching Paste, and for Combination Joint Cement, Topping Cement and Texture Paint.
First use Dec. 21, 1955, on spachtling and patching compound.

SN 6,705. The Flintkote Company, New York, N. Y. Filed Apr. 19, 1956.

DURA-SHIELD

Owner of Reg. No. 608,573.
For Asbestos-Cement Siding.
First use on or about Jan. 31, 1952.

SN 6,706. The Flintkote Company, New York, N. Y. Filed Apr. 19, 1956.

FLINTAR

For Tar Composition Pavement Sealer.
First use in or about July 1954.

SN 8,983. The Reardon Company, St. Louis County, Mo. Filed May 24, 1956.

SX

For Joint Cement and Topping Cement.
First use Jan. 10, 1956.

SN 9,116. Comstock-Kitte Company, Philadelphia, Pa. Filed May 28, 1956.

DURAFORM

For Plastic Faced Plywood for Concrete Forms Used in Construction Work.
First use June 1, 1954.

## CLASS 13

## HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES

SN 700,073. Akron Brass Manufacturing Co., Inc., Wooster, Ohio. Filed Dec. 2, 1955. Sec. 2(f).

AKRON

For Fire-Fighting Apparatus—Namely, Nozzles, Couplings, Valves, Tips, Siamese Hose Fittings, Shut-Offs, Play Pipes, Deck Pipes, Ladder Pipes and Accessories—Namely, Hose and Ladder Straps, Thread Adapters, Siphons, Hose Jackets, Clamps, Strainers, Expanders, Hose-Mending Sleeves, Caps, and Plugs; and Portable Irrigation Equipment—Namely, Conduit, Couplings, Sprinklers, Valves, Elbows, Stabilisers, Risers, Gaskets, and Plugs.
First use in or about 1918.

SN 9,787. The Gabriel Company, Cleveland, Ohio. Filed June 7, 1956.

DUBL-GRIP

For Hose Coupling.
First use Sept. 5, 1952.

SN 12,020. Flynn Burner Corporation, New Rochelle, N. Y. Filed July 12, 1956.

UNIMIXER

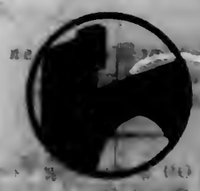
For Air-Gun Mixers.
First use Mar. 24, 1953.

SN 12,021. The Gailstyn Company Inc., New York, N. Y. Filed July 12, 1956.

GAIL-A-WARE by GAILSTYN

For Householdware Consisting of Ice Buckets, Casseroles, Water Pitchers, Tumblers, Tid-Bit Trays, Trays and Lazy Susans Made of Base Metals Such as Aluminum, Copper, Brass, Steel and/or Combinations of Such Base Metals and Glass.
First use Mar. 30, 1953.

SN 12,514. Kwikset Locks, Inc., Anaheim, Calif. Filed July 20, 1956.



BEL AIR

For Knobs—Namely, Doorknobs, and Dummy Knobs.
First use Dec. 23, 1955.

## CLASS 14

## METALS AND METAL CASTINGS AND FORGINGS

SN 682,893. Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main Hochst, Germany. Filed Mar. 7, 1955.

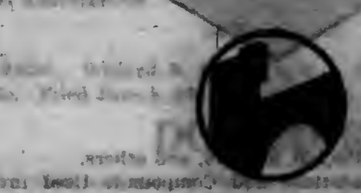
The mark consists of a bridge and tower design. Owner of German Reg. No. 617,606, dated Mar. 7, 1952.
For Solders and Hardening Agents for Metals.

SN 11,508. Union Carbide and Carbon Corporation, New York, N. Y. Filed July 3, 1956.

INJECTOLOY

For Alloying Compositions for Addition to Molten Metal.
First use on or about June 22, 1954.

SN 12,269. General Machine Works, Inc., Los Angeles, Calif. Filed July 17, 1956.



For Metal Stampings.
First use July 19, 1950.

## CLASS 15

## OILS AND GREASES

SN 682,894. Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main Hochst, Germany. Filed Mar. 7, 1955.

The mark consists of a bridge and tower design. Owner of German Reg. No. 617,606, dated Mar. 7, 1952.
For Oils and Greases for Lubrication and/or Rust Prevention Purposes.

SN 4,624. Enjay Company, Inc., New York, N. Y. Filed Mar. 15, 1956.

PARADYNE

For Chemical Ingredient Used as an Additive for Liquid Fuel in Internal Combustion Engines.
First use Mar. 7, 1941.

SN 15,169. Ashland Oil & Refining Company, Ashland, Ky. Filed Sept. 6, 1956. Sec. 2(f).

Ashland FLYING OCTANES

Owner of Reg. No. 535,578.
For Gasoline.
First use Jan. 12, 1946.

SN 16,006. Standard Oil Company of California, San Francisco, Calif. Filed Oct. 8, 1956.

Owner of Reg. Nos. 356,109, 533,798, and others.
For Chemical Preparations and Compounds Used in the Manufacture of Lubricating Oil Additives; Chemical Preparations and Compounds for Use as Additives in Burner Fuel, Gasoline, Oil, Greases, and Lubricants; and Chemical Preparations and Compounds for Use in High Temperature Industrial Lubricants.
First use Aug. 1, 1956, on lubricating oil additives.

## CLASS 16

## PROTECTIVE AND DECORATIVE COATINGS

SN 682,895. Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main Hoechst, Germany. Filed Mar. 7, 1955.

The mark consists of a bridge and tower design. Owner of German Reg. No. 617,906, dated Mar. 7, 1952.
For Primers, Lacquers, etc. for Photographic Purposes for Imparting Protective or Decorative Coatings, Wood Preservatives as a Protective Coating, Resins as an Ingredient for Paint, Resins Used as a Floor Finish as a Protective Coating.

SN 700,276. Sunbeam Corporation, Chicago, Ill. Filed Dec. 19, 1955.

Sunbeam

Owner of Reg. Nos. 318,056 and 390,181.
For Paints.
First use September 1947.

## CLASS 18

## MEDICINES AND PHARMACEUTICAL PREPARATIONS

SN 682,896. Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main Hoechst, Germany. Filed Mar. 7, 1955.

The mark consists of a bridge and tower design. Owner of German Reg. No. 617,906, dated Mar. 7, 1952.
For Pharmaceutical Chemicals and Specialties of All Kinds for Medicinal and Veterinary Purposes—Namely, Analgesics, Anesthetics, Antimalarials, Antihistamines, Disinfectants, Sulfa Drugs, Antibiotics, Vaso-Constrictors and Dilators, Heart Stimulants and Hormone Preparations, and Vaccines.

SN 685,670. The Drug Products Co., Inc., Brooklyn, N. Y. Filed Apr. 18, 1955.

For Antibiotics, Acids Used for Medicinal Purposes, Compounds Used as Ingredients of Medicines, Stimulants, Sedatives, Herbs for Medicinal Purposes, Analgesics, Antispasmodics, Barium Compounds, Diuretics, Iron and Iron Compounds, Magnesium Compounds, Mercury Compounds, Oil

Compounds, Potassium Compounds, Zinc Compounds, and Biological Products in Ampule, Tablet, Liquid, Powder, or Ointment Forms.
First use Feb. 6, 1913.

SN 696,046. Johnson & Johnson, New Brunswick, N. J. Filed Oct. 7, 1955.

J&J

Owner of Reg. Nos. 605,838, 554,242, and others.
For Athlete's Foot Treatment Kits, Powders for the Treatment of Prickly Heat, Athlete's Foot and Any Other Conditions of the Skin, Antiseptics, Ointments for the Treatment, Alleviation or Prevention of Skin Infections, Inhalants, Ammonia for the Treatment of Fainting, Iodine, Bicarbonate of Soda for the Treatment of Stomach Upsets, Petrolatum, Castor Oil, Lotion for the Treatment, Alleviation and Prevention of Skin Infections, Jelly for Lubrication in Medical Treatment, and Antiseptic Jelly.
First use at least as early as 1898.

SN 697,563. Dr. Bernhard A. Makiola, d. b. a. Dr. Bernhard A. Makiola (Institut für Arzneimittelforschung), Vaduz, Liechtenstein. Filed Nov. 2, 1955.

MONOPHARM

Owner of Liechtenstein Reg. No. 233, dated Sept. 30, 1953.
For Medicinal Preparations for the Treatment of Nervous Diseases in General, Nervous Exhaustion, Neurasthenia, Skin Affections, Measles, Rozeola, Scarletina, Erysipelas, Paradentosis, Gingivitis, Stomatitis, Vascular Troubles in General, High Blood Pressure, Affections of the Mucous Membranes of the Respiratory and Digestive Organs, Nasal Catarrh, Whooping Cough, Hay Fever, Bronchial Asthma, Bronchitis, Grippe, Laryngitis, Affections of the Blood Vessels, Arteriosclerosis, Headache, Cardiac Ailments, Weak Heart, Diathesis of Uric Acid, Diabetes, Rheumatism, Neuralgias, Neuritis, Subcute and Chronic Diseases of the Joints, Myalgias, Lumbago, Arthritis, Sciatica, Gout, Goitre, Hyperthyroidism, Graves Diseases, Liver Trouble, Gallbladder Trouble, Gall Stones, Ailments of the Stomach and Intestines, Constipation, Typhoid Fever, Diarrhoea, General Weakness, Diseases of the Climacterium, Intestinal Obstructions, Hemorrhoids, Varicose Veins, Kidney Troubles, Kidney Stones, Nephrolithiasis, Cystitis, Pyelitis, Metabolic Diseases in General, Insomnia.

SN 697,564. Dr. Bernhard A. Makiola, d. b. a. Dr. Bernhard A. Makiola (Institut für Arzneimittelforschung), Vaduz, Liechtenstein. Filed Nov. 2, 1955.

POLION

Owner of Liechtenstein Reg. No. 492, dated Feb. 19, 1955.
For Pharmaceutical Preparations for the Treatment of Nervous Diseases, Atrophy, and Paralysis.

SN 697,565. Dr. Bernhard A. Makiola, d. b. a. Dr. Bernhard A. Makiola (Institut für Arzneimittelforschung), Vaduz, Liechtenstein. Filed Nov. 2, 1955.

MONORUBIN

Owner of Liechtenstein Reg. No. 519, dated Mar. 15, 1955.
For Pharmaceutical Preparations for the Treatment of Cancerous Sores and Allied Disorders.

SN 700,295. Max Sherrin, d. b. a. Renpak Chemist, Jackson Heights, N. Y. Filed Dec. 30, 1955.

RENPAK

For Preparations for the Treatment of Children's Coughs, Adults' Coughs, Colds, and Pain Due to Headache, Neuralgia, and Neuritis.
First use Dec. 1, 1930.

SN 1,611. The S. E. Massengill Company, Bristol, Tenn. Filed Jan. 27, 1956.

SEMCO

Owner of Reg. No. 549,846.
For Line of Medicated Preparations in Compressed Tablet Form.
First use Jan. 19, 1953.

SN 3,905. Whitehall Pharmacal Company, New York, N. Y. Filed Mar. 5, 1956.

3-LB4

For Medicinal Sedative Preparation in Tablet Form.
First use Nov. 28, 1955.

SN 7,002. Dr. Wendell G. Hendricks, d. b. a. Hendricks Laboratories, Los Angeles, Calif. Filed Apr. 24, 1956.

LACTO-ZYME

For Nutritional Vitamin Tablets Containing Yogurt, Lactose, and Brewers' Yeast.
First use Mar. 1, 1956.

SN 9,344. Clark, Puffer and Brown, Inc., Carlisle, Pa. Filed May 31, 1956.

CPB SEAL OF INTEGRITY

For Pharmaceutical Products—Namely, Tablets, Capsules, Liquids, Ointments, Injectibles, Suppositories, and Inhalants.
First use Mar. 15, 1956.

SN 9,685. Aktiebolaget Bofors, Bofors, Sweden. Filed June 6, 1956.

CARBOCAIN

Owner of Swedish Reg. No. 73,060, dated Nov. 21, 1952.
For Medicines and Pharmaceutical Preparations—Namely, Local Anaesthetics.

SN 9,850. Willard R. Erwin, d. b. a. Doesmore Co., Bolivar, Mo. Filed June 9, 1956.

DOESMORE

For Counter-Irritant Preparation for Providing Relief in Simple Neuralgia and Minor Muscular Strains, Aches and Pains, To Be Inhaled to Aid Relief of Nasal Congestion Associated With Simple Colds; Also Used for Chapped Hands and Cracked Cow Teats.
First use Mar. 14, 1956.

SN 9,935. Blair Laboratories, Inc., Short Hills, N. J. Filed June 11, 1956.

## SERPHYLLINE

For Preparation for the Relief of Cardiac Conditions.
First use May 28, 1956.

SN 9,937. Blair Laboratories, Inc., Short Hills, N. J. Filed June 11, 1956.

## SERPHEDRINE

For Preparation for the Relief of Asthma.
First use May 28, 1956.

SN 10,847. Chicago Pharmacal Company, Chicago, Ill. Filed June 25, 1956.

## RESYDESS

For Medicinal Preparation Used for the Treatment of Obesity Without the Accompanying Nervousness and Anxiety.
First use Dec. 30, 1955.

### CLASS 19

### VEHICLES

SN 676,536. William A. Schiller, d. b. a. Handyman Twin Lift Truck Company, Houston, Tex. Filed Nov. 12, 1954.

## Handyman Twins

For Wheels With Spiked Brackets Attached for Use in Moving Heavy Objects.
First use Dec. 15, 1953.

SN 4,827. New England Cut Stone Co., Inc., d. b. a. Boston Boat Sales Co., Dorchester, Mass. Filed Mar. 19, 1956.

## Royal

For Boats.
First use Feb. 4, 1956.

SN 7,699. Herman Mills Construction and Cement Corporation, New York, N. Y. Filed May 4, 1956.

## GARDETTE

For Automobile Accessories—Namely, Bumpers and Bumper Guards.
First use Dec. 8, 1955.

SN 10,034. Société à Responsabilité Limitée Recherches Etudes Production S. E. P., Paris, France. Filed June 11, 1956.

## MAXIHALT

Priority is claimed under Sec. 44(d) on French Reg. No. 456,302, dated Mar. 7, 1956 (Seine); Natl. Inst. No. 70,287.
For Automatic Brake Apparatus or Mechanisms for All Air or Land Vehicles, as Well as Their Spare Parts and Constituting Elements.

SN 10,545. Nils Lucander, d. b. a. International Yacht Sales, Detroit, Mich. Filed June 19, 1956.

## DAGGER

For Boats.
First use Jan. 13, 1954.

SN 10,567. Vertol Aircraft Corporation, Morton, Pa. Filed June 19, 1956.

## VERTOL Aircraft Corporation

For Aircraft of the Vertical Takeoff and Landing Type.
First use Mar. 12, 1956.

SN 10,721. Studebaker-Packard Corporation, Detroit, Mich. Filed June 21, 1956.

## Pinehurst

For Automobiles.
First use Nov. 23, 1955.

SN 10,722. Studebaker-Packard Corporation, Detroit, Mich. Filed June 21, 1956.

## Parkview

For Automobiles.
First use Nov. 12, 1953.

SN 10,723. Studebaker-Packard Corporation, Detroit, Mich. Filed June 21, 1956.

## Pedham

For Automobiles.
First use Nov. 15, 1955.

SN 10,752. Central States Coal Co., Inc., d. b. a. Central States Sales Co., Dallas, Tex. Filed June 22, 1956.

## LONGHORN

For Combination Truck Bumpers and Trailer Hitches.
First use May 30, 1956.

SN 10,901. Neserd Enterprises, Inc., Madison, Wis. Filed June 25, 1956.

## E-Z-AIR

For Air Deflectors for Vehicles.
First use June 13, 1956.

### CLASS 21

### ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES

SN 684,366. Vondy Mfg. Co., Burns, Wyo. Filed Mar. 28, 1955.

STACYWOOD

For Lamps.
First use Dec. 9, 1954.

SN 690,536. Kaiser Aluminum & Chemical Corporation, Oakland, Calif. Filed Dec. 2, 1955.

## POLYPRENE

For Insulated Conductor Cable.
First used Aug. 10, 1955.

SN 700,017. C. Conrad & Co., Nuremberg, Germany. Filed Dec. 15, 1955.

## NORIS

Owner of German Reg. No. 422,993, dated Sept. 1, 1926.
For Manufactured Products From Electric and Galvanic Carbons of All Kinds, Carbon Pencils, With and Without Addition of Illuminescent Materials, for Arc Lamps and Projectors, Carbon Rods, Carbon Cylinders, Carbon Plates for Primary Cells and Storage Batteries, Carbon Electrodes for Electrochemical and Metallurgical Processes, Carbon Brushes for Motors and Dynamos, Copper and Metal Brushes, Sliding and Pressure Contacts, Carbon Sealing Rings, Carbon Sliding Yokes for Current Takeoff Devices of Electrically-Driven Vehicles, Incandescent Carbons and Heating Rods for Heaters, Resistance Carbons for Protection Against Lightning and for Electrothermic Purposes, Artificial Graphite, Plates, Electrodes, Rods, and Other Molded Articles Made of Artificial Graphite, Silicon Carbide, and Molded Rods Made of Silicon Carbide.

SN 4,875. Robert C. Wuerth, d. b. a. Wuerth Enterprises, Philadelphia, Pa. Filed May 19, 1956.

## SURGISTOR

For Electrical Circuit Device for Initially Limiting Current to Filamentary Loads.
First use Dec. 27, 1955.

SN 5,320. Ray-O-Vac Company, Madison, Wis. Filed Apr. 9, 1956.

The drawing is lined for red and golden brown, but color is not claimed as an essential element. Owner of Reg. No. 421,450.
For Dry Cells and Dry Batteries.
First use Feb. 1, 1956; and June 4, 1945, as to "Ray-O-Lux."

SN 8,511. Spencer-Kennedy Laboratories, Inc., Boston, Mass. Filed May 17, 1956.

## SKL

For Radio and Television Equipment and Parts Thereof.
First use Jan. 31, 1949.

SN 10,389. Arguane Electronics Mfg. Corp., New York, N. Y. Filed June 18, 1956.

## POLY-VARI-CON

For Variable Condensers (Electrical).
First use Mar. 1, 1956.

SN 10,412. Charles Engelhard, Incorporated, East Newark, N. J. Filed June 18, 1956.

## CAPAC

For Electrical Control System and Cathodic Protection Apparatus for Counteracting Corrosion on Metallic Articles in Contact With Liquids.
First use Mar. 20, 1956.

SN 10,633. Westrex Corporation, New York, N. Y. Filed June 20, 1956.

## Monatel

For Radio Transmitting, Receiving, and Relaying Sets.
First use Dec. 21, 1954.

SN 10,846. Chicago Condenser Corporation, Chicago, Ill. Filed June 25, 1956.

## PI-CAPS

For Electric Capacitors.
First use May 1, 1956.

SN 11,267. Palo Alto Engineering Company, Palo Alto, Calif. Filed June 29, 1956.

## PAECO

For Transformers.
First use March 1952.

### CLASS 22

### GAMES, TOYS, AND SPORTING GOODS

SN 690,830. American Metal Specialties Corporation, Hatboro, Pa. Filed Oct. 21, 1955.

## DOLL-E-SITTER

For Packaged Kit of Items Used by Little Girls in Tending and Feeding Their Toy Dolls—Namely, Diapers, Nursing Units, and Toy Animals.
First use Apr. 1, 1955.

SN 4,906. Preston E. Michael, Richmond, Va. Filed Mar. 20, 1956.

## Michael's Races

For Parlor Games, Played on a Board With Movable Pieces and Dice.
First use Mar. 2, 1956.

SN 5,493. Cardinal Greetings, Inc., Providence, R. I. Filed Mar. 30, 1956.

## PIC-A-STORY

For Children's Card Game.
First use Mar. 1, 1956.

SN 8,353. Philbert Designs, Port Washington, N. Y. Filed May 15, 1956.

## TUBO TOY

The word "Toy" is disclaimed apart from the mark as shown.
For Dolls in Package Form Filled With Gift Favors and Toys or Playthings, Such as Noisemakers, Horns, Whistles, Pipes, Tops, Magnets, Balls, Stuffed Animals, Plastic Boats, Tricks, or Puzzles, Etc.
First use May 11, 1956.

SN 9,239. Charles R. De Angelis, Watchung, N. J. Filed May 16, 1956.

Suvie Doll

Applicant disclaims the word "Doll" apart from the mark as shown. The mark is "Suvie Doll."
For Dolls.
First use Apr. 27, 1956.

SN 9,242. Allied Manufacturing Corporation, d. b. a. AMC and Allied Mfg. Corp., Bozeman, Mont. Filed May 29, 1956.

CRAZY DUCK

No claim is made to the word "Duck" apart from the mark as shown.
For Plastic Ducks Embodying Permanent Magnets Used for Toy and Amusement Purposes.
First use November 1953.

SN 9,243. Allied Manufacturing Corporation, d. b. a. AMC and Allied Mfg. Corp., Bozeman, Mont. Filed May 29, 1956.

ROCKING CRAZY DUCK

No claim is made to the word "Duck" apart from the mark shown.
For Plastic Ducks Embodying Permanent Magnets Used for Toy and Amusement Purposes.
First use on or about July 18, 1955.

## CLASS 23

## CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF

SN 691,784. Lawrence G. Sagen, d. b. a. Sagen Boat Hoist Co., Auburn, N. Y. Filed July 22, 1955. Sec. 2(f).

SAGEN

For Boat Hoist.
First use June 23, 1947.

SN 698,901. N'Land Industries, Inc., Lewiston, Idaho. Filed Nov. 25, 1955.

AQUAJECTOR

For Tractor-Drawn Fertiliser Machine for Injecting Fertiliser Into the Soil.
First use July 1, 1954.

SN 1,333. Clarkson (Engineers) Limited, Nuneaton, England. Filed Jan. 24, 1956.

AUTOLOCK

Owner of British Reg. No. B713,527, dated Dec. 30, 1952.
For Cutters and Chucks All Being for Use in Machine Tools.

SN 1,901. George R. Pickering, Bakersfield, Calif. Filed Feb. 1, 1956.

Pixey

For Spoons and Forks Made From Stainless Steel or Other Suitable Non-Precious Metal and Used by Infants and Children.
First use Dec. 23, 1955.

SN 2,695. Essex Conveyors, Inc., Newark, N. J. Filed Feb. 15, 1956.

FLORLIFT

For Hydraulically Operated Materials Handling Lifts.
First use June 24, 1955.

SN 10,013. Perfecta Sewing Machine Co. Inc., New York, N. Y. Filed June 11, 1956.

Perfecta

For Sewing Machines and Hand Knitting Machines.
First use Dec. 1, 1954.

SN 10,208. Allis-Chalmers Manufacturing Company, Milwaukee, Wis. Filed June 14, 1956.

AC ALLIS-CHALMERS

Owner of Reg. Nos. 14,423, 579,013, and others.
For Excavating, Transporting, Dumping, Lifting and Leveling Machinery, Towing and Pushing Tractors, Agglomerating and Pelletizing Machinery, Blending and Mixing Machinery, Casting Machines, Oil Extraction Equipment, and Hydraulic Separating Machinery.
First use on or before Oct. 1, 1952, on excavating machinery.

SN 10,273. Western Tool & Stamping Co., Des Moines, Iowa. Filed June 14, 1956.

Flexor

For Lawn Mowers, Lawn Sweepers, and Hand Electric Trimmers, Snow Plows, Trimmer Edgers, Riding Mowers, Utility Carts, Mowers, Sweeper Hitch, Seeders, and Spreaders.
First use Oct. 17, 1955.

SN 10 478. Popular Manufacturing Company, Minneapolis, Minn. Filed June 18, 1956.

DRILLMATE

For Drill Attachments and Tool Sharpening Assemblies.
First use May 19, 1956.

SN 10,479. Proportioneers, Inc., Providence, R. I. Filed June 18, 1956.

PROPORTIONEER

For Pumps for Feeding Liquid Reagents.
First use May 28, 1956.

SN 10,630. Vanton Pump & Equipment Corp., Hillside, N. J. Filed June 20, 1956.

VANTON

For Mechanical Pumps.
First use in September 1947.

SN 10,631. Vanton Pump & Equipment Corp., Hillside, N. J. Filed June 20, 1956.

VP

For Mechanical Pumps.
First use in May 1953.

SN 10,648. Bissell Carpet Sweeper Company, Grand Rapids, Mich. Filed June 21, 1956.

Continental

Owner of Reg. No. 67,695.
First use Mar. 20, 1956.

SN 10,667. Davenport Machine and Foundry Company, Davenport, Iowa. Filed June 21, 1956.

Shooter

For Core Making Machines, Mold Making Machines, Cores, Core Boxes, Molds and Parts of Said Machines, Cores, Boxes, and Molds.
First use Feb. 28, 1956.

SN 10,669. Eclipse Counterbore Company, Ferndale, Mich. Filed June 21, 1956.

ECLIPSE

Owner of Reg. Nos. 119,518 and 388,323.
For Machine Tools for Cutting in Metal—Namely, Counterbores, Pilots, Hollow Mills, Reamers, Taps, Spot Facers, Countersinks, Center Cutting Tools, Cutters, Form Cutters, End Mills, Drills, Boring Bars, Interchangeable Drives, Core Drills, Tool Holders, and Multi-Diameter Cutters.
First use Feb. 1, 1914.

SN 10,700. New Holland Machine Company, New Holland, Pa. Filed June 21, 1956. Sec. 2(f).

NEW HOLLAND

Owner of Reg. Nos. 409,512, 623,834, and others.
For Farm Equipment, Including Automatic Hay Balers, Mowers, Blower Conveyers, Wheel Loaders, Hay Rakes, Manure Spreaders, Corn Husker-Shellers, Forage Harvesters, and Attachments Therefor.
First use 1940 on automatic hay balers.

SN 10,716. Studebaker-Packard Corporation, Detroit, Mich. Filed June 21, 1956.

SWEEPSTAKES

For Internal Combustion Engines for Automobiles.
First use Nov. 12, 1955.

SN 10,717. Studebaker-Packard Corporation, Detroit, Mich. Filed June 21, 1956.

SKY-POWER

For Internal Combustion Engines for Automobiles.
First use Nov. 10, 1955.

SN 10,718. Studebaker-Packard Corporation, Detroit, Mich. Filed June 21, 1956.

POWER STAR

For Internal Combustion Engines for Automobiles.
First use Nov. 8, 1955.

SN 10,719. Studebaker-Packard Corporation, Detroit, Mich. Filed June 21, 1956.

First use Aug. 24, 1955.

638,913. Enrique Cornejo Villanueva, Lima, Peru. SN 698,468. Filed P. R. 11-17-55. Am. S. R. 8-23-56.

Owner of Peruvian Reg. No. 44,658, dated Sept. 15, 1955.
For Boots, Shoes, and Slippers Made Wholly or in Part of Leather.

### CLASS 46

### FOODS AND INGREDIENTS OF FOODS

638,914. Aron Streit, Inc., New York, N. Y. SN 694,166. Filed P. R. 9-2-55. Am. S. R. 10-19-56.

## RI-STRIPS

For Matzos.
First use Aug. 30, 1955.

### CLASS 49

### DISTILLED ALCOHOLIC LIQUORS

638,915. Park & Tilford Distillers Corporation, New York, N. Y. SN 696,725. Filed P. R. 10-19-55. Am. S. R. 9-14-56.

## Mr. PARK

For Whisky.
First use Sept. 9, 1955.

638,916. Park & Tilford Distillers Corporation, New York, N. Y. SN 696,726. Filed P. R. 10-19-55. Am. S. R. 9-14-56.

## Mr. TILFORD

For Whisky.
First use Sept. 9, 1955.

638,917. Majestic Distilling Co., Inc., Lansdowne, Md. SN 699,331. Filed P. R. 12-2-55. Am. S. R. 10-19-56.

BALTIMORE COUNTY

For Whiskey.
First use July 29, 1955.

CLASS 50

MERCHANDISE NOT OTHERWISE CLASSIFIED

638,918. C. Birnbaum Ltd., London, England. SN 698,831. Filed 11-25-55.

**FITWELL**

For Coat, Trousers, and Skirt Hangers.
First use in July 1933; in commerce in July 1933.

CLASS 52

DETERGENTS AND SOAPS

638,919. E. F. Drew & Co. Inc., New York, N. Y. SN 694,131. Filed P. R. 9-2-55. Am. S. R. 9-25-56.

**SAF-ACID**

For Powdered, Dry, Compounded Acid Mixture Used as a Scale Solvent in Cleaning Industrial and Marine Power Plant Equipment Such as Boilers, Evaporators, and Condensers, and in Water Treatment for Reduction of Alkalinity.
First use Aug. 9, 1955.

Service Mark

CLASS 101

ADVERTISING AND BUSINESS

638,920. Harry T. Johnson, New York, N. Y., to Merchant-Consumer Plans Inc., New York, N. Y. SN 674,163. Filed P. R. 10-1-54. Am. S. R. 6-13-56.

# REGISTRATIONS PUBLISHED UNDER SEC. 12(c)

The following marks registered under the act of 1905, or the act of 1881, are published under the provisions of section 12(c) of the Trademark Act of 1946. These registrations are not subject to opposition but are subject to cancellation under section 14 of the act of 1946.

## CLASS 6

## CHEMICALS AND CHEMICAL COMPOSITIONS

220,798. Nov. 16, 1926. James Frederick Moseley, Manchester, England. Pub. by Industrial Processes Development, Limited, Kingston, Ontario, Canada.

**MULSOID**

For Preparations and Compounds for Scouring and Finishing Textile Yarn and Fabrics.

## CLASS 23

## CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF

332,786. Feb. 25, 1936. The Peck, Stow & Wilcox Company, Southington, Conn. Pub. by registrant.

PEXTO

For Awls; Bending Brakes; Bench Plates; Stake Holders; Bench Stakes; Chisels; Crimping Tools and Machines; Cutters for Wire and Sheet Metal; Forms for Shaping Sheet Metal; Forms for Closing Eave Trough Ends; Gouges; Grooving Tools and Machines; Hammers; Handles for Tools; Mandrels; Nippers; Notching Tools; Punches; Rivet Sets; Roof Rippers; Scrapers; Seaming Tools; Shears, Hand, Foot and Power; Slatters' Brakes and Hand Tools; Snippers; Tinners' Hand Tools; Tongs for Tinners and Roofers; Tools and Machines, Hand, Foot and Power, for Cutting, Punching, Shaping, Beading, Corrugating, Burring, Crimping, Double Seaming, Edging, Flanging, Folding, Forming, Grooving and Setting Down, Slitting, and Trimming, Sheet Metal, Pipe, Box and Pan Forming; Tools and Machines for Wire Bending; Wire Forming and Wiring Machines; and Wrenches.

## CLASS 26

## MEASURING AND SCIENTIFIC APPLIANCES

332,787. Feb. 25, 1936. The Peck, Stow & Wilcox Company, Southington, Conn. Pub. by registrant.

PEXTO

For Rules, Dividers, Straightedges, and Squares.

## CLASS 28

## JEWELRY AND PRECIOUS-METAL WARE

434,442. Nov. 18, 1947. Vargas Manufacturing Company, Providence, R. I. Pub. by registrant.

For Ornamental Jewelry, Particularly for Children—Namely, Pendants, Necklaces, Ornamental Pins, Bracelets, Lockets, and Finger-Rings, Made Wholly or Partly of Precious Metals.

## CLASS 34

## HEATING, LIGHTING, AND VENTILATING APPARATUS

338,737. Sept. 15, 1936. Modern Engineering Company, Inc., St. Louis, Mo. Pub. by registrant.

**WELDMASTER**

For Welding Torches.

## CLASS 37

## PAPER AND STATIONERY

350,189. Sept. 21, 1937. Blake, Moffitt & Towne, San Francisco, Calif. Pub. by registrant.

**NULINE**

For Paper Bags.

## CLASS 39

## CLOTHING

114,398. Dec. 12, 1916. United States Rubber Company, Passaic, N. J. Pub. by registrant.

**Raynster**

For Rain-Coats.

337,805. Aug. 18, 1936. Joseph Love, Inc., New York, N. Y. Pub. by Cosgrove Brothers, Inc., Quincy, Mass.

Authentic

'Princess Elizabeth'

For Knitted Wear for Children—Namely, Dresses, Panties, Coats, and Caps; Hats, Bathing Suits, Raincoats, Play Togs, Pajamas, Undershirts, and Drawers; Leather Shoes and Slippers.

## CLASS 44

## DENTAL, MEDICAL, AND SURGICAL APPLIANCES

158,557. Sept. 5, 1922. The United States Dental Manufacturing Co., Cleveland, Ohio. Pub. by registrant.

For Dental Tools—Namely, Burs, Broaches, Mandrels, Dental Vulcanisers, Flask Presses, Dental Engines, Duplex Springs, Bur Gauges, Broach Holders, Root-Canal Instruments, and Hypodermic Needles.

164,254. Feb. 13, 1923. The United States Dental Manufacturing Co., Cleveland, Ohio. Pub. by registrant.

U-S-DENTCO-

For Dental Engines, Dental Handpieces, Engine Burs, Finishing Burs, Cross Cut Burs, Cavity Openers, Bur Cases, Dental Pliers, Engine Burnishers, Dental Broaches, Root-Canal Instruments, Root Pliers, Root Elevators, Disk Mandrels, Port Polishers, Dental Needles, Cone-Socket Handles, Mouth Mirrors, Separating Files, Flasks, Flask Lifter, Nerve Lances, Duplex Springs, Dental Burs, Excavating Burs, Inlay Burs, Vulcanite Burs, Bur Gauges, Dental Matrix, Handle Burnishers, Plastic Instrument, Broach Holders, Root-Canal Drills, Root Facers, Root-Canal Files, Stone Mandrels, Port-Polishing Brushes, Hypodermic Needles, Screw Drivers, Mouth-Mirror Handles, Vulcanisers, Flask Presses, Screw Posts, Acid-Proof Instruments.

192,929. Dec. 16, 1924. The United States Dental Manufacturing Co., Cleveland, Ohio. Pub. by registrant.

**ALONIUM**

For Root-Canal Instruments, Root-Canal Cleaners, Root-Canal Drills, Root-Canal Probes, Root-Canal Knives, Root-Canal Files, Root-Canal Reamers, Medicine Carriers, Root Pliers, Root Elevators, Dental Mandrels, Screw Mandrels, Disk Mandrels.

## CLASS 46

## FOODS AND INGREDIENTS OF FOODS

410,879. Dec. 26, 1944. R. C. Williams & Company, Inc., New York, N. Y. Pub. by registrant.

**ROYAL SCARLET**

For Canned Vegetables; Fruits; Fruit and Vegetable Juices for Food Purposes; Fish, Shrimp, Crabmeat, Clams; Meat Products—Namely, Pork and Beans; Soups; Broths; Puddings and Brown Breads; Dried Vegetables; Wheat, Rye, Potato, Rice, Gluten, Cake, Graham and Pancake, Waffle Combination Flours; Prepared Buckwheat; Tea; Coffee; Rice; Molasses; Maple Syrup; Pancake Syrup; Honey; Sauces—Namely, Spaghetti, Chili, Worcestershire, Whole Pepper and Concentrated Hot; Gelatine; Tomato Paste; Tomato Catsup; Paprika; Spices; Chili Powder; Mustard; Poultry Seasoning; Black Pepper; White Pepper; Salad Oil; Prepared Vegetable Shortening; Barley (Packaged); Bran (Packaged); Hominy; Corn Meal; Tapioca; Farina; Corn Flakes; Rolled Oats; Bran Flakes (Packaged); Rice Flakes; Wheat Cereal; Wheat and Rice Puffs; Bouillon Cubes; Condensed and Evaporated Milk; Dried and Glace Fruits; Citron and Orange and Lemon Peels; Stuffed Assorted Fruits; Crystallized Ginger; Preserved Figs; Shelled Nuts; Macaroni; Spaghetti; Noodles; Olives, Plain and Stuffed; Olive Oil; Pimientos; Mushrooms; Anchovy Paste; Capers; Cherries (Maraschino and Mint Styles and for Dipping and Fountain Use); Fruit Preserves, Jams and Jellies; Apple Butter; Jelly Powders; Mincemeat; Salt Mackerel; Cheese; Salt; Cocoanut; Corn Starch; Pickles; Vinegar; Horse Radish; Chocolate; Cocoa; Chocolate Malt-Flavored Syrup; Marshmallow Creme; Cracker Meal; Flavoring Extracts for Food Purposes; Sweet Chocolate Coating; Hot Chocolate Powder; Chocolate Liquor; Malted Milk; Peanut Butter; Candy; Crushed Fruits; and Bird Seed.

424,386. Oct. 1, 1946. Richard & Smith, Sunset, La. Pub. by registrant.

For Fresh Sweet Potatoes.

CLASS 51

COSMETICS AND TOILET PREPARATIONS

263,121. Oct. 29, 1929. Société Anonyme M. Naef & Cie, Geneva, Switzerland. Pub. by Firmenich, Incorporated, New York, N. Y.

**FLORALBA**

For Artificial and Synthetical Perfumes, Essential Oils.

270,793. May 13, 1930. Société Anonyme M. Naef & Cie, Geneva, Switzerland. Pub. by Firmenich, Incorporated, New York, N. Y.

OFFICIAL GAZETTE • UNITED STATES PATENT OFFICE
December 25, 1956 Volume 713 Number 4

# PATENTS

## NOTICES

### Erratum

All references to Patent No. 2,772,674 to Carl W. Brabender, assignor to Pillsbury Mills, Inc., for Apparatus for Controlling Flowable Solid Materials, appearing in the OFFICIAL GAZETTE of December 4, 1956, should be deleted as the application was withdrawn from issue and the patent was not issued.

### Adjudicated Patents

(D. C. Ind.) Maescher, doing business as Crown Manufacturing Company, Patent No. 2,215,010 (38—8), for pressing apparatus. Claims 4 and 5 *Held* invalid. *Maescher v. Reliance Mfg. Co.*, 144 F. Supp. 574; 110 USPQ 113.

(C. A. Ill.) Cubert Patent No. 2,304,339 (179—107), for microphone. Claims 1, 2, 15, and 16 *Held* not infringed. *Acrex Corp. et al. v. Beltone Hearing Aid Company*, 236 F.2d 644; 110 USPQ 513.

(C. A. Kans.) Mackey Patent No. 2,681,673 (145—116), for drill bit. Claim 1 *Held* invalid. *Black, Mac & Stillman Hardware Co. v. Time Saver Tools Inc.*, 236 F.2d 913; 111 USPQ 6.

### Disclaimers

Re. No. 24,186.—*Biagio Castiglia*, New York, N. Y. WHEEL GAUGE. Patent dated July 24, 1956. Disclaimer filed Nov. 15, 1956, by the assignee, *Wheel Aligning Necessities, Inc.*

Hereby enters this disclaimer to claims 11 and 12 of said patent.

2,611,199.—*William Steiner*, Summit, N. J. TAG. Patent dated Sept. 23, 1952. Disclaimer filed Nov. 19, 1956, by the assignee, *Steffel Seals Corporation*.

Hereby enters this disclaimer to claims 3, 7, 10, 11, 12, 13, 24, and 25 of said patent.

### Patents Available for Licensing or Sale

2,401,107. Adjustable Splint. George Richmond, M. D., 242 Herzl St., Brooklyn 12, N. Y.

2,765,942. Easy Load Boat Trailer. Edward J. Niemeier, 3106 Mount Vernon Ave., Evansville 12, Ind.

2,767,721. Non-Slip Barrette. Mrs. Marian S. Cockley, 401 Avenue N, N. W., Winter Haven, Fla.

2,768,771. Dispenser for Carbonated Beverages. Werner K. Beutel, 2 Bayberry Lane, Rocky Hill, Conn.

2,768,949. Methods for Treating Clogged Underground Sewage Drain Systems (Done Chemically, No Pumping Out). George R. Hewey, 1323 Crafton Ave., Mentone, Calif.

2,770,876. Can Opener Aid. Murray Teitelbaum, 836 Faile St., Bronx 59, N. Y.

2,771,911. Stop Motion for Looms. Charlie W. Holt, P. O. Box 31, Draper, N. C. Correspondence to: Eaton, Bell, Hunt & Seltzer, 904 Johnston Building, Charlotte 2, N. C.

General Electric Company is prepared to grant non-exclusive licenses to domestic manufacturers on reasonable terms under the following 10 patents.

Applications for licenses may be addressed to: General Electric Company, Housewares and Radio Receiver Division, 1285 Boston Ave., Bridgeport 2, Conn.

2,250,979. Timing Device.
2,250,989. Timing Device.
2,250,997. Timing Device.
2,266,100. Attachment for Electric Appliance.
2,281,319. Control Device.
2,317,228. Electric Heater.
2,445,591. Coffee Maker.
2,531,180. Automatic Control for Water Heater.
2,582,084. Guide Bearing and Shaft.
2,588,145. Electric Cooking Appliance.

### Patent Removed From Register

The following patent is hereby withdrawn from the *Register of Patents Available for Licensing or Sale*. It was listed by General Electric Company in the Register section of the OFFICIAL GAZETTE of June 22, 1954.

2,652,532. Electrical Vapor Detector.

### Classification Order No. 267

The following transfer is hereby ordered to take effect on Monday, December 3, 1956:

From Division 46 to Division 38

Class 260, CHEMISTRY, CARBON COMPOUNDS, Subs. 453 through 460.

M. C. ROSA,
Nov. 30, 1956. *Director, Patent Examining Operation.*

### New Applications Received During October 1956

| | |
|---|---|
| Patents | 6,722 |
| Designs | 473 |
| Plants | 9 |
| Reissues | 21 |
| Total | 7,225 |

### Issue

| | |
|---|---|
| Patents | 794—No. 2,774,968 to No. 2,775,761, incl. |
| Designs | 32—No. 179,435 to No. 179,466, incl. |
| Plants | 1—No. 1,542 |
| Reissues | 5—No. 24,258 to No. 24,262, incl. |
| Total | 832 |

# CONDITION OF PATENT APPLICATIONS AS OF OCTOBER 31, 1956

| | |
|---|---|
| Total number of pending applications (excluding Designs) | 217,058 |
| Total number of pending Design applications | 6,321 |
| Total number of applications awaiting action (excluding Designs) | 117,257 |
| Total number of Design applications awaiting action | 2,972 |
| Date of oldest new application | June 27, 1955 |
| Date of oldest amended application | June 18, 1954 |

ROSA, M. C., Director, Patent Examining Operation

| PATENT EXAMINING GROUPS, AND SUPERVISORY EXAMINERS | DIVISIONS |
|---|---|
| I. STONE, I. G., CHEMICAL AND RELATED ARTS | 6, 31, 35, 42, 46, 50, 56, 59, 60, 63, 64. |
| II. STRACHAN, C. W., COMMUNICATIONS, RADIANT ENERGY AND ELECTRICAL ARTS | 16, 23, 26, 37, 42, 44, 49, 51, 54, 60, 70. |
| III. YUNG KWAI, B., MECHANICAL MANUFACTURING, MACHINE ELEMENTS AND DESIGNS | 2, 12, 13, 14, 21, 24, 57, 58, 61, Designs. |
| IV. FREEHOF, H. B., MATERIAL HANDLING AND TREATING, OPTICS, RAILWAYS AND AMUSEMENT DEVICES. | 7, 11, 17, 27, 34, 35, 36, 53, 62. |
| V. HULL, J. S., STATIC STRUCTURES AND INSTRUMENTS OF PRECISION | 8, 20, 29, 33, 36, 40, 41, 52, 66. |
| VI. MURPHY, T. F., AGRICULTURE, TRANSPORTATION, PUMPS AND MOTORS | 1, 4, 5, 9, 10, 18, 22, 32, 45, 47. |
| VII. KAUFFMAN, H. E., HEATING AND COOLING, PLASTIC SHAPING AND COATING, SEPARATION AND MIXING, BODY TREATMENT AND CARE. | 3, 15, 19, 25, 30, 32, 48, 55, 67. |
| CL. GORECKI, G. A., ARTS UNDERGOING RECLASSIFICATION AS LISTED UNDER CLASSIFICATION DIVISIONS. | I, II, III, IV, V. |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application: New | Amended |
|---|---|---|
| 1. (VI) GOLDBERG, A. J., Brakes; Excavating; Planting; Plant Husbandry; Scattering Unloaders | 11- 6-55 | 1- 3-55 |
| 2. (III) HERRMANN, D., Fishing, Trapping and Vermin Destroying; Presses; Tobacco; Textile Wringers | 2- 6-56 | 8- 3-55 |
| 3. (VII) LE ROY, C. A., Metal Founding and Treatment; Metallurgy (Process and Apparatus); Alloys | 3-19-56 | 1-14-55 |
| 4. (VI) FALLER, E. A., Hoists; Power Driven Conveyors; Handling Apparatus; Elevators; Feeding of Indefinite Lengths | 2- 1-56 | 9-10-55 |
| 5. (VI) ROBINSON, C. W., Harvesters; Potato Diggers; Stalk Pullers and Choppers; Stone Gatherers; Threshing; Knotters; Animal Husbandry; Bee Culture; Dairy; Butchering; Vegetable and Meat Cutters and Comminutors; Fences; Gates | 2- 6-56 | 7- 5-55 |
| 6. (I) SURLE, H., Carbon Chemistry (part), e. g. Natural Resins, Proteins, Heterocyclic Amides, Amines, General Organic Processes | 7-20-55 | 8-10-55 |
| 7. (IV) GONSALVES, J. E., Optics, Photographic Apparatus | 12-23-55 | 2-21-56 |
| 8. (V) LEWIS, R. O., Beds; Chairs and Seats; Cabinets; Tables; Miscellaneous Furniture | 9-23-55 | 1- 5-55 |
| 9. (VI) BRANSON, J. H., Pumps; Fans; Turbines | 2- 1-56 | 9-14-55 |
| 10. (VI) BOYD, S., Firearms; Ordnance; Ammunition; Explosive Charge Making | 10-28-55 | 1-20-55 |
| 11. (IV) BENHAM, E. V., Boots, Shoes and Leggings; Shoe and Leather Manufacture; Button, Eyelet and Rivet Setting; Nailing, Stapling and Clip Clenching; Card, Picture and Sign Exhibiting; Cutlery; Cleaning and Liquid Treatment of Solids | 1- 3-56 | 2-10-55 |
| 12. (III) SPINTMAN, S., Machine Elements; Engine Starters; Interrelated Clutch and Motor Controls | 10-11-55 | 9-16-54 |
| 13. (III) BEALL, T. E., Gear Cutting; Electric Lamp and Tube Manufacture; Needle and Pin Making; Metal Working (part), e. g. Special Work, Forging, Plastic Working, Drawing, Sawing, Milling, Planing, Turning | 1-10-56 | 11-23-54 |
| 14. (III) MANIAN, J. C., Metal Working (part), e. g. Sheet Metal, Wire Bending, Miscellaneous Processes, Assembly and Disassembly Apparatus; Wire Fabrics; Air Brakes | 11-14-55 | 11-16-54 |
| 15. (VII) BRINDISI, M. V., Plastics; Plastic Block and Earthenware Apparatus; Glass | 2- 1-56 | 12- 6-54 |
| 16. (II) LOVEWELL, N. N., Television; Telephony; Recorders | 10-19-55 | 9-30-54 |
| 17. (IV) LEIGHEY, R. A., Paper Manufactures; Packaging; Typewriters; Printing; Type Casting and Setting; Sheet Material Association or Folding; Sheet or Web Feeding | 12-15-55 | 1-17-55 |
| 18. (VI) BLUM, A., Power Plants; Fluid Transmissions; Servomotor Systems; Jet Motors; Combustion Turbines; Speed Responsive Devices | 12-19-55 | 12- 8-54 |
| 19. (VII) PATRICK, P. L., Stoves and Furnaces; Boilers; Concentrating Evaporators; Fluid Fuel Burners | 1- 5-56 | 4-20-55 |
| 20. (V) BROWN, L. M., Miscellaneous Hardware; Closure Fasteners; Locks; Safes; Bank Protection; Bread, Pastry and Confection Making; Tents and Canopies; Umbrellas; Canes; Undertaking | 2-20-56 | 2-10-55 |
| 21. (III) MADER, R. C., Textiles | 1-23-56 | 1-28-55 |
| 22. (VI) MARLAND, M. L., Aeronautics; Boats; Buoys; Ships; Marine Propulsion; Propellers; Windmills; Fluid Diaphragms and Bellows; Boring and Drilling | 12-27-55 | 12- 6-54 |
| 23. (II) ANDRUS, L. M., Cash and Fare Registers; Calculators and Counters; Education | 8-22-55 | 7-16-54 |
| 24. (III) DRACOPOULOS, P. T. (HICKEY, T. J., acting), Apparel (except Corsets and Brassieres); Apparel Apparatus; Sewing Machines; Textiles, Ironing or Smoothing; Clutches and Power-Stop Control | 2- 9-56 | 2- 2-55 |
| 26. (VII) NEVIUS, R. D., Coating—Processes, Miscellaneous Products and Apparatus; Distillation; Wood Treating Apparatus | 1- 3-56 | 6- 8-55 |
| 28. (II) YOUNG, R. R., Electricity—Generation, Motive Power, Transmission Systems, Voltage and Phase Control Systems, Furnaces, Battery Charging and Discharging, Arc Lamps, Prime Mover Dynamo Plants; Elevators (part), e. g. Miscellaneous Electric Control Mechanism | 2- 5-56 | 9- 2-55 |
| 27. (IV) JAMES, S., Brushing, Scrubbing and General Cleaning; Brush, Broom and Mop Making | 2- 1-56 | 3-29-55 |
| 28. (VI) BRAUNER, R. H., Internal Combustion Engines; Expansible Chamber Motors; Fluid Servomotors; Spring, Weight and Animal Powered Motors; Cylinders; Pistons; Drive Shafts; Flexible-Shaft Couplings; Chucks or Sockets; Chute, Skid, Guide and Way Conveyors; Fluid Current Conveyors; Pressure Modulating Relays; Pneumatic Dispatch; Store Service; Wheel Substitutes | 10-24-55 | 2-21-55 |
| 29. (V) HABECKER, L. B., Tools; Woodworking; Button, Barrel and Wheel Making; Rubber Tire Removing Tools; Washing Machines; Baggage; Cloth, Leather and Rubber Receptacles; Package and Article Carriers | 12- 2-55 | 11-25-55 |
| 30. (VII) O'LEARY, R. A., Refrigeration; Heating Systems; Automatic Temperature and Humidity Regulation, Thermostats, Humidistats; Illuminating Burners; Miscellaneous Heating | 5- 2-56 | 7- 8-55 |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application: New | Amended |
|---|---|---|
| 31. (I) HUTCHISON, E. W., Carbon Chemistry (part), e. g. Urea Adducts, Silicon Containing Carbon Compounds, Hydrogenation of Carbon Oxides, Partial Oxidation of Non-Aromatic Hydrocarbon Mixtures, Hydrocarbons, Halogenated Hydrocarbons | 12-23-55 | 11-17-55 |
| 32. (VII) BERMAN, H., Gas and Liquid Contact Apparatus; Heat Exchange; Gas Separation; Agitation; Self Proportioning Fluid Systems; Liquid Level Responsive Systems; Fire Extinguishers | 2-15-56 | 8- 1-55 |
| 33. (V) MUSHAKE, W. L., Bridges; Hydraulic and Earth Engineering; Building Structures; Roads and Pavements | 2- 1-56 | 12- 3-54 |
| 34. (IV) SAPERSTEIN, S., Railways—Draft Appliances, Switches and Signals, Surface Track, Rolling Stock, Track Sanders; Electricity, Transmission to Vehicles; Dumping Vehicles; Vehicle Fenders; Hand and Hoist Line Implements | 12-19-55 | 9-13-54 |
| 35. (IV) BROMLEY, E. D., Dispensing; Fluent Material Handling, Filling; Toilet, Kitchen and Table Articles | 12- 9-55 | 2-14-55 |
| 36. (V) McFADYEN, A. D., Measuring and Testing | 11- 2-55 | 10-19-55 |
| 37. (II) LEVY, M. L., Electricity—Switches, Welding, Heating | 11-30-55 | 8-11-55 |
| 39. (I) MARMELSTEIN, N., Carbon Chemistry (part), e. g., Aso, Carbocyclic or Acyclic Compounds (part), e. g. Anthrones, Triarylmethanes, Esters, Acids, Ketones, Aldehydes, Ethers, Phenols, Alcohols | 3- 1-56 | 10-11-55 |
| 39. (IV) WEIL, L., Fluid-Pressure Regulators; Valves; Fluid Handling (except Pressure Modulating Relays, Self-Proportioning Systems, Float Valves, Diaphragms and Bellows) | 1-31-56 | 11-10-54 |
| 40. (V) DRUMMOND, E. J., Receptacles—Metallic, Paper, Wooden, Glass; Special Receptacles and Packages | 3- 1-56 | 10- 3-55 |
| 41. (V) GURLEY, R. B., Coin Controlled Apparatus; Dispensing Cabinets; Coin Handling; Mail, Fare or Other Collection Boxes or Chutes; Buckles, Buttons and Clasps; Racks; Fire Escapes; Ladders; Scaffolds | 10- 3-55 | 9-16-54 |
| 42. (II) MARANS, H., Electric Signaling; Signals and Indicators; Telegraphy; Electrical Connectors | 6-27-55 | 11- 3-54 |
| 43. (I) ARNOLD, D., Medicines, Poisons, Cosmetics; Sugar and Starch; Skins, and Leathers; Preserving, Sterilising and Disinfecting (except Wood Treatment Apparatus) | 11- 2-55 | 4- 1-55 |
| 44. (II) EVANS, N. H., Antennas; Automatic Pilots; Directive Radio Systems; Mass Spectrometers; Nuclear Batteries; Nuclear Resonant Devices; Neutron Detecting and Measuring; Radar; Sonar; Torpedoes | 7-22-55 | 6-16-54 |
| 45. (VI) MANIAN, J. A., Wheels, Tires and Axles; Railway Wheels and Axles; Lubrication; Bearings and Guides; Belt and Sprocket Gearing; Spring Devices; Animal Draft Appliances | 11- 4-55 | 2-18-55 |
| 46. (I) WILES, W. G., Actinide Series (e. g., fissionable) Compounds; Sintered Metal Stock; Explosives; Power Plants (part); Metallurgy (part); Surgery (part); Radioactive Medicines; Irradiation Chemistry; Carbon Chemistry (part) | 12- 7-55 | 1-12-55 |
| 47. (VI) KANOF, W. J., Mining, Quarrying, and Ice Harvesting; Motor Vehicles; Land Vehicles | 2- 6-56 | 9-13-55 |
| 48. (II) BERNSTEIN, S., Electricity—Conversion Systems, Protective Systems; Measuring and Testing (except Meters); Spark Plugs and Ignition Systems, Switchboards, Relays, Magnets, Inductors, Transformers, Condensers, Transistors, Barrier Layer Rectifiers | 7-20-55 | 9-23-54 |
| 49. (VII) BENDETT, B., Drying and Gas or Vapor Contact with Solids; Ventilation; Wells; Earth Boring | 11-21-55 | 4- 4-55 |
| 50. (I) BENGEL, W. G., Carbon Chemistry (part), e. g. Synthetic Resin Compositions, Synthetic Rubber Compositions, Natural Rubber | 1- 6-56 | 11- 3-54 |
| 51. (II) YAFFEE, S., Radio Transmitters, Receivers and Tuners; Modulators; Piezoelectric Devices; Music | 2- 1-56 | 9-13-54 |
| 52. (V) NEFF, P. R., Supports Joint Packing; Valved Pipe Joints or Couplings; Rod Joints or Couplings; Tool Handle Fastenings; Pipes and Tubular Conduits; Shaft Packing | 12- 8-55 | 12-24-54 |
| 53. (IV) REYNOLDS, E. R., (NINAS, G. A., acting), Label Pasting and Paper Hanging; Books and Book Making; Manifolding; Printed Matter; Stationery; Paper Files and Binders; Flexible or Portable Closures or Partitions; Doors, Windows, Awnings and Shutters; Harness; Whip Apparatus | 1-20-56 | 5-24-55 |
| 54. (II) NILSON, R. G., Electric Lamps; Electronic Tubes; Miscellaneous Discharge Devices; Lamp, Cathode Ray and Gas Discharge Device Circuits; Ray Energy (e. g. X-Ray, Ultraviolet, Radioactive) Applications | 12-12-55 | 12- 1-54 |
| 55. (VII) KLINE, J. R., Surgery; Dentistry; Artificial Body Members; Separating and Sorting Solids; Centrifugal Bowl Separators; Comminutors | 8-22-55 | 12- 1-54 |
| 56. (I) SPECK, J. R., Abrading Compositions; Batteries; Coating or Plastic Compositions; Electrical and Wave Energy Chemistry | 1-26-56 | 11-18-55 |
| 57. (III) MILLER, A. B., Bolt, Nut, Rivet, Nail, Screw, Chain and Horseshoe Making; Driven and Screw Fastenings; Nut and Bolt Locks; Jewelry; Pipe Joints or Couplings | 4-10-56 | 5- 5-55 |
| 58. (III) BRONAUGH, F. H., Rolls and Rollers; Making Metal Tools and Implements; Stone Working; Abrading Processes and Apparatus; Food Apparatus; Closure Operators; Baths, Closets, Sinks and Spittoons | 12-14-55 | 4-21-55 |
| 59. (I) HENKIN, B., Inorganic Chemistry; Fertilizers; Gas, Heating and Illuminating | 12-19-55 | 3-24-55 |
| 60. (I) MANGAN, P. E., Carbon Chemistry (part), e. g., Synthetic Resins, Synthetic Rubber; Photographic Processes and Products | 12-28-55 | 1-24-55 |
| 61. (III) MORSE (Miss), E. L., Winding and Reeling; Pushing and Pulling; Horology; Time Controlling Apparatus; Railway Mail Delivery | 2- 6-56 | 3-16-55 |
| 62. (IV) SHAPIRO, A., Games; Toys; Amusements and Exercising Devices; Mechanical Guns and Projectors; Illumination | 2- 6-56 | 8-17-55 |
| 63. (I) WINKELSTEIN, A. H., Foods and Beverages; Carbon Chemistry (part), e. g., Lignins, Carbohydrate Derivatives; Fats and Metal Containing Carbocyclic or Acyclic Carbon Compounds | 2- 1-56 | 1-12-55 |
| 64. (I) GREENWALD, J., Fuels; Miscellaneous Compositions | 2-13-56 | 1- 3-55 |

## EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during December 1956, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1953*.

# PATENT SUITS

Notices under 35 U. S. C. 290; Patent Act of 1952

2,169,668, H. Freedman, Artificial dental structure, appeal filed Nov. 16, 1956, C. C. A., 4th Cir., Doc. 7353, *Hyman Freedman v. Friedman Dental Supply Co. et al.*

2,190,705, N. A. Christensen, Packing, filed Nov. 14, 1956, D. C., N. D. Ohio (Cleveland), Doc. 33232, *Jo. C. Calhoun Jr. and Esther C. Young, executors of the Estate of Niels A. Christensen, deceased v. General Motors Corp.* Same, Doc. 33233, *Jo. C. Calhoun Jr. et al. v. J. I. Case Co.* Same, Doc. 33234, *Jo. C. Calhoun Jr. et al. v. Ford Motor Co.* Same, Doc. 33235, *Jo. C. Calhoun Jr. et al. v. International Harvester Co.* Same, Doc. 33236, *Jo. C. Calhoun Jr. et al. v. Chrysler Corp.*

2,227,502, Togesen and Fisher, Electrical distribution system, filed Nov. 14, 1956, D. C., E. D. Pa. (Philadelphia), Doc. 21631, *Bulldog Electric Co. v. Keller-Smith Corp.*

2,227,695, Valentine and Peña, Powder puff, and similar article, and means and method of making the same, filed Mar. 1, 1955, D. C., S. D. N. Y., Doc. 99/97, *Victoria-Vogue, Inc. v. Valcourt, Inc.* Patent held not infringed; counterclaim dismissed Nov. 15, 1956.

2,445,222, M. C. Fridolph, Body garment, filed June 1, 1955, D. C., S. D. N. Y., Doc. 101/58, *Sarong, Inc. et al. v. Bifax Foundations, Inc.* Order of discontinuance Nov. 16, 1956.

2,481,065, A. J. Penick, Well head assembly; 2,532,662, Eckel and Jones, Wellhead assembly, filed Feb. 29, 1956, D. C., E. D. Tex. (Beaumont), Doc. 3163, *Oil Center Tool Co. v. Gulf Coast Machine & Supply Co.* Order of dismissal without prejudice (notice Nov. 16, 1956).

2,502,151, R. J. Horclois, Dimethylaminoalkylamino antihistiminic compounds, filed Nov. 20, 1956, D. C., S. D. N. Y., Doc. 114/391, *Merck & Co., Inc. et al. v. Hexagon Laboratories Inc.* Same, D. C. N. J. (Newark), Doc. 907/56, *Merck & Co., Inc. et al. v. Chemo Puro Mfg. Corp.*

2,532,662. (See 2,481,065.)

2,577,975, H. T. Moore, Wood planer, filed Aug. 2, 1956, D. C. Vt. (Burlington), Doc. 2058, *Henry Moore et al. v. Herbert L. Cummings.* Cause discontinued Nov. 8, 1956.

2,606,234. (See Re. 24,017.)

2,606,187. (See 2,618,563.)

2,615,166. (See Re. 24,023.)

2,618,563, H. J. Barnhard, Food container; 2,606,187, G. W. Stiehm, Food packing rack and method of packing food articles, filed Sept. 18, 1953, D. C., E. D. N. Y. (Brooklyn), Doc. 13844, *Peckeese-Sorveese Corp. et al. v. B. M. Reeves Co. Inc.* Case discontinued Nov. 20, 1956.

2,626,905, Antle and Bohn, Method of preventing discoloration of sliced organic materials, appeal filed June 22, 1955, C. C. A., 8th Cir., Doc. 15367, *L. L. Antle & Co., Inc. v. Sno-Spud Co.*

2,672,016, J. Gerbe, Bag distending apparatus, filed Nov. 15, 1956, D. C., E. D. Wis. (Milwaukee), Doc. 56/c/248, *John Gerbe et al. v. American Laundry and Cleaner Supplies, Inc.*

2,688,374. (See Des. 172,649.)

2,690,827, L. E. Carson, Accordion panel closure and bath enclosures using same, filed Jan. 20, 1956, D. C., S. D. Ind. (Indianapolis), Doc. IP 56/c/7, *American Shower Door Co., Inc. v. New Castle Products, Inc.* Stipulation dismissing cause with prejudice Nov. 15, 1956.

2,704,730, H. Glatt, Semi-porous coated cloth and articles made therefrom, filed Nov. 16, 1956, D. C. Md. (Baltimore), Doc. 9278, *Magic Products v. G. C. Murphy Co.*

2,708,695. (See Des. 172,456.)

2,708,654. (See Des. 172,456.)

2,708,187, Schiens and Langdon, Method of and apparatus for digesting sludge, filed Nov. 16, 1956, D. C., W. D. N. Y. (Buffalo), Doc. 7239, *Pacific Flush Tank Co. v. Buffalo Sewer Authority.*

Re. 24,017 (of 2,606,234), J. A. Henricks, Method of coating and drawing metal and composition therefor, filed Nov. 13, 1956, D. C., N. D. Ill. (Chicago), Doc. 56c1912, *Devoe Corp. et al. v. General Motors Corp. et al.*

Re. 24,023 (of 2,615,166), J. Schmidinger, Snap action device, filed Nov. 16, 1956, D. C., E. D. N. Y. (Brooklyn), Doc. 17076, *Joseph Schmidinger et al. v. Signal-Stat Corp.*

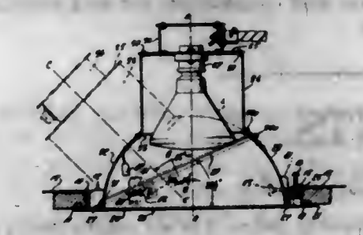
Des. 172,488, C. A. Baratelli, Case for spectacles; 2,706,885, same, Spectacle case and method of making same; 2,736,054, same, Receptacles, filed June 13, 1955, D. C. N. J. (Newark), Doc. 526/55, *American Optical Co. v. The Opticase Co. et al.* Consent judgment; patents held valid and infringed; defendants enjoined Nov. 13, 1956.

Des. 172,649, E. Rodrigues, Expansible link chain for a bracelet; 2,688,374, J. M. Bender, Wrist watch bracelet connector, filed Mar. 12, 1956, D. C., S. D. N. Y., Doc. 107/382, *Jacoby-Bender, Inc. v. Lester Friedman.* Consent judgment; injunction granted Nov. 14, 1956.

Des. 172,122, L. E. Giesen, Tray, filed Nov. 16, 1956, D. C., N. D. Ohio (Cleveland), Doc. 33240, *Mid-West Metallic Products, Inc. v. Banner Metals, Inc.*

# REISSUES

## DECEMBER 25, 1956



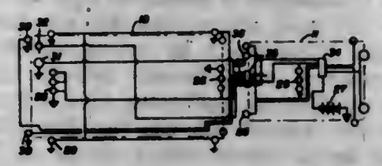
Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.

### 24,258
### RECESSED LIGHTING EQUIPMENT

David Burliuk, Huntington, and Edward Rambusch, Harrison, N. Y., assignors to Rambusch Decorating Company, New York, N. Y., a corporation of New York

Original No. 2,716,185, dated August 23, 1955, Serial No. 158,026, April 25, 1950. Application for reissue March 7, 1956, Serial No. 570,205

15 Claims. (Cl. 240—78)



*14. The combination with a projector type incandescent lamp adapted to produce a concentrated light beam, of an overhead, two-part, lamp support, one part being above the other, wholly supported therefrom and directly supporting the lamp in a position to direct light downwardly, means for supporting a lower part for adjustment through substantially 360° about a vertical axis, means for supporting the upper part for adjustment through substantially 360° about an oblique axis making the same angle with the vertical which the beam axis of the light from the lamp makes with the oblique axis, and in a position such that when the beam axis is vertical, it coincides with the vertical axis.*

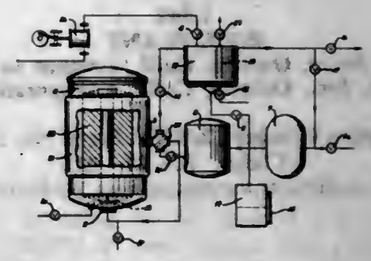
### 24,259
### COUPLING SYSTEM FOR INTERCHANGEABLY CONNECTING THE WIRING SYSTEMS OF TRUCKS AND TRAILERS

Arthur E. Hunt, Rensselaer, N. Y., assignor to Arthur E. Hunt, George B. Beatty, and Maurice W. Grady as tenants-in-common

Original No. 2,660,679, dated November 24, 1953, Serial No. 275,201, March 6, 1952. Application for reissue November 17, 1955, Serial No. 547,593

9 Claims. (Cl. 307—10)

*8. A switch bank adapted for use on a tractor to facilitate connecting various of the electric lighting circuits of the tractor to the corresponding lighting circuits on a trailer drawn by the tractor; said bank comprising a plurality of selector switches each of which has a plurality of fixed contacts and a movable contact thereon; each movable contact on a switch being adapted to be moved into contact with each of the fixed contacts on said switch to establish an electrical connection therewith; each of said movable contacts being provided with means adapting it to be electrically connected to one of the lighting circuits of a trailer; and each of said fixed contacts being provided with means adapting it to be electrically connected to one of the lighting circuits of the tractor; whereby, when the switches are connected as set forth, the movable contact of each of the switches may be moved by an operator into contact with a selected fixed contact thereon to connect each of the lighting circuits of the tractor with the corresponding lighting circuits of the trailer.*



### 24,260
### PROCESS FOR DRYING TEXTILES

Alfred Friedrich Bernhard Thies, Coesfeld, Westphalia, Germany, assignor to Firma B. Thies, Spezialmaschinenfabrik, Coesfeld, Westphalia, Germany

Original No. 2,739,392, dated March 27, 1956, Serial No. 277,100, March 18, 1952. Application for reissue September 11, 1956, Serial No. 609,333

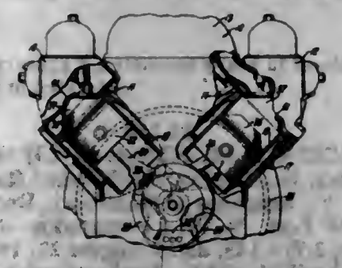
Claims priority, application Germany March 21, 1951

8 Claims. (Cl. 34—15)

1. A process for drying textile materials, comprising, in combination, the steps of passing *under superatmospheric pressure* heated air [under superatmospheric pressure] through a textile material containing moisture so that at least a portion of the moisture contained in said textile material is absorbed by said heated air under superatmospheric pressure *and said heated air leaves said textile material under superatmospheric pressure and containing moisture absorbed from said textile material;* drying said air containing absorbed moisture; reheating said thus dried air; and passing said thus dried and reheated air again through said textile material so that the air for drying said textile material is kept in a closed circuit and maintained substantially dust-free, thus drying said textile material in a substantially dust-free atmosphere.

### 24,261
### ANIMAL FEED AND METHOD FOR MAKING THE SAME

Stanley A. Martin, Deerfield Beach, Fla.



No Drawing. Original No. 2,707,151, dated April 26, 1955, Serial No. 423,523, April 15, 1954. Application for reissue February 23, 1956, Serial No. 567,433

9 Claims. (Cl. 99—6)

1. A process for dehydrating molasses which comprises the steps of mixing molasses with a filler to form a mixture, raising the temperature of said mixture so as to substantially avoid charring of said molasses to between 225° F. and 350° F. for less than about 15 seconds thereby flashing steam therefrom, rapidly cooling said mixture to a temperature below 140° F. and repeating said steps until the moisture content is below about 5% by weight.

**24,262**
**ENGINE MANUFACTURING PROCESS**
**Joseph D. Turley, Flint, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware**
**Original No. 2,722,049, dated November 1, 1955, Serial No. 321,348, November 19, 1952. Application for reissue March 1, 1956, Serial No. 568,957**
**10 Claims. (Cl. 29—425)**

1. A process of manufacturing engines of different displacement which comprises constructing identical crankshafts for all of said engines, said crankshafts being statically and dynamically balanced for operation with said engines of smaller displacement *and being statically and dynamically unbalanced for operation with said engines of larger displacement*, constructing flywheels and fan belt pulleys for operation on the rear and front ends of said crankshafts respectively, said flywheels and fan belt pulleys for said engines of smaller displacement being statically and dynamically balanced and said flywheels and fan belt pulleys for said engines of larger displacement being statically and dynamically unbalanced *to the extent necessary to balance said crankshafts for operation with said engines of larger displacement*, and assembling said engines *with the parts thereof in balanced relation and*

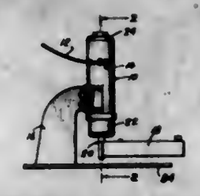
with said statically and dynamically balanced flywheels and pulleys on said engines of smaller displacement and with said statically and dynamically unbalanced flywheels and pulleys on said crankshafts for said engines of larger displacement.

# PLANT PATENTS

## GRANTED DECEMBER 25, 1956

Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.

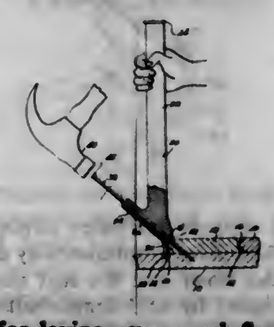
**1,542**
**ROSE PLANT**
**Herbert C. Swim, Ontario, Calif., assignor to Armstrong Nurseries, Inc., Ontario, Calif., a corporation of California**
**Application October 12, 1955, Serial No. 540,177**
**1 Claim. (Cl. 47—61)**



A new and distinct variety of rose plant of the hybrid tea class, substantially as herein shown and described, characterized particularly as to novelty by its abundant and glossy foliage, the abundance of its blooms throughout the growing season, its habit of bearing blooms on long and strong flowering stems, the strong fragrance of its blooms, and the very dark Red color of its buds and blooms.

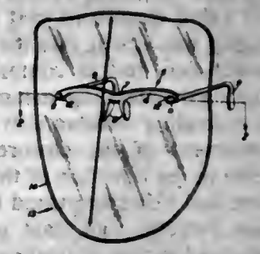
# PATENTS

## GRANTED DECEMBER 25, 1956



## GENERAL AND MECHANICAL

**2,774,968**
**STAPLING MACHINE**
**Lloyd M. Osborne and Oda J. Garant, Burbank, Calif.**
**Application October 4, 1954, Serial No. 460,061**
**10 Claims. (Cl. 1—44.4)**

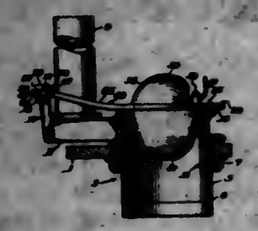


1. A stapling machine comprising an outer casing, a combination cylinder and piston slidable in the outer casing, another piston slidable in the cylindrical piston and a staple driver operated by the second piston, both pistons being pneumatically operated, the second piston being connected to the first piston for automatic disengagement therefrom, said automatic disengaging means including a pair of pins movable in tapered slots in the first piston and an upper extension of the second piston having an annular slot therein to selectively receive the pins.

**2,774,969**
**LAYING TOOL FOR TONGUE AND GROOVED FLOORING**
**Charles R. Sampler, Akron, Ohio**
**Application September 2, 1955, Serial No. 532,339**
**2 Claims. (Cl. 1—47)**

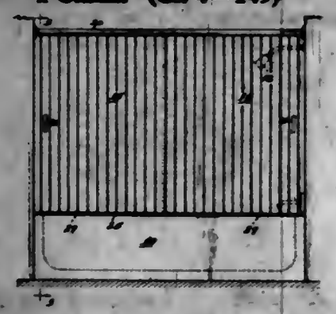
1. In a tool for laying over a sub-flooring a piece of flooring of the type including a longitudinal tongue extending along one side edge of the piece and engageable in a longitudinal groove of a previously laid piece: a wholly rigid member including an elongated, straight handle, a cross head extending normally to the length of the handle adjacent one end thereof and forming at one side of the handle a downwardly facing shoulder lying in a plane substantially normal to said length of the handle for exerting a downward pressure against said tongue, prong means projecting downwardly from the handle below the shoulder and formed as a longitudinal extension of said one side of the handle, the prong means having a tongue-engaging surface at one side of the shoulder lying in a plane substantially perpendicular to that of the shoulder, said prong means being sharpened for engagement in the sub-flooring to provide a fulcrum about which the handle may rock thus to shift the shoulder downwardly against the tongue simultaneously with conjoint, lateral movement both of the prong means and cross head for exerting a pressure in a horizontal direction against the tongue and against said side edge, respectively, of the piece being laid thereby to force said piece against the previously laid piece, and a nail guiding sleeve extending obliquely to the length of the handle and to said plane and opening downwardly at said side of the handle through the shoulder at the other side of the shoulder; and a driving tool element slidably engaged in the sleeve for driving a nail into the tongue of the piece being laid.

**2,774,970**
**FACE SHIELD**
**Rudolf Du Bois, Alliance, N. J.**
**Application December 20, 1954, Serial No. 476,331**
**4 Claims. (Cl. 2—9)**



1. A shield of the character described comprising; a frame for mounting on the nose of a wearer, lugs on the end portions of said frame, and a resilient sheet having spaced openings therein for the reception of the lugs for mounting said sheet on the frame, the openings in the sheet being spaced a greater distance apart than the lugs for bowing and tensioning said sheet for frictionally securing the same on said lugs.

**2,774,971**
**KNOT-SIMULATING NECKTIE CLASP**
**Theodore G. Schrade, Nichols, Conn.**
**Application January 3, 1955, Serial No. 479,431**
**7 Claims. (Cl. 2—153)**



1. A knot-simulating necktie clasp comprising a shell-like body including a generally outwardly convex wall, and a block portion upon the inner side of said body having a substantially horizontal top wall substantially spaced below the upper edge of said body to provide the base of a tie loop receiving pocket above said block portion, the front and sides of which are provided by said body above said block portion, said block portion having a vertically extending tie-end receiving slot, the front wall of said slot having a centrally disposed vertically extending rib projecting rearwardly into said slot, and the rear wall of said slot comprising a pair of spring parts connected at their outer ends to said block portion and spaced apart at their inner ends to provide a central entrance opening to said slot.

2,774,972
**FLAPPER DISCHARGE VALVE FOR FLUSH TANKS**
Axel B. Nelson, Chicago, Edward G. Schmidt, La Grange, and Roy H. Zbikli, Oak Park, Ill., assignors to Crane Co., Chicago, Ill., a corporation of Illinois
Application December 10, 1953, Serial No. 397,456
6 Claims. (Cl. 4—57)

1. In combination with a flush tank or the like having an outlet portion provided with an outlet opening, the latter portion including a seat surface around the opening at the upper end thereof and overflow means in fluid communication with the outlet opening, a valve closure engageable with the seat surface in the closed valve position, said valve closure including extending means, means for attaching said valve closure to said outlet portion of the tank for swinging movement into the open and closed positions, said attachment means comprising post means projecting through said extending means of the closure, said post means extending substantially in the plane of the swinging movement of the closure, said extending means being flexible in the direction of the swinging movement of the closure and being apertured for the projection of the post means therethrough, said post means being provided with enlarged means extending partly over and retaining said extending means of the closure thereon when the closure is in attached relation, said extending means being of elastic material distortable over the enlarged means and onto the post means therebeyond for effecting the attachment of the valve closure.

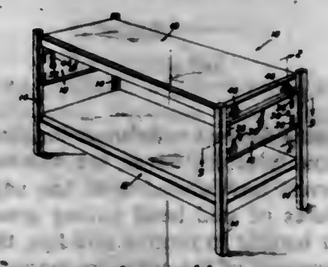
2,774,973
**SHOWER SHIELD FOR BATHTUB**
Reino Aarnio, River Edge, N. J., assignor to Flat Metal Manufacturing Company, Franklin Park, Ill., a corporation of Illinois
Application February 6, 1951, Serial No. 209,562
1 Claim. (Cl. 4—149)

A shower shield for a bathtub comprising a pair of panels of lightweight, self-supporting plastic material, each panel being of a width corresponding with substantially half the bathtub length, each panel having vertical corrugations that terminate short of the top and bottom panel edges, the uncorrugated top and bottom edge portions of each panel being offset in the same direction from the general plane of the panel, a cooperating upwardly facing channel secured to the top of the front bathtub rim and extending the length of the bathtub, said channel being of a transverse width to receive the bottom edges of said panels with said bottom edges bearing on the channel web and to permit said panels to be moved relative to each other in overlapping relation, the said panels being reversely oriented in said channel so that the respective offset edge portions thereof are adjacent, and means engaging the top edge portions of said panels for maintaining said panels in a generally vertical plane.

2,774,974
**SHOWER CURTAIN ROD ATTACHMENT**
Edwin A. Zalenga, Watertown, Mass.
Application December 23, 1955, Serial No. 555,972
6 Claims. (Cl. 4—156)

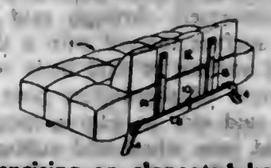
1. An accessory for a curtain rod and shower curtain assembly comprising a stretcher member adapted to support said shower curtain in a laterally extended position, said stretcher member including an elongated body portion, means located at one end of the body portion for securing same in a laterally extended position with respect to the said curtain rod, and means secured at the opposite end of the elongated body for supporting a shower curtain thereagainst.

2,774,975
**TOILET ARMREST**
Richard J. Frank, St. Petersburg, Fla., assignor to Winfield Company, Inc., St. Petersburg, Fla.
Application November 20, 1953, Serial No. 393,336
2 Claims. (Cl. 4—254)



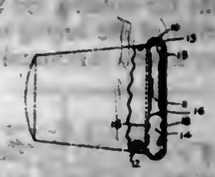
2. An invalid support for toilet bowls including journalled fittings adapted to simultaneously engage the upper surface of a toilet bowl and the seat hinge bolts and to be held to said bowl by said hinge bolts, said fittings in combination with hinging and holding cross members terminating in riser members at the end thereof and at either side of the toilet bowl, said risers joining and supporting substantially horizontal arm rest and hand grip members extending forwardly at the sides of said bowl and raised thereabove and leg members at the front ends of said arm and hand grip members extending downwardly therefrom at either side of the aforesaid bowl to the floor therebeneath to further support the arm and hand grips and to transfer a substantial part of the invalid's weight directly to the floor and thereby relieve the bowl of a substantial part of the vertical and lateral strain.

2,774,976
**DOUBLE BUNK BED CONSTRUCTION**
Eli Ross, Klamath Falls, Oreg., assignor of five percent to Ruth C. Sullivan, Klamath Falls, Oreg.
Application March 31, 1955, Serial No. 498,317
2 Claims. (Cl. 5—9)



1. A double bunk bed construction comprising a lower mattress supporting member supported at each end by pairs of upwardly extending support legs, an upper mattress support member rotatably supported by said support legs, means connected between said upper mattress support member and said support legs for permitting said upper support member to be rotated downwardly and toward the lower mattress support member, embodying transverse support members connected to the support legs adjacent the opposite ends of the double bunk bed, and pairs of link elements pivotally connected between said upper mattress support member and said transverse support member, said link elements defining a rotary path of the upper mattress support member relative to the lower

mattress support member, said transverse support member including pairs of transversely disposed gear members rotatably mounted on stub shafts extending through said transverse support member, said link elements being secured and rotatable with said stub shafts, chain elements entrained over said gears, compression spring means carried on said transverse support members, and means extending between said chain and compression spring means for compressing said springs when the upper mattress support member is rotated towards said lower mattress support member.



2,774,977
**CONVERTIBLE SOFA**
Henry Mintz, Newton, Mass., assignor to New England Bedding Co., Medford, Mass., a corporation of Massachusetts
Application April 15, 1954, Serial No. 423,317
1 Claim. (Cl. 5—12)

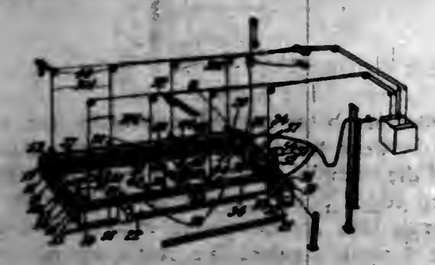
A sofa comprising an elongated body section having front and rear walls, front and rear legs respectively secured to said front and rear walls at points spaced inwardly of their ends, the upper ends of said rear legs having parts extending outwardly to provide notched portions spaced from the outer face of said rear wall, a relatively rigid horizontally extending bar having its opposite ends secured in said notched portions and defining with said rear wall an elongate slot, a spacer block interposed between and secured to the center of said bar and rear wall so as to hold said bar from bowing outwardly and to provide a stop, and a backrest of lesser length than said body section, said backrest having spaced depending supporting members secured to its rear face with their lower end portions projecting into and having a tight sliding fit in said elongate slot, said backrest being slidable lengthwise of the sofa until one of said supporting members contacts said stop.

2,774,978
**CUTTING ATTACHMENT FOR SEWING THIMBLE**
Ernest O. Gribble, Akron, Ohio
Application July 9, 1954, Serial No. 442,319
3 Claims. (Cl. 7—14.5)

1. A thread cutting attachment for a thimble of the type having an integral annular rib adjacent an open end thereof, comprising a split annulus of resilient metal and having inner peripheral portions of cross-sectional shape complementally engageable with said rib of the thimble to affix the annulus to the thimble against longitudinal movement thereon, said annulus having opposed end portions defined by said split thereof, at least one of said

end portions being turned outwardly for receiving a thread between the same and the corresponding rib portion of the thimble, said outwardly turned portion having a sharp edged portion engageable by the thread to cut the same, said annulus being expandible over said rib of the thimble against the resiliency of the material thereof.

2,774,979
**LIFE JACKET**
Harold J. Morse, Trenton, N. J., assignor to Switlik Parachute Company, Inc., Trenton, N. J.
Application July 7, 1954, Serial No. 441,764
5 Claims. (Cl. 9—19)



1. A life jacket comprising an inflatable bladder having an elongated curved neck portion and a body portion communicating therewith, a container of compressed gas adapted to be released into said bladder upon the actuation of a movable inflating member, a flexible case having a tubular portion adapted to fit around the wearer's neck and enclosing the deflated and folded neck portion of said bladder and having along substantially the full length of said tubular portion a seam closed by fastener means which are separable by internal pressure, said case also having a chest envelope adjoining the opposite ends of said neck tube and enclosing the deflated and folded body portion of said bladder, a releasable locking means normally holding at least a portion of said case closed, a release member connected to said releasable locking means and to said movable inflating member whereby movement of said release member unlocks said case and releases the compressed gas into said bladder to force said case open.

2,774,980
**APPARATUS FOR CLEANING VEHICLES**
William John Morison, Chelmsford, and Ronald Fortescue Cronin, Hollingbury, Brighton, England; said Cronin assignor to Stratstone Limited, London, England, a British company
Application September 8, 1953, Serial No. 379,034
Claims priority, application Great Britain September 15, 1952
18 Claims. (Cl. 15—21)

1. Apparatus for cleaning vehicles, which apparatus comprises in combination a carrier comprising two horizontally spaced limbs, between which a vehicle may be received for cleaning, one or more cleaning devices carried by each limb, at least one tie member of continuously variable length connecting the two spaced limbs substantially at one pair of corresponding ends thereof, means urging the two spaced limbs towards one another,

whereby the two spaced limbs may be maintained in close relation to the vehicle so that the cleaning devices may act thereon, suspension means for suspending the carrier from a superstructure lying above the top of the vehicle, which suspension means are operable to effect vertical movements of the carrier while the cleaning devices act on the vehicle, holding means for holding the two spaced limbs apart, against the action of the urging means, in relative positions in which they have a maximum distance of sepa-

ration, detector means for detecting the presence of a vehicle between the two spaced limbs, means operated by the detector means to render the holding means inoperative so that the two spaced limbs may adopt a lesser relative distance of separation determined by the vehicle between them, and means for moving the two spaced limbs relatively apart to their said relative positions of maximum separation and for rendering the holding means operative when the carrier moves to a position beyond a vertical extremity of the vehicle.

---

**2,774,981**
**FOUNTAIN TOOTH BRUSH**
**Samuel Rodolfo Solis Bonilla, Retalhuleu, Guatemala**
**Application February 15, 1952, Serial No. 271,670**
**1 Claim. (Cl. 15—137)**

A fountain toothbrush which includes a handle having a dentifrice receiving bore opening thereinto through one end thereof, means within the bore and operable from the exterior of the handle for expelling dentifrice from said bore, a neck closing the open end of the bore and having an opening extending longitudinally therethrough, longitudinally spaced internal screw threads carried by the neck and extending thereinto adjacent opposite ends of the opening, a tube carried by the neck for movement longitudinally through one end of said opening, a fountain brush head carried by the tube and extending outwardly therefrom adjacent the end thereof remote from the handle, and screw threads carried by the tube remote from the brush head for longitudinal movement in the opening and selective engagement with the internal screw threads to hold the tube retracted or extended.

---

**2,774,982**
**TOOTHBRUSH AND COVER THEREFOR**
**Jack Reed, Detroit, Mich.**
**Application April 8, 1955, Serial No. 500,130**
**1 Claim. (Cl. 15—184)**

A tooth brush and cover comprising: a tooth brush including a handle, a head, and a connecting portion, all formed from a single length of material, with said connecting portion being disposed at an obtuse angle to both the head and the handle; and a cover coextensive in length with the combined lengths of the connecting portion and head, said cover including a top wall of planiform formation, an end wall lying in a plane normal to that of the top wall, side walls lying in planes normal to those of both the top wall and end wall, said end wall closing the cover at one end and the other end of the cover being formed open, the top wall including an extension lying in a plane obtusely related to the plane of the top wall,

said side walls being formed with lower longitudinal edges curved longitudinally of the cover, the side walls including inwardly turned lips formed upon the edges, the opposite side surfaces of said head having grooves curved throughout their lengths to receive said lips, thus to effect application or removal of the cover by movement thereof through an arcuate path about a center common to the lips and grooves, said extension of the top walls, when the lips are fully engaged in the grooves, abutting against the connecting portion, thus to cause the cover and the tooth brush to cooperate in defining a sealed enclosure.

---

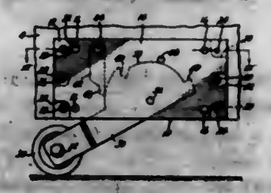
**2,774,983**
**SCOURING PAD HOLDER**
**Henri L. Crowther, San Leandro, Calif.**
**Application February 25, 1955, Serial No. 490,454**
**4 Claims. (Cl. 15—209)**

1. In a scouring pad holder, the combination of: a body of rubber forming a resilient backing for a scouring pad; gripping means formed by the provision of a hole extending transversely through said rubber body close to the upper surface thereof with a slot communicating through said surface of said body with said hole throughout the length of the latter; jaws provided by opposite edges of said slot to grip a scouring pad extended between said jaws when said rubber body is relaxed after having been flexed to separate said jaws, whereby the tendency of said rubber body to return to its normal condition causes said jaws to grip said scouring pad; and a reinforcing spring embedded in said rubber body, said spring yieldably resisting the separation of said jaws and enhancing the clamping action of said jaws on a scouring pad clamped therebetween thereby preventing accidental removal of said pad from said gripping means.

---

**2,774,984**
**LIP STICK AND APPLICATOR**
**Jacque C. Morrell, Chevy Chase, Md.**
**Application June 7, 1956, Serial No. 589,917**
**7 Claims. (Cl. 15—209)**

1. An individual prefabricated lip stick comprising a stiff rod, one end of said rod being covered with a soft porous absorbent material, the said absorbent material being in compact condition and of bulbous shape and being impregnated at least in part with normally semi-solid lip rouge extending inwardly from the outer surface thereof to a substantial depth normally beyond that which would be reached by wiping up said lip rouge



in its normally semi-solid state with said absorbent material, whereby to support and to reduce crumbling of said lip rouge, said absorbent material being adapted to retain said lip rouge over an extended period between impregnation and use and said stiff rod being adapted for use as a handle in the application of said lip rouge.

---

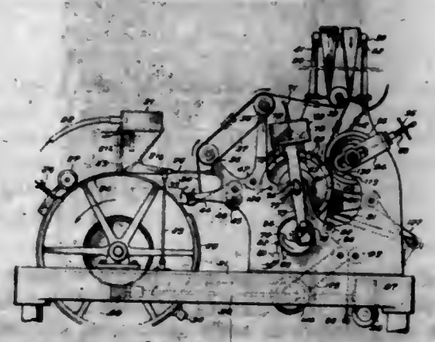
**2,774,985**
**WITHDRAWN**

---

**2,774,986**
**RETRACTABLE FURNITURE WHEEL**
**Richard Moorehouse, Carthage, Mo., assignor to Flex-O-Lators, Inc., Carthage, Mo., a corporation of Missouri**
**Application April 30, 1954, Serial No. 426,733**
**7 Claims. (Cl. 16—34)**

1. A retractable furniture wheel comprising a body member adapted to be secured to a piece of furniture, an arm pivoted freely adjacent its upper end in said body member and sloping angularly downwardly from its pivotal axis, said arm having an upwardly opening notch formed therein intermediate its ends, a wheel rotatably mounted at the lower end of said arm and resting against the floor by gravity, and a pawl freely pivoted in said body member and normally hanging substantially vertically downwardly by gravity adjacent the arcuate path of said notch, said pawl being provided at its lower end with a finger normally disposed beneath the level of said notch, whereby as said body member is simultaneously elevated and tilted, said pawl finger is brought into alignment with said notch.

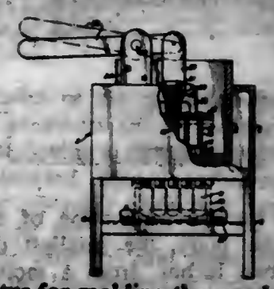
---



**2,774,987**
**DOOR CLOSING MECHANISM**
**Henrik Ring, Sierra Madre, Calif., and Arlington A. Ferguson, Toledo, Ohio**
**Application February 11, 1953, Serial No. 336,268**
**2 Claims. (Cl. 16—62)**

2. In a door closing mechanism, a casing mounted on the door, a door operating shaft having one end thereof journaled in said casing and the other end extending outwardly therefrom, a gear fixedly mounted on said shaft within said casing, a fluid-containing closed cylinder formed in said casing, a piston mounted for reciprocation within said cylinder, a gear rack connected to said piston and operatively engaged with said gear, said gear rack having oppositely disposed teeth, a second shaft having a gear fixedly mounted thereon, the second gear being operatively engaged with the teeth of said gear rack oppositely disposed from the first-mentioned gear to maintain the gear rack in operative engagement with said first-mentioned gear, compressible means within said cylinder normally urging the piston away from the shafts and against one end of said cylinder, a compound lever having one end thereof pivotally mounted about a fixed point and the other end fixed to the first-mentioned shaft to rotate the same upon opening or closing of the door relative to said fixed point, means for permitting movement of the piston away from said cylinder end upon opening of said door, and means for permitting return movement of the piston toward said cylinder end upon closing of the door.

---

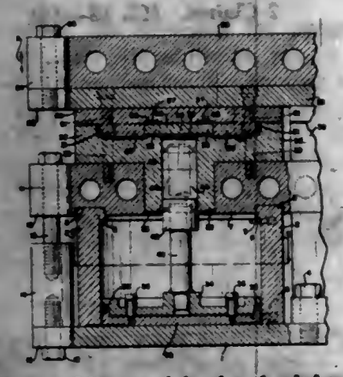


**2,774,988**
**CAPSULE FORMING GELATIN FILM STRIPPING**
**Frank E. Stirn, Pearl River, and Arthur S. Taylor, Spring Valley, N. Y., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine**
**Original application March 23, 1948, Serial No. 16,554, now Patent No. 2,663,128, dated December 22, 1953. Divided and this application April 27, 1953, Serial No. 351,168**
**2 Claims. (Cl. 18—15)**

1. An apparatus for the production of soft gelatin strip for capsule manufacture, comprising a continuously moving casting surface, means for casting a continuous gelatin strip thereon, a multibladed counter-rotating paddle wheel adjacent said casting surface at the gelatin strip take-off point and contacting the gelatin strip, means for rotating said paddle wheel at higher peripheral speed than the speed of the casting surface, and strip conveying means drawing the strip away from the paddle wheel, whereby the gelatin strip is repeatedly contacted by the leading edges of the paddles, and thereby pulled free from the casting surface with a minimum of stretching.

---

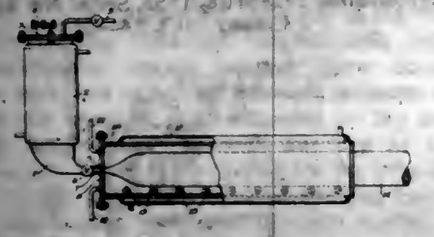
**2,774,989**
**MOLDING APPARATUS**
**Peter Crammond, Ruislip, and John Ernest Denney, Belvedere, England, assignors to Warner-Hudnut, Inc., New York, N. Y., a corporation of Delaware**
**Application March 26, 1953, Serial No. 344,826**
**2 Claims. (Cl. 18—26)**



1. Apparatus for molding thermoplastic materials comprising a chamber adapted to contain thermoplastic material in the molten state, said chamber having side walls and a bottom, a heating jacket surrounding said chamber and spaced from said side walls and bottom of said chamber, a plurality of pouring spouts open at each end extending downwardly from the bottom of said chamber and through the bottom of said heating jacket, valves positioned at the upper end of each of said pouring spouts, the upper ends of said pouring spouts comprising valve

seats and said valves comprising plug valves adapted to be seated therein, each of said valves being carried by upwardly extending valve stems slidably supported by a carrier plate disposed in said chamber, said carrier plate slidably supported by upwardly extending guide members, lever means coupled to said carrier plate for raising said plate, spring means for urging said plate to its lowermost position in the chamber, and spring means for urging said valves into engagement with said valve seats.

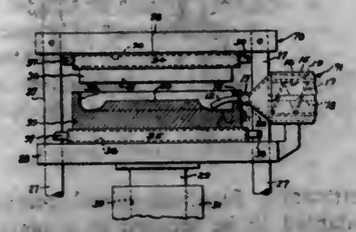
---



2,774,990
INJECTION MOLDING PRESS
Leslie Edward Soderquist, Akron, Ohio, assignor to The McNeil Machine and Engineering Company, Akron, Ohio, a corporation of Ohio
Application March 28, 1951, Serial No. 218,027
3 Claims. (Cl. 18—30)

1. A press for molding articles by the injection method comprising upper and lower platens movable relatively to one another, complementary mold sections carried on the platens, a chamber to receive a charge of plastic material in communication with the space between the mold sections, a bed plate, releasable means to secure the lower platen to the bed plate, and means to connect the two platens for joint movement when the lower platen is released from the bed plate.

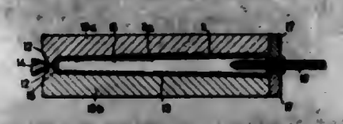
---



2,774,991
PROCESS FOR MAKING ELONGATED CELLULAR ARTICLES FROM THERMOPLASTIC POLYMERS
John Lloyd McCurdy, New London, Conn., and Chancey E. De Long, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Application April 17, 1952, Serial No. 282,744
7 Claims. (Cl. 18—48)

1. In a method for the production of an elongated thermoplastic cellular body, the smallest dimension of which is at least two inches, from a mobile gel comprising a thermoplastic polymer having a normally gaseous agent dissolved therein under pressure, wherein the mobile gel is extruded from a pressurized vessel containing the same at a temperature between 60° and 130° C. into a zone of lower pressure wherein the normally gaseous agent vaporizes and expands the polymer to form a cellular product, the steps which consist in expanding the polymer to form a cellular product in a zone of lower pressure maintained at temperatures between 50° and 150° C. in an open chamber and without restraining contact of the cellular product against inner walls of said chamber and maintaining the cellular product within said open chamber for a time of from 20 seconds to 15 minutes to complete the expansion of the polymer and permit the diffusion of a major proportion of the normally gaseous agent from the cellular product and withdrawing the cellular product from said open chamber.

---

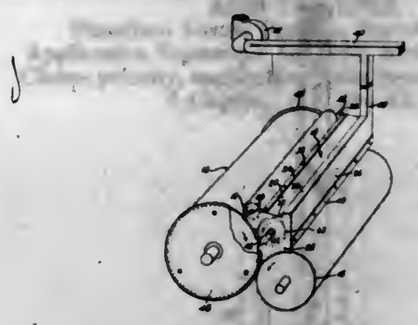


2,774,992
PROCESS OF PRODUCING PEARLESCENT PLASTIC ARTICLES
Edward M. McElligott, Detroit, Mich., assignor to Swedish Crucible Steel Company, Detroit, Mich., a corporation of Michigan
Original application October 4, 1949, Serial No. 119,434, now Patent No. 2,648,098, dated August 11, 1953. Divided and this application August 22, 1951, Serial No. 243,081
1 Claim. (Cl. 18—55)

A process of molding approximately annular plastic articles from synthetic resin compound in an approximately annular mold cavity, comprising reducing the compound to a plastic condition, extruding the plastic compound in the form of a rope directly into the mold cavity grasping the forward end of the extruded rope, maintaining the mold cavity in a substantially stationary position while leading the forward end of the extruded rope and the portion of the rope following thereafter in an approximately annular path around said approximately annular mold cavity at substantially the same speed as the speed at which said rope is being extruded, severing the extruded portion of the rope thus deposited in the mold cavity from the remaining portion of the rope, and compressing the portion of the rope deposited in the mold cavity to fill a predetermined portion of the mold cavity.

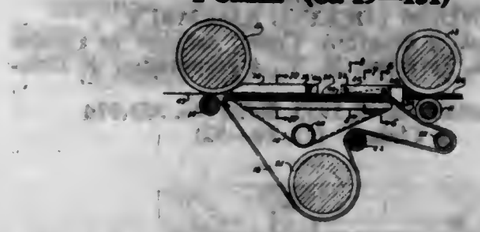
---

2,774,993
PROCESS FOR MAKING GRIPS FOR HANDLES OF PLIERS AND SIMILAR HANDLES
Reinold Hagen, Hangelar Ueber Siegburg, Rhineland, and Norbert Hagen, Siegburg, Rhineland, Germany
Application December 30, 1952, Serial No. 328,558
2 Claims. (Cl. 18—59)



1. Process for covering handles of pliers and other tools, bicycle handlebars, etc. with grips of thermoplastic material, comprising the steps of extruding tubing, feeding same into a sectional mold, closing the mold, thereby pinching off the tube section in the mold from the rest of the tubing and closing the rear end of said tube section, expanding the tube section, while still above the flow point, by interiorly applied pressure to a diameter smaller than that of the handle to be covered, withdrawing the raw grip, allowing the same to cool, reheating same to a temperature to the softening point and below the flow point, introducing the raw grip into another mold, expanding said grip to a diameter greater than that of the handle, cooling the raw grip within said other mold to a temperature below the softening point of the material used, withdrawing the cooled expanded grip from the mold, slipping same over the handle, heating the grip above the softening point, and allowing the grip to shrink to a tight fit.

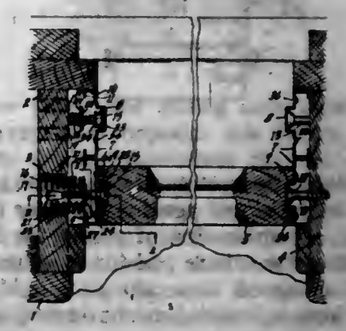
---



2,774,994
APPARATUS FOR REMOVING FLY
Arthur F. Hayes, Uxbridge, Mass.
Application March 22, 1954, Serial No. 417,732
7 Claims. (Cl. 19—98)

1. Apparatus for collecting and removing fly from a carding machine including a card cylinder, a fancy, a worker and a doffer, which comprises a hood extending over the fancy from the worker to the doffer including end portions extending down over the respective ends of the fancy, said hood thus coacting with the worker, the cylinder and the doffer to provide an enclosure for the fancy, a portion of said hood being adjustable toward and away from the doffer to admit a controlled amount of air into said enclosure from adjacent the doffer, a conduit leading from the hood, and means for reducing the pressure within said conduit to cause air to be drawn into said hood to entrain and exhaust from the hood fly intercepted in and collected by said hood and at the same time to draw into the hood adjacent said doffer sufficient air to prevent the total suction force within said hood from removing stock which is on the worker.

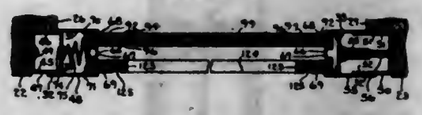
---



2,774,995
HIGH REDUCTION FIBER DRAFTING
Olle Evald Sandelin, Cleveland, Ohio, assignor to The Warner & Swasey Company, Cleveland, Ohio, a corporation of Ohio
Application October 26, 1951, Serial No. 253,300
1 Claim. (Cl. 19—131)

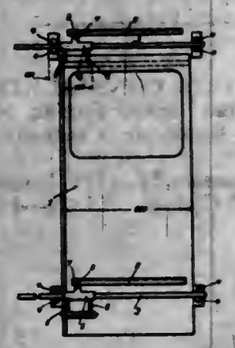
A sliver control system for subjecting the fibers of a sliver being drafted to the conjoint effect of suction and condensation or compression, comprising in combination a suction box having a top wall with a substantially linear air pervious zone therein, adapted to be mounted in a drafting ratch in advance of draft rolls, a surface member having an air pervious zone therein corresponding to the air pervious zone in the suction box, means for moving such member in the direction of the sliver draft, a substantially rectangular condenser plate resting relatively close to the moving surface member for cooperation therewith in the control of slivers being drawn therebetween, and a substantially rectangular compressor plate resting relatively close to the moving surface member between said condenser plate and the portion of the drafting ratch adjacent to the draft rolls for cooperation with said surface member for the control of slivers being drawn therebetween, said condenser plate being mounted in a relatively fixed position with respect to said surface member and said compressor plate being yieldably mounted to produce a pressure on the sliver in the direction of the surface member normal thereto depending only on the force of gravity of said compressor plate, whereby the compressor effect is substantially independent of the width or thickness of the sliver being drawn therebetween.

---



2,774,996
WINDOW CONSTRUCTION
Claude J. Teggelaar, Grand Rapids, Mich., assignor to Grand Rapids Hardware Company, Grand Rapids, Mich.
Application January 16, 1956, Serial No. 559,226
10 Claims. (Cl. 20—12)

5. A window structure comprising a jamb, and a sash slide rail, a base member mounted on said jamb and having outwardly projecting arms terminating in stops, coil springs arranged on said arms and seated on the base member to normally project beyond the ends of said arms, a thrust member provided with inwardly projecting arms disposed in telescoping relation to said arms of said base member and having stops coacting with said stops of said arms on said base member to limit the outward movement of said thrust member, said thrust member being in supported engagement with the outer ends of said springs, and a screw rotatably mounted on said rail and against axial movement relative thereto and having threaded engagement with said thrust member.

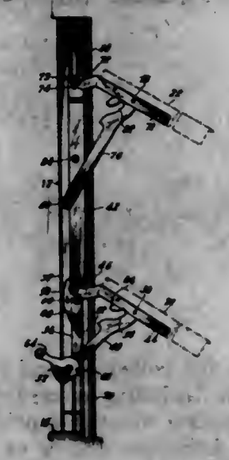


---

2,774,997
SASH AND SASH FRAMES
Abe Zitomer, Milwaukee, Wis., assignor to Alumatic Corporation of America, Milwaukee, Wis., a corporation of Wisconsin
Application August 2, 1951, Serial No. 239,866
8 Claims. (Cl. 20—12)

1. In a device of the character described, a subframe having side members of H-shaped cross section, each such member having a transverse web and inwardly and outwardly directed flanges providing inner and outer channels, the inwardly projecting flanges of one of said members being the longer and the outwardly directed flanges of the other of said members being the longer, way-strips fitted longitudinally between the inner flanges of each of said members and provided with guide ribs, the strip being seated against the web of the member wherein the outwardly projecting flanges are the longest, compression spring means seated in the inner channel of the member in which the inwardly directed flanges are the longer, said spring means being in supporting relation to the guide strip in said last mentioned channel, and sash having marginal grooves in bearing engagement with the corresponding ribs of the respective strips.

2,774,998
SLIDING DOORS
Friedrich Wilhelm Klobert, Hellgenhausen, Germany
Application October 24, 1950, Serial No. 191,831
Claims priority, application Germany October 31, 1949
14 Claims. (Cl. 20—24)



1. In a slidable door structure for wall enclosed vehicles, where in the closed position the door is flush with a vehicle wall, a combination of means for the advance of the door from the vehicle and for the lateral displacement of the advanced door alongside said wall, said means comprising a longitudinal horizontal member for the suspension of the door, said suspension member being displaceably supported inside of said vehicle and extending in the longitudinal direction thereof, rollers fixed in said vehicle for the support of said displaceable suspension member, at least one lever mechanism rotatably supported on said suspension member, said door being suspended from the lower end of said lever mechanism, a cavity enclosing guide rail for said lever mechanism located in the interior of said vehicle and extending parallel with said suspension member.

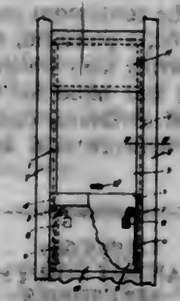
2,774,999
INSULATED DOOR STRUCTURES FOR REFRIGERATOR TRUCKS
Raymond P. Mansmann, Pittsburgh, Pa.
Application November 19, 1952, Serial No. 321,483
1 Claim. (Cl. 20—35)

In a refrigerator door, a pair of sheet metal members spaced to constitute an inner and outer wall for the door, the outer wall having a lip and flange formed integrally therewith the flange construction having cut out corner portions joined by corner gussets and having corner reinforcing angle members, channels disposed between the lip and the facing extending the width of the door and having hinge and latch reinforcing plates disposed therein and secured thereto, the inner wall having a flange extending in the direction of the flange of the outer wall, angle bars joined to the juxtaposed flanges of the inner and outer wall members constituting spacers and reinforcing for the door, and sheet insulating material secured to the flanges of the inner and outer door facings and connecting angle bars to form a housing for receiving insulating material.

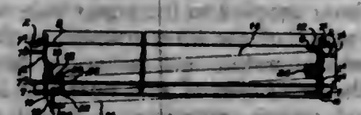
2,775,000
LOCKING MECHANISM FOR AWNING TYPE WINDOWS
George M. Kleinknecht, Ridgewood, N. J., assignor to Woodco Corporation, North Bergen, N. J., a corporation of New Jersey
Application February 28, 1956, Serial No. 568,220
15 Claims. (Cl. 20—42)

1. A window structure of the awning type comprising a window frame channel, a slide bar mounted in said channel for reciprocable movement, a sash bracket pivotally connected to said slide bar, a link pivotally connected at one end to said channel and at the other end to said sash bracket, said link having a locking slot near the end adjacent said sash bracket, a locking bar mounted in said channel for reciprocable movement, a locking stud provided near the upper end of said locking bar for cooperation with said slot, a locking lever connected to the lower end of said locking bar for imparting reciprocable movement to said locking bar, and means normally acting to prevent movement of the locking lever and locking bar to thereby maintain said stud in position to be received within said slot, said means being engaged by said link as the stud is received within the slot to allow movement of the locking lever and locking bar to sash-locking position.

2,775,001
WINDOW LOCKING ASSEMBLY
Donald L. Baker, Branford, Conn., assignor to Carrier Corporation, Syracuse, N. Y., a corporation of Delaware
Application May 5, 1953, Serial No. 353,070
3 Claims. (Cl. 20—52)

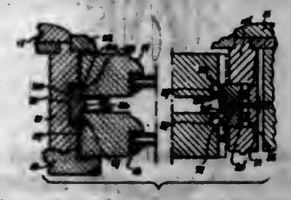


3. A window securing device for preventing relative movement between sashes of a window assembly, one sash of which has been displaced comprising an elongated rod having a hooked end portion adapted to be connected to a sash rail, and a threaded shank portion extending therefrom; a bracket slidably mounted on the shank portion of the rod, said bracket including spaced sash rail engaging portions, laterally offset from the rod



to maintain the latter member substantially parallel to the sashes; and an internally threaded member threadably mounted on the shank to prevent separation of said bracket and rod members.

2,775,002
MOVABLE GLASS PANES FOR WINDOWS, DOORS, AND THE LIKE
Francisco Torras Frudera, Barcelona, Spain
Application September 16, 1953, Serial No. 380,537
Claims priority, application Spain September 25, 1952
5 Claims. (Cl. 20—52.1)

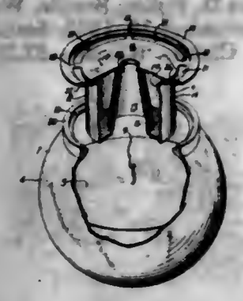


1. In a building structure of the class comprising a window, glazed door or the like which includes a rectangular frame member having a pair of uprights for said door or the like, the provision of means for mounting and operating a movable, unframed glass pane in said frame member which comprises a pair of substantially U-section guides carried by the uprights of said frame member in which said pane is guided by its lateral edges and along which it is adapted to slide, a pair of vertically extending rails abutting against and supporting the lower edge of said pane, a cord attached to the bottom end of each rail, a counterweight on each of said cords, and a grooved pulley over which each cord runs, each of said pulleys being situated in a horizontal plane slightly higher than that occupied by said bottom ends of said rails in the position of maximum opening of said glass pane.

2,775,003
WINDOW WITH REMOVABLE SASH GUIDES
Henry J. Blanco, Baltimore, Md., assignor to The Burch Company, Baltimore, Md., a corporation of Maryland
Application June 30, 1953, Serial No. 365,856
9 Claims. (Cl. 20—52.2)

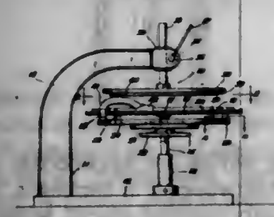
1. Guide means for a sliding frame comprising: an elongated fixed supporting member having a guide supporting surface and parallel longitudinal fixed flanges disposed perpendicular to said surface and extending along opposite edges thereof; a guide having a wall portion lying against said surface and edge portions engaging said flanges, parallel walls on said guide disposed perpendicular to said wall portion and defining therebetween a trackway of sufficient width to receive therein an edge of a sliding frame, one of said fixed flanges being of substantially less height than the other so that said guide when moved away from said surface into contact with said sliding frame may be moved laterally with said frame and clear said one fixed flange, one of said parallel walls being spaced from the fixed flange of greatest height to provide a second trackway of sufficient width to receive therein an edge of a second sliding frame; and means independent of said sliding frames removably securing said guide to said supporting member.

2,775,004
WINDOW CONSTRUCTION
James D. Fuller, Seattle, Wash.
Application November 30, 1953, Serial No. 395,820
1 Claim. (Cl. 20—52.2)



A window frame and sliding sash combination comprising a frame with opposite side jambs, each formed on its inside with a longitudinal channel, parting strips fitted in said channels, each formed along its opposite longitudinal edges with projecting ribs, an upper and a lower sash contained in the frame for up and down adjustment between the jambs, each sash having longitudinal channels in the outer faces of its side rails containing corresponding ribs of the opposite parting strips therein to mount and guide the sash in its adjustment, one of said strips being adjustable into and from its jamb channel to seat its ribs in the sash channels or to disengage them from the sash for removal of the sash from the frame, said adjustable parting strip having parallel longitudinal channels formed in its inner face, bowed leaf springs arranged along the parallel channels with their ends seated against the bases of the jamb channel in which the strip is contained, and their central portions contained in the parallel channels and bearing against the strip to urge it outwardly, and adjusting screws arranged along the strip, and passing therethrough between the channels and through the jamb and nuts fixed in the jamb and into which the screws are threaded for adjustment of the parting strip.

2,775,005
STERILIZING DEVICES FOR HYPODERMIC NEEDLES AND/OR SYRINGES
Milton B. Weinberger, White Plains, N. Y., assignor to Hospital Equipment Corporation, New York, N. Y., a corporation of New York
Application October 28, 1953, Serial No. 388,902
1 Claim. (Cl. 21—82)

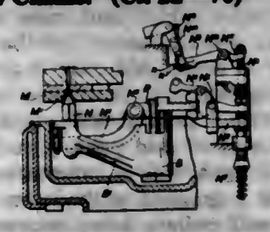


In a sterilizing device for hypodermic needles and/or syringes, the combination of a container, a cover for the container, a support member placed within the container below the cover comprising a relatively thin disk and a plurality of spaced legs resting on the base of the container, and disk containing a plurality of spaced relatively long tapered eyelets placed in circular relation about the center of the disk and a plurality of spaced openings of an area larger than the area of the eyelets peripherally of the disk, the disk being thin with respect to the length of the eyelets, said eyelets and said openings serving to receive instruments to be sterilized and to hold the same in a substantially vertical position during the sterilizing operation.

**2,775,006**
**VAPORIZING APPARATUS**
Casimir Kranc, Oshkosh, Wis., assignor to Victrylite Candle Company, Oshkosh, Wis., a corporation of Wisconsin
Application March 5, 1953, Serial No. 340,431
1 Claim. (Cl. 21—117)

A vaporizing vessel of the type which is adapted to be placed within the mouth of a jar containing a candle, to be heated by the flame of the candle to effect vaporization of insecticide, perfume, medicament or the like in said vessel, comprising: an annular trough-like container adapted to contain vaporizable material, the inner wall of said container defining an upright flue through which hot gases from the flame of the candle may travel upwardly, and the bottom wall of the container being annular; a substantially flat annular cover on said container having apertures therein through which vaporized material from the vessel may be expelled to the atmosphere; a plurality of circumferentially spaced radial supporting arms integral with the cover and extending radially outwardly therefrom, said arms having portions at their outer ends engageable with an upwardly facing ledge on a jar containing a candle to support the cover in the mouth of the jar; and downwardly and radially inwardly curled portions on the periphery of the cover, between said arms, engaged under radially outwardly projecting bead portions on the top of the outer wall of the container to secure the cover to the container and support the container in the mouth of the jar with its outer wall spaced from the wall of the jar to enable a down draft of combustion air to flow to the flame of the candle.

**2,775,007**
**MOLD ASSEMBLY DEVICE**
Samuel G. Johnson, Jr., North Riverside, Ill., assignor to International Harvester Company, a corporation of New Jersey
Application April 11, 1955, Serial No. 500,573
12 Claims. (Cl. 22—37)



10. A mold assembly device for positioning mold sections comprising; a support, a platform on said support, locating means on said platform, a plate movably disposed beneath said platform, means adapted to vertically move said plate relative to said platform, and a plurality of circumferentially spaced spacer members positioned on said plate, said spacer members being movable with said plate to a position above said platform for engaging and circumferentially spacing mold sections on said platform.

**2,775,008**
**MOLD MOUNTING FOR CONTINUOUS CASTING**
Rufus Easton, Schenectady, and Thomas Yates Wilson, Albany, N. Y., assignors to Continuous Metalcast Co., Inc., Wilmington, Del., a corporation of Delaware
Application April 2, 1953, Serial No. 346,302
2 Claims. (Cl. 22—57.2)

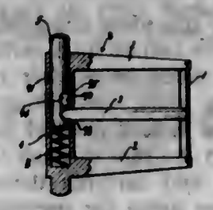
1. Apparatus for the continuous casting of metal, comprising, a casting mold, a platform, means including two pairs of trunnions having axes which intersect at a right angle for supporting said mold for universal movement on said platform, and a vibrator connected to said mold at a point midway between said axes and below said axes.

**2,775,009**
**PUMP MECHANISM FOR TYPE CASTING MACHINES**
Edward Charles Meldrum, Redhill, and Alfred Edward Roper, Morden, England, assignors to The Monotype Corporation Limited, London, England, a British corporation
Application August 14, 1953, Serial No. 374,386
Claims priority, application Great Britain May 26, 1953
4 Claims. (Cl. 22—70)

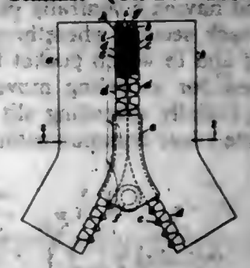
1. In a pump-operating mechanism for individual-type casting machines, a pump body, a nozzle thereon, a piston operable in said body, pump body elevating means comprising rockable levers supporting said pump body and a spring acting on said levers to elevate said body to bring said nozzle to an operating position, piston operating means comprising two levers linked together intermediate their ends and coupled one to said pump body and the other to said pump piston, driving means operative on said linked levers to move said levers in unison, an abutment connected to said lever coupled to the pump body and a stop arranged to engage said abutment and arrest said lever coupled to the pump body whereby continued movement of the lever coupled to the pump piston operates said piston, and means for temporarily interrupting the movement of said nozzle to the operating position, said means comprising a detent operative on said pump elevating levers to prevent operation thereof, and an abutment on said driving means arranged to release said detent at a predetermined point in the cycle of operations of said driving means, whereby said pump elevating levers are given an accelerated movement by the spring acting thereon to accelerate the nozzle to the operating position.

**2,775,010**
**PANEL FASTENING DEVICE**
William A. Bedford, Jr., North Scituate, Mass., assignor, by mesne assignments, to United-Carr Fastener Corporation, Boston, Mass., a corporation of Delaware
Application August 23, 1954, Serial No. 451,429
3 Claims. (Cl. 24—73)

1. A panel fastener for securing a panel to a sheet metal support having a slot formed therein, said fastener



comprising a base having a panel engaging means associated therewith and a stud extending from one end of the base substantially perpendicular thereto, said stud comprising a flat portion having a longitudinal slot disposed therein and extending into the adjacent portion



of the base, and a flexible snap fastener member joined to the flat portion at the end of the slot and to the base at the other end of the slot, said snap fastener member having an upper portion bowed outwardly to provide a snap shoulder and a lower portion curving gradually into the plane of the base.

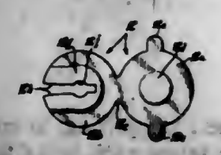
**2,775,011**
**BELT BUCKLE**
Roland Beuchat and Samuel Junod, Geneva, Switzerland
Application December 20, 1951, Serial No. 262,528
4 Claims. (Cl. 24—178)

4. A buckle which comprises a longitudinally extending frame, said frame having a first lateral arm which has an interior space which communicates with the exterior of said first lateral arm, said frame also having a lateral pivot arm mounted thereon and longitudinally spaced from said first lateral arm, said first lateral arm having a transversely extending, through-and-through opening in the side thereof which is proximate to said pivot arm, a prong mounted on said pivot arm for pivotal movement about the axis thereof, said opening being shaped and located so that when said opening is unobstructed the tip of said prong can be swung through said opening between a first position in which said tip is located transversely above said first lateral arm and a second position in which said tip is located transversely below said first lateral arm, a detent rod movably mounted within the interior of said first lateral arm, said rod having a detent recess extending transversely through the side thereof, said detent recess having a lateral cam surface, a spring mounted within said interior space and engaging said rod so as to normally hold same in a blocking position in which said rod obstructs the upper portion of said opening so as to prevent free movement of said prong tip from said first position to said second position, said detent recess being also then positioned so that said cam surface is in registration with the lower portion of said opening, said tip being adapted to bear against said cam surface in movement of said tip from its second position toward its first position and being thereby adapted to cooperate with said cam surface to force said rod into an unblocking position in which the upper portion of said detent recess is in registration with said opening, so as to permit said tip to complete its movement to its first position, said rod having an extension which protrudes outwardly of said first lateral arm and which is manually movable against the action of said spring so as also to move said rod into its unblocking position.

**2,775,012**
**SLIDE FASTENER**
Friedrich Mulka, Wewelsburg, near Paderborn, Germany
Application December 13, 1950, Serial No. 200,663
Claims priority, application Germany December 13, 1949
15 Claims. (Cl. 24—205.1)

1. A slide fastener, comprising, in combination, a pair of opposed stringer tapes, each being formed with a longitudinal fold; a row of fastening elements associated with each of said stringer tapes, each element having a locking portion adapted to cooperate with the locking portion of an opposed element and an attaching portion located within the fold of the tape; a row of clamping elements associated with each of said stringer tapes, each clamping element corresponding to one fastening element and embracing the outside of a fold in that region thereof where the attaching portion of the corresponding fastening element is located within the fold, firmly clamping the fold to said portion of the elements; and a slider cooperating with said fastening elements for connecting and disconnecting the fastening portions thereof and thereby closing and opening the slide fastener.

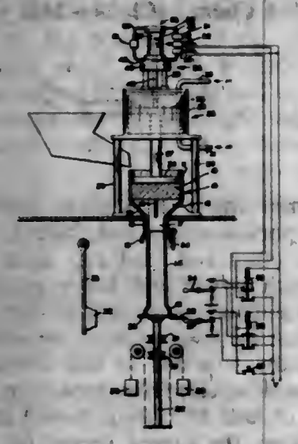
**2,775,013**
**PIVOTED CLAMP**
Edelmira Pedrero, New York, N. Y.
Application May 20, 1953, Serial No. 356,210
1 Claim. (Cl. 24—248)



A clasp comprising a base plate having an integral curved keeper portion at one end thereof, opposed parallel ears at the other end, said ears each having a continuous slot with upper and lower parallel horizontal sections and a connecting section at one end thereof, a clamping bar having hinge pins at one end thereof slidably and hingedly mounted in said connected slots for pivoting the bar at selected distances from the base plate, the other end of said bar being curved and adapted to frictionally engage the curved keeper on the base plate to hold the clamping bar releasably in closed position, said horizontal slots sections having notches offset from each other for receiving the pins and holding the clamping bar in adjusted position, and spaced corrugations on the opposed surfaces of the base plate and clamping bar, extending the widths of said surfaces, said corrugations being disposed in staggered relation, for securing the overlapped ends of a belt.

**2,775,014**
**CUSHIONING ACCESSORY FOR EARRINGS**
William Gollobin, Beechhurst, N. Y., assignor of fifty percent to Leonard Lawrence, Kew Gardens, and fifty percent to Gollobin Dental Company, Inc., New York, N. Y., a corporation of New York
Application August 5, 1953, Serial No. 372,534
2 Claims. (Cl. 24—263)

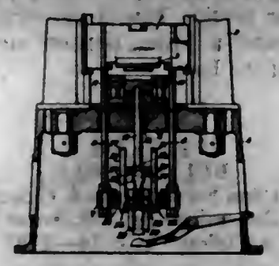
1. A cushioning accessory attachment for a conventional type earring having an adjustable ear lobe clamp-



ing screw terminating in a pressure head comprising, a one-piece sheet metal anchorage formed with front and back sections interconnected by an integral portion folded to bring said sections in overlying mating relation forming a pocket therebetween with their peripheral portions in engagement and having a centrally positioned through-opening in said back section wherethrough said opening the screw extends and in which pocket the pressure head is loosely confined for swiveling movement, said back section having a radially extending slit formed with inwardly tapered side edges communicating with said open-

ing, portions of the said side edges adjoining the opening being spaced apart a distance less than the diameter of the clamping screw to provide a restriction means requiring pressure force for springing the clamping screw from the slideway into said opening and from the latter out into the slideway for attachment and removal, a resilient cushioning pad secured to said front section positioned to be compressed on clamp fastening to the wearer's ear lobe, and bent tabs extending from the periphery of at least one of said sections embracing the other section to retain mating relating of said sections in close contact along the periphery edges thereof.

---



**2,775,015**
**CONTROL APPARATUS FOR EXTRUSION PRESSES AND THE LIKE**
**Clarence F. Erb, Youngstown, Ohio**
**Application May 20, 1952, Serial No. 288,888**
**4 Claims. (Cl. 25—16)**

1. In combination with an extrusion press of the type having a ram, a main fluid cylinder actuator adapted for operation by a compressible fluid, said main actuator having a movable piston member, and rigid means connecting said ram with said piston member; a hydraulic actuator having a piston and a cylinder one of which is a fixed member and the other of which is a movable member, means mounting said fixed member in rigid relation to said main actuator, means interconnecting said piston member and said movable member whereby movement of said piston member in a predetermined extruding direction causes related movement of said movable member relative to said fixed member, conduit means communicating with and forming a closed circuit between opposite ends of said cylinder, fast acting valve means in said conduit means for preventing the flow of fluid from one end to the other of said cylinder whereby to quickly stop the movement of said piston in said cylinder, a second conduit member communicating with opposite ends of said cylinder, and a check valve in said conduit means oriented therein in such a manner that when said ram and movable member move in said predetermined direction fluid in said cylinder is caused to circulate through said valve means and when said movable member moves in an opposite direction fluid in said cylinder may circulate from one end to the other of said cylinder through said check valve independently of said valve means.

**2,775,016**
**AUTOMATIC TILE PRESSES**
**Franz Dubois and Felix Engmann, Aachen, Germany, assignors to Dubois & Co., Aachen, Germany, a firm**
**Application December 29, 1952, Serial No. 328,462**
**Claims priority, application Germany December 29, 1951**
**3 Claims. (Cl. 25—42)**

1. An automatic tile press comprising in combination a mold, an upper die carried by a vertically reciprocating ram, a lower die seated on a lifter rod, a horizontally reciprocating filling slide, and lifting elements for the lifter rod, a pair of spaced parallel tie rods fastened to and extending from the ram through the press table into the press pedestal and carrying therein a cross beam, means on this cross beam for operating the lifting elements of the lifter rod and a vertical tooth rack on the cross beam in operative engagement with a toothed gearing adapted to actuate rocking levers connected with the filling slide for imparting the required horizontal reciprocating movement to the same; said lifting elements for the lifter rod including an upper and lower pair of tilting levers which are jointly and pivotally mounted on a single fulcrum member arranged parallel to the said cross beam, the upper pair of levers being provided with cam faces which are in contact with rollers that are mounted on the cross beam and constitute the driving element for the said levers, and the lower pair of levers engaging a vertically adjustable driver mounted on the lifter rod, said pairs of tilting levers being in engagement on their pivot pins by means of clutches, with the upper levers being slidable on the pivot pins in an axial direction, and the cross beam being provided with a vertically adjustable wedge which is adapted to cooperate with rollers on the levers of the upper pair for forcing these levers apart when the lifter rod with the lower die is in its top position and thereby disengage the clutches between the upper and lower levers and release the latter from their lifter rod supporting position.

**2,775,017**
**CONCRETE FORM STRUCTURE**
**Paul F. McDonough, Dorchester, Mass.**
**Application February 20, 1953, Serial No. 337,964**
**1 Claim. (Cl. 25—118)**

Concrete form structure providing, in the concrete moulded in the form, a conduit having an outlet which has a screw threaded coupling terminating substantially flush with the finished concrete face moulded by said form, said form structure comprising, in combination, a form panel for moulding the concrete face, a conduit on the side of the panel on which the concrete is moulded, said conduit having an exteriorly threaded end portion

approaching substantially normal to the panel, a unitary attachment for said threaded end portion, said attachment having an outwardly flared portion forming a flange having a flat face and an interior threaded passage extending from one end of the attachment to the other, said flat face extending radially inwardly from the outer periphery of the flange to said passage, and part of

which passage engages said threaded end portion and another part of which passage is arranged to receive a threaded conduit extension when the panel is removed from the said concrete face, said flat face portion abutting the panel and thereby being positioned flush with the concrete face formed by the panel, and means in said flange for securing the said attachment to the panel.

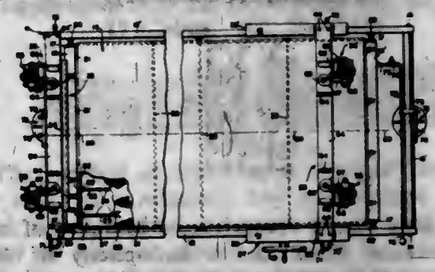
**2,775,018**
**CONCRETE SPACER TIE ROD**
**James A. McLaughlin, Lafayette, Calif.**
**Application April 16, 1953, Serial No. 349,194**
**2 Claims. (Cl. 25—131)**

1. A device for spacing a pair of panels for forming a concrete wall, comprising a rod arranged to extend between and through said panels, washers mounted on said members and arranged for positioning at the inner sides of said panels whereby the washers will be at least partially embedded in the concrete, each washer having an axial opening therein through which the rod is extended and being larger than the rod whereby the rod may be rotated in the opening relative to the washer, and stops on the rod at each side of the washers and spaced apart sufficiently to permit free rotation of the rod relative to the washers.



---

**2,775,019**
**DISPOSABLE CARDBOARD PAN, END FORMS, AND INSERTS**
**Thomas F. Bonis, Plainville, Kans.**
**Application February 2, 1953, Serial No. 334,531**
**4 Claims. (Cl. 25—131.5)**

1. A disposable concrete form comprising a plurality of pans, each of said pans comprising an elongated channel-shaped member including a web and spaced flanges, a reinforcing member disposed within said channel-shaped member and bracing said flanges relative to said web, said reinforcing member being generally V-shaped and forming in combination with said web and flanges triangular tubular sleeve-like spaces, triangular cross sectional inserts disposed in ends of said sleeve-like spaces joining adjacent pans together.

**2,775,020**
**CONDITIONING APPARATUS FOR WOVEN FABRIC AND THE LIKE**
**John T. Boyes, Quincy, Ill.**
**Application May 26, 1953, Serial No. 357,523**
**12 Claims. (Cl. 26—68)**

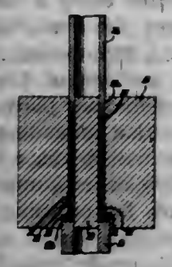
1. In a device for conditioning fabric material comprising a frame, carrying means for supporting fabric material on said frame in position for exposure to a fabric conditioning medium, said carrying means including fabric clamping means on said frame, at one end thereof, for gripping fabric to be conditioned, a carriage shiftable on said frame toward and away from said clamping means, a fabric clamp on said carriage for clampingly gripping the fabric to be conditioned, fluid operated clamp actuating means on said carriage, including conduit and control valve means for supplying fluid under pressure for the operation of said actuating means, means for shifting said carriage on said frame to stretch said material between said fabric clamp and said clamping means during exposure thereof to the conditioning medium, and means operable to dry out the material after exposure thereof to said medium.

---

**2,775,021**
**BURIAL CASKET**
**George J. Bourgraf, Mack, Ohio**
**Application March 25, 1954, Serial No. 418,563**
**1 Claim. (Cl. 27—6)**

A burial casket which comprises an elongated substantially rectangular base plate, downturned supporting walls along the sides of the base plate to support the base plate above a supporting surface, an upwardly extending side plate attached to the base plate parallel to and spaced inwardly of each of the lengthwise sides of the base plate, there being a corpse-receiving space between the side plates, the side plates being of substantially equal height and terminating short of the ends of the base plates, the portion of the upper face of the base plate outboard of the side plates being unobstructed, said unobstructed portion extending completely around the upper face of the base plate, a hollow cover for the base plate, said hollow cover comprising a top portion, and side and end walls for encasing the corpse-receiving space, inwardly projecting flanges on the side and end walls for overlying the unobstructed portion of the base plate outboard of the side plates, said side walls extending below the flanges and downwardly along the opposite sides of the base plate, a resilient gasket attached to the under side of the flanges, the flanges and gasket overlying said unobstructed portion of the base plate, and latches linking the end walls of the cover with the ends of the base plate to draw the cover downwardly on the base plate, the gasket being compressed between the flanges and said unobstructed portion of the base plate.

2,775,022
**SILICEOUS STRAND**
Archibald H. Davis, Silver Spring, Md.
Original application October 23, 1950, Serial No. 191,595. Divided and this application May 18, 1953, Serial No. 355,657
3 Claims. (Cl. 28—81)



1. A flexible strand comprising a plurality of aligned parallel siliceous fibers and a multiplicity of discrete organic plastic elements distributed within and throughout the strand, each of said plastic elements being adherent to a plurality of fibers and said elements maintaining the fibers in spaced relationship and transferring stress from fiber to fiber.

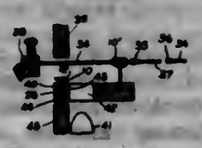
2,775,023
**MANUFACTURE OF SMALL RECTIFIER CELLS**
Lizzie K. Hedding, Wilkinsburg, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application May 21, 1952, Serial No. 289,073
2 Claims. (Cl. 29—25.3)

1. The method of manufacturing selenium rectifier cells comprising the steps of providing a layer of selenium in its crystalline state on a base plate, removing the selenium layer from regions surrounding predetermined areas of the layer, filling in the regions where the selenium layer was removed with an insulating compound resistant to moisture, forming a barrier layer on said selenium layer, applying a counterelectrode layer to the selenium layer and the insulating compound, electroforming the selenium layer, and then subdividing the base plate in the regions filled with the insulating compound to produce a plurality of individual rectifier cells.

2,775,024
**POWDER METAL MULTI-RING BUSHING**
Reed E. Seal, Lakewood, Ohio, assignor to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application May 29, 1953, Serial No. 358,231
3 Claims. (Cl. 29—182.2)

1. A wear resisting and self lubricating valve stem guide comprising a superimposed stack of bands of sintered compacts of wear resistant metal powder alternated with sintered compacts of a mixture of wear resistant metal powder and discrete particles of a solid lubricant, the alternating compacts being bonded together into a self sustaining guide by autogenous bonds between the adjoining compacts.

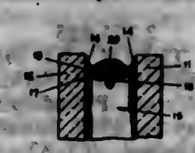
2,775,025
**SELF-ADJUSTING CAM BEARING OR BUSHING KNOCKER AND INSTALLER**
Ollie Dee Williams, Kress, Tex.
Application February 25, 1952, Serial No. 273,314
1 Claim. (Cl. 29—275)



A bushing knocker and installer comprising an elongated shaft having a threaded outer end, a shoulder affixed to said shaft in spaced relation to said outer end, a handle removably mounted on the inner end of said shaft, an inner plate surrounding said shaft and abutting said shoulder, an outer plate surrounding said shaft adjacent the outer end thereof, said plates each having a plurality of radially extending slots, a plurality of mandrel-forming segments each provided with a bushing-engaging rib adjacent the inner end plate, a pintle extending from each end of each segment and receivable in one of said slots, a compression spring interposed between each adjacent pair of segments, a guide pin affixed to each segment, each segment having an opening therein receiving the pin of an adjacent segment, and a nut threaded upon the outer end of said shaft and abutting said outer plate.

2,775,026
**METHOD FOR AUTOMATIC SCREW MACHINE OPERATIONS**
Clarence O. Schrader, Lake Tahoe, Calif., assignor of one-half to Paper Mate Manufacturing Company, Culver City, Calif., a corporation of Delaware
Application April 26, 1954, Serial No. 425,570
6 Claims. (Cl. 29—406)

1. A method of making articles having oppositely directed countersunk ends from bar stock on a single automatic screw machine comprising: moving bar stock axially in one direction; moving a previously cutoff, partly worked part axially in the opposite direction but in alignment with said bar stock; infeeding boring tools into the path of travel of said bar stock and partly worked part to counterbore the forward end of the bar stock and simultaneously counterbore the reverse end of the previously cutoff partly worked part; recoiling the bar stock and outfeeding the boring tools, said boring tools laterally moving the countersunk previously cut part therewith.



2,775,027
**METHOD OF ASSEMBLING SLIDERS WITH PULLS AND WITH SEPARABLE FASTENER STRINGERS**
Louis H. Morin, Bronx, N. Y.
Application January 22, 1953, Serial No. 332,633
10 Claims. (Cl. 29—408)

1. The method of assembling a slider and pull for separable fastener stringers comprising inserting a pivot portion of a pull between a pair of parallel walls of a slider blank, said slider blank comprising said pair of parallel walls connected together by a compressible web, said web being of such a height as to space said walls apart a distance greater than the thickness of the pivot portion of the pull, one of said walls having a recess extending transversely thereof and opening through the inner surface thereof, moving the pivot portion of the pull into said recess, then reducing the distance between said walls to a distance less than the thickness of said pivot portion by compressing the web of said blank to deform the same and to move the slider walls towards each other while maintaining them parallel, said walls being thereby moved into stringer-controlling position to enable said slider to couple and uncouple a pair of stringers.

2,775,028
**METHOD OF SEALING MULTIPLE SHEET GLAZING UNITS**
Roy W. Wampler, Toledo, Ohio, assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Application August 23, 1952, Serial No. 305,945
3 Claims. (Cl. 29—455)

1. The method of establishing pressure equilibrium between the internal areas and external areas of a hermetically sealed multiple sheet glazing unit to accommodate for changes in pressure externally of the unit, comprising hermetically sealing spaced sheets of glass together so as to enclose an insulating medium in the space between the sheets at a pressure substantially equal to the pressure existing externally of the unit, then upon a change in external pressure on the unit, venting the hermetically sealed space between said sheets to the atmosphere existing externally of the unit to allow the pressure within said space to at least approximately assume that of the external pressure, and subsequently sealing said vent to again hermetically seal said space between said sheets at a pressure substantially equal to that then existing externally of the unit.

2,775,029
**METHOD OF MAKING COMPOSITE METAL BODIES**
Arthur S. Bennett, Pittsburgh, and Donald B. Williams, Canonsburg, Pa.
Application March 2, 1951, Serial No. 213,512
3 Claims. (Cl. 29—474.3)

1. The method of making composite metal tubing which comprises placing a relatively thin copper tube inside of a steel tube with the outer dimension of the copper tube of substantially the dimension of the inner diameter of the steel tube, flaring the ends of the copper tube to cause it to seal the space between said tubes, placing end caps on the steel tube, one of which is connected to a source of gaseous pressure, charging said copper tube with a compressed fluid of a pressure sufficient to deform the copper tube outwardly and placing the assembled tube structure in a heating furnace to heat the same to a bonding temperature below the melting temperature of either metal while under pressure of the compressed fluid to cause a diffusion of the metal of the contacting surfaces of the copper tube into the grain boundaries of the adjacent steel tube surfaces.

2,775,030
**METHOD OF SECURING SHEETS OF DISSIMILAR METALS TOGETHER**
Karl E. Weiss, Arlington, Mass., assignor to New England Lead Burning Corp., St. Louis, Mo., a corporation of Missouri
Application May 26, 1954, Serial No. 432,471
11 Claims. (Cl. 29—530)

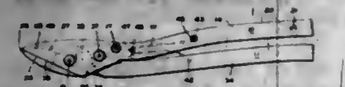
1. The method of attaching a sheet of fusible metal which melts at a relatively low temperature to a sheet of steel, which method comprises the steps of forming a plurality of holes at spaced intervals in a sheet of the said fusible metal, placing a layer of expanded metal lath over said fusible sheet so that solid portions of said lath are in line with the holes in said fusible sheet, flowing additional quantities of said fusible metal into the interstices of the said expanded metal lath and building the fusible metal sheet up to a thickness to include therein the said metal lath, placing the combined sheet of fusible metal and metal lath against a sheet of steel with the lath side of said combined sheet facing said steel sheet, directly securing the metal lath to the sheet steel at those places where solid portions of the lath are in line with and visible through the holes in said fusible metal sheet and then filling in all of the holes with additional fusible metal to give an impervious sheet of fusible metal secured to said metal lath and said metal lath secured to said steel sheet.

2,775,031
**SAFETY RAZOR BLADE HOLDER WITH SELF-CLOSING OPERATION**
John Guardino, New York, N. Y.
Application October 22, 1954, Serial No. 464,045
3 Claims. (Cl. 30—60.5)

1. The combination of a double edge razor blade holder having a tubular handle and a holder base secured to the upper end of the tubular handle, clamping plates, links disposed at the opposite ends of the base and having pivotal connection with the clamping plates to rock the same, a rod sliding through the handle and having operating connections with the links to open and close said clamping plates; of a sleeve slidable on the handle, a spring within the handle for actuating the rod downwardly in the handle, and a pin having its outer ends secured to the sleeve and sliding longitudinally of the handle, said handle being formed with opposing slots through which said pin freely extends for sliding movement.

2,775,032
**WORKPIECE-HOLDING PRUNING SHEARS WITH RESILIENT IN-DRAWING GRIPPER ELEMENT**
Edgar P. Sorensen, Ontario, Calif.
Application October 19, 1953, Serial No. 386,723
4 Claims. (Cl. 30—134)

1. Workpiece-holding and indrawing pruning shears comprising: a pair of articulated handles united by pivotal means; coacting workpiece-severing jaws operatively



supported by said handles; and workpiece-gripping means also supported in cooperative relation to the respective jaws and including a rigid gripper element immovable with respect to one of said jaws and a resilient gripper element movable with the other jaw in yielding relation thereto and positioned directly opposite to said rigid gripper element for contact therewith when the jaws are closed, said gripper elements having normally substantially straight opposed workpiece-contact faces of which the said face of the resilient gripper element is angularly arranged on the corresponding jaw with its forward portion more remote from the handle pivotal means projecting inward from said jaw into the mouth of the space

between jaws when open to form a workpiece restraining nose and the rearward portion of said workpiece-contact face converging upon the rearward portion of said jaw, the composition and construction of the resilient gripper element being such that its nose is comparatively stiff and the portion rearward of said nose is increasingly more compressibly yielding with distance from the nose, whereby a workpiece initially restrained by the nose of the resilient gripper element in cooperation with the rigid gripper element will be drawn rearwardly inward along the said rigid element during closing action of the workpiece-severing jaws due to progressive rearward declination of resistance to compressive forces by said resilient gripper element.

---

**2,775,033**
**SHEET METAL SHEARS**
**Jim Wilson, West Palm Beach, Fla.**
**Application July 21, 1954, Serial No. 444,835**
**2 Claims. (Cl. 30—250)**

1. A sheet metal shears comprising a first handle member being formed of a pair of identically shaped elongated, flattened bars secured together in spaced face to face relation to each other, a second handle member being formed of a pair of similarly shaped elongated flattened bars secured together at one end and in confronting face to face relation to each other, and at the other in spaced face to face relation and pivotally secured adjacent one end to said first handle member adjacent said one end, a cutting blade pivotally connected between the confronting faces of each of said pair of fixed blades, a spacer member secured between said second-named pair of bars fastened to the other end thereof and being provided with a concave end face, said cutting blade being formed with a convex end edge adapted to slide to said concave end face, an operating pin connecting said second handle member to said cutting blade for movement thereof between open and closed positions, said operating pin being disposed on said second handle member at a point closer to said one end thereof than the point of pivotal attachment of said handle member to said first handle member and connecting with said cutting blade at a point thereon further from said one end than its pivotal connection with said pair of fixed blades.

---

**2,775,034**
**SEAM OPENER**
**Victor Bulocki, Toronto, Ontario, Canada**
**Application November 18, 1955, Serial No. 547,721**
**1 Claim. (Cl. 30—294)**

A seam opener comprising a relatively thin plate including an elongated shank and a generally rectangular head, a narrow thread receiving slot in said head disposed generally transversely of said head, said slot being arcuately curved outwardly and presenting curved edges, a cut-thread clearance opening in said head intermediate

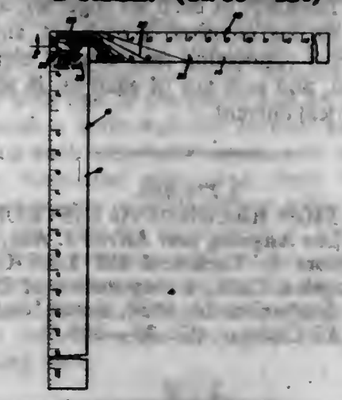
the opposite side edges thereof, said slot having one end thereof opening through one side edge of the head and the other end thereof communicating with said clearance opening and the outer curved edge of said slot having a sharpened cutting edge.

---

**2,775,035**
**ARTIFICIAL TEETH AND METHOD OF ASSEMBLING SAME**
**Morris Berzin, Philadelphia, Pa.**
**Application May 16, 1955, Serial No. 508,433**
**42 Claims. (Cl. 32—8)**

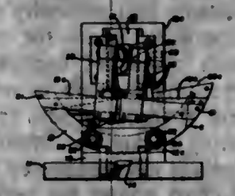
1. An artificial posterior tooth comprising a crown with an occlusal portion having a conical cusp, and a band cusp connecting with said conical cusp, the top contact surfaces of said cusps being on the surface of a sphere.

---



**2,775,036**
**APPARATUS FOR AND METHOD OF FORMING TOOTH POSITIONING APPLIANCES**
**Harold D. Kesling, La Porte, Ind.**
**Original application November 25, 1946, Serial No. 712,212. Divided and this application November 15, 1950, Serial No. 195,842**
**9 Claims. (Cl. 32—14)**

1. A method of forming a tooth positioning appliance comprising the steps of preparing models of the upper and lower teeth of a patient with the teeth relocated to predetermined positions of movement, reproducing the said models in separable upper and lower bases of a flask with the upper end lower teeth in occluded relation, establishing a position of said upper and lower teeth simulating the relaxed slightly opened position of the teeth, disposing resilient deformable material between said upper and lower teeth spaced apart to receive it, and returning said upper and lower teeth to the established relaxed position forming permanent impressions of the upper and lower teeth in said material to provide a tooth positioning appliance.

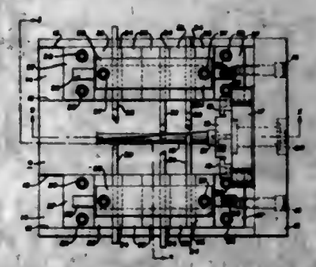


**2,775,037**
**CARPENTER'S SQUARE**
**Harry Bezemek, Big Rapids, Mich.**
**Application October 19, 1953, Serial No. 386,731**
**2 Claims. (Cl. 33—120)**

1. A carpenter's square comprising a pair of blades, a pivot pin connecting said blades together, a plurality of apertures spaced about said pin, a plurality of index lines on each of said blades for indicating the angular relation of the blades, and disengageable means engaging selective apertures when said blades are aligned with selective index lines, said apertures and index lines being provided with corresponding indicia for denoting an angular relationship, said pivot pin including a projecting shank, a sleeve slidable on said shank, a projecting arm on said sleeve, said disengageable means including a depending pin on said arm receivable in selective apertures, and spring means urging said sleeve, arm and pin downwardly.

---

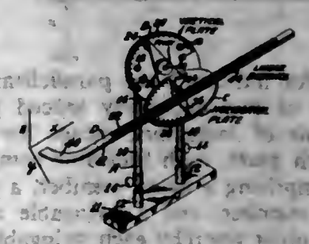
**2,775,038**
**GAUGE MOUNTING ASSEMBLY**
**Lee Price, Cleveland Heights, Ohio**
**Application May 20, 1955, Serial No. 509,710**
**7 Claims. (Cl. 33—174)**



2. In a gauge mounting, the combination of a base member having a pair of openings extending therealong, said openings having parallel axes, a plurality of cross-pieces each having straight slide portion adapted to slidably carry therealong a pair of holders for gauge fingers movable relative to each other to gauge an article disposed along a reference line between the gauge fingers, each of said cross-pieces having a pair of holes extending therethrough, said holes of each pair of holes having parallel axes disposed on a circle generated around said reference line, the said axes for each pair of holes being disposed on a chord of said circle inclined at an angle to the corresponding chord for each other pair of holes, said pairs of openings in the base member and said pairs of holes in the cross-pieces being in alignment, aligning means securing said openings and holes in alignment, the varying angular disposition of said chords providing for varied angular disposition of the slide portions of said cross-pieces relative to the plane of said base member.

---

**2,775,039**
**GUILLOTINE GAUGE**
**Lee Price, Cleveland Heights, Ohio**
**Application May 20, 1955, Serial No. 509,725**
**7 Claims. (Cl. 33—174)**

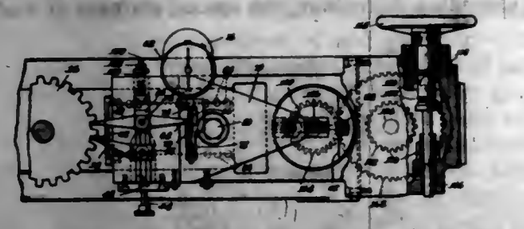


1. A gauging device comprising in combination a base member, said base member having a reference point intermediate of opposite sides thereof, aligning means mounted to said base member and positioned relative to said reference point for aligning an article to be gauged, said base member having adjacent each of said opposite sides a pair of opposed straight shoulders parallel to each other and to the shoulders of the other pair of shoulders, a line passing thorugh said reference point parallel to said shoulders being equidistant from the inner shoulders of said pairs of shoulders and equisdistant from the outer shoulders of said pairs of shoulders, a plurality of guide blocks, a plurality of spacer blocks, a first group of said guide blocks and spacer blocks being alternately arranged in a line over said base member between the shoulders of one said pair of shoulders and a second group of said guide blocks and spacer blocks being alternately arranged in a line over said base member between the shoulders of the other said pair of shoulders, the blocks of each group of alternately arranged guide blocks and spacer blocks having oppositely disposed and spaced surfaces extending therealong, the spaced surfaces of said al-

ternately arranged blocks engaging the opposed shoulders of said pairs of shoulders, respectively, to retain the position of said blocks relative to said line passing through said reference point, and abutting means secured to said base member and abutting the opposite ends of the respective groups of alternately arranged guide blocks and spacer blocks to restrain said blocks against movement along said base member parallel to said shoulders, each of said guide blocks having a channel formed in a face thereof and disposed transversely of the guide block, each said channel being adapted to slidably receive and guide a guillotine gauge blade movable through the channel, each said guide block having a side forming a reference plane at the end of said channel for comparing a position of a said blade in the channel with the said side, said sides of the guide blocks of each group being in a common plane parallel to the common plane of the other group, the guide blocks and spacer blocks of each group having aligned open spaces adjacent said common plane to provide finger access to blades in said channels.

---

**2,775,040**
**THREE DIMENSIONAL PELVIMETER**
**Benjamin Leff, Philadelphia, Pa.**
**Application September 4, 1952, Serial No. 307,830**
**3 Claims. (Cl. 33—174)**



1. A device to measure the pelvic opening of an expectant mother wherein unseen distances are located beyond an obstruction comprising a support externally located of said opening, a calibrated plate mounted upon

said support and lying in a vertical plane, a pivoted dial pointer mounted upon said calibrated plate, a second calibrated plate attached at right angles to said first named pointer, a second pointer pivotally mounted upon and complementary to said second plate, a rod slidable with respect to said second pointer and being slidable only along its longitudinal axis, means for holding said second pointer and said rod to rotate together, and a tip extending laterally on one end of said rod which tip is adjustable to engage different unseen points within said unseen pelvic opening.

---

2,775,041
GEAR TESTING APPARATUS
Henry Pomernacki, Chicago, Ill., assignor to Illinois Tool Works, Chicago, Ill., a corporation of Illinois
Application March 30, 1954, Serial No. 419,716
11 Claims. (Cl. 33—179.5)

1. An apparatus for testing gears and the like comprising means for rotatably mounting a gear-like workpiece having a plurality of generally radially extending circumferentially spaced surfaces, support means, a first contact member fixed on said support means and extending generally toward said workpiece mounting means for engaging one of said surfaces, a second contact member mounted on said support means for movement relative to said first contact member and for engaging another of said surfaces and extending generally toward said workpiece mounting means, and means for moving said contact members around an endless path with the contact members continuously extending generally toward said workpiece mounting means and into and out of engagement with said surfaces of a workpiece on said mounting means for testing and indexing the workpiece.

---

2,775,042
DEVICE FOR ALIGNING PLATES IN PARALLEL
Charles W. MacMillan, Rock Island, Ill., assignor to Bear Manufacturing Company, Rock Island, Ill., a corporation of Delaware
Application October 3, 1955, Serial No. 536,088
5 Claims. (Cl. 33—180)

1. A device for indicating the parallelism of opposed datum surfaces of two oppositely spaced plates which comprises, a pair of indicators, means for securing an indicator to each plate, each indicator comprising a set of members comprising a beam member, a pivot carried by each beam member, and a swingable arm member carried by said pivot whereby each swingable arm member is swingably mounted upon a beam member of its set, a pair of spaced electrically conductive contact elements carried by one of the members of each set, the mid portion between said contact elements being in a common plane with the axis of an adjacent pivot which plane extends at right-angles to an adjacent datum surface, an electrically conductive pin carried by the other member of each set and adapted to be disposed between the contact elements carried by the adjacent member of the set, flexible resilient means connecting the opposite swingable arm members of each set together, an electrical signal carried by one member of each set, and electrical connecting means connecting said contact elements, said electrical signal, and said pin of each set in series with a source of electrical current.

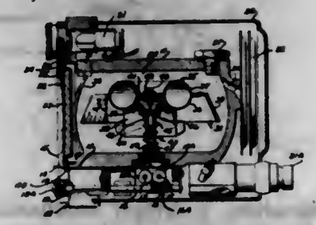
---

2,775,043
INCLINATION RECORDING INSTRUMENT
Oswald Suter, Los Angeles, and Alfred J. Abs, Van Nuys, Calif., assignors to Technical Oil Tool Corporation, Ltd., Los Angeles, Calif., a corporation of California
Application September 14, 1950, Serial No. 184,876
17 Claims. (Cl. 33—205.5)

17. An inclination recording instrument for use in well bores, which includes: a housing; pendulum means including a marking element suspended in said housing; a chart holder mounted for sliding and rotational movement within said housing and normally spaced from said marking element; operating means for reciprocating said chart holder through cycles of engagement and withdrawal from said marking element to record the relative angular displacement thereof; means to control the release of said operating means for intermittent cycles of reciprocation; and means interconnected with said operating means and said chart holder for periodically rotating said holder between successive contacts thereof with said marking element and limiting the rotation of said holder to that period when said holder is not in contact with said marking element.

---

2,775,044
ANGLE INDICATOR
Forest O. Beebout, Trinidad, Colo.
Application December 19, 1955, Serial No. 553,846
2 Claims. (Cl. 33—221)



1. An angle indicating device comprising a sealed, hollow body of transparent material having four edge faces forming bases at right angles and separated side walls perpendicular to the bases which provide substantially unobstructed space therebetween for pointer movement and observation, a set of three weighted pointers, pivotal mounts carried by the side walls which provide for the pointers swinging freely, two of the mounts being so located off center that their pointers may swing through 90° and the third pointer being centrally mounted for

rotation through 360°, scale markings corresponding with the pointer movements located on the inside of the hollow body which are visible through both side walls, each pointer being shaped at its end to move close to its associated scale, a plate fixed to move with each pointer, three slidably and pivotally mounted shafts, each having a stop at one end releasably engageable respectively with one of the plates and an outer end projecting through a body wall for manual manipulation, a spring urging each stop into engagement with the plate, and means associated with each shaft for releasably holding its stop out of engagement with the associated plate which provides for movement of the stop to lock the pointer from swinging while at any indicating angle, said off center pointers and their scales serving to indicate angles relative to two perpendicular bases and the third pointer and its 360° scale serving to measure an angle relative to any base.

2,775,045
LIQUID FILLED MAGNETIC COMPASS
Ladislav Kadlec, Lansdale, Pa., assignor to American Machine and Metals, Inc., New York, N. Y., a corporation of Delaware
Application May 4, 1954, Serial No. 427,636
1 Claim. (Cl. 33—223)

In a fluid compass, the combination including a fluid filled bowl, said bowl having a chamber with concave vertical walls, a magnetic card having a central hollow doughnut shaped float in said bowl supported on a pivot therein, a transparent panel in one wall of said bowl for reading the card, and an expansion chamber connected to said bowl through a passage on one of said vertical concave faces of said chamber above said card, the outlet axis of said passage into said bowl being directed upwardly toward the roof of said chamber and away from said card.

2,775,046
METHODS AND APPARATUS FOR THE PROCESSING OF TEXTILE MATERIALS
Hans Kabelitz, M. Gladbach, Germany, assignor to Gebrüder Sucher G. m. b. H., M. Gladbach, Germany
Application May 25, 1951, Serial No. 228,191
Claims priority, application Germany May 31, 1949, and Sweden September 14, 1949
10 Claims. (Cl. 34—23)

10. The method of processing an unwoven and unwebbed strand of textile material which has been treated with treatment matter, comprising supporting and moving horizontally a substantial straight strand of the material through three zones in sequence, passing a gaseous processing agent through said zones exclusively longitudinally of and in contact with the strand, the gas velocity in first zone being gradually increased in the direction of the second zone in order to diminish shock, the gas velocity in the second zone exceeding that required to yield the critical Reynold's number for tubulent flow, the second zone being longer than the first and third and being the main treating zone, the gas velocity in the third zone being gradually decreased to diminish turbulence, to diminish tendency of the gaseous processing agent to blow the chemical treatment matter out of the strand.

2,775,047
DRIER CONTROL
Harold E. Morrison, St. Joseph, Mich., assignor, by mesne assignments, to Whirlpool-Seeger Corporation, St. Joseph, Mich., a corporation of Delaware
Application January 23, 1952, Serial No. 267,769
4 Claims. (Cl. 34—45)

3. In an automatic clothes drier including a rotatable drier drum, a drive motor for said drier drum, a heater unit, a control circuit for said heater unit for controlling drying in accordance with a succession of cooling cycles, an energizing circuit for said control circuit and drive motor, a relay having a contact connecting said heater unit in said energizing circuit when closed, a thermostat controlling operation of said relay and effecting the operation of said relay to close said contact at temperatures below the temperature setting of said thermostat and effecting the operation of said relay to open said contact and the circuit to said heater unit upon predetermined temperature rises, a sequence timer including a timer cam and a timer switch operated thereby, a timer motor for operating said timer cam, said timer cam also being manually operable to initiate a drying operation, said timer switch closing upon the initial turning of said timer cam to initiate a drying operation and remaining closed to the termination of the drying operation at the end of a cycle of rotation of said timer cam, and said relay also having another contact connected in series with said timer switch and said timer motor, and closing upon operation of said thermostat upon predetermined temperature rises and the opening of the circuit to said heater unit, to connect said timer motor in said energizing circuit during a cooling cycle.

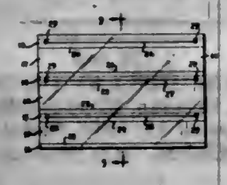
---

2,775,048
VISUAL DISPLAY DEVICE
Hymie D. Berman, Minneapolis, Minn.
Application August 15, 1955, Serial No. 528,191
3 Claims. (Cl. 35—35)

1. In a visual display device for use with a flannel-covered display board, the combination of panel means defining enlarged front and rear surfaces, said rear surface having a flock covering thereon to engage the

flannel-covered display board for holding said panel means in a desired position thereon, a number of spaced and parallel strips of non-drying adhesive applied on said front surface, and a plurality of display characters having contrasting colors relative to said surface and each having a flock-covered surface on one side thereof, said characters being applied to said front surface, said adhesive strips providing a reference for the arrangement of said characters in a uniform and orderly fashion, and also co-acting with said flock-covered surfaces of said characters in retaining the characters on said front surface, whereby said characters may be readily and easily removed and interchanged to provide a desired display, and said panel means with prearranged characters thereon may be quickly applied to and removed from the flannel-covered display board.

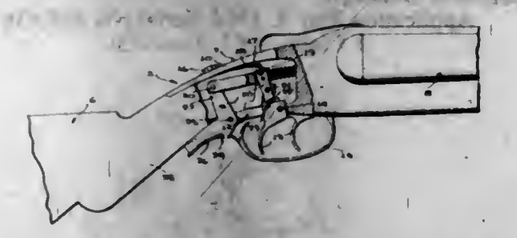
---



**2,775,049**
**SELF-RETAINING PUMP TYPE SHOE**
Rubin Aptaker, Villa Park, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application August 24, 1953, Serial No. 375,974
3 Claims. (Cl. 36—55)

1. A low-cut pump type shoe comprising a sole and an upper, said upper comprising an outer sheet and a lining therefor, and an insert between said outer sheet and said lining of the upper, said insert comprising a layer of resilient material of the character of sponge rubber, said insert being disposed at least in the quarter portion of said shoe, and said lining adjacent said insert being formed of quilted material, whereby said shoe will snugly fit the wearer's foot without the necessity for fastening means.

---



**2,775,050**
**FILE CARD STRUCTURE**
Russell S. Ellsworth, Massey, N. Y., assignor, by mesne assignments, to Mickle Printing Press & Manufacturing Company, Chicago, Ill., a corporation of Delaware
Application September 12, 1955, Serial No. 533,837
10 Claims. (Cl. 40—159)

1. A card-like filing jacket for strips and/or individual frames of photographic film and the like, comprising two rectangular sheets arranged in superposed relation, a narrow width spacer element interposed between said sheets and extending lengthwise thereof parallel to the longitudinal edges of said sheets, and another narrow width spacer element interposed between said sheets and extending lengthwise thereof parallel to said first-named spaced element, said spacer elements being spaced apart a distance somewhat greater than the width of the film strip and/or film frame insert so as to receive therebetween completely said film insert, said sheets being adhesively secured to the top and bottom planar surfaces, respectively, of one of said spacer elements at least at and along the entire length of the longitudinal edge thereof facing the other of said spacer elements, one of said sheets being adhesively secured to one of the planar surfaces of the other of said spacer elements at least at and along the entire length of the longitudinal edge thereof facing the said one of said spacer elements, the other of said sheets being adhesively secured to the other of the planar surfaces of the said other of said spacer elements only at and along the entire length of the longitudinal edge thereof facing away from the said one of said spacer elements leaving the remainder of the said other of the planar surfaces free from the said other of said sheets, the said other of said sheets having a slit therethrough extending lengthwise thereof and located directly over the said remainder of the said other of the planar surfaces, said slit providing an entrance opening through which the film insert may be edgewise inserted over the said other of said spacer elements between said sheets and positioned between said spacer elements.

---

**2,775,051**
**SAFETY FOR FIREARMS**
George Gehnsen, Oxford, N. J.
Application October 23, 1953, Serial No. 387,914
2 Claims. (Cl. 42—70)

1. In combination, a trigger mechanism including a housing having a front wall, side walls, a top wall, and a bottom wall provided with opening means, a trigger positioned in a forward part of said opening means and pivoted on the housing to move forwardly and rearwardly relative thereto, a vertical latch lever within said housing and having upper and lower ends, said latch lever being pivoted intermediate its ends on the housing above said trigger to swing forwardly and rearwardly relative thereto, the lower end of the latch lever having a portion normally engaging an upper portion of the trigger and preventing firing operation of the trigger, a horizontal bolt having a forward end and a rear end, the forward end of the bolt having a closed slot through which loosely extends the upper end of the latch lever, spring means acting between the forward end of said bolt and the front wall of the housing and normally urging said bolt in a rearward direction so as to maintain said lower end of said latch lever in blocking engagement with the said upper portion of the trigger, and a releasing lever pivoted intermediate its ends on said housing beneath the rear end of the bolt, said releasing lever having a horizontal arm underlying the housing at a point rearwardly of the trigger and a vertical arm rising through said opening means and pivoted to the rear end of said bolt.

---

**2,775,052**
**BIPOD AND FACE SHIELD FOR A RIFLE**
C Walton Musser and Francis W. Dietsch, Philadelphia, Pa., assignors to the United States of America as represented by the Secretary of the Army
Application November 21, 1952, Serial No. 321,961
9 Claims. (Cl. 42—94)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A support for an object comprising a pair of leg members, means for pivotally attaching said leg members to said object, said attaching means being adjustable rotatively relative to said object for selectively positioning said object in a vertical position and including means to allow movement of said leg members in a first plane between a first position substantially normal to said object and a second position substantially parallel to said object but removed from said first position, said attaching means further being operative to allow movement of said members with respect to each other only

in said first position in a second plane normal to said first plane, whereby said leg members may be angularly disposed with respect to each other to provide a bipod for said object, and moving means carried by said leg members operatively connecting said leg members to effect simultaneous movement thereof.

---

**2,775,053**
**SIGNAL FOR FISHING RODS**
Paul H. Knoll and Stanley J. Kozlowski, Acme, Mich.
Application April 2, 1953, Serial No. 346,446
4 Claims. (Cl. 43—17)

1. A signal attachment for fishing tackle including a rod, a reel mounted on the rod and provided with a crank, a line operatively associated with the reel and rod, the attachment comprising a pair of pivotally connected rod supporting legs, opposed rod engaging jaws on said legs for detachably connecting the legs to the rod, said jaws being disposed above and in spaced relation to the pivotal connection for the legs, a V-shaped spring having the bight thereof engaged with the pivot for the legs and its arms engaged with the legs to bias the legs to a downwardly diverging jaw closing position, and a resiliently springable signal arm fixedly mounted at one end on one of the legs to be detached as a unit with said legs from said rod, said signal arm when free projecting upwardly from said legs to a position substantially higher than said jaws when the signal arm is in signal position, said arm being springable from said upwardly projecting position to a bowed position in which its outer end is substantially closer the level of the rod engaging jaws than in said upwardly projecting position, and means adjacent the outer end of the arm for releasably engaging the arm with the crank of the reel when the arm is under spring tension and in said bowed position, said arm when released from said bowed position and in an upright position constituting viewable means to indicate the strike of a fish.

---

**2,775,054**
**LINE GUIDE FOR FISHING ROD**
Edward Shinbane, Los Angeles, Calif.
Application July 19, 1954, Serial No. 444,017
3 Claims. (Cl. 43—24)

3. A line guide for a flexible fishing rod of the kind having a handle at its forward end comprising a resilient wire having a loop between its ends, a first end portion of the wire extending forwardly and downwardly from said loop and then forwardly and terminating in a first rod-engaging extremity portion spaced below and forwardly of said loop, a second portion of the wire extending rearwardly and downwardly from the loop and then forwardly spaced beneath the central portion of the loop in contact with the upper surface of said rod when said rod is in its normal unflexed condition and terminating in a second rod-engaging extremity portion in juxtaposition to said first rod-engaging extremity portion, whereby said second portion is adapted to support the loop without increasing the resistance of the rod to be flexed downwardly as by a fish which may be caught on a line attached thereto; said rod-engaging extremity portions extending lengthwise of the upper surface of said rod and being secured together and shaped to define a foot which is wider between its ends than at its rearward end whereby to be securable to the rod by a single wrapping in a manner to resist being pulled from said wrapping in the direction of said loop.

---

**2,775,055**
**FISHING LURES AND METHOD FOR PRODUCING THE SAME**
Thomas D. Waugh and Richard C. Waugh, Boulder, Colo.
Application September 17, 1951, Serial No. 246,934
8 Claims. (Cl. 43—42.25)

1. A fishing fly comprising a hook provided with a shank, a bill and an eye; and short fibers initially associated with the shank by electrostatic action and subsequently adhered to the shank by an adhesive.

---

**2,775,056**
**FISHING FLOAT ASSEMBLY**
Joseph F. Saeed, Sunflower, Kans.
Application February 21, 1956, Serial No. 566,954
4 Claims. (Cl. 43—43.11)

1. A fishing float or the like for use with a fish line having a sinker member thereon, comprising an elongated hollow body member, longitudinally aligned passage portions extending through opposite ends of the body member, anchor means on the body member engageable with an intermediate portion of a fish line extending therethrough for adjustably retaining the body member on said line, said body member including an annular spool portion for receiving a predetermined convoluted length of fish line thereabout, a line-support member pivotally supported on a transverse pivot axis portion on the body member, said line-support member including a lug element off-set from the transverse pivot axis portion for receiving an intermediate loop portion of the fish line thereover, trigger means carried on the body member in engagement with the fish line-support plate member for retaining the plate member in a fixed position preventing the line from being dispensed off the spool portion of the body member, and sealed float means contained in the body member and engageable with the trigger means permitting the line-support plate to pivot

due to the force applied by the sinker member on the fish line and allowing the line on the spool portion of the body member to be dispensed, there being aperture means in the body member permitting the interior thereof to be filled with water for actuating the float means.

---

2,775,057
**DEVICE FOR JETTISONING SNAGGED FISHHOOKS**
Herbert T. Ludgate, Toledo, Ohio
Application September 1, 1954, Serial No. 453,598
8 Claims. (Cl. 43—43.12)

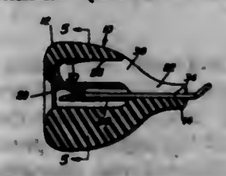
1. A snagged fish hook jettisoning device comprising in combination an element adapted to be connected to a fishing line, a fish hook retainer, an intermediate member, there being a high-pitched spiral connection between said element and said member to cause relative rotation upon relative endwise movement of said element and said member, there being a low pitch threaded connection between said intermediate member and said fish hook retainer, means inhibiting turning of said low pitch threaded connection in a direction to screw said fish hook retainer and said member together upon relative endwise movement of said element and said member in one direction, means tending to cause said low pitch threaded connection to turn in a direction to unscrew said fish hook retainer and said member from each other upon relative endwise movement of said element and said member in the opposite direction and a spring which yields to permit relative endwise movement of said element and said member in one direction and reacts to cause relative endwise movement of said element and said member in the opposite direction.

---

2,775,058
**FISHHOOK**
Roy J. Roberts, Corpus Christi, Tex., assignor of one-half to Jake B. Jarmon, Jr., Corpus Christi, Tex.
Application March 18, 1954, Serial No. 417,163
2 Claims. (Cl. 43—44.4)

1. As a new article of manufacture, a fishhook shaped to include a pair of arms lying in a plane and having their rear ends arranged in spaced apart relation with respect to each other, a curved socket member extending from the rear end of each of said arms, said socket members coacting to grip bait therebetween, said socket members being arranged angularly downwardly with respect to said arms and lying in a plane arranged angularly with respect to the plane of said arms, a finger extending from the lower end of each of said socket members, said fingers being mounted for movement towards and away from each other, said fingers being arranged angularly with respect to said socket members, a barb extending forwardly from each of said fingers, said fishhook being fabricated of a single piece of springy material, the front ends of said arms being twisted together and formed into a loop adapted to be connected to a fishing line, and gripping means on said socket members for engagement with the bait.

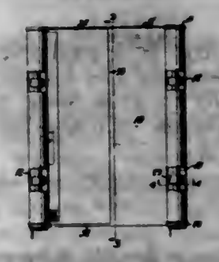
---



2,775,059
**FISH BOBBER ATTACHMENT**
John Kosanovich, Pittsburgh, Pa.
Application May 4, 1953, Serial No. 352,632
1 Claim. (Cl. 43—44.88)

In a fishing line holder, a wire bent into a V-shaped body having diverging straight legs adapted to frictionally hold a line therebetween, the free end of one leg being formed into a coil to enable the body to be attached to a float or bobber, and the free end of the other leg being formed into a loop to receive and guide a portion of said line and bent around itself closing said loop.

---

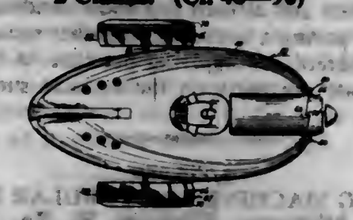


2,775,060
**FISHHOOK GUARD**
Raymond C. Barker, Monmouth, Oreg.
Application June 15, 1954, Serial No. 436,791
3 Claims. (Cl. 43—57.5)

1. A fish hook guard for sheathing and shielding barbed hooks on a gang-type fish hook comprising a pear-shaped compressibly resilient rubber body embodying a bulbous-shaped body gradually decreased in cross-section at one end merging into an axial reduced neck, a plurality of circumferentially spaced radially disposed slots formed in said neck and body portions and communicating with one another at their inner edges and having their outer edges opening through the surfaces of the body and neck portions, all of said slots being linearly straight from end-to-end and restricted in size proportional with the portions of the barbed hooks which are adapted to be protectively fitted and frictionally lodged therein.

---

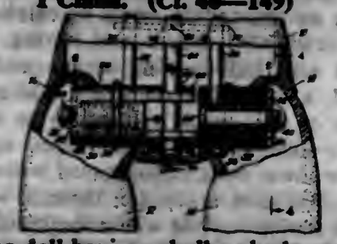
2,775,061
**BLUE PRINT HOLDER**
Dale L. Wahlstrom, Astoria, Oreg.
Application October 20, 1953, Serial No. 387,293
1 Claim. (Cl. 45—131)



A portable holder for rolled blue prints and the like comprising a stiff, flat sheet of material having upwardly rolled end portions forming cylindrical paper roll holders

at opposite ends of said sheet, said rolled end portions being tangent to that flat portion of the sheet therebetween so that said flat and rolled portions will rest flat against a flat supporting surface, an upstanding flange along one edge of the flat portion of said sheet and a bead along the opposite edge to stiffen said flat portion between said rolled end portions, the ends of said sheet being downturned in said roller portions and defining paper slots for said roll holders adjacent the lines of tangency, flanged end caps frictionally engaged on said cylindrical holders having slots in registry with said paper slots, bearing means in said end caps, paper rollers rotatably mounted in said bearing means, and a plurality of sponge rubber discs on said rollers adapted to frictionally engage the end of a sheet of paper inserted in one of said paper slots and wind the paper around said discs and roller when the roller is turned.

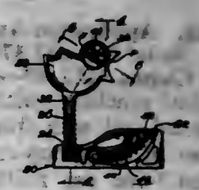
---



2,775,062
**COMBINATION TOY LAND AND WATER VEHICLE**
Carl A. Gibson, Jr., and Marvin I. Glass, Chicago, Ill.
Application August 3, 1953, Serial No. 371,926
2 Claims. (Cl. 46—96)

1. In a combination land and water vehicle comprising a body adapted to serve as a boat or as a land motor vehicle, said body having the lower portion shaped in the form of a boat, an axle secured to said body and supporting a pair of paddle wheels, said paddle wheels each having an outer plate and a plurality of radial fins inwardly of said outer plate with said radial fins extending from the hub to the periphery of said wheel, a plurality of gears, including a crown gear mounted within said body for operating said axle, a rotatable windup shaft extending longitudinally and rearwardly of said body and rotatable with respect to said crown gear, a coiled spring around said windup shaft and having one end secured to said shaft and the other end to said crown gear, a windup knob secured to said windup shaft rearwardly of said body, said windup knob having a cammed surface adapted to engage a cammed surface on the rear of said body to permit said windup knob and windup shaft to rotate in one direction and locked against rotation in the opposite direction.

---

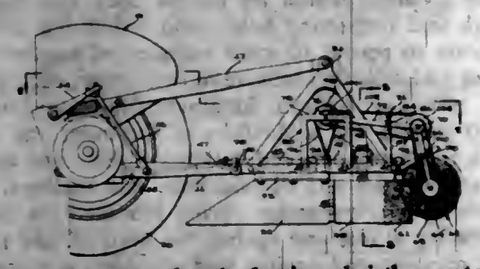


2,775,063
**WALKING DOLL WITH ADJUSTABLE HIP JOINTS**
Irving Mansdorf, Brooklyn, N. Y.
Application November 7, 1952, Serial No. 319,344
1 Claim. (Cl. 46—149)

In a walking doll having a hollow body and hip sockets formed in said hollow body and legs movably seated in said hip sockets, the combination of a pair of axially aligned cylinders, one being adjustably secured to one leg and the other being adjustably secured to the other leg, tensional locking means between each leg and the cylinder to which it is adjustably secured for releasably locking the leg in either of two angularly spaced positions against angular movement relative to said cylinder, an extension piece on one of said cylinders projecting toward the other cylinder, a second extension piece on the other cylinder projecting toward the first cylinder, said extension pieces being vertically spaced from each other and having relatively elongated holes formed therein in vertical registration with each other, and a vertically extending rod mounted within the hollow body and projecting through said registering holes, said rod fitting loosely in said holes to permit of some measure of angular movement of said cylinders relative to each other, each cylinder being provided with a longitudinally extending hole formed therein and a shoulder at the outer end of said hole, a rod being disposed within said hole and having a head at the inner end of said hole, said tensional means comprising a compression spring mounted on said rod and bearing at one end against the head of said rod and at the opposite end against said shoulder, a crosspin secured to the opposite end of the rod from its head and a pair of intersecting grooves formed at the outer end of said cylinder to receive said crosspin in either of two positions, said crosspin being secured to the leg to which it is adjacent for adjustably securing said leg to the cylinder against which said crosspin is disposed.

---

2,775,064
**TOY MAGNETIC NOVELTY**
Carl A. Otto, Evanston, Ill., assignor to H. Fishlove & Co., Chicago, Ill., a corporation of Illinois
Application October 26, 1953, Serial No. 388,137
2 Claims. (Cl. 46—242)



2. In a toy magnetic novelty comprising a base, a simulated bird having a beak and a pair of rotatable eyes, resilient means between said base and bird for supporting said bird, a magnet supported inside said bird on an axis extending between said eyes adjacent the beak, and operably connected to said eyes, a simulated worm having a second magnet in at least one end positioned on said base, said eyes adapted to be manually engaged for rotating said first mentioned magnet so that when the beak of said bird is positioned adjacent the magnet of said simulated worm the simulated worm will be caused to adhere to said beak and when said first mentioned magnet is further rotated the magnetic attraction between said magnet will be so modified that said simulated worm will not adhere to said beak.

---

2,775,065
**APPARATUS FOR EFFECTING THE FECUNDATION OF PLANTS**
John W. Chepil and William S. Chepil, Manhattan, Kans.
Application September 9, 1955, Serial No. 533,488
4 Claims. (Cl. 47—1)

1. In a machine for tripping blooms on growing plants comprising a frame adapted to be carried by an associated prime mover, separator plates secured to and depending from said frame and disposed substantially in planes which are uniformly spaced apart and parallel to each other and perpendicular to the plane of said frame, each of said plates having a substantially vertically disposed rear edge, vanes hingedly connected at their front ends to the rear edges of said separator plates and extending rearwardly one from each separator plate, power operated means mounted on said frame and drivingly con-

nected to said vanes to impart to said vanes oscillating movements about the axes of the hinge connections between said vanes and the corresponding separator plates; the improvement residing in means for collecting and dispersing pollen from the tripped blooms, said means comprising a material having a filamentous surface carried by the outer surfaces of said vanes with the filamentous

surfaces exposed, a brush having bristles extending radially therefrom mounted on said frame for rotation about an axis extending transversely of said separator plates adjacent the ends of the vanes remote from said separator plates to engage and brush across said filamentous surfaces on said vanes, and means drivingly connected between said vane driving means and said brush to impart rotary movement to the brush.

2,775,066

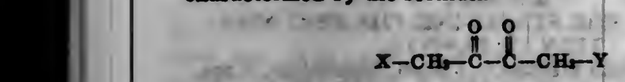
## 1-BUTEN-3-ONE AND 1-PENTEN-3-ONE FUNGICIDAL COMPOSITIONS AND METHOD OF APPLYING SAME TO SOIL

Lloyd J. Mesil, Long Beach, Calif., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application August 2, 1954, Serial No. 447,378
4 Claims. (Cl. 47—58)

1. An agronomical practice which comprises impregnating fungus infected soil with from 5 to 50 parts by weight of a member of the group consisting of 1-buten-3-one and 1-penten-3-one per million parts by weight of the medium and thereafter planting the treated medium.

---



2,775,067

## HALOBUTANEDIONE FUNGICIDAL COMPOSITIONS AND METHOD OF APPLYING THE SAME TO SOIL

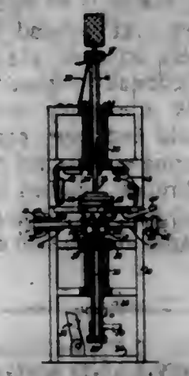
Lloyd J. Mesil, Long Beach, Calif., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application August 2, 1954, Serial No. 447,375
6 Claims. (Cl. 47—58)

1. An agronomical practice which comprises impregnating fungus infected soil with from 5 to 50 parts by weight of a halobutanedione compound per million parts by weight of the medium and thereafter planting the treated medium, the halobutanedione compound being characterized by the formula

wherein X is a member of the group consisting of chlorine and bromine and Y is a member of the group consisting of hydrogen and the halogen represented by X.

---



2,775,068

## METAL TO GLASS SEALING FIXTURE

John K. McDuffee, Kutztown, Pa., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

Application March 22, 1954, Serial No. 417,685
5 Claims. (Cl. 49—1)

1. In a fixture for fusing a plurality of glass and metal parts together in accurately predetermined positions, a mandrel for receiving the parts mounted for movement between a loading and a heating position, said mandrel having parallel, annular plane surfaces therealong, means at the loading position for concentrically locating the parts on the mandrel, a chamber having an induction heat-

ing coil surrounding the parts when the mandrel is in the heating position and at least one rod extending down into the chamber having a contoured member mounted on the lower end thereof for applying pressure to the parts to properly locate the parts on the annular surfaces along the mandrel.

---

2,775,069

## SEALING MACHINE FOR TUBULAR LAMPS

John H. T. Millington, Fairmont, W. Va., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application April 24, 1951, Serial No. 222,648
11 Claims. (Cl. 49—2)

1. A machine for sealing a tubulated and an untubulated mount to opposite ends of tubular bulbs for fluorescent lamps, comprising means for driving said machine, a conveyor driven by said means and indexing from station to station, fires at certain of said stations for sealing mounts to the lower ends of such bulbs, a series of means on said conveyor each for holding a bulb with its axis vertical, stop means for insuring placement of each bulb at a proper height at the beginning of bulb indexing movement, a corresponding series of carriages each for supporting a tubulated mount and having locking rods receivable in said bulb-holding means and a roller at its lower end, a cam track on which said rollers travel, the elevation of said track varying so as to bring said mounts, after loading on said carriages, up to engagement with the lower ends of supported bulbs at said fires and, after said mounts are sealed thereto, withdraw said carriages at a station beyond where the mounts are sealed to the lower ends of their bulbs, by dropping to also unlock one at a time each bulb-holding member on the conveyor, means at said station for turning said bulbs end for end, said cam beyond said turning position rising to lock each bulb-holding member one at a time in inverted position, and means at the other side of said machine for repeating the bulb-processing operations with untubulated mounts.

2,775,070

## SEALING APPARATUS FOR MERCURY ARC DISCHARGE TUBES

William W. Burroughs, Jr., Manchester, Mass., assignor to Sylvania Electric Products Inc., Salem, Mass., a corporation of Massachusetts

Application January 29, 1954, Serial No. 407,017
3 Claims. (Cl. 49—2)

1. In a rotatable turret type machine having a plurality of work-supporting heads mounted thereon and movable to a plurality of work stations, the combination of: means for holding said work in said head; a ring-type burner disposed at at least one of the work stations; means for reciprocating said burner in encompassing relationship with respect to the work at said one work station and means for oscillating said burner in encompassing relationship with respect to the work at said one work station all to effect a heating thereof.

---

2,775,071

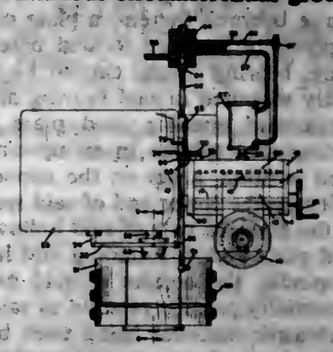
## METHOD OF DRAINING MELTING TANKS

William E. McCown, Maumee, and Harold M. Alexander, Toledo, Ohio, assignors to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio

Application April 21, 1954, Serial No. 424,604
5 Claims. (Cl. 49—77)

3. The method of draining substantially solidified glass from a melting tank through an opening in the tank located beneath the surface of the glass, which comprises heating the surface of the glass so that it will become fluid, placing an electrode in contact with said fluid surface portion, placing a second electrode in contact with the substantially solidified portion of the glass adjacent said opening, and passing an electric current between said electrodes to produce a fluid channel therebetween through which the fluid glass will flow in passing through the tank opening.

---



2,775,072

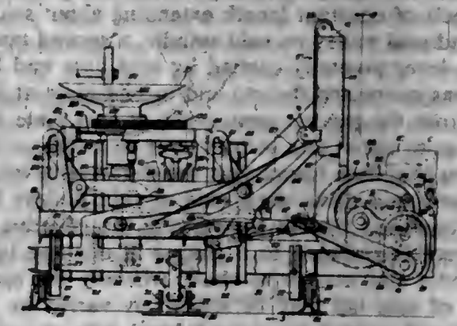
## BELT NOTCHING MACHINE

Lawrence A. Meyer, Dayton, Ohio, assignor to The Dayton Rubber Company, a corporation of Ohio

Application April 15, 1952, Serial No. 282,310
11 Claims. (Cl. 51—34)

1. A V-belt notching machine comprising cylindrical supporting means for the material to be notched, a notching cutter of abrasive material mounted for movement axially of said support near the surface thereof, and traversing means for so moving said cutter, said cylindrical support having its supporting surface characterized by a plurality of continuous circumferential grooves conform-

ing in cross-sectional shape to the base and a portion of the sides of a V-type belt to be held in place therein.



---

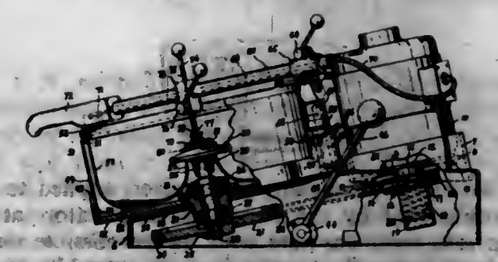
2,775,073

## AUTOMATIC POLISHING MACHINE

James H. Ingersoll and Joseph A. White, Flossmoor, Ill., Walter W. Kovalick, Munster, Ind., and Moses Hegyi, Lansing, Neal A. Ruisard, Chicago, and Leo L. Levitt, Blue Island, Ill., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois

Application December 12, 1951, Serial No. 261,324
46 Claims. (Cl. 51—97)

39. In a polishing machine having a polishing medium, the improved means for effecting and controlling the engaging pressure between an article and said polishing medium comprising the combination of means responsive to fluid pressure and resilient pressure means both being adapted for exerting forces on said article to move it toward said polishing medium, and means including valve means for varying said fluid pressure to control the forces exerted by said fluid pressure responsive means and said resilient pressure means.



---

2,775,074

## ABRADING MACHINES

Oscar W. Dillon, Sturbridge, Mass., assignor to American Optical Company, Southbridge, Mass., a voluntary association of Massachusetts

Application April 14, 1953, Serial No. 348,710
1 Claim. (Cl. 51—124)

A lens surfacing device of the character described adapted to be supported upon a work bench or the like during use thereof, said device comprising an elongated hollow base of shallow depth and having a forwardly

and downwardly inclined top wall, said wall at the forward part thereof being of appreciable width and having a relatively large opening therein, a plate overlying said opening and pivotally attached to said base at one side of said opening, bearing means carried by said plate, a spindle rotatably mounted in said bearing means and extending through said opening, said plate and bearing means supporting said spindle in an upwardly and forwardly inclined position, a lap on the upper end of said spindle, a pulley on the lower end of said spindle and enclosed within the forward part of said hollow base, a pan carried by said plate and surrounding said lap and upper part of said spindle, the bottom of said pan being disposed in substantially parallel relation to said top wall so as to cause abrasive material being used by the device to collect in the lower forward portion thereof, a manually operable lever universally pivotally connected at its rear end to supporting means secured to said base, and extending forwardly across the top of said pan to a location above the forward portion of said base, said lever having a hand grip at its forward end and carrying depending means intermediate its opposite ends for retaining a lens blank in operative engagement with said lap, a motor carried by a rear part of said base and having its drive shaft extending downwardly through a smaller opening in said top wall, said drive shaft being disposed in substantially parallel relation to said rotatable spindle, a drive pulley on said drive shaft within said hollow base, a drive belt of constant length extending about said drive pulley and said pulley on said spindle, a second manually operable lever pivotally carried by said base and having link means connected thereto and to said plate at a point spaced from the pivotal connection of said plate to said base so as to allow said second lever to swing said plate relative to said base for varying the distance between said spindle and said drive shaft, one of said pulleys having means connected thereto for varying the effective diameter thereof in response to a change in distance between said spindle and said drive shaft, whereby the speed of rotation of said lap may be selectively varied by movement of said second lever, said hand grip on said first lever having a trigger-like electrical switch positioned thereon for controlling the operation of said motor, and electrical means extending from said switch to said motor for electrically connecting said motor to a source of electrical energy, said first and second manually operable levers being disposed adjacent opposite sides of said pan so as to enable an operator of the device to conveniently simultaneously manipulate both of said lever when desired while in front of the device and observing the lens surfacing operation being performed thereby.

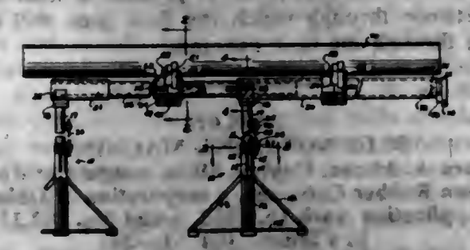
**2,775,075**
**KNIFE SHARPENER**
**Archie J. McMaster, Deerfield, and William H. Kitto, Evanston, Ill., assignors to G-M Laboratories, Inc., Chicago, Ill., a corporation of Illinois**
**Application February 9, 1951, Serial No. 210,158**
**4 Claims. (Cl. 51—128)**

1. A device for sharpening steel knives, applied to the device while held by the hand of an operator, at an optimum rate commensurate with the permissible maximum rate of removal of metal from knives while avoiding burning or nicking, comprising, in combination, an abrasive wheel having a substantially fine grit size and an annular knife grinding portion on at least one face thereof located at a radius not substantially less than 0.4 inch nor greater than 1.25 inches; means rotatably supporting said wheel; a substantially constant speed induction motor directly connected to said wheel to drive the same, said motor having a rate of rotation such that the lineal speed of any wheel in said radius range measured at the grinding portion thereof falls in the range 500 to 2000 feet per minute and a speed-torque characteristic such that the motor stalls when the load torque exceeds the pull-out torque of said motor, and being capable of developing power sufficient only to remove metal at a rate not in excess of the permissible maximum rate; and guide means for positioning the edge of a knife blade to be sharpened, as it is manually moved longitudinally, in contact with the grinding portion of said wheel, the radius at which such contact is made being such that when combined with the rate at which said wheel is rotated the power requirements to maintain rotation, upon application of the knife blade to said wheel with increasing pressure, exceed the power of said motor before the pressure of the knife blade against said wheel reaches a value such as would cause removal of metal from the knife blade at a rate in excess of the permissible maximum rate.

---

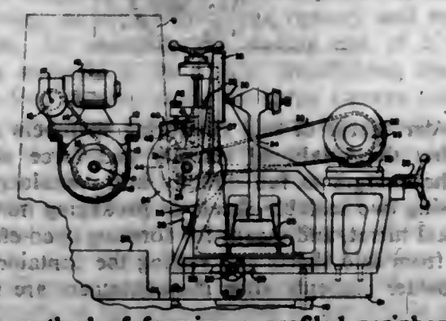


**2,775,076**
**PORTABLE RUBBING MACHINE ASSEMBLY**
**John F. Reeds, Burlington, Vt., assignor to Fairchild Camera and Instrument Corporation, a corporation of Delaware**
**Application April 23, 1954, Serial No. 425,171**
**4 Claims. (Cl. 51—170)**

1. A portable rubbing machine assembly comprising: a manually supportable frame and housing including a driving mechanism; a readily disengageable rubbing platen including disengageable supporting connections to said frame, a disengageable driving connection to said mechanism, and releasable clamping means for an expendable rubbing element; and means mounted on said frame and normally free of said platen when engaging said frame but manually operable to engage said clamping means to release the same.

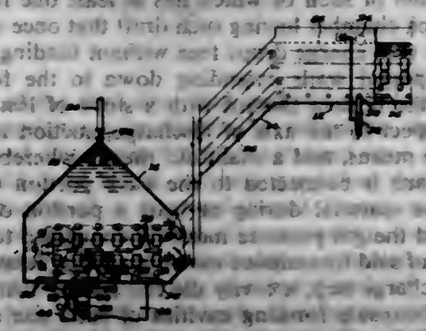
---

**2,775,077**
**WORK SUPPORTING MEANS FOR CENTERLESS GRINDERS**
**George R. Whittenberg, Detroit, Mich.**
**Application January 30, 1956, Serial No. 562,080**
**6 Claims. (Cl. 51—236)**



1. A fixture for use with a centerless grinding machine, the fixture including tubular means disposed horizontally, a plurality of standards for support thereof, a plurality of V-shaped brackets mounted on said tubular means in a spaced relation to each other, each bracket including two short sleeves mounted on said tubular means in end to end relation to each other, an arm radially extending from each sleeve, the arms being disposed in a V-shaped formation with respect to each other, a block longitudinally slidable on each arm, each block carrying a roller, the rollers on both arms being adapted to support a work piece within the gap between the two arms, means to adjust the position of each block on the respective arm, each roller being adapted to be rotated in a plane obliquely to the axis of the work piece resting thereon.

---



**2,775,078**
**METHOD AND APPARATUS FOR FORMING GRINDING WHEELS**
**Orrion A. Guenther, Waynesville, Ohio, assignor to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland**
**Application June 17, 1955, Serial No. 516,295**
**5 Claims. (Cl. 51—283)**

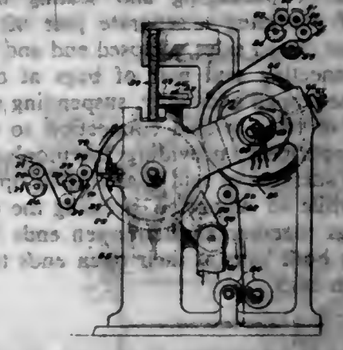
1. The method of forming a profiled periphery on a diamond grinding wheel of the type which is bonded together with organic resin-like material, including the step of mounting the diamond wheel on the arbor on which it is to be used; causing the diamond wheel to be rotated at a peripheral speed of between 600 inches and 2,000 inches per minute; and bringing into contact with the periphery of the diamond wheel the periphery of a ceramic bonded aluminum oxide grinding wheel which is rotating at a peripheral speed of between 1.2 inches and 3.2 inches per minute, and whose periphery has been shaped with a profile the reverse of that which is to be formed on the diamond wheel.

---

**2,775,079**
**PROCESSES OF PACKAGING WATER AND OTHER COMMODITIES AND APPARATUS USEFUL IN THE PRACTICE OF SUCH PROCESSES**
**George M. J. Sarofeen, Dorchester, Mass.**
**Application February 8, 1951, Serial No. 209,458**
**16 Claims. (Cl. 53—25)**

1. The method of packaging commodities which comprises sealing a confined body of an air-free fluid from the air with a body of boiling liquid, passing a container through said boiling liquid into said body of air-free fluid, and hermetically sealing a commodity in said container while the container is immersed in said body of air-free fluid.

---



**2,775,080**
**METHOD OF FORMING POWDER-AND-LIQUID FILLED CAPSULES**
**Frank Edwin Sohn, Pearl River, and Arthur Sinclair Taylor, Spring Valley, N. Y., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine**
**Application May 26, 1950, Serial No. 164,426**
**4 Claims. (Cl. 53—26)**

2. A method of forming symmetric capsules in asymmetric dies containing both a liquid and a powder, which comprises subjecting two gelatin films to two different heat treatments, forming a series of empty capsule shells by the localized application of subatmospheric pressure to successive portions of one side only of one strip only, passing the thus formed shells uniformly and continuously under a uniformly and continuously flowing stream of liquid, said liquid being discharged at a rate proportional to the rate of movement of said strip and in such quantity that all of the liquid is filled into the cavities, depositing a premeasured charge of a powder in each successive shell, placing the other of said films uniformly and continuously in juxtaposition to the first of said films, sealing the periphery of the portions of the films enclosing the contents of the shells to each other by the localized application of pressure which combines the sealing of the films with the cutting out of the desired portions from the films, separating the cut out capsules thus formed from the residue of the films, and permitting the strains induced in the formation to modify the gelatin walls of the capsule to the desired shape.

---

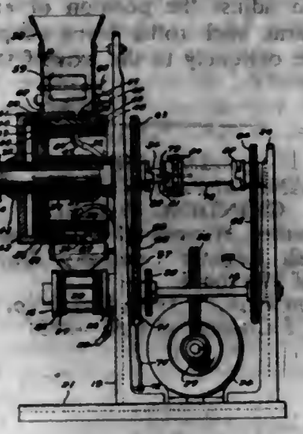
**2,775,081**
**HIGH DENSITY ENCAPSULATION**
**Frank Edwin Sohn, Pearl River, and Arthur Sinclair Taylor, Spring Valley, N. Y., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine**
**Application June 19, 1953, Serial No. 362,926**
**20 Claims. (Cl. 53—30)**

1. A method of forming plastic film covered precompacted powder-filled capsules which comprises, compacting a powder into long oval slugs, placing a plurality of said slugs in a vibratory feeder bowl, vibrating said bowl, thereby causing said slugs to feed serially axially, passing the slugs serially axially through a vibrating feed tube, feeding the slugs end-wise into a magazine, vibrating said magazine, by dropping gravity to a predominantly horizontally aligned position with a plurality of the slugs in parallel oriented stacked relationship, dropping past elongated apertures permitting selective hand aligning of the slugs, shaking out by vibration through said apertures mis-

aligned slugs, collecting and re-using the shaken out slugs, and continuing to drop the stack of slugs until adjacent to the hereinafter recited recesses, laying a first continuous strip of plastic sheet material over a plurality of capsule forming cavities in a cavity die roll, reducing the pressure within the cavities, thereby drawing the first strip down into the cavities to form a series of recesses, continuously passing said series of such recesses under the stack of slugs, dropping a slug at least partially into each recess as said recess passes under the stack of slugs, thereby positioning a slug in each recess, moving the slug in its associated recess from under the stack of slugs, warming a second continuous strip of plastic sheet material, placing said second strip in juxtaposition to said slug-containing recessed first strip, maintaining the reduced pressure within the cavities until just prior to the emplacement of the second strip, raising the pressure in the cavities, thereby releasing the first strip and permitting it to shrink against the slugs as the cavities approach a sealing position, sealing together and cutting out the portions of said strips surrounding each slug, re-applying a reduced pressure within the cavities to retain the capsules therein, pulling the net, consisting of the residual portions of the two strips, away from the capsules retained in the cavity die roll, ejecting the capsules from the cavities, and permitting the cut-out portions of the strips by the release of differential strains induced by the heating of the second strip, to adjust the capsules to a symmetrical final form.

---

**2,775,082**
**METHOD OF FILLING AND SEALING BAGS**
Clarence W. Vogt, Norwalk, Conn.
Original application June 2, 1948, Serial No. 30,647, now Patent No. 2,628,013, dated February 10, 1953. Divided and this application November 1, 1952, Serial No. 318,171
5 Claims. (Cl. 53—37)



1. The method of packaging and sealing materials which consists of providing a separate pair of bags in which each bag has closed sides, a closed end and an open opposite end, connecting said pair of bags at opposing sides thereof at their open ends only, suspending and supporting said pair of bags at said connection so that the open ends are uppermost, providing thermoplastic material on the inner surfaces of said bags at their open ends, filling said bags while so supported, pressing the opposite walls of both bags together at their open ends to close them, and heating both bags at their open ends to simultaneously seal both bags.

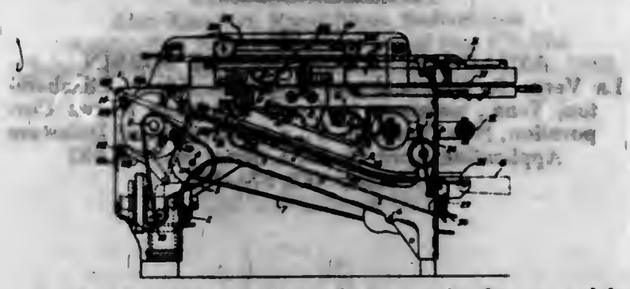
---

**2,775,083**
**PACKAGE FORMING AND FILLING APPARATUS**
Frank Edwin Stirn, Pearl River, and Arthur Sinclair Taylor, Spring Valley, N. Y., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine
Application March 26, 1951, Serial No. 217,628
13 Claims. (Cl. 53—180)

1. A packaging machine comprising a hopper, a rotary turret provided with a plurality of measuring chambers adapted to rotate under said hopper, a foraminous material comprising at least a portion of the surface of each of such measuring chambers, means for withdrawing the gas present in the measuring chambers through said foraminous material, means for rotating the turret and thereby moving the said measuring chambers past a doctor means and to a discharge position, means for adjusting said discharge position while the machine is in operation, gaseous pressure change means for discharging

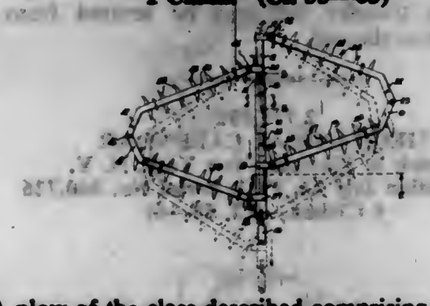
the powder charge of said measuring chambers at such a point that the rotational velocity and force of gravity cause the charges to fall directly into containers, means for passing two sealable sheets of packaging material beneath said turret, and means for forming open-ended containers from said sheets and sealing the containers above their powder contents after the containers are filled.

---



**2,775,084**
**APPARATUS FOR FILLING POWDER IN CAPSULES**
Frank E. Stirn, Evans Park, and Arthur S. Taylor, Spring Valley, N. Y., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine
Application November 26, 1948, Serial No. 62,612
4 Claims. (Cl. 53—182)

3. In a machine for filling uniform powder charges into capsules, a rotatable measuring roll having therein a plurality of spaced tapered long oval charge chambers, the bottom of each of which has at least one foraminous area, each chamber having such draft that once a charge is released said charge drops free without binding, and having peripheral walls extending down to the foraminous area at the bottom thereof with a slope of less than 45° with respect to the axis of discharge, suction means, gas pressure means, and a manifold means whereby the suction means is connected to the back portion of the foraminous material during at least a portion of a filling step, and the gas pressure means is connected to the back portion of said foraminous means during at least a portion of a discharge step, a cavity die roll having therein a plurality of capsule forming cavities of such size and shape as to be, when lined with strip material, substantially filled by the contents of said charge chambers, means to supply capsule forming strip material to line said cavities, and means for operating said die roll in timed relationship with said measuring roll and in such a position relative thereto that the strip lined cavities receive the discharged powder from said charge chambers.



**2,775,085**
**MECHANISM FOR CONTROLLING THE TIGHTNESS OF THE WRAP IN A WRAPPING MACHINE**
Arthur A. Kotimann, Davenport, Iowa, assignor, by mesne assignments, to American Machine & Foundry Company, New York, N. Y., a corporation of New Jersey
Original application October 6, 1950, Serial No. 188,696. Divided and this application February 28, 1952, Serial No. 273,941
16 Claims. (Cl. 53—210)

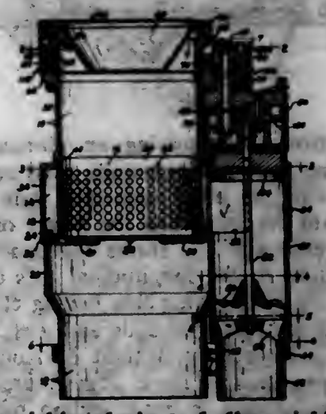
1. In a wrapping machine of the type having an article feed runway, an article discharge runway and wrapping mechanism for clamping the leading end of a web of wrapping material to the article, transferring the article from the feed runway to the discharge runway and wrapping the web about the article during the transfer, means operating to feed from a source of supply a length of web sufficient to closely wrap the article, means adjacent said discharge runway for tightening or loosening the wrap comprising a pair of rollers between which the web is gripped, a friction brake retarding rotation of one of said rollers to impose a drag on the web during the initial portion of the advancement of the article over the rollers to the discharge runway, and intermittently operated driving means for automatically imparting a turning movement to one of said rollers in a direction to advance the web toward the article about which the web is wrapped and at a speed sufficient to relieve tension on the web during the final portion of said advancement.

---

**2,775,086**
**PLOW AND DIAMOND-SHAPED FRAME THEREFOR**
David C. Vaughn and Shelby F. Vaughn, Cactus, Tex.
Application April 2, 1953, Serial No. 346,436
1 Claim. (Cl. 55—83)

A plow of the class described comprising a frame, said frame comprising a longitudinally adjustable draw-bar, a plurality of disc-supporting bars arranged upon opposite sides of said draw-bar in converging relation thereby defining segments of a diamond-shaped frame, each segment comprising a forward disc-supporting bar and a rear disc-supporting bar adjustably connected to said draw-bar at their inner ends, the outer ends of the forward and rear bars of each segment being pivotally connected together, the adjustable connection of the disc-supporting bars with said adjustable draw-bar facilitating the adjustment of the angles of the disc-supporting bars relative to the draw-bar, said draw-bar being longitudinally adjustable to vary the length of said draw-bar, discs carried by each disc-supporting bar, the discs of the forward bars having concave faces facing toward said draw-bar to throw the earth inwardly while plowing, and the discs of the rear bars having concave faces facing outwardly away from said draw-bar to throw the earth outwardly while plowing, the discs of the rear bars crossing the furrows formed by the discs of the forward bars at a selected angle as the plow passes in a forward direction to plow criss-cross furrows as the plow passes in a forward direction.

---



**2,775,087**
**POWER MOWER WITH CORD SECURING CLIP**
Frederick Abel, Dayton, and Francis R. McNeil, New Carlisle, Ohio, assignors to The Huffman Manufacturing Company, Dayton, Ohio, a corporation of Ohio
Application September 2, 1953, Serial No. 378,100
1 Claim. (Cl. 56—25.4)

For use with a power lawn mower including a main frame provided with wheels and a guiding handle and supporting an electric motor which drives the cutting means of said mower and is provided with a resiliently surfaced electric cord, a supporting member for said electric cord comprising a rod having means at one end thereof for attachment to said handle, clip means on the other end of said rod including a pair of partial ring members mounted in axially aligned relation and extending in opposite directions to define a combined opening of substantially cylindrical shape for receiving said cord therethrough, said ring members each having one end thereof secured to the end of said rod on substantially opposite sides of said rod, each said ring member being of such circumferential extent that the free end thereof is spaced from said rod by a distance slightly less than the diameter of said cord to provide for laterally wedged entry of said cord therein, each said ring member being of an inner diameter sufficiently greater than the diameter of said cord for sliding movement of said cord therethrough following said wedged entry therein, and said ring members being inclined away from each other in an angular relation providing a spacing between the outermost portions thereof which is slightly less than the diameter of said cord to provide for correspondingly wedged insertion of an intermediate section of said cord therebetween followed by said wedged entry within said rings upon substantially 90° of relative rotation of said cord section and said rod about the axis of said rod.

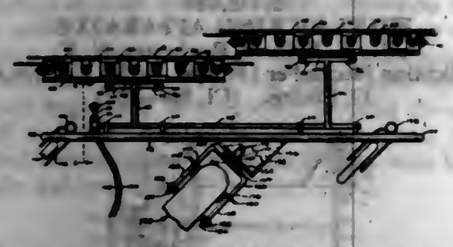
---

**2,775,088**
**FRUIT PICKING APPARATUS**
Giles E. Bullock, Rochester, N. Y.
Application December 10, 1954, Serial No. 474,432
11 Claims. (Cl. 56—332)

1. In a fruit picking device, a hollow picking head having a fruit receiving end, rotatable annular means mount-

ed for rotation upon and associated with the head adjacent the receiving end for frictionally contacting the body of a fruit to be picked, means connected in driving relation to said rotatable means for rotating said fruit contacting means to impart a twist to a fruit in contact therewith, and differential pressure means for reducing the pressure within said head for drawing said fruit into contacting engagement with said fruit contacting means.

---



2,775,089
**CONVERTIBLE PICK-UP UNIT FOR BALERS**
Stanley D. Russell, Racine, Wis., assignor to J. I. Case Company, Racine, Wis., a corporation of Wisconsin
Original application March 10, 1948, Serial No. 13,969, now Patent No. 2,674,839, dated April 13, 1954. Divided and this application September 8, 1953, Serial No. 378,958
4 Claims. (Cl. 56—341)

1. In combination with a baler having a mobile supporting frame and a pick-up unit supported on said frame in transversely extending relation thereto, an improved feed means carried by said frame rearwardly of said pick-up unit in position to receive material therefrom, said feed means comprising a housing rotatably mounting an auger extending generally transversely of said frame, said housing including a bottom member, a removable closure member adjacent the discharge end of said auger, and a rear platform member which is movable relative to said bottom member to thereby provide an opening at the rear of said housing, whereby said feed means may be selectively used to discharge material collected by said pick-up unit either axially of said auger when said end closure is removed or transversely of said auger when said rear platform member is moved to provide an opening at the rear of said housing and said end closure member is in position on the housing.

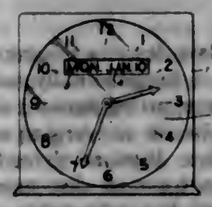
2,775,090
**SIDE DELIVERY WINDROWER**
Dan T. Huffman, Decatur, Nebr.
Application June 5, 1953, Serial No. 359,759
8 Claims. (Cl. 56—376)

1. A windrower comprising an elongated vertically disposed frame having horizontally positioned upper and lower rails with the ends connected with semi-circular sections, means for mounting the frame on the forward end of a tractor with the frame positioned at an acute angle in relation to the longitudinal axis of the tractor, oval shaped supporting members having elongated parallel edges with semi-circular ends and with the centers of the ends spaced whereby straight horizontally disposed portions are provided on lower edges thereof, continuous tracks, channel-shaped in cross section mounted on the edges of said supporting members, endless chains slidably mounted in said tracks, means for mounting the supporting members on the frame to provide vertical movement of the supporting members and chains, and spring fingers extended outwardly from said chains the spring fingers on lower sections of said chains being adapted to engage the ground upon which a tractor on which the windrower is mounted whereby upon forward movement of the tractor the chains are actuated to carry products gathered by the spring fingers to one side of the device.

---



2,775,091
**ATTACHMENT FOR TEXTILE BOBBIN**
La Verne R. Graybeal and Donald J. Edgar, Elizabethton, Tenn., assignors to North American Rayon Corporation, New York, N. Y., a corporation of Delaware
Application April 10, 1953, Serial No. 348,002
4 Claims. (Cl. 57—34)

2. A transfer tail holder and cutter for textile yarn wound onto a spool having a barrel and a flange secured to the bottom of said barrel, a hub extending from the bottom of said flange, said flange having a radially extending slot formed therein, the improvement comprising a clip member, means for attaching said clip member to the bottom of said flange adjacent to said slot, said clip member having resilient clamping means for clamping the yarn transfer tail against the bottom surface of said flange, said resilient clamping means being oriented to face in a direction away from said slot so that said yarn transfer tail emerging from said slot to the under side of said flange may be wound around said hub and then clamped by said resilient clamping means, said clip member having a sharp edge positioned between said resilient clamping means and said slot so that the free end portion of said yarn transfer tail may be severed from the clamped portion thereof.

---

2,775,092
**MECHANICAL CALENDAR**
Frank A. Howard, New York, N. Y.
Application July 24, 1952, Serial No. 300,726
4 Claims. (Cl. 58—6)

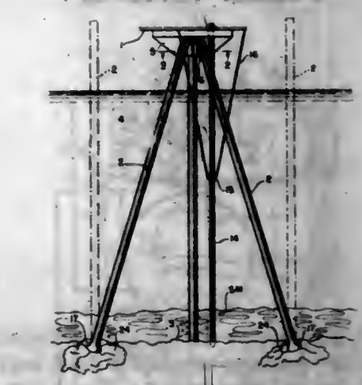
1. A mechanical calendar capsule comprising a case, having one end curved to semi-cylindrical form and having a circumferential groove in the cylindrical surface, a cylindrical feed roller carried by the case within said curved end, the surface of the roller being spaced from the curved surface of the case by a small interval, the roller having a row of teeth which travel in the said groove, a loose calendar tape of flexible material, and of thickness slightly less than the width of the said space interval, stored within the case and passed over the said roller, the teeth passing through the tape into the said groove and guide surfaces carried by the case for stripping the tape from the roller at the exit side, the said case being partly open in proximity to the roller to expose a complete calendar legend carried by the tape.

---

2,775,093
**DETACHABLE LINK STRAP OF SYNTHETIC PLASTIC MATERIAL**
Alex Kundert, Rueschlikon, Switzerland
Application March 30, 1956, Serial No. 575,206
Claims priority, application Switzerland August 25, 1955
4 Claims. (Cl. 59—80)

1. A flexible link strap comprising a plurality of one-piece substantially planar link members of flexible plastic material, each of said link members being provided with separable fastener elements consisting of a male member and an open loop-like female member serving when the dissimilar fastener elements of adjacent successive link members are engaged to provide connections between said link members linearly of the strap, the cooperating fastener elements of adjacent link members including complemental concave and convex peripheral mating surfaces on said male and female members respectively, and the said concave peripheral surface of said male member having a terminal lip of greater transverse dimension than the transverse dimension of the convex peripheral surface of the said female member, whereby said elements are capable of cooperative mating snap engagement and disengagement.

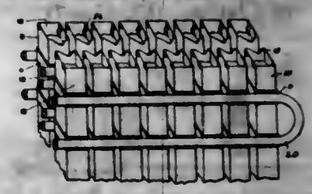
---



2,775,094
**END CAP FOR FLUID FUEL COMBUSTOR**
Bruce O. Buchland, Schenectady, and Arthur Y. Hillman, Jr., Scotia, N. Y., assignors to General Electric Company, a corporation of New York
Application December 3, 1953, Serial No. 395,907
2 Claims. (Cl. 60—39.65)

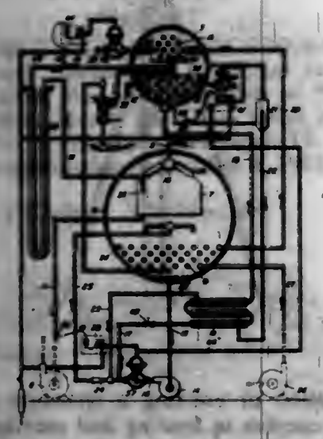
1. In a combustor end cap assembly, an annular wall portion comprising a substantially conical stack of separate ring members each comprising an annular band of an axial width on the order of one-tenth the diameter of the band, each adjacent pair of bands cooperating to define coolant passages therebetween, each band being displaced axially relative to adjacent bands by a distance substantially less than half the axial width of the band, means securing said bands to each other in said axially spaced relation, said means comprising a plurality of circumferentially spaced radially disposed weld beads each fused to radially aligned portions of each band, each band having a slot proceeding from the edge of the band adjacent the weld bead at an acute angle to the edge of the band to form a substantially triangular prong to which the weld bead is secured.

---



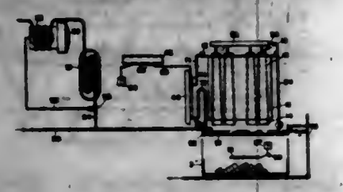
2,775,095
**METHOD OF ERECTING STRUCTURES IN WATER**
Frederic R. Harris, New York, N. Y.; Michael S. Lobenthal, Monroe Percy Bloch, and Florence B. Downs, executors of said Frederic R. Harris, deceased, assignors to Frederic R. Harris, Inc., New York, N. Y., a corporation of New York
Application April 22, 1949, Serial No. 89,002
2 Claims. (Cl. 61—46)

1. The method of erecting a structure in a body of water, which consists in floating and moving hollow piles in horizontal positions and with both ends sealed, to a selected location, opening one end of said piles to admit water into said piles and removing air from the interior of said piles to flood portions of said piles to submerge said portions, buoying up the remaining portions of said piles to maintain the remaining portion of each pile above the surface of the water, setting up said piles in substantially upright positions till their open ends rest upon the earth at the bottom under the water, with their opposite ends above the surface of the water, exerting a force laterally against each pile to cause the piles to lean towards each other, uniting the upper portions over said surface and attaching a support to the upper portions at said opposite ends, forming a cavity in the earth adjacent the open end of each pile, pouring concrete through the piles and said open ends to embed said open ends in place upon the bottom and affixing a support to the opposite ends.



---

2,775,096
**ICE CUBE MAKERS**
Carlyle M. Ashley, Fayetteville, N. Y., assignor to Carrier Corporation, Syracuse, N. Y., a corporation of Delaware
Application July 1, 1950, Serial No. 171,621
15 Claims. (Cl. 62—4)

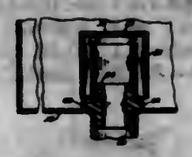


1. In an ice cube maker, the combination of a hollow ice forming element, a plurality of bands substantially surrounding the exterior of the element and being placed in spaced relation to each other, said bands having a heat conductive value greater than the element, means to direct a stream of water through the hollow element in contact with the interior wall of the element, a refrigeration system including an evaporator placed in heat exchange relation with the bands to form spaced pieces of ice within the interior of the element, and means to harvest the formed pieces of ice.

2,775,097
**ABSORPTION REFRIGERATION SYSTEMS**
Alexis A. Berestoff, Syracuse, N. Y., assignor to Carrier Corporation, Syracuse, N. Y., a corporation of Delaware
Original application July 13, 1946, Serial No. 683,387, now Patent No. 2,565,943, dated August 28, 1951. Divided and this application August 3, 1951, Serial No. 240,229
5 Claims. (Cl. 62—5)

1. In the method of operation of an absorption refrigeration system including an absorber, an evaporator, a generator and a condenser, the steps which consist in forwarding a weak solution of absorbent and refrigerant from the absorber to the generator, heating the weak solution in the generator to release refrigerant therefrom, condensing the released refrigerant, forwarding the condensed refrigerant to the evaporator, forwarding strong solution from the generator to the absorber, passing a heating medium through the generator in heat exchange medium to the generator in response to the temperature relation with solution therein, regulating flow of heating of strong solution leaving the generator, flash-cooling refrigerant in the evaporator, absorbing the flashed vapor in the solution in the absorber, purging non-condensible gases from the condenser and the absorber and regulating the flow of solution through the system in response to the temperature of flash cooled refrigerant leaving the evaporator.

2,775,098
**ICE CUBE MAKER AND CONTROL MECHANISM THEREFOR**
David Earle MacLeod, Syracuse, N. Y., assignor to Carrier Corporation, a corporation of Delaware
Application July 1, 1950, Serial No. 171,593
19 Claims. (Cl. 62—7)



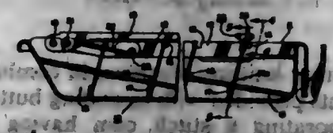
1. In an ice cube maker, the combination of a hollow ice forming element, a refrigeration system including a compressor, a condenser, a discharge line connecting the compressor and the condenser, an evaporator, a liquid line connecting the condenser and the evaporator, expansion means disposed in the liquid line and comprising capillary tubes, a suction line connecting the evaporator and the compressor, a first accumulator and a second accumulator placed in the suction line and said capillary tubes being disposed about the first accumulator, the evaporator in the refrigeration system being placed in contact with the ice forming element, means to pass a stream of water for ice formation through the element, a line connecting the evaporator with a portion of the refrigeration system containing heated refrigerant vapor, means in said line normally closing the line, opening of said means permitting heated refrigerant vapor to pass to the evaporator to harvest ice formed in said element.

2,775,099
**SELF-CONTAINED ICE MAKING UNIT**
Seymour W. Brown, New York, N. Y., assignor to Carrier Corporation, Syracuse, N. Y., a corporation of Delaware
Application May 5, 1953, Serial No. 353,116
1 Claim. (Cl. 62—106)

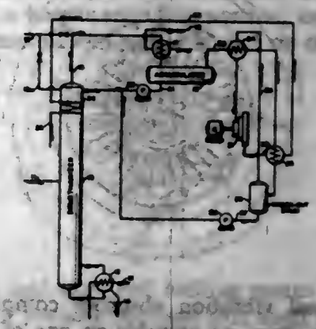
Ice making apparatus comprising a housing, a deck supported in the housing, said deck being provided with a plurality of openings therein, a container adapted to contain liquid to be frozen positioned in each opening, means for fixedly securing the top portion of each container to the deck, a refrigeration system including an evaporator disposed about the container for freezing liquid therein, means for overcoming the bond between the ice and the inner surface of the container, means for removing the ice after the bond has been overcome, a cover for each container and closure means including an elongated bar adapted to engage a plurality of the covers and clamping means arranged to exert a force on the bar sufficient to cause the covers to tightly engage the containers.

2,775,100
**ICE MAKING APPARATUS**
Harlan L. Howe, De Witt, N. Y., assignor to Carrier Corporation, Syracuse, N. Y., a corporation of Delaware
Application November 20, 1953, Serial No. 393,431
6 Claims. (Cl. 62—107)

1. In combination with an ice making machine of the type wherein a formation of ice is produced as water flows, under the influence of a pump, through a circuit including a supply tank, water distribution means, and a refrigerated member having an ice forming surface adapted to receive water from the distributor, means for withdrawing from the circuit, a portion of the water returning to the tank, said means including an outlet pipe in communication with the bottom of the tank, an overflow pipe, a cap secured to the overflow pipe in spaced relation to the sides and top thereof, and a resilient mounting member having portions in engagement with both the overflow pipe and the outlet pipe for detachably securing the overflow pipe and cap in communication with the outlet pipe.

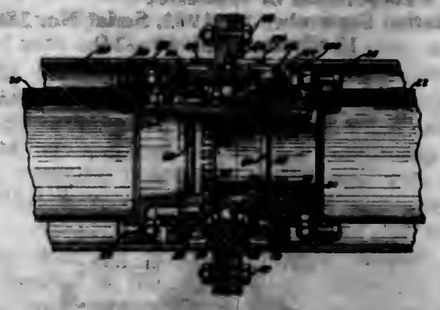


2,775,101
**SELF-CONTAINED ICE MAKING UNIT**
Lars Hansen, Syracuse, N. Y., assignor to Carrier Corporation, Syracuse, N. Y., a corporation of Delaware
Application November 7, 1952, Serial No. 319,325
2 Claims. (Cl. 62—106)



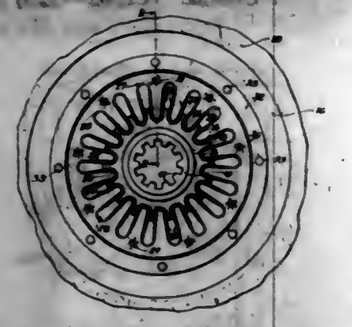
1. In an ice maker, the combination of a casing, a refrigerated chamber within said casing, a steam chest within said casing, and a partition within said casing separating the chamber from said chest, said chamber including a container for containing the liquid to be frozen and means for lowering the temperature of the liquid so as to form the ice, said steam chest including a receptacle to receive the container of said chamber, a steam coil disposed about the interior walls of the receptacle, said coil having spray means adapted to supply steam over the exterior surface of said container to thaw the ice from said container.

2,775,102
**FREEZING DEVICE**
Edward C. Simmons, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application June 15, 1955, Serial No. 515,613
1 Claim. (Cl. 62—106.5)



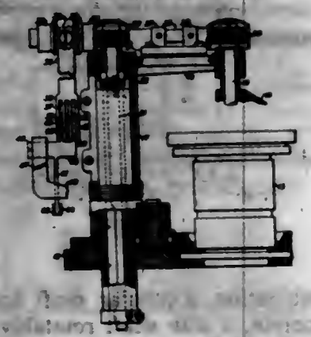
In combination, a tray having a unitary grid structure removably disposed therein, said grid structure including a longitudinal wall formed of two superimposed members disposed in the same plane with one another and a plurality of wall members extending transversely thereacross in spaced apart relation dividing the interior of said tray into compartments in which water is to be frozen into ice blocks, said transverse grid wall members being normally inclined with respect to the vertical, means for interlocking said transverse wall members to said longitudinal wall for tilting movement relative thereto, said means including spaced apart upwardly opening exposed notches in the uppermost member of said longitudinal wall each receiving a portion of one of said transverse wall members, a single lever pivotally mounted upon one end of said grid structure for moving said uppermost member of said longitudinal wall lengthwise relative to the lowermost of said superimposed members thereof to elevate said one end of the grid and ice blocks adhering thereto with respect to said tray, a side of said upwardly opening notches normally being spaced from said transverse wall members and adapted, when said uppermost member is so moved relative to said lowermost member, to engage and tilt said transverse wall members toward the vertical for releasing ice blocks from the grid structure, means at the top of one of said grid wall members having a portion projecting laterally out of the inclined plane thereof horizontally over said side of the notch at the end of said grid structure opposite its said one end, and said horizontally projecting portion of said means being wider than the thickness of said one grid wall member whereby a substantially flat smooth hold-down pad is provided at the end of said grid structure opposite the lever end thereof.

2,775,103
**HYDROCARBON SEPARATION**
Robert A. Kobin, Bartlesville, Okla., and Fred T. Shunk, Pasadena, Tex., assignors to Phillips Petroleum Company, a corporation of Delaware
Application December 23, 1954, Serial No. 477,336
7 Claims. (Cl. 62—123)



1. A demethanizing system comprising a demethanizer having a feed inlet, a bottoms product outlet, an overhead products outlet, and a reflux inlet; means for mixing the overhead product with a solvent; means for cooling a resulting mixture; a first means for separating said mixture into a liquid and a gas; means for passing the resulting liquid to the reflux inlet of said demethanizer; means for cooling said resulting gas, as hereinafter set forth; a second means for separating a liquid from said gas; means for passing a resulting liquid to the reflux inlet of said demethanizer; gas expanding means; and means for passing the gas from the second separator through said gas expanding means and in indirect heat exchange relationship with the gas from said first separator as the hereinbefore referred to cooling means.

2,775,104
**ENGINE EXTENSION SHAFT**
Harry C. Karcher, Indianapolis, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application March 12, 1952, Serial No. 276,135
3 Claims. (Cl. 64—4)



1. In combination, a tubular shaft housing, a bearing supported therein, a stub shaft rotatably mounted in the bearing, the first shaft having a radially extending flange at an end thereof, a second shaft in the housing, means fastening the second shaft to the flange of the first shaft, the fastening means projecting from the face of the flange nearest the bearing, air inlet openings in the housing adjacent the bearing, air outlet openings in the housing adjacent the flange, and baffle means mounted in the housing for directing air entering the air inlets to a point adjacent the flange radially inward of the fastening means so that the fastening means serve to impel the air centrifugally from the inlets past the baffle to the outlets, the baffle constraining the air to flow adjacent the first shaft to cool the same.

2,775,105
TORSIONAL VIBRATION ABSORBER
Oscar H. Barthel, Evanston, Ill., assignor to New Products Corporation, Chicago, Ill., a corporation of Delaware
Application February 10, 1954, Serial No. 409,363
3 Claims. (Cl. 64—27)

1. A torsional vibration absorber comprising driving and driven members, an annulus on one of the members and having radially inwardly extending teeth, radially outwardly extending teeth on the other member fitting loosely within the spaces between the radially inwardly extending teeth, and resilient means connecting the teeth on the members to provide a drive therebetween, said means comprising a strip of resilient material formed to fit between the teeth on the members and passing alternately around the ends of the teeth of said members, said strip being of lesser thickness than the depth of the space between the sides of adjacent teeth and contacting corresponding portions of the teeth of the members one of said members overlapping the other member on one side of the teeth on both members, and having frictional contact with the other member, a plate secured to the said one member and passing around the other side of the teeth on both members and having frictional contact with the other member to define a chamber around the teeth and strip, and a lubricant in said chamber, the said frictional contact providing a damping force for the resilient strip.

2,775,106
DIAL RACKING MECHANISM
Clarence W. Minton, Nashville, and John G. O'Hara, Lyle, Tenn., assignors to May Hosiery Mills, Nashville, Tenn., a corporation of Tennessee
Application September 16, 1953, Serial No. 380,502
11 Claims. (Cl. 66—24)

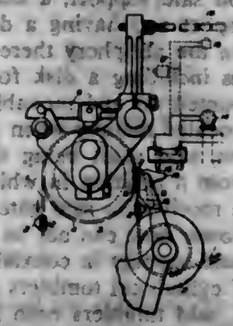
1. In an automatic transfer knitting machine for the continuous knitting of socks, separated by a pull top and each sock having a non-running welt, a ribbed top and plain or ribbed knit leg and foot portion, dial racking mechanism comprising a sleeve rotatably mounted on the dial drive shaft of said knitting machine, gear means for rotatably driving said sleeve, a bevel gear fixed to said sleeve, a carrier rotatably mounted on said drive shaft, oppositely disposed bevel pinions rotatably mounted on said carrier and meshing with said bevel gear, a second bevel gear fixed to said drive shaft and meshing with said pinions, said first and second bevel gears, said carrier and said pinions providing a differential gear transmission, an elongated arm extending from said carrier, a plurality of cam followers pivotally mounted on said arm, screw threaded means for adjusting the position of each cam follower relative to said arm, a cam shaft rotatably mounted on said machine, a low cam on said cam shaft for engaging one of said cam followers, a high cam on said cam shaft for engaging another of said cam followers, a drum on said machine driven in timed relation to the operation thereof, a control cam on said drum and a control lever and linkage system connected to said cam shaft and operable by said control cam to engage either said high or low cam with the associated cam follower whereby upon engagement of said low cam with the associated cam follower the dial and needles carried thereby will be in position for knitting said ribbed top and upon engagement of said high cam with the associated follower said carrier will be moved angularly and through said pinions will move the dial relatively to the cylinder to knit said pull top and non-running welt.

2,775,107
CIRCULAR RIB KNITTING MACHINE
Arthur Shorland, Leicester, England, assignor to Mellor Bromley & Co. Limited, Leicester, England, a British company
Application February 13, 1953, Serial No. 336,812
Claims priority, application Great Britain February 18, 1952
2 Claims. (Cl. 66—37)

1. In a circular knitting machine, in combination, knitting instruments provided with operating butts, and a cam system incorporating a stitch cam having an inclined operative edge for action on said butts, the said cam being adjustable obliquely at the same angle as its operative edge, being made double-ended and reversible suchwise as to enable it, depending on its position, to present to the operating butts a selected one of two, circumferentially separated knocking-over points.

2,775,108
KNITTING MACHINE NEEDLE DEVICE WITH OPERATING MEANS AND METHOD
Eugene Bellini, Jackson, Ala., assignor to Vanity Fair Mills, Inc., Reading, Pa., a corporation of Pennsylvania
Application March 31, 1953, Serial No. 345,787
14 Claims. (Cl. 66—86)

1. A needle structure of the character described comprising, a pair of complementary needle elements that are adapted to be adjacently actuated longitudinally in unison and relative to each other during their loop forming operation, one of which elements has a hook formed at its working end provided with a straight portion adjacent to its tip and the other element is provided with an inside groove along its tip portion for receiving an outer part of said straight portion of the hook formed on the first mentioned element.



2,775,109
YARN CARRIER TUBE FOR KNITTING MACHINES
Frederick Scarborough, Northampton, Mass.
Application April 13, 1954, Serial No. 422,810
9 Claims. (Cl. 66—126)

1. A yarn carrier for a full-fashioned knitting machine having a feed finger arm comprising a yarn carrier tube extending through said feed finger, opposed recesses on said carrier tube, and an endless band extending around said feed finger arm, said endless band including opposed extensions seated in said recesses.

2,775,110
KNITTING MACHINE
John E. Lyness, Mapperley, Nottingham, England, assignor to William Cotton Limited, Loughborough, England
Application May 12, 1952, Serial No. 287,383
Claims priority, application Great Britain May 11, 1951
8 Claims. (Cl. 66—107)

1. In a knitting machine, the combination of a chain, studs on the chain in different tracks in its width, a feeler for each track of studs and adapted at an operating station in the movement of the chain for actuation by the studs to cause operation in the machine as predetermined by the stud layout on the chain, detector means disposed in advance of the feelers in the movement of the chain and adapted for detecting a misplaced part of the studded chain consisting of a displaceable gate member having a gate or gap for each track of studs and of a width just sufficient to permit passage of the studs in the respective tracks, mechanism for stopping the machine, and means operable by the detector means for operating said mechanism for stopping the machine.

2,775,111
FREEZER LOCK
Kenneth W. Savage, Grand Rapids, Mich., assignor to Crawford Manufacturing Company, Holland, Mich.
Application December 16, 1954, Serial No. 474,425
2 Claims. (Cl. 70—9)

1. A lock mechanism comprising, a housing having a mounting surface, an opening, aligned bearing means disposed on opposite sides of said opening on a single axis substantially parallel to said mounting surface, said bearing means being radially open over at least 180 degrees on the side thereof facing said mounting surface, said housing also having a stop adjacent an edge of said opening which is parallel to said axis, and a shelf portion; a bolt member formed to be received in said opening and having journal portions normally engaging said bearing means, said bearing means being spaced from said mounting surface sufficiently to receive said journal portions, and said bolt member also having a portion disposed to engage said stop on rotation of said bolt toward locking position, a keeper engaging portion, and a handle portion both remote from said axis and on the opposite side thereof from said stop, and locking means including a bar moveable to a position opposite said shelf to prevent rotation of said bolt member about said axis, said housing being formed to receive said bolt member into said opening from a lateral direction with respect to said mounting surface to engage said bearing means and journal portions; and compression spring means acting between said shelf portion and a point on said bolt to rotate said bolt about said axis against said stop.

2,775,112
COMBINATION RESETTING GUARD FOR EXPOSED SHACKLE PADLOCK
James L. Taylor, Rochester, N. Y., assignor to Serpent & Greenleaf, Inc., Rochester, N. Y., a corporation of New York
Application July 29, 1955, Serial No. 525,130
8 Claims. (Cl. 70—25)

1. In a combination lock, the combination with a lock housing having a socket therein and including a wall having a combination resetting key opening, rotatable tumblers, a driving cam therefor, a fence operatively associated with said tumblers and driving cam, and means normally occupying said socket barring access thereto when said lock is in locked condition and removable from said socket to expose the same when said lock is unlocked, of a guard mechanism comprising a guard member rotatably supported on said wall with a portion thereof normally covering said wall key opening and having a resetting key opening disposed out of registry with said wall key opening, a guard member adjusting screw disposed at the base of said socket for axial adjustment upon rotation of the same by an instrument inserted into said socket when the socket is exposed, and linkage means interconnecting said screw with said guard member for translating axial movement of said adjusting screw into rotary movement of said guard member to shift said guard member key opening into and out of registry with said wall key opening upon preselected axial movement of said adjusting screw.

2,775,113
COMBINATION LOCKS
Herbert C. Behrens, Canton, Ohio, assignor to Diebold, Incorporated, Canton, Ohio, a corporation of Ohio
Application May 8, 1951, Serial No. 225,167
20 Claims. (Cl. 70—133)

16. In combination lock construction, a rotatable and axially movable spindle, a plurality of rotatable tum-

biers provided with outwardly opening notches adapted to be aligned when the combination is set, drive means engageable between the spindle and tumblers when the spindle is in one position of axial movement for rotating the tumblers to set the combination upon selective rotation of the spindle, said drive means being disengaged when the spindle is in another position of axial movement, a bolt, an operating lever pivotally mounted on the bolt, a fence on the operating lever adapted to be received in said aligned tumbler notches upon movement of the operating lever toward the spindle when the combination is set, interengageable means on the operating lever and spindle holding the lever in a raised position with respect to the spindle and holding the fence out of contact with the tumblers when the spindle is in said one

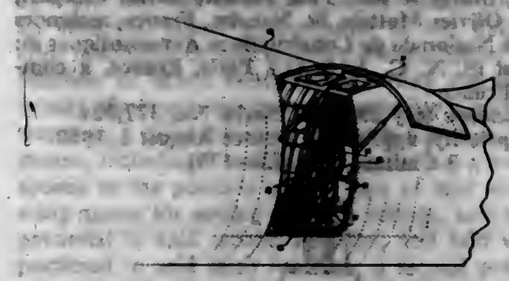
position, said interengageable holding means being disengaged when the drive means is disengaged upon actuation of the spindle axially to said other position, and interengageable notch and tongue means on the spindle and lever for actuating the lever to operate the bolt by rotation of the spindle when the spindle is in said other axial position, a control member, and the spindle being formed with co-acting axially extending and sectoral groove means engageable with the control member, the axially extending groove means receiving the control member and permitting axial movement of the spindle from said one position only at one rotated position of the spindle, and the sectoral groove means and control member limiting rotative movement of the spindle when axially moved to said other axial position.

---

2,775,114
COMBINATION LOCK
George Edward Lee, Kansas City, Kans.; Cora A. Lee, administratrix of said George Edward Lee, deceased
Application January 3, 1949, Serial No. 68,976
18 Claims. (Cl. 70—133)

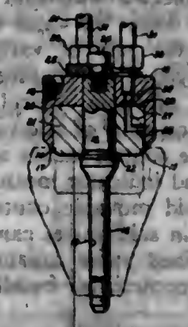
1. In a combination lock of the kind having a housing, a locking member movably mounted on said housing, an elongated, manually-rotatable dial shaft extending into said housing, a disk like cam secured to said shaft within said housing for rotation with said shaft, said cam having a gate in the periphery thereof, a movable fence associated with said locking member for controlling movement thereof, said fence being formed to interlock with the gate of said cam when the latter is rotated to a predetermined position with respect to said fence, whereby continued rotation of said cam in one direction shifts said fence and said locking member to an unlocked position, the walls defining said gate being formed to move said fence to a position released from said cam when said cam is rotated in the opposite direction, a plurality of tumblers interconnected by lost motion driving connections and being operably mounted within said housing and about the axis of said shaft, and a lost motion driving connection between said cam and one of said tumblers, said tumblers blocking movement of said fence from said released position except when they are shifted to a predetermined set position in which said fence is permitted to move to a position interlocked with said cam; the improvement of which comprises means for imparting continued movement to said fence, when said fence moves to said released position, to a position spaced from the cam and tumblers, releasable means for continuously holding said fence in said position spaced from the cam and tumblers throughout rotation of said cam to move said tumblers to said set position, and manually-operable means for releasing said releasable means.

---



2,775,115
MANIPULATION-RESISTANT COMBINATION LOCK
Frederick J. Bremer, Hamilton, Ohio, assignor to The Mosler Safe Company, Hamilton, Ohio, a corporation of New York
Application December 29, 1950, Serial No. 203,431
11 Claims. (Cl. 70—133)

11. A combination lock comprising a support, a bolt slidably mounted on said support, a dial shaft movably carried by said support and having a disk thereon provided with a gate in the periphery thereof, a fence lever having fence means including a disk follower nose and being pivotally mounted on and movable with said bolt as the bolt is reciprocated thereby when the disk follower nose is in said gate, said shaft being slidable along its longitudinal axis from a position in which said disk follower nose may be received in said gate to a position in which said disk follower nose can not be received therein, a spindle fixed to said support in coaxial relation to said shaft, a plurality of cylindrical tumblers rotatably mounted on said spindle, said tumblers each having a gate in the periphery thereof, said tumblers having a lost motion driving connection one with another, said disk having a circular portion of larger diameter than the gated portion thereof upon which said disk follower nose rides when the shaft is in one position, said disk having a driving connection with its adjacent tumbler when in the position in which said disk follower nose rides on the circular portion of said disk, and said fence means also including a bar extending from said fence lever across said tumblers, said circular portion of larger diameter of said disk being of such diameter as to hold the bar out of contact with the rims of said tumblers when said disk is in a position to be connected with said adjacent tumbler and said notched portion of said disk being of such diameter that said bar will rest on the peripheries of said tumblers and hold the disk follower nose out of said disk gate when the gates of the tumblers are not in alignment and when said disk is in a position to be disconnected from said adjacent tumbler, said tumblers being rotatable to align their gates with said bar when said shaft is turned in accordance with the combination of the lock when the driving connection is established, said bar and disk follower nose dropping into said tumbler gates and disk gate, respectively, when the disk gate is aligned with said tumbler gates and the disk is moved to a position where the adjacent tumbler is disengaged therefrom, whereby the lock bolt may be moved to or from locked position by turning said shaft.

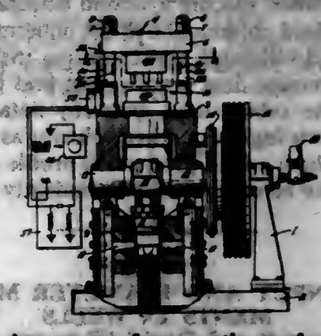


2,775,116
METHOD OF TESTING PRESSURE VESSELS
William H. Bonell, Pasadena, and Boyd E. Ludwig, Encino, Calif., assignors to Lockheed Aircraft Corporation, Burbank, Calif.
Application July 17, 1953, Serial No. 368,612
6 Claims. (Cl. 73—37)

1. A method of pressure testing large vessels comprising stacking hollow vented drums within the vessel to be tested, inserting space filling forms in the voids between the hollow drums, closing all external openings in the vessel necessary to render the same substantially fluid-tight, and thereafter pressurizing the vessel.

---

2,775,117
PNEUMATIC GAUGING DEVICE
Willis Fay Aller, Dayton, Ohio, assignor to The Sheffield Corporation, Dayton, Ohio, a corporation of Ohio
Application October 15, 1952, Serial No. 314,796
7 Claims. (Cl. 73—37.8)



1. A gauging head for checking the relative alignment of two substantially concentric and axially displaced surfaces of revolution comprising a pilot element for telescopic engagement with the one of said two surfaces chosen as a reference to definitely locate the axis of the pilot element to coincide with the axis of said one surface, a radially enlarged body supported by said pilot element having a plurality of fluid leakage gauging means equally spaced at equal radii about the center line of said body in a common radial plane gauging association with spaced points on the other of the said two surfaces for control of the flow therethrough, and individual passage means for independently connecting each of said gauging means to a separate gauge and an air supply.

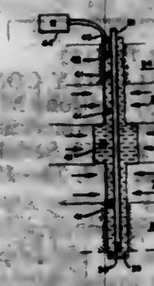
---

2,775,118
DIEING MACHINE LOAD MEASURING SYSTEM
Elmer E. Legge, West Hartford, and Edward J. Stephens, Manchester, Conn., assignors to Emhart Manufacturing Company, Hartford, Conn., a corporation of Delaware
Application March 1, 1952, Serial No. 274,478
2 Claims. (Cl. 73—88.5)

1. In combination, force members movable relative to each other for stressing a work piece therebetween, force means for repetitively moving and progressively loading said members in stressing relationship, a plurality of parallel rods generally paralleling the resultant force effected between the two members and carrying the total force on one of said members, an electrically responsive strain gauge on each of said rods, and electronic means for selectively measuring the total and individual loads on said rods, and stroke counting means actuated

by said measuring means for counting only those strokes of the repetitively moving members when said force means exerts a preselected minimum load.

---



2,775,119
DYNAMOMETRY
Thomas G. Kirby, Ecorse, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Application June 2, 1953, Serial No. 359,153
4 Claims. (Cl. 73—134)

1. A high speed dynamometer comprising a squirrel cage induction motor cradled to permit the mechanical measurement of torque and arranged to be mechanically connected to a prime mover, a variable frequency, constant speed alternator electrically connected to but mechanically independent of said squirrel cage induction motor and an alternating current motor connected only mechanically to said variable frequency alternator for transferring energy to a power system.

---

2,775,120
FLUID ENTRY DETECTION IN WELLS
Arthur D. Bennett and Daniel Silverman, Tulsa, Okla., assignors to Stanolind Oil and Gas Company, Tulsa, Okla., a corporation of Delaware
Application January 2, 1953, Serial No. 329,398
7 Claims. (Cl. 73—155)

1. The method of testing wells to obtain data from which both a fluid-production profile and a volume-caliper log can be determined comprising, in combination, the steps of producing a well through a tubing extending to a depth below the producing formations under such conditions of bottom-hole pressure that there is fluid flow both from the formations and from the well annulus above the formations, the ratio of formation and annulus flows having a first value, placing at least one detectable marker in the annulus fluid column at a point at least as high as the uppermost producing formation, following

and recording the movement of said marker downwardly past the producing formations to the tubing inlet, changing the bottom-hole pressure conditions to create a second ratio of said flows, placing a second detectable marker in said annulus fluid column above the uppermost producing formation, and following and recording the movement of said second marker downwardly past said producing formations to the tubing inlet, whereby data are obtained for plotting two logs of marker velocity as a function of depth from which a fluid-production profile and a volume-caliper log may be computed independently of each other.

---

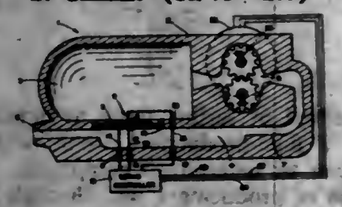
2,775,121

## FLUID INPUT AND DIAMETER MEASUREMENTS IN WELLS

Arthur D. Bennett and Daniel Silverman, Tulsa, Okla., assignors to Stanolind Oil and Gas Company, Tulsa, Okla., a corporation of Delaware

Application December 29, 1952, Serial No. 328,454
5 Claims. (Cl. 73—155)

1. A method of obtaining data from which both the fluid-injection profile and the hole-size variations of a well bore can be determined comprising, in combination, the steps of injecting liquid into a well through a tubing extending to a level below the permeable formations of said well, said liquid traveling upwardly outside said tubing into said formations and into the annulus outside said tubing above said formations under such conditions that the ratio of the flow up said annulus to the flow entering said formations has one value, establishing a detectable marker in the fluid stream emerging from said tubing, following and recording the motion of said marker past said permeable formations, altering the conditions of injection to change said ratio of flows to a second value, establishing a second detectable marker in said fluid stream, and following and recording the motion of said second marker, whereby two logs of the velocity of said markers may be plotted, from which logs said profile and hole-size variations may be computed independently of each other.



---

2,775,122

## VERTICAL VELOCITY COMPUTER

Robert E. Smith, Downey, and John M. Wuerth, Whittier, Calif., assignors to North American Aviation, Inc.

Application March 2, 1953, Serial No. 339,598
17 Claims. (Cl. 73—179)

1. A rate altimeter comprising a constant volume sealed chamber, a pressure sensitive element responsive to the pressure differential between said chamber and the static atmosphere, servo means responsive to said sensitive element for varying the pressure in said chamber to maintain said pressure differential substantially at zero, and means for indicating the rate said servo means varies the pressure in said chamber whereby the rate of varying said pressure is the measure of the rate of change of altitude.

---

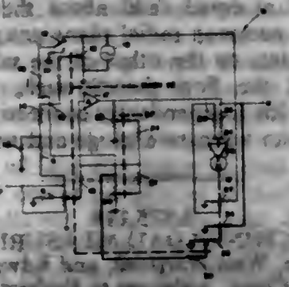
2,775,123

## RATE OF CLIMB INDICATOR

René Salle, Marly le Roi, Paul Etienne Sévin, Clamart, and Jean Olivier Mettais, St. Nazaire, France, assignors to Societe Nationale de Constructions Aeronautiques du Sud-Ouest (S. N. C. A. S. O.), Paris, France, a company of France

Application July 29, 1953, Serial No. 371,094
Claims priority, application France August 1, 1952
3 Claims. (Cl. 73—179)

1. A variometer comprising, in combination, a closed vessel, a capillary tube connecting said closed vessel with an outer space to vary the pressure in said vessel in response to pressure variations in said outer space with a pressure difference with respect thereto, a device responsive to said pressure difference, said device having an element exposed to the pressure in said vessel and an element exposed to the pressure in said outer space, an index operatively connected with said pressure difference responsive device to detect the value of said pressure difference and hence the rate of variation of said outer space pressure, a cylindrical chamber adapted to form part of said vessel, movable control means within said chamber to vary the capacity of said vessel, locating means to hold said movable control means stationary when they are not operated, and indicator means to indicate the located position of said movable control means, whereby the initial pressure in said vessel can be brought before use to a predetermined value capable of reducing to a minimum the time required for building-up said pressure difference.



---

2,775,124

## ANGLE OF ATTACK COMPUTER

Frederick H. Gardner, Long Beach, James C. Elsaa, Newport Beach, and David Rosenstock, Long Beach, Calif., assignors to North American Aviation, Inc.

Application November 30, 1953, Serial No. 395,072
5 Claims. (Cl. 73—180)

1. Means for generating an electrical signal proportional to the angle of attack of an aircraft relative to its surrounding free air comprising electrical means for generating an electrical signal proportional to the weight of said craft multiplied by the acceleration of said craft in a direction parallel to its yaw axis; differential pressure measuring means, including a shaft, for generating a shaft rotation proportional to the difference between ram and static pressure measured upon said craft; Mach number computing means, including a shaft, for generating a shaft rotation proportional to Mach number of said craft; means having distributed resistance including a first potentiometer connected to said electrical means and connected to be mechanically driven by said Mach number computing means to generate a voltage, upon the arm of said first potentiometer, which is proportional to the weight of said aircraft multiplied by said acceleration multiplied by a first function of Mach number; means for generating an electrical signal proportional to the weight of said craft multiplied by said acceleration multiplied by a second function of Mach number; computing means connected to said Mach number means to generate a voltage proportional to a third function of Mach number; flap voltage means, including a switch, for generating a voltage in response to the position of the flaps of said aircraft; summing means for adding said flap voltage, said voltage proportional to said second function, and said voltage proportional to said third function; a second potentiometer; means for applying the voltage of said summing means across said second potentiometer, the arm of said second potentiometer being connected to be driven by said differential pressure measuring means, an amplifier, the arm of said second potentiometer being electrically connected to the input of said amplifier, the arm of said first potentiometer being electrically connected to the input of said amplifier; third potentiometer means connected across the output of said amplifier mechanically connected to said differential pressure measuring means, and electrically connected to the input of said amplifier whereby the output of said amplifier is a voltage proportional to the angle of said aircraft.

2,775,125

## MASS FLOW METER

Donald W. Peaceman, Houston, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware

Application July 16, 1954, Serial No. 443,782
5 Claims. (Cl. 73—194)

1. In a device for measuring mass rate of flow of fluids which comprises, in combination, an impeller provided with vanes, a driving shaft connected with said impeller provided with a passageway for introducing fluids radially between the vanes of said impeller, the vanes of said impeller extending outwardly from the periphery of the driving shaft, a casing provided with vanes extending inwardly from the periphery thereof rotatably mounted on said driving shaft to enclose said impeller and for rotation independently of the rotation of the driving shaft around the vanes of the impeller, said casing being provided with peripheral ports for discharge of fluid from between the vanes of the casing, an indicating shaft connected to said vaned casing for rotation with the vaned casing, resilient means connected to said indicating shaft for restraining said indicating shaft and casing, and indicating means attached to the indicating shaft for indicating variations in flow rate of fluids introduced through said passageway between the vanes of said impeller and discharging into said casing between the vanes of the casing.

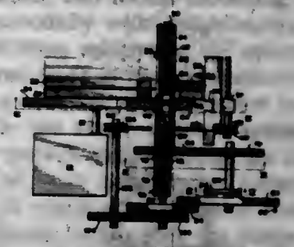
2,775,126

## DENSITOMETERS FOR MEASURING THE SPECIFIC GRAVITY OF LIQUIDS

Kenneth Robert Hesnick, Mytchett, near Aldershot, England, assignor to Simmonds Aerocessories Limited, Pontypridd, Glamorganshire, Wales

Application October 13, 1953, Serial No. 385,842
Claims priority, application Great Britain October 15, 1952
8 Claims. (Cl. 73—453)

1. Remote indicating densitometer apparatus for use with liquids within a predetermined density range, including a stop, a float mounted for movement totally immersed in a liquid the density of which is to be measured towards and away from a position defined by said stop, the density of the float being predetermined such that for any liquid in said range the float tends to move in one direction only towards the stop under the action of gravity, magnetic means providing the sole means for influencing the float in the other direction, remote means for progressively increasing the influence of said magnetic means until the float is shifted from the stop, electrical circuit means for sensing when the float has moved a small distance from the stop, and remote means for indicating the magnitude of the influence of the magnetic means whereby said indication at the time when the circuit means senses said movement of the float provides a measure of the density of the float relative to the liquid.



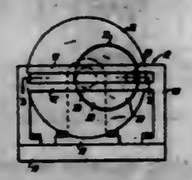
---

2,775,127

## SHAFT POSITIONING DEVICE

Harry J. Lalming, Springfield, Pa., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

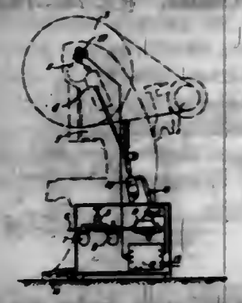
Application November 25, 1952, Serial No. 322,425
5 Claims. (Cl. 74—10.29)



1. In a shaft positioning device the combination of a shaft to be positioned; a plurality of mechanisms associated with said shaft, each of said mechanisms being adapted, when actuated, for rotating said shaft to an angular position, said position being determined by the respective mechanism actuated; a cam associated with each of said mechanisms to actuate the same when said cam is rotated; and means for sequentially rotating said cams, said means comprising a hollow shaft having a longitudinal slot in the wall thereof, each of said cams being journaled upon said hollow shaft and having a slot therein adjacent said hollow shaft, a key projecting through the slot of said hollow shaft and adapted to move longitudinally therein to engage the slot of one of said cams and to secure said one cam to said hollow shaft to rotate therewith, an actuating shaft adapted for rotation, means responsive to a portion of a revolution of said actuating shaft for causing said key to move from

said slot of said one cam to the slot of an adjacent cam, and means responsive to another portion of a revolution of said actuating shaft for rotating said hollow shaft.

---



2,775,128
DEVICE FOR CHANGING CIRCULAR MOTION TO RECTILINEAR MOTION
William K. Young, Rockford, Ill.; The Third National Bank of Rockford, executor of said William K. Young, deceased
Application July 14, 1952, Serial No. 298,794
4 Claims. (Cl. 74—49)

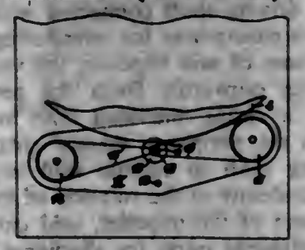
1. A device of the type described, comprising a rotatably mounted driving member having a fixed center of rotation; a driven member supported within the confines of the driving member and mounted for rotation relative thereto, the driven member having a center of rotation in a fixed position relative to the driving member; a power member carried by the driven member and spaced from the center of rotation thereof, the distance between the center of rotation of the driven member and the power member carried thereby being greater than the distance between the centers of rotation of the driving member and the driven member; and guide means restricting the movement of said power member.

---

2,775,129
ADJUSTABLE CONTROL DEVICE WITH TIMING SYSTEM
Lucien Jules Perne, Billancourt, France, assignor to Regie Nationale des Usines Renault, Billancourt, France, French Works under the Control and the Authority of the French Government
Application July 7, 1954, Serial No. 441,826
Claims priority, application France August 5, 1953
4 Claims. (Cl. 74—125.5)

1. An adjustment device for controlling the operation in predetermined spaced cycles of a clutch connecting a driven member to a continuously operating driving member, which comprises electrically controlled means for initiating the engagement of said clutch, switch means actuated by said driven member, a first electron tube having an anode, control grid and cathode, means connecting said control grid to said switch, said switch being operable to render said tube non-conducting at the beginning of a cycle and to render said tube conducting during a predetermined intermediate portion of the cycle, a capacitor in the anode circuit of said tube and a variable resistor connected in series with said capacitor, a second electron tube having an anode, control grid and cathode, means connecting the cathode and control grid of said second tube to opposite sides of said capacitor, and means connecting said electrically controlled means in the anode circuit of said second tube so as to cause engagement of the clutch when said second tube is conducting, said second tube being rendered non-conducting by the charging of said capacitor by said first tube and becoming conducting when said capacitor has become discharged, the rate of discharge of said capacitor and hence the time between successive cycles being variable by the adjustment of said resistor.

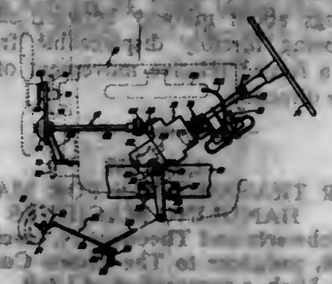
---



2,775,130
COMBINED HORIZONTAL BORING, DRILLING AND MILLING MACHINE
Hollis N. Stephen, Cleveland Heights, Ohio, assignor to The New Britain Machine Company, New Britain, Conn., a corporation of Connecticut
Application May 29, 1953, Serial No. 358,410
12 Claims. (Cl. 74—221)

1. In a machine tool, a frame, a rotatable shaft supported by said frame, a belt drive for rotating said shaft comprising a continuous belt, a driving pulley for driving said belt, a driven pulley engaged by said belt and connected to said shaft for rotating said shaft, idler means for guiding said belt and adjustable to control the belt tension and comprising first and second rollers for engaging the inner side of said belt, a yoke comprising spaced parallel members, first and second parallel shafts removably supported intermediate said members for supporting said first and second rollers, respectively, said first shaft being hollow, and a removable pin within said first shaft having its outer ends supported by said frame, said yoke being movable about the axis of said pin to adjust the tension in said belt.

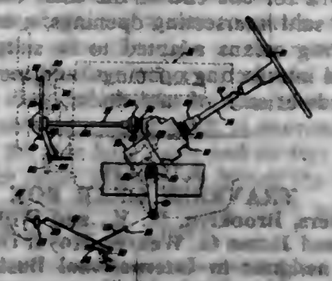
---



2,775,131
MECHANICAL DRIVE
Hubertus Jan Smits, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Original application November 17, 1949, Serial No. 127,997, now Patent No. 2,664,758, dated January 5, 1954. Divided and this application April 16, 1953, Serial No. 356,629
Claims priority, application Netherlands November 24, 1948
2 Claims. (Cl. 74—221)

1. A phonograph driving mechanism comprising a base, a turntable member, a pivoted mounting plate on said base and provided with an opening therethrough, a pair of driven pulleys spatially mounted on said mounting plate, a drive shaft positioned in said opening and located between said driven pulleys and having two driving pulleys of different diameters, two endless belts, one of said belts encircling one of said driving pulleys and one of said driven pulleys while the other belt encircles said other driving pulley and other driven pulley, said driven pulleys being so mounted on said pivoting plate whereby the former can be moved laterally relative to the axis of said turntable member, and either of said belts may be thus moved into and out of engagement with the circumference of said turntable member.

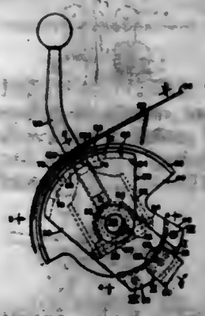
---



2,775,132
POWER STEERING MECHANISM
Palmer Orr and Donald W. Kiblad, Muncie, Ind., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application December 6, 1952, Serial No. 324,556
14 Claims. (Cl. 74—388)

1. In steering mechanism for a vehicle, a steering shaft adapted to be manually operated by means of a steering hand wheel, an output shaft adapted for connection with the steering ground wheels of the vehicle, a lost motion connection between said shafts, engageable means for driving said output shaft in one direction or the other, a motor for engaging said engageable means for a drive in either direction, and controlling mechanism for said motor controlled by said lost motion connection.

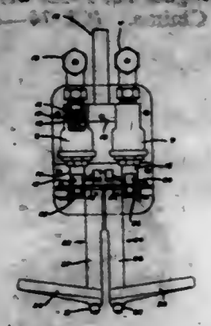
---



2,775,133
POWER STEERING MECHANISM
Kenneth M. Armentrout, Muncie, Ind., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application March 9, 1953, Serial No. 341,147
17 Claims. (Cl. 74—388)

1. In steering mechanism for motor vehicles, a steering shaft adapted to be manually operated by means of a steering hand wheel, an output shaft adapted for connection with the steering ground wheels of the vehicle, power operated mechanism under the control of said steering shaft for driving said output shaft for steering the vehicle, said power operated mechanism having a pair of clutches with a common pressure plate that engages one or the other of said clutches depending on the direction of rotation of said steering shaft, an overload releasing means between said steering shaft and said power operated mechanism for disconnecting said steering shaft with said power operated mechanism when more than a predetermined rotative force is applied to the steering shaft, and means for simultaneously connecting said steering shaft with said output shaft to permit the latter to be turned by manual effort from the steering shaft when said power operated mechanism is inoperative.

2,775,134
SHIFTER MECHANISM FOR TRANSMISSION
Victor Eugene Swenson, Cedar Falls, Iowa, assignor to Deere Manufacturing Co., Dubuque, Iowa, a corporation of Iowa
Application August 12, 1955, Serial No. 528,075
4 Claims. (Cl. 74—473)



1. Shifting mechanism for a multi-speed, multi-range transmission, comprising: a support; a range selector and a speed selector carried by the support in coaxially spaced apart side-by-side relation for independent fore-and-aft rocking out of and back to respective neutral positions, said selectors respectively having arcuate flanges extending axially toward each other in concentrically overlapped relation; said range selector flange having front and rear circumferentially spaced notches opening laterally toward the speed selector and separated by an intervening lug projecting laterally toward said speed selector; said speed selector flange having therein a pocket opening laterally toward the range selector and laterally blocked by said lug when both selectors are neutrally positioned, said speed selector flange further having a zig-zag slot including front and rear circumferential portions laterally offset and interconnected by a crossover portion, said crossover portion lying behind the lug and in radial register with the rear notch, the rear portion lying adjacent to the range selector and extending rearwardly past the rear notch, and the front portion lying remote from the range selector and extending forwardly past the lug to intersect the pocket and to register radially with the front notch when both selectors are neutrally positioned; a shift lever extending radially from the selector axis and through the pocket to be confined by the lug against lateral escape from said pocket; and means mounting the shift lever on the support coaxially with the selectors and for rocking and lateral shifting relative to the selectors, whereby the pocket-received lever is movable selectively forwardly or rearwardly to rock the speed selector to a selected speed position while the range selector remains in its neutral position, the pocket thus clearing the lug and becoming laterally alined with a notch for lateral shifting of the lever into such notch and for travel along the front portion of the zig-zag slot to rock the range selector through an angular range determined by the length of said front slot portion while the speed selector remains in said selected speed position, and said lever being shiftable laterally through the crossover to travel along the rear portion of the zig-zag slot for rocking the range selector through an additional range determined by the length of said rear portion.

---

2,775,135
MIXING VALVE OPERATION
Gerard D. Phillips, Jr., Louisville, Ky., assignor to American Radiator & Standard Sanitary Corporation, Pittsburgh, Pa., a corporation of Delaware
Application October 23, 1952, Serial No. 316,927
2 Claims. (Cl. 74—478)

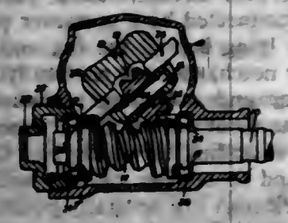
2. In an actuating device, a pair of bell crank levers having crank arms and lever arms, means to be actuated by said bell crank levers, said means having slotted portions engageable with said bell crank arms, said bell crank

levers being pivotally mounted adjacent to said means, said crank arms being movable into said slotted portions to engage said means for actuation thereof, said lever arms extending downward, pedals on the lower ends of said lever arms and positioned closely side by side for

simultaneous depression by an operator's foot to actuate said means, said pedals being inclined upwardly to form a dihedral angle for receiving the operator's foot so that the relatively depressed position of said pedals may be varied by rotary movement of the foot about the axis of the leg and substantially in a single plane.

---

2,775,136



**STEERING GEAR FOR MOTOR VEHICLES**

Alfred Peter Dörper, Russelsheim (Main), Germany, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application February 14, 1955, Serial No. 487,938

Claims priority, application Germany March 6, 1954

12 Claims. (Cl. 74—500)

1. In a steering gear, the combination of a steering shaft, a worm on said shaft, a pitman shaft rockably disposed at substantially right angles to said worm, operative connection means between said worm and said pitman shaft to cause rocking of said pitman shaft upon rotation of said worm in either direction, a pair of projections on said pitman shaft movable towards and away from said worm upon rocking of said pitman shaft, and a pair of radial stops, one at each end of said worm, respectively adapted to engage one of said projections in a limit position of said pitman shaft.

---

2,775,137

**OVERLOAD RELEASE CONNECTORS**

Jackson Chang, South Bend, Ind., assignor to Dodge Manufacturing Corporation, Mishawaka, Ind., a corporation of Indiana

Original application November 7, 1951, Serial No. 255,274, now Patent No. 2,753,969, dated July 10, 1956. Divided and this application November 14, 1952, Serial No. 320,667

8 Claims. (Cl. 74—534)

1. An overload release connector comprising a tube, a rod slidably fitted in said tube, said rod having an annular cam groove, angularly spaced balls seated in said groove, said tube having guide holes through which the balls protrude and in which they are movable radially, a pair of confronting cup rings slidably fitted on said tube and having tapered inside surfaces engaged by said balls, balanced compression springs forcing said cup rings toward each other for holding the balls in said cam groove, and a housing for said springs having abutments therein between which said cup rings the said springs

are respectively compressed, said cup rings being held by the springs about midway between said abutments, said balls being forcibly displaceable from said cam grooved by a forced relative movement of said rod and tube in either direction.

---

2,775,138

**POWER TRANSMISSION FOR MATERIAL HANDLING MACHINES**

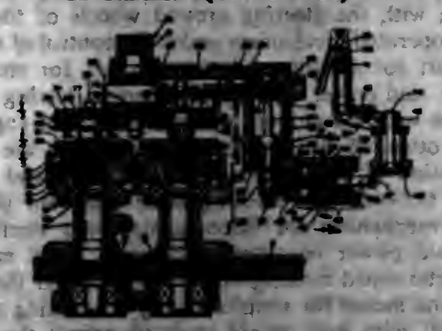
Daniel M. Schwartz and Theodore N. Hackett, Salt Lake City, Utah, assignors to The Eimco Corporation, Salt Lake City, Utah, a corporation of Utah

Original application October 24, 1950, Serial No. 191,808. Divided and this application December 14, 1951, Serial No. 261,835

3 Claims. (Cl. 74—606)

1. A power transmitting mechanism including two shafts on fixed centers, a housing for said shafts, intersecting openings in a wall of said housing corresponding to each of the shaft centers, each of the openings being concentric with its corresponding shaft, a removable cover for said openings, said cover adapted to fit snugly in one of the intersecting openings in the wall, bearing means supported by said cover for one end of the shaft corresponding to said one of the intersecting openings, second bearing means for one end of the shaft corresponding to the other of said intersecting openings, a support for said second bearing means adapted to fit snugly in the said other of said intersecting openings, and means supporting the other ends of each of said shafts.

---



2,775,139

**TRAVERSE GEAR BOX**

Ward Leathers, Brooklyn, N. Y., and Wilfred E. Mazur, Pontiac, and James G. Weaver, Royal Oak, Mich.; said Leathers assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York

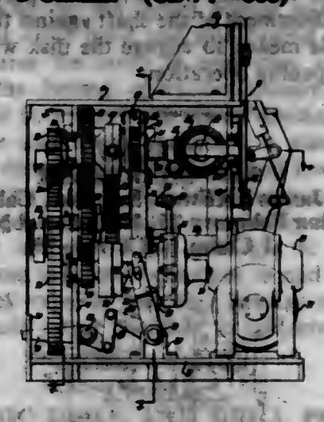
Application January 28, 1955, Serial No. 484,637

12 Claims. (Cl. 74—626)

1. A continuous acting locking mechanism for preventing undesired turning of a turret member or the like

relative to a mobile support member upon which it is mounted comprising a ring gear mounted on one of said members, a pair of heavy duty gears engaging said ring gear and mounted on the other of said members, a differential for completing a connection between said pair of heavy duty gears and a single rotatable shaft, shock absorbing spring means located between said differential and each of said pair of heavy duty gears, and no-back lock means for preventing rotation of said single shaft being initiated by said pair of heavy duty gears.

---



2,775,140

**INTERMITTENT DRIVE MECHANISM**

Edward G. Lees, Oakland, Calif., assignor, by mesne assignments, to John J. Knight, Piedmont, Calif.

Application January 11, 1954, Serial No. 403,193

5 Claims. (Cl. 74—665)

1. A drive mechanism for a bundle tying machine comprising a drive motor, a first driving means transmitting alternate opposite rotary motion to a first mechanism, clutch means intermittently connecting said first driving means to said motor, a cam shaft for actuating a second mechanism, a second driving means for rotating said cam shaft, said second driving means comprising an input shaft driven at a constant speed by said first driving means, an output shaft, a differential assembly connected between said shafts, a housing for said differential assembly, said housing being free to rotate relative to both said input and output shafts, means connecting said output shaft to said cam shaft, and means to rotate said differential housing in the same direction as the rotation of said input shaft during the first half cycle of said machine and in the opposite direction during the last half cycle of said machine, whereby the output shaft is approximately stationary during the first half cycle and rotates at approximately twice the input shaft speed during the second half cycle causing said second mechanism to be actuated only during the latter part of the cycle.

---

2,775,141

**DIFFERENTIAL**

Adolph Rensing, Minneapolis, Minn.

Application January 23, 1952, Serial No. 267,841

13 Claims. (Cl. 74—711)

1. In a differential of the character described and having a power rotated cage and a pair of opposed differential gears therein, each opposed gear having cooperating tubular and telescoping hub members rotatable with respect to each other, the said hubs having cooperating fluid chambers and longitudinally extending vanes therein for operation as a kinetic fluid clutch to retard relative rotation of the associated gears, and means for supplying fluid to the chambers.

---

2,775,142

**DIFFERENTIAL**

Walter L. Brunelle, Appleton, and Harold R. Brunelle, New London, Wis.

Application April 21, 1953, Serial No. 350,096

8 Claims. (Cl. 74—711)

1. A torque-proportioning differential comprising a rotatably driven casing, a pair of axially aligned axle gears contained therein for rotation about an axis coaxial therewith, at least two differential pinions journaled in said casing about spaced parallel axes extending along each side of the axis of said axle gears and perpendicular thereto, two intermediate coupling pinions rotatable about spaced parallel axes intersecting the axis of rotation of said axle gears and meshing with two differential pinions and one of said axle gears, and a cage for said intermediate coupling pinions rotatable about the axis of rotation of said axle gears and relatively movable with respect to said casing about the axis of rotation thereof.

---

2,775,143

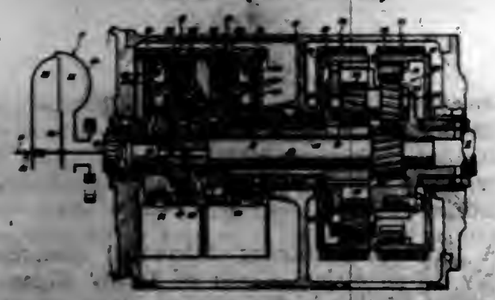
**TRAINING-MECHANISM HANDWHEEL**

Heinrich Hetlach, Zurich, Switzerland, assignor to Machine Tool Works Oerlikon, Administration Company, Zurich-Oerlikon, Switzerland, a Swiss company

Application May 2, 1952, Serial No. 285,727

Claims priority, application Switzerland May 5, 1951

1 Claim. (Cl. 74—750)



In a speed-varying device, a shaft, a hub keyed upon said shaft, a bracket firmly connected with said hub, a handwheel casing rotatably mounted upon said hub and having a projection extending parallel to said shaft, a handle rotatably mounted upon said projection, a clutch plate firmly connected with said hub, another clutch plate rotatably mounted upon said hub, gears carried by said bracket and meshing with said other clutch plate, two friction members engaging separate clutch plates, resilient means maintaining said friction members in engagement with the clutch plates, two spaced pairs of cams connected with separate friction members for releasing said friction members, a two-armed lever pivoted upon said handle, a ram reciprocable in said casing projection, means operatively connecting said two-armed lever with said ram, rollers carried by said ram for selective engagement with any one of said two pairs of cams, said clutch plates being coupled by said resilient means when said rollers are out of engagement with said cams,

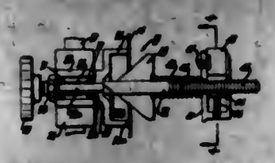
the engagement of rollers with one of said two pairs of cams causing a transmission of movement from said casing through said other clutch plate, said gears, said brushes and said hub to said shaft, the engagement of rollers with the other one of said two pairs of cams causing a transmission of movement from said casing directly to said shaft through the first-mentioned clutch plate and said hub.

---

2,775,144
TRANSMISSION
Donald W. Kolbek, Muncie, Ind., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application April 5, 1951, Serial No. 219,434
8 Claims. (Cl. 74—769)

1. In transmission mechanism, the combination of a drive shaft, a driven shaft, means including planetary gearing constructed and arranged to transmit torque therethrough comprising a pair of relatively rotatable sun gears and a pair of ring gears rotatable relative to said sun gears and planet gear means adapted to intermesh between said sun and ring gears for providing a plurality of forward drive power trains including a relatively low speed forward drive power train and a relatively high speed forward drive power train and also a reverse drive power train between said shafts, said low speed forward drive power train including a one-way engaging device adapted for coupling one of said sun gears to said drive shaft and also including a friction engaging device operative to hold one of said ring gears against rotation for completing the train, said reverse drive power train including said one-way engaging device coupling said one sun gear to said drive shaft and also including a second friction engaging device operative to hold the other of said ring gears against rotation for completing the train, said high speed forward drive power train including an additional friction engaging device adapted to couple the other of said sun gears to said drive shaft for completing the power train and said one-way engaging device overrunning and disengaging when said relatively high speed forward drive power train is completed.

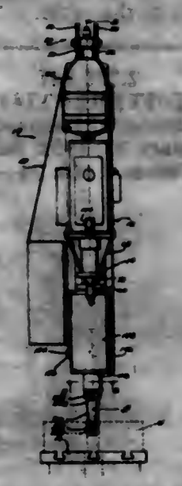
---



2,775,145
SAW SHARPENING MECHANISM
Lawrence E. Higgins, Yakima, Wash., assignor, by decree of distribution, to Florence H. Cast, Kirkland, Wash.
Application March 10, 1955, Serial No. 493,407
7 Claims. (Cl. 76—41)

1. In a saw sharpening means, a frame structure, means therein for the support of a saw in a set position for the advancement of its cutting elements successively to a position for sharpening, a bearing fixed in the frame structure, above the saw supporting means, a shaft mounted vertically in said bearing for longitudinal and rotary adjustments, a motor supported by and movable with the shaft, an arbor supported from the lower end portion of the shaft, a grinding disk fixed on the arbor, means effecting a driving connection between motor and arbor, yieldable means acting against the said shaft to lift and normally hold it in an elevated position of adjustment at which the grinding disk will be clear of the saw, and a lever pivotally fixed to the shaft and extended outwardly therefrom as a handle for effecting its rotary adjustment in opposite directions to change and establish the working angles of the grinding disk relative to the saw; a plate secured to the lower end of the bearing and said lever being engageable at its inner end with said plate for effecting downward adjustment of the shaft against the resistance of said yieldable means to engage the disk with the saw for a cutter sharpening operation.

---



2,775,146
SAW SHARPENER
James McEwan, San Jose, Calif.
Application February 25, 1953, Serial No. 338,669
1 Claim. (Cl. 76—79)

In a saw holder, a support member having a boss, a support shaft journalled in said boss, a clamping structure carried by said shaft for rotation therewith to hold a saw, said structure including a recessed clamping element presenting an annular face to the saw and a saw clamping cone slidably mounted on said shaft for engaging a saw and holding it against said annular face in centered relation with respect to said shaft, a series of ratchet teeth on said shaft, a ratchet collar slidably mounted on said shaft including means for engaging said teeth, and a spring interposed between said collar and said cone.

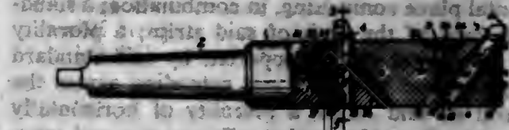
---

2,775,147
TAPER BORING DEVICE
Emil Schneebeli and Theodore E. Crawford, Racine, Wis., assignors to J. I. Case Company, Racine, Wis., a corporation of Wisconsin
Application April 30, 1952, Serial No. 285,152
11 Claims. (Cl. 77—4)

1. In a machine tool having a frame and a vertical slide, a taper boring device comprising a drive head having a splined drive shaft and being shiftable on said slide, a boring head shiftable on said slide and comprising a body, a quill rotatable co-axially with said shaft and provided with an internal bore eccentric with said shaft, said shaft being of a length sufficient to extend within said internal bore, a splined cap, slidable on said shaft and secured to said quill, an extension on said shaft concentric with said internal bore, a spindle rotatable in said bore and provided with a cutting tool, means to connect said extension and said spindle for independent rotation, said spindle having a helical cam slot extending 180 degrees about the periphery thereof, a follower in said quill co-acting with said cam slot to effect rotation of said spindle relative to said quill upon axially traversing said spindle in said bore, an adjustable stop on said frame positioned to contact said boring head to limit the latter to the initial boring position, means connecting said drive head and said boring head to successively, traverse the latter to said stop, and said tool to complete the boring operation, comprising a fluid cylinder in said body having a piston dividing said cylinder into upper and lower chambers, a piston rod connected to said drive head, said upper and lower chambers interconnected by a pair of fluid passages, said cylinder and said passages comprising a completely closed circuit, a check valve in one of said passages to restrict free flow of fluid from said lower chamber to said upper chamber and a check valve in the other passage to allow fluid to flow from said upper chamber to said lower chamber.

---

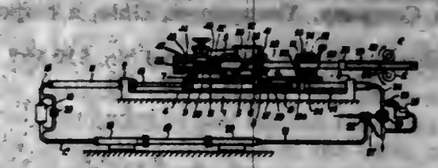
2,775,148
CONCENTRIC DRILL AND DRILL PRESS FOR USE THEREWITH
James Hunter Campbell, Richmond, N. H.
Application April 8, 1952, Serial No. 281,110
1 Claim. (Cl. 77—55)



In a drill press for use with concentric drills, a first spindle member for the outer drill and having an axial bore extending from end to end thereof, a second spindle member having one end entrant of said bore and rotatable relative to said first spindle member, said second spindle member having an axial bore, said bores in said members receiving the inner drill, the other end of said second spindle member being exposed, means engageable with said exposed end to rotate one of said second members, a gear fast on each of said spindle members, an operator control to lock the gear on the first spindle to the gear on the second spindle, a rotatable spindle including an eccentric, an operator control to turn said eccentric between first and second positions, and gears rotatable together relative to said spindle and in the first position of said eccentric meshing with respective ones of said spindle member gears.

---

2,775,149
ADJUSTABLE BIT BORING BAR
Albert Thomas, Homestead Park, Pa.
Application April 30, 1954, Serial No. 426,582
3 Claims. (Cl. 77—58)

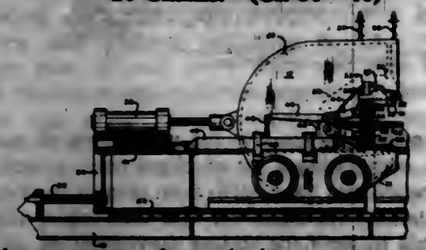


1. An adjustable bit boring bar formed with an opening in which a bit is adapted to be fitted for lengthwise adjustment therein, said bar being further formed with a threaded bore angularly intersecting such opening, an adjusting screw threaded into such bore and having an end portion adapted to extend into such opening to bear against a bit adapted to be positioned in such opening to thus move the bit longitudinally in such opening, and screw rotating means coaxial with said threaded bore and mounted in said bar for rotation with respect to said threaded bore but held against axial movement, said screw rotating means and said adjusting screw having

complementary interfitting portions providing a non-rotary, axial slidable connection between them whereby, upon rotation of said screw rotating means in opposite directions, said adjusting screw is moved axially in opposite directions in said threaded bore, said bar being formed with another bore angularly related to and intersecting such opening, and a spring fitted into said last-named bore for yieldably engaging such bit to maintain engagement between said adjusting screw and the bit irrespective of the direction of rotation of said adjusting screw.

---

2,775,150
PILGER MILL APPARATUS
Gavin Smellie McLay, London, England, assignor to Stewarts and Lloyds Limited, Glasgow, Scotland, a British company
Application March 6, 1953, Serial No. 340,792
Claims priority, application Great Britain March 7, 1952
5 Claims. (Cl. 80—14)



1. Pilger mill apparatus for the production of seamless metal tubes, comprising a set of pilger rolls, a feed table movable forward and backwards with respect to said rolls, a carriage slidably mounted on said feed table, stops on said feed table to limit the sliding movement of said carriage on said feed table, means to move said table and said slidably mounted carriage thereon constantly towards said rolls until the latter have completed the rolling of a tube, a mandrel carrier mounted in said carriage, a mandrel operatively connected to said mandrel carrier, resilient means at one end of said carriage and responsive to cushion the rearward axial movement of said mandrel carrier on said carriage under the action of said rolls on their rolling stroke and braking means at the opposite end of said carriage between and coaxial with said mandrel carrier and said carriage to take up the forward thrust movement of the said mandrel carrier under the reactive action of said resilient means when the rolls free the work piece and stop means for said mandrel carrier comprising a first and second cooperating means, said first means being mounted on said mandrel carrier and said second means being mounted on said feed table between the rolls and the said mandrel carrier so that immediately after said braking means comes into action, the said stop means will arrest the said forward movement of said mandrel carrier so that the mandrel carrier will be in same position relative to the feed table at the end of every such forward movement of said mandrel carrier.

2,775,151
METAL WORKING APPARATUS
Richard M. Schumacher, Chicago, Ill., assignor to Caine Steel Company, a corporation of Illinois
Application February 9, 1953, Serial No. 335,914
3 Claims. (Cl. 80—40)

1. Apparatus for concurrently edge rolling a plurality of coplanar strips contiguous to each other and in a common horizontal plane comprising, in combination; a standard on each side of the path of said strips; a plurality of pairs of horizontal shafts supported by said standard in vertically disposed positions and extending across the path of travel of said strips; a plurality of horizontally extending arms adjustably carried adjacent one end upon said shafts for horizontal sliding movement along said shafts and rotary movement about said shaft as an axis; a plurality of pairs of edge rolling units carried by the outer ends of said arms and each having a pair of rolls mounted for rotation about horizontal axes, said rolls having vertically extending flanges adopted to engage the edges of said strips to edge the four longitudinal corners thereof, there being a pair of rolls for each strip to be edged and a pair of arms for each roll; means for securing said arms on said shafts to position said edge rolling units in vertically arranged and staggered relationship with the strips therein retained in horizontal position; and means for forcing the rolls of each unit toward each other whereby said strips are edged without being bent laterally from their original positions and their path of movement.

2,775,152
APPARATUS FOR TAPERING THE ENDS OF SPRING LEAVES AND THE LIKE
Frank R. Krause, New Castle, Pa., assignor to The McKay Machine Company, Youngstown, Ohio, a corporation of Ohio
Application July 6, 1955, Serial No. 520,197
10 Claims. (Cl. 80—40)

1. An apparatus for reducing a metal blank on one side only comprising a platform for supporting said blank, a roll supporting slide, a first roll carried by said slide and adapted to engage said platform on the side thereof opposite said blank, a second roll carried by said slide and adapted to engage said blank, and a rigid back-up frame for said rolls, said frame having a cam plate thereon engaging the outer portion of said second roll whereby upon movement of said frame said rolls are rotated and moved longitudinally by frictional engagement with said frame, said cam plate causing said second roll to be forced toward said blank to cause a reduction of the same, said first roll acting upon said platform to oppose the forces exerted by said second roll.

2,775,153
STUD DRIVERS AND PULLERS
Osmo E. Parhamieni, Astoria, Oreg., assignor of one-half to Leonard J. Parhamieni, Astoria, Oreg.
Application March 25, 1955, Serial No. 496,822
2 Claims. (Cl. 81—53)

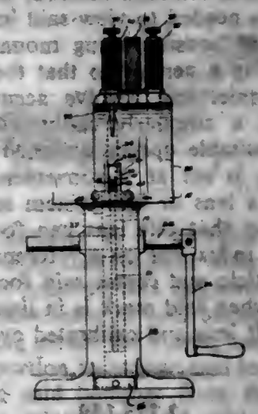
1. A tool for selectively installing and removing threaded studs, said tool comprising a body having a wrench-receiving polygonal outer surface and provided with an axial bore, opposite end portions of said bore being provided with oppositely screw-threaded counterbores whereby the intermediate portion of the bore is of a smaller diameter than the counterbored end portions and whereby said body provides at the inner ends of the counterbores a pair of flat annular shoulders disposed in planes normal to the axis of the bore, one of said counterbores being adapted to receive a stud so

that the latter abuts the shoulder at the inner end thereof to lock said body on the stud for rotation therewith, a driver screw provided in the other counterbore, and a cylindrical shank provided at the inner end of said driver screw, said shank being of greater length than said intermediate portion of said bore whereby the inner end face thereof may be locked against the stated stud and being of substantially the same diameter as and rotatable in said intermediate bore portion for supportable engagement therewith.

2,775,154
COUPLING PIN FOR SEPARABLE PARTS HAVING SPRING URGED PIVOTAL LOCKING PLATE THEREON
Noah C. Leaphart, Sr., Leesville, S. C.
Application November 26, 1953, Serial No. 393,261
1 Claim. (Cl. 85—3)

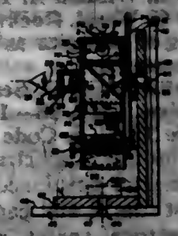
A coupling device comprising a main tubular pin having a longitudinal bore, said pin being provided at one end with a main longitudinal slot which extends through such end, said slot having said bore leading into the same, said main longitudinal slot forming spaced longitudinal extensions, said extension having longitudinal slots which lead into the main longitudinal slot, an adjustable locking plate disposed within the main longitudinal slot and arranged between said extensions, said adjustable locking plate having a longitudinal slot terminating short of one end of the locking plate and extending through the opposite end of said locking plate and also extending through the side edges of the locking plate, said locking plate being provided at the open end of the slot of the locking plate with tapered detents disposed near the central longitudinal axis of the locking plate, a pivot pin secured to the locking plate near its center and extending transversely of the locking plate and passing through the slot of the locking plate and projecting beyond the sides of the locking plate and held within the longitudinal slots of said extensions, and a retractile coil spring bodily mounted within the bore of the tubular pin and including a first longitudinal arm attached to the end of the main tubular pin remote from the locking plate and a second longitudinal arm extending into the slot of the locking plate and attached to the pivot pin of the locking plate, the arrangement being such that when the locking plate is in the transverse position it is held in contact with the walls of the main slot by the retractile coil spring, the spring permitting the pivot pin to shift outwardly longitudinally within the longitudinal slots of said extensions so that the closed end of the locking plate is arranged next to the outer ends of said extensions and the detents will then be held within the adjacent end of said bore, the arm of said spring which is secured to said pivot pin then being arranged within the open end of the slot of the locking plate adjacent to said detents, the locking plate being then swingable in either direction to return the locking plate to the transverse position, the retractile spring tending to hold the locking plate in the longitudinal position with the detents within said bore.

2,775,155
SHEET METAL CLAMP
Will M. Tompkins, Los Angeles, and Preston L. Ellis, Venice, Calif., assignors to Monogram Manufacturing Company, Culver City, Calif., a corporation of California
Application April 12, 1954, Serial No. 422,604
8 Claims. (Cl. 85—6)



2. A sheet metal clamp comprising: a casing having openings through the opposite ends thereof; a retaining member reciprocably mounted in said casing and projecting through said openings, said member including a threaded plunger at one end formed with a circular head, and a pair of separate laterally flexible work engaging pins at the other end provided with enlarged inner and outer ends; a collar slidably and non-rotatably mounted in said casing and having one end portion formed with a chamber to receive the enlarged inner ends of said pins rotatably therein and a reduced bore for the outward passage of said pins, the other end portion of said collar being internally threaded to engage said plunger and hold said pins longitudinally fixed relative to said plunger; and a non-circular nut of a diameter across the flats to circumscribe said head mounted on said plunger outwardly of said casing and being advanceable against said casing and retractable outwardly against said head by a power driven nut runner to engage and release said retaining member.

2,775,156
SPRING CLIP FOR SPROCKET CHAINS
Philip J. Inse, Westfield, Mass., and Earl E. Swanson, Suffield, Conn., assignors to Chain Belt Company, Milwaukee, Wis., a corporation of Wisconsin
Application July 10, 1952, Serial No. 298,146
5 Claims. (Cl. 85—8.8)



1. A spring clip for ready application to and removal from the circumferentially grooved end portions of a pair of adjacent sprocket chain pins, said clip comprising a resilient metal element having an elongated eye defined by a pair of spaced longitudinal legs which are connected at one end of the eye and unconnected at its other end, the metal defining the ends of the eye being provided with straight convergent surfaces adapted to tangentially contact arcuately spaced portions only of the bottoms of the chain pin grooves, and said eye being of a width relative to the chain pin diameter to prevent engagement between the inward edges of said legs and said groove bottoms when the convergent surfaces are in contact with the latter, whereby the resilient action of the legs may constantly maintain such contact between said convergent surfaces and groove bottoms and prevent vibration of the clip.

2,775,157
CARTRIDGE RELOADING DEVICE
Manley Lee Hand, Jr. and Billie Cleave Sparkman, Hobbs, N. Mex.
Application June 18, 1954, Serial No. 437,722
4 Claims. (Cl. 86—23)

1. A device for reloading cartridges comprising a pedestal provided with a reservoir in the lower end thereof, a platform on the top of said pedestal, an upstanding support extending through said platform intermediate the ends of the latter and connected to said pedestal for upward and downward movement, one end portion of said support projecting upwardly of said platform and the other end portion being adjacent said reservoir, said support having a bore extending longitudinally thereof from end to end, seating means in said one end portion of said support for holding the base of a cartridge case containing a spent primer cap, the bore of said support being adapted to convey a spent primer cap upon removal from the cartridge case base to said reservoir, means operatively connected to said support for causing the upward and downward movement of the latter, an upright upon said platform intermediate said projecting end portion and the other end of said platform and connected at its lower end to said platform for transverse sliding movement, a head carried by the upper end of said upright and projecting over the intermediate portion of said platform, and a plurality of spaced dies carried by said head and each selectively alignable with said cartridge case seating means upon sliding movement of said upright.

2,775,158
OPTICAL ANGLE SETTING AND ALIGNING DEVICE
Reginald F. Mitchell, Mount Vernon, N. Y.
Application May 9, 1952, Serial No. 286,930
9 Claims. (Cl. 88—2.3)

1. An optical angle setting and checking device having a housing containing cells, retaining rings or the like arranged to hold in correct optical relationship a lamp which illuminates a target reticle set at the exact focus of a corrected objective lens to make a collimator where the image of said target is projected from the objective

as parallel rays, means such as a rack and pinion for focusing said collimator by moving said objective or by splitting it into a fixed and a movable component so that the device can be used either as a collimator or focusing telescope, a beam splitter between said target reticle and objective so that when the device is set as a collimator and an external reflecting surface is set exactly normal to said parallel rays the image of said target is reflected back into the collimator with said beam splitter reflecting said reflected image to a fous on a calibrated eyepiece reticle and centered thereon, with suitable magnifying means as needed to view said image on said eyepiece reticle, said housing being mounted on a hollow shaft and carrying a vernier so that the combination of housing and vernier can revolve accurately concentric with respect to a circularly calibrated scale which is mounted on a suitable upright attached to a base so the complete device is set at a convenient position above said base, with a lens or lens system set in said hollow shaft arranged so that this lens can focus any mark or line, such as an index line on a reference surface, on to said eyepiece reticle and center said focused index mark on said reticle when said mark is in line with the optical axis of said shaft lens and calibrated eyepiece reticle.

**METHOD AND APPARATUS FOR THE COUNTING OF PARTICLES PER UNIT VOLUME IN A FLUID**

Joseph C. Frommer, Cincinnati, Ohio

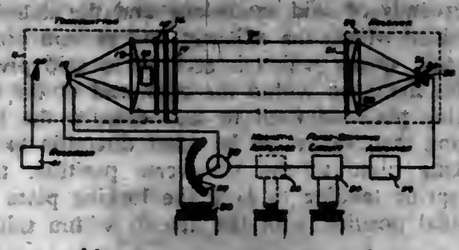
Application February 20, 1952, Serial No. 272,590

7 Claims. (Cl. 88—14)

5. A device for indicating the density of particle distribution comprising means for forming an inspection zone into which particles may be introduced, means responsive to the presence of a particle in said inspection zone to place an electrical circuit into a first state and to the absence of a particle in said zone to place said electrical circuit into a second state, a member to indicate the density of particle distribution, and means operatively connected to said member and responsive to the average state of said electrical circuit for actuating said member.

2,775,160

**APPARATUS FOR ABSORPTION SPECTRA ANALYSIS**



Lawrence W. Foskett, Washington, D. C., Norman B. Foster, Falls Church, Va., William R. Thickstun, Washington, D. C., and Rex C. Wood, Rockville, Md., assignors to the United States of America as represented by the Secretary of Commerce

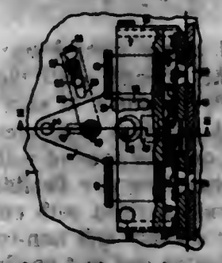
Application November 26, 1952, Serial No. 322,837

3 Claims. (Cl. 88—14)

(Granted under Title 35, U. S. Code (1952), sec. 266)

1. Apparatus for absorption spectra analysis comprising a light source, a detector positioned to receive a beam of light from said light source and capable of converting radiant energy into electrical energy, means for breaking said light beam into two rapidly oscillating groups of light waves one of which is absorbable by a constituent of the material to be analyzed and the other of which is not absorbable by this constituent, means for adjusting the temperature of the light source in response to an unbalance in the energy components at the detector due to the presence of absorbable material in the light path to thereby balance said energy components, and means for indicating changes in the intensity of said light source.

2,775,161



**MOTION PICTURE PROJECTOR DESIGNED FOR STEREOSCOPIC PROJECTION**

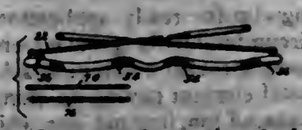
Jean Thévenaz, Grandson, Switzerland, assignor to Paillard S. A., Sainte-Croix, Switzerland, a corporation of Switzerland

Application December 2, 1953, Serial No. 395,680

Claims priority, application Switzerland July 3, 1953

7 Claims. (Cl. 88—16.6)

1. A stereoscopic motion picture projector wherein the film is displaced horizontally, comprising, in combination, a gate member having a pair of apertures, a lens support member, a pair of lenses fixedly mounted on said support member, said lenses being positioned on said support member in cooperative relationship with said apertures, at least one pressure plate means on said support for normally pressing film against said gate member, means for elastically connecting said pressure plate to said support, said means including at least one spring member, means for adjusting the lens support in the direction of the focus axis of each of said lenses, whereby the two projected images may be simultaneously focused without changing the position of the pressure plate with respect to the film and the said support may occupy a different position with respect to the plane of the film, and means for moving the lens support and the pressure plate connected thereto from the said gate, whereby film may be easily introduced into the gate.



2,775,162

**EYEGLASS FRAME**

Robert James Hipple, Hibbing, Minn.

Application September 28, 1953, Serial No. 382,601

5 Claims. (Cl. 88—41)

4. In an eyeglass frame, a decorative device mounting means comprising an arm pivotally connected to said frame having a portion extending outwardly therefrom and a pin mounted on said frame in spaced relationship with said arm and extending outwardly therefrom, said portion being movable laterally of said pin upon pivotal movement of said arm, and means connected to said frame and said arm biasing said arm for movement of said portions in a direction laterally of said pin.

2,775,163

**PRE-SPIN DEVICE FOR ROCKET LAUNCHER**

Conrad R. Vagnes, Washington, D. C.

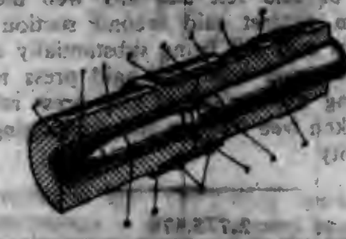
Application May 7, 1952, Serial No. 286,589

4 Claims. (Cl. 89—1.7)

(Granted under Title 35, U. S. Code (1952), sec. 266)

1. Apparatus for launching a rocket of the type having canted exhaust nozzles through which gas is adapted to issue and produce forces on the rocket to propel it along its longitudinal axis and rotate it about said axis comprising; a launcher tube adapted to contain the rocket, a rotary member disposed within the tube having vane means against which gas issuing from the rocket nozzles may impinge and effect rotation of the member, said member being rotatable in a plane normal to the longitudinal axis of the tube, the cant angle of said vanes being related to the cant angle of the nozzles in such manner that the member tends to rotate in said plane at a speed in excess of the speed of rotation of the rocket, means operative in response to the tendency of said member to rotate at said speed in excess of the speed of rotation of the rocket for locking said member and rocket together for conjoint rotation and for restraining forward axial movement of the rocket along the tube, and means for limiting the speed of rotation of said member to obviate the tendency for it to rotate at a speed in excess of the rocket and to permit the rocket to be released from said member.

2,775,164



**GUN BARREL**

Folke Gustav Tillander and Ivar Åslund, Bofors, Sweden, assignors to Aktiebolaget Bofors, Bofors, Sweden, a Swedish corporation

Application December 27, 1952, Serial No. 328,162

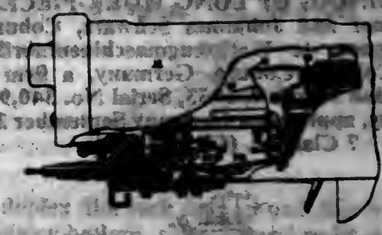
Claims priority, application Sweden February 11, 1952

10 Claims. (Cl. 89—16)

1. A gun barrel comprising a separate muzzle part and breech part in aligned abutment forming the chamber for a cartridge rammed into the barrel, a liner removably fitted in said muzzle part and extending from the end thereof abutting the breech part toward the muzzle of the barrel to a point slightly ahead of the nose of the projectile of a rammed cartridge, and joining means detachably joining the said parts in aligned position.

2,775,165

**FIRING MECHANISM**



John L. Lobstein, Springfield, Mass., assignor to the United States of America as represented by the Secretary of the Army

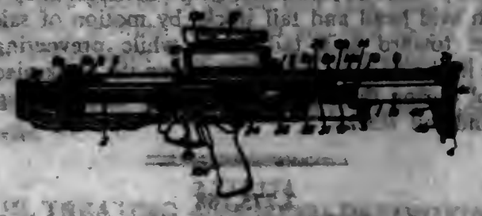
Application June 3, 1954, Serial No. 434,598

2 Claims. (Cl. 89—139)

(Granted under Title 35, U. S. Code (1952), sec. 266)

1. In a firearm having trigger means for firing the firearm, a hammer pivotal between a recoil and a firing position, a sear movable against said hammer, a ledge portion on said sear engageable with a lip portion on said hammer for releasably holding said hammer in a cocked position between said recoil and firing positions, latch means cooperating with the trigger means for disengaging said sear from said hammer to fire the firearm and releasably hold said sear out of the path of said hammer during movement thereof from the firing to the recoil position, a tongue portion extending from said latch means into the path of said hammer to be movable thereby to disengage said sear from said hammer after said lip portion is moved past said ledge portion to prevent contact therebetween during movement of said hammer to the recoil position, and spring means for biasing said sear into position for said lip portion to engage said ledge portion during movement of said hammer from the recoil to the firing position to releasably hold said hammer in the cocked position.

2,775,166



**PIVOTED BREECH BOLT LOCK FOR GAS PISTON FIREARMS**

Stefan K. Janus, London, England, assignor to the Minister of Supply in Her Majesty's Government of the United Kingdom of Great Britain and Northern Ireland, London, England

Application August 22, 1952, Serial No. 305,005

Claims priority, application Great Britain August 22, 1951

2 Claims. (Cl. 89—191)

2. An automatic firearm comprising a body portion, a barrel extending forwardly from said body portion, a piston disposed to be moved rearwardly by propellant gases from the said barrel, a breech mechanism comprising, a hollow cylindrical breech block mounted for translation in said body portion, a hollow firing sleeve concentric with and slidable in said breech block, a cam surface extending from the forward face of said sleeve, a concentric firing pin slidable within said sleeve, said pin having a ramp formed medially thereon, a plurality of radially spaced levers, said levers having a lug formed at one end, a tail portion at the other end thereof and a retaining shoulder between said lug and a fulcrum point at the median portion of said levers about which said levers are pivotally mounted in said breech block, said lug portion of said levers acted upon by said firing sleeve cam to lock said breech block in battery position when said sleeve is in forward position, a rigid connection between said piston and said sleeve, said connection passing through an elongated aperture in said breech block whereby said sleeve is moved rearwardly to disengage said cam surface and said lugs, said sleeve drawing said firing pin rearwardly simultaneously whereby said firing pin ramp engages said lever tail portion to unlock said breech block, said connection engaging the rear end of said aperture to move said breech block, sleeve and

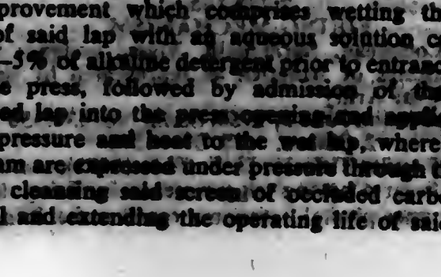
pin simultaneously and eject a cartridge; on forward movement of said breech block, sleeve and pin in response to resilient means acting against said pistol, said retaining shoulder engaging and restraining movement of said firing pin until said breech block is locked in battery position whereupon said firing pin is released by said shoulders.

---

2,775,167
MACHINING OF LONG WORK-PIECES
Richard Wagner and Johannes Schwarz, Coburg, Germany, assignors to Werkzeugmaschinenfabrik Adolf Waldrich Coburg, Coburg, Germany, a firm
Application March 9, 1953, Serial No. 340,962
Claims priority, application Germany September 29, 1952
7 Claims. (Cl. 90—11.4)

1. A machine for cutting screw threads in bar stock longer than the machine, comprising a bed, a hollow head stock mounted at one end of said bed including a collet chuck to grip the stock and through which the stock may be fed, a tail stock capable of centering the stock and through which the stock may be fed, a tool carriage mounted on said bed between said head and tail stocks, at least one screw cutting tool mounted in said tool carriage for cutting engagement with the stock, means to drive said carriage lengthwise of said bed, said cutting tool operating to cut threads as the tool carriage moves toward said head stock, and gripping means mounted in said tool carriage operable to clamp said stock in said tool carriage whereby upon clamping said bar stock by said gripping means prior to release of said collet chuck and upon release of said collet chuck the stock may be fed through said head and tail stocks by motion of said tool carriage toward said tail stock while preventing any change in the angular relation between the work-piece and the tool during the feeding of the bar stock through the head and tail stocks.

---



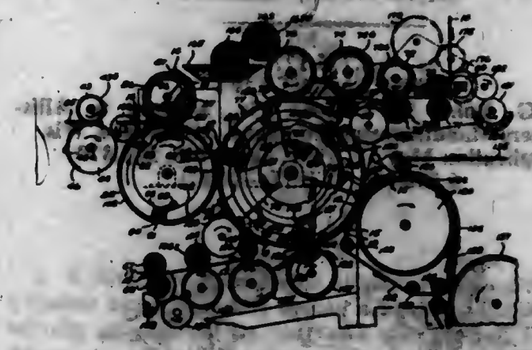
2,775,168
PAPER MACHINERY
Joseph Baxter, Jr., Franklin, Ohio, assignor to The Black-Clawson Company, Hamilton, Ohio, a corporation of Ohio
Application October 20, 1953, Serial No. 387,151
9 Claims. (Cl. 92—23)

1. Apparatus for screening and pulping a liquid slurry stock comprising a base, a shell mounted on said base and including an upper wall forming a cover and a lower wall forming a sump, a perforate screen mounted within said shell and cooperating with said cover to form a main chamber above said sump, a radial partition forming primary and secondary chambers within said main chamber, means on said shell forming an inlet for stock to said primary chamber, means defining a discharge passage from said first chamber through said cover, impeller means extending lengthwise of both said chambers for rotation therein causing essentially circumferential travel of said stock and discharge through said passage of large particles too large to pass through said screen into said sump, means for conducting said discharged large particles into said secondary chamber for further reduction and discharge through said screen into said sump, and means forming a discharge outlet in said cover from said secondary chamber for particles too large to pass through said screen, both said discharge outlet and said discharge passage being in portions of said cover located above the rotational axis of said impeller for essentially tangential discharge of said particles therethrough.

---

2,775,169
PAPERMAKING MACHINE
Ulf Gustav Söderlund, Norrköping, Sweden, assignor to Aktiebolaget Karlstads Mekaniska Werkstad, Karlstad, Sweden, a company of Sweden
Application August 25, 1954, Serial No. 452,155
Claims priority, application Sweden August 31, 1953
3 Claims. (Cl. 92—49)

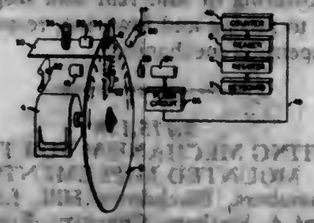
1. In a paper making machine having a wire with an outer surface on which a paper web is formed; the combination of a first suction roll adjacent to the outer surface of said wire, a second suction roll spaced from said first roll and said wire and substantially parallel with said first roll, an endless felt passing around and below said suction rolls and being interposed between and having an inner surface in direct engagement with the first and second suction rolls and an outer surface adjacent to said wire to pick-up said web and carry it away from said wire, a plain press roll directly beneath said second suction roll and having a surface engaging the outer surface of said felt and any web thereon and squeezing them against said second suction roll, the outer surface of said felt being substantially completely exposed between said wire and said press roll and a scraper engaging the surface of said press roll for disengaging a broken web thereon and discharging it downwardly by gravity.



---

2,775,170
METHOD OF CLEANING PRESS WIRES
Norris Lee Dustin and Charles T. Smith, Laurel, Miss., assignors to Masonite Corporation, Laurel, Miss., a corporation of Delaware
No Drawing. Application May 20, 1954, Serial No. 431,298
4 Claims. (Cl. 92—51)

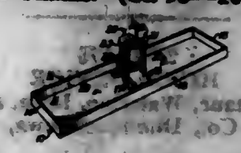
1. In the production of lignocellulose hardboard wherein a felted lap of hydrolyzed lignocellulose fiber containing about 30–50% fiber and 75–50% water is charged into a heated platen press on a supporting wire screen, the improvement which comprises wetting the lateral edges of said lap with an aqueous solution containing about 2–5% of alkaline detergent prior to entrance thereof into the press, followed by admission of the screen-supported lap into the press opening and application of platen pressure and heat to the wet lap, whereby water and steam are expressed under pressure through the screen thereby cleansing said screen of occluded carbonaceous material and extending the operating life of said screen.



2,775,171
METHOD AND MACHINE FOR BAG MAKING
Harford K. Stem, Newburgh, N. Y., and Harold L. Thompson, deceased, late of Newburgh, N. Y., by Thelma V. Thompson, administratrix, Newburgh, N. Y., assignors to Interstate Bag Company, Walden, N. Y., a corporation of New York
Application June 11, 1951, Serial No. 230,906
11 Claims. (Cl. 93—8)

4. A bag making machine comprising in combination means for advancing in an endwise direction a continuous sheet of paper or the like, means for severing same into a first bag side piece, means for advancing a continuous strip of handle material and means for cutting and folding the cut strips, means for attaching one end of each folded strip to an end portion of said first bag side piece, means for advancing simultaneously with said first sheet a second sheet, means for severing same into a second bag side piece, means for attaching said second bag side piece to such first bag side piece and to the unattached end of said handle, and means for bottoming the bag structure thus formed.

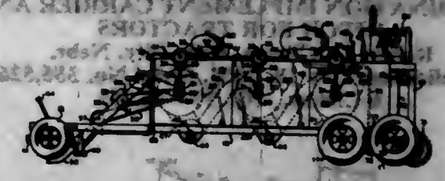
---



2,775,172
PHOTOGRAPHIC TYPE COMPOSING APPARATUS
René Higonnet and Louis Moyroud, Cambridge, Mass., assignors to Graphic Arts Research Foundation, Inc., Cambridge, Mass., a corporation of Delaware
Application August 26, 1952, Serial No. 306,462
Claims priority, application Great Britain August 27, 1951
6 Claims. (Cl. 95—4.5)

1. Photographic type composing apparatus comprising, in combination, a matrix support bearing a number of characters to be projected and marks each in precise relation to a corresponding character, a continuously rotating mechanism for moving the characters successively through a projection position and the corresponding marks simultaneously through a trigger position, an intermittent discharge device to illuminate a character in the projection position, means for projecting an image of said character upon a sensitized sheet, sensing means operable by each mark in the trigger position to generate an impulse, a multistage counter comprised of series-connected elements each adapted for a plurality of stable conditions and connected for cumulative addition of impulses from the sensing means, said counter also having a circuit connected with one of the stages to be energized by one of said impulses received when the counter represents a fixed sum, presetting means to introduce to the counter a sum corresponding to the number of marks intermediate the mark corresponding to the selected character and a predetermined mark, said preset sum being such that said circuit of the counter is energized when the selected character is in the projection position, and means actuated by said circuit to energize the discharge device.

---

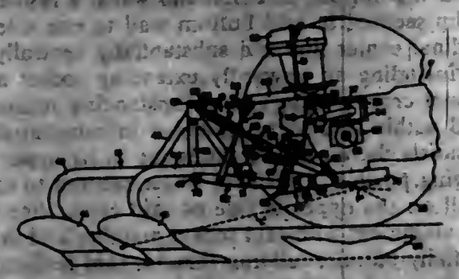


2,775,173
DUPLEX FILM RACK SUPPORT AND DRIP TRAY
George G. Ingham, Amarillo, Tex.
Application June 2, 1954, Serial No. 433,904
8 Claims. (Cl. 95—100)

1. A duplex film rack support and drip tray comprising a tray having bottom, side and end walls, a resilient one-piece clip secured to said bottom wall to one side of the longitudinal center line and substantially centrally thereof and including an upwardly extending socket member of channel cross-section and an upstanding resilient arm disposed within said socket member in substantially parallel relation thereto and terminating at its upper end in a diverging portion, a resilient finger secured to said bottom wall on the opposite side of said center line in substantial alignment with said socket member and in spaced substantially parallel relation thereto, said resilient finger terminating at its upper end in an outwardly diverging portion and upwardly extending protuberances in said bottom wall disposed on opposite sides of said clip substantially on said center line whereby the central member of a film rack having film supporting cross bars may be detachably received in said socket member and retained therein by said resilient arm, the walls of said socket preventing tilting of said film rack and the upper edge of said socket engaging the lower cross bar of said film rack to support film carried thereby above the side walls of said tray and whereby a second film rack may be detachably received between said finger and said socket member and in engagement with said protuberances to firmly support said second rack on said tray and with the lowermost films in said second rack clearly visible above said side walls.

---

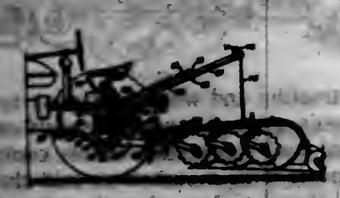
2,775,174
SOIL TREATING AND WEED DESTROYING APPARATUS
Richard F. Petrick, Ellsworth, Kans., Charles H. Everett, guardian of said Richard F. Petrick, incompetent
Application December 1, 1950, Serial No. 198,575
3 Claims. (Cl. 97—10)



3. A soil-treating and weed-destroying apparatus comprising a chassis, ground-engaging wheels on said chassis, soil and weed seed pulverizing means comprising a plurality of hammer mills mounted on said chassis, whereby the particles of soil and weed seeds are progressively reduced in size, power means on said chassis for driving said hammer mills, a ramp on the forward end of said apparatus communicating with the inlet of the first hammer mill, a ground engaging plow mounted on the forward end of said ramp, means to adjust the depth of cut of said plow, paddle wheel means on said ramp for moving soil upwardly thereon and into said first hammer mill, means for driving said paddle wheels from said power

means, means mounted on said chassis for conveying soil from one hammer mill to the next and an outlet chute on the last hammer mill for depositing pulverized soil on the ground, and screen means in the path of pulverized soil from each hammer mill, the mesh of said screen means being progressively smaller from the said one hammer mill to the said next hammer mill thereby preventing pulverized soil from the said one hammer mill from passing out of the said one hammer mill to the said next hammer mill until a predetermined degree of pulverization is obtained therein.

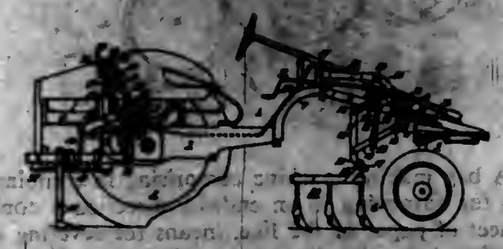
---



2,775,175
HITCH DEVICE
Wallace H. Du Shane, Waterloo, Iowa, assignor to Deere Manufacturing Co., Dubuque, Iowa, a corporation of Iowa
Application December 3, 1951, Serial No. 259,537
8 Claims. (Cl. 97—46.89)

1. A hitch device for connecting an implement to a tractor having a rear axle structure, said hitch device comprising generally fore-and-aft extending upper and lower link means spaced apart generally vertically and adapted to be pivotally connected at their rear ends to generally vertically spaced apart points on said implement, means for connecting the forward end of the upper link means with the tractor, and means for pivotally connecting the forward end of the lower link means with the rear axle structure of the tractor, said last mentioned connecting means comprising a part pivotally connected at one end with the forward end of the lower link means and shiftable relative thereto so as to be reversible and thereby extend either generally vertically upwardly or downwardly therefrom, optionally, vertically extending means receiving said part in either position and adapted to be carried by the tractor, and means fixing said part to said part-receiving means in different vertical positions and in either upwardly or downwardly extending position relative thereto.

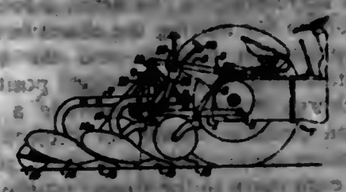
---



2,775,176
COMBINATION IMPLEMENT CARRIER AND HITCH FOR TRACTORS
Robert G. Gibson, Falls City, Nebr.
Application May 18, 1953, Serial No. 355,526
6 Claims. (Cl. 97—46.35)

2. A device for elevating and transporting an implement attached to the hitch of a tractor or the like, comprising, spaced standards rigidly secured to the axle housing of said tractor, a carriage pivotally attached to said standards, spaced booms having one end pivotally attached to said axle housing of said tractor, means on the outer ends of said booms for attachment to said implement for suspending said implement therefrom, hydraulic means having one end pivotally connected to said standards below the attached ends of said booms and the other end attached to said booms, adjustable means connecting said carriage with said booms for regulating the height of said carriage and fluid supply means connected to said tractor and to said hydraulic means for raising said implement for transporting the same behind the tractor.

---



2,775,177
IMPLEMENT LIFT
August G. Buhr, La Crosse, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.
Application May 17, 1951, Serial No. 226,879
6 Claims. (Cl. 97—46.57)

5. In combination with a tractor, a vertically adjustable front tool suspension mechanism and a vertically adjustable rear tool suspension mechanism mounted on said tractor for operation independently of each other, single acting fluid motors operatively connected, respectively, with said front and rear tool suspension mechanisms so as to move said front and rear tool suspension mechanisms in tool raising direction upon admission of pressure fluid to said fluid motors, a source of pressure fluid, and valve means selectively operable to either simultaneously connect both of said front and rear fluid motors to said source of pressure fluid for raising of both said front and rear tool suspension mechanisms, or to simultaneously connected both said fluid motors to a discharge for emission of pressure fluid from both said fluid motors for lowering of both said front and rear tool suspension mechanisms, and double acting biasing means operatively interposed between said tractor and said rear tool suspension mechanism and effective to delay both said raising and lowering of said rear tool suspension mechanism relative to raising and lowering, respectively, of said front tool suspension mechanism.

---

2,775,178
ADJUSTING MECHANISM FOR TRACTOR MOUNTED IMPLEMENTS
John M. Chambers, Blackdown Hill, Leamington Spa, and Vincent A. Stafford, Coventry, England, assignors to Massey-Harris-Ferguson (Sales) Limited, a British company
Application October 26, 1951, Serial No. 253,416
4 Claims. (Cl. 97—46.59)

2. In an implement adapted to be coupled to a tractor having a pair of trailing laterally spaced draft links, the combination of a pair of connecting elements on the implement for attachment to the respective draft links of the tractor, a member rotatably mounted on the implement and supporting one of said elements eccentrically of its rotational axis, a pressure fluid operated device operable to rotate said member, and a manually operable pump connected to supply pressure fluid to said device.

2,775,179
HITCH MECHANISM FOR TRACTOR-DRAWN IMPLEMENTS
John M. Chambers and James C. McVicker, Leamington Spa, England, assignors to Massey-Harris-Ferguson (Sales) Limited, a British company
Application April 10, 1952, Serial No. 281,644
Claims priority, application Great Britain April 14, 1951
2 Claims. (Cl. 97—47.14)

2. A hitch mechanism for attaching an implement to a tractor having laterally spaced draft links trailingly universally pivoted on its rear end portion and having a power unit for raising and lowering the links, an elongated flat bar adapted to be connected across the trailing ends of the draft links for universal pivotal movement relative thereto, said bar having a pair of laterally spaced recesses, a pair of vertically disposed pins rigidly mounted on the implement and spaced apart to register with and engage in the respective recesses in said bar as the latter is raised by the tractor hitch linkage, one of the pins having its projecting end positioned so as to engage in its associated recess before engagement of the other pin upon upward movement of said bar whereby to establish a pivot about which the implement can swing in response to fore-and-aft movements of the tractor, said other pin being engaged in its recess upon further raising of said bar by the tractor draft links.

---

2,775,180
HITCH DEVICE
Wallace H. Du Shane, Waterloo, Iowa, assignor to Deere Manufacturing Co., Dubuque, Iowa, a corporation of Iowa
Application May 31, 1952, Serial No. 290,916
6 Claims. (Cl. 97—47.36)

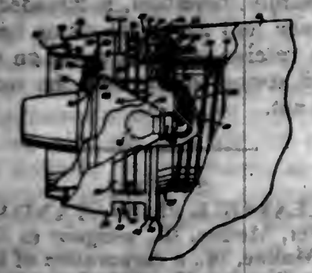
1. A hitch device for connecting an argricultural implement with a tractor of the type having front and rear wheels and a power lift including a pair of generally vertically swingable lift arms, said hitch device comprising a pair of lower draft links, an upper compression link, each of said links having means at their rear ends to receive said implement, means for connecting said lift arms with said lower links, means adapted to be fixed to the tractor for pivotally receiving the forward ends of said lower links, said link-receiving means being vertically adjustable, relative to the tractor, between upper and lower positions, and means adapted to be fixed to the tractor for pivotally receiving the forward end of said upper link and for connecting the latter to the tractor at a point disposed vertically between the levels of said upper and lower positions.

2,775,181
SPRING MOUNTED TOOL SHANK
Karl Martin Zeiss, Stockton, Calif., assignor to International Harvester Company, a corporation of New Jersey
Application August 17, 1953, Serial No. 374,732
2 Claims. (Cl. 97—47.24)

1. In an agricultural implement including a transverse frame and an earth-working tool having a lower earth-penetrating portion and an upper horizontal shank portion, means for mounting the tool on the frame comprising a clamp secured to the frame and having a portion depending therefrom, a transverse pivot pin carried by said depending portion, a rockable member including laterally spaced lugs affixed thereto depending therefrom and pivotally mounted on said pin and straddling the shank and a horizontal portion between the shank and the clamp, another transverse pivot pin carried by said lugs engaging the lower surface of the shank and confining the latter therebetween and the first mentioned pin, means for connecting the rockable member to the shank forwardly of said pivot pins, a pair of ears on the rockable member projecting upwardly therefrom, a threaded rod pivotally mounted between said ears, said clamp having an opening to slidably receive said rod, a nut on the end of the rod, and a coil spring surrounding the rod between the clamp and the nut.

---

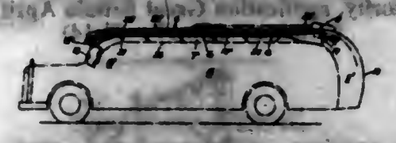
2,775,182
RELEASABLE FLOW STANDARD
Walter H. Silver, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application October 22, 1952, Serial No. 316,147
10 Claims. (Cl. 97—47.39)



1. A safety device for a ground working tool that is movably connected with a support, said device comprising a link, releasably connectible with said tool, a spring-biased arm pivotally connected with said link and receiving thereby the reaction of the force transmitted by said tool to said link, an extension carried by said link in rigid relation therewith and disposed adjacent the pivotal connection between said arm and said link, said extension being disposed generally normal to said link, and a fixed abutment disposed on said support in a position to engage said extension when said link is shifted, as by yielding of said spring biased arm, and thereby swing said link out of engagement with said tool.

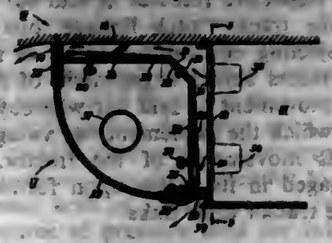
2,775,183
**OVERLOAD TRIP DEVICE FOR PLOWS**
Hermann E. Alspaugh, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application May 28, 1953, Serial No. 357,963
11 Claims. (Cl. 97—47.39)

11. A safety device for a ground-working tool, said device comprising an arm, resilient means acting against said arm, said arm being connected at one portion to said means, means including a part swingable relative to said arm for releasably connecting another portion of said arm with said tool to receive the ground-working reaction thereof, and means on said swingable part and engageable with said tool in response to swinging movement of said part, as by an overload on said resilient means, whereby movement of said tool relative to said part disengages the latter from said tool.



2,775,184
**VEHICLE AIR INTAKE STRUCTURE**
George R. Pipes, Mayfield Heights, Ohio, assignor to Eaton Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application May 6, 1953, Serial No. 353,361
5 Claims. (Cl. 98—2)

1. In an automotive vehicle having rear fenders with a taillight opening in the rear extremity of at least one of the fenders and a compartment in the rear body thereof with a vehicle air conditioning apparatus located in said compartment, the combination of a taillight assembly mounted on the rear extremity of the fender in said opening, said taillight assembly including an annular mounting member adapted to be received in sealed relation thereto, a shell having openings therethrough communicating with the atmosphere and a lamp reflector mounted internally of the shell, a conduit secured to a portion of the mounting member and extended inwardly of the fender between the shell and air conditioning apparatus in open communication with the atmosphere through the shell.

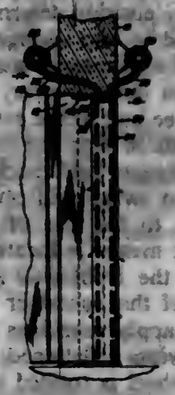


2,775,185
**AERATING DEVICE FOR VEHICLES, PARTICULARLY OMNIBUSSES**
Hermann H. F. Ahrens, Stuttgart-Weilimdorf, Wurttemberg, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Application May 14, 1952, Serial No. 287,732
Claims priority, application Germany May 18, 1951
10 Claims. (Cl. 98—9)

1. A ventilating device for vehicles comprising a body including side walls, a roof having sharply rounded side portions connecting said roof with said side walls, means in the front end of said roof including channel means for introducing fresh air from without said vehicle to the inside thereof, and suction hood means formed at least in part by said side portions and located in the rear portion of said roof including channel means

for drawing out the vitiated air from within the vehicle, said suction hood means facing rearwardly and being located substantially at the points of transition of said roof into said side walls by said sharply rounded portions, said suction hood means being in substantial alignment with said channel means to minimize resistance to flow of air therethrough.

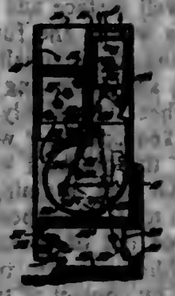
2,775,186
**VENTILATING APPARATUS**
John D. Strobell, New Haven, Conn., assignor to The Safety Car Heating and Lighting Company, Inc., New Haven, Conn., a corporation of Delaware
Application May 19, 1953, Serial No. 356,048
12 Claims. (Cl. 98—14)



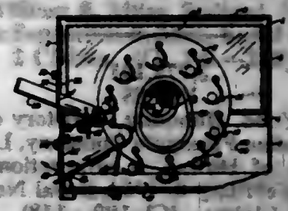
4. In ventilating apparatus for railroad cars or the like the combination of a centrally located overhead longitudinal air supply duct mounted adjacent to and extending down from a car ceiling having spaced side walls, with longitudinally disposed discharge openings in said side walls spaced one above the other and flow diverting structures comprising a top plate and a side plate disposed at an angle to said top plate, said structures being mounted adjacent but spaced from the side wall of said duct, to form downwardly directed passages therebetween whereby air emerging from said duct through said discharge openings is directed in a downward direction generally toward the aisle of the car and said structures being spaced from the ceiling of said car to form laterally directed discharge passages therebetween, whereby air emerging from said duct through said discharge openings is directed in a sweeping path along the ceiling and down by the windows of the car.

2,775,187
**AIR CIRCULATING DOOR FOR REFRIGERATOR**
Cleise M. McClankin, Norfolk, Va.
Application February 18, 1954, Serial No. 411,080
1 Claim. (Cl. 98—36)

A temperature barrier for use in an opening between two spaces at different temperatures comprising a compound member forming a pair of air ducts of equal size arranged about the periphery of said opening, said compound member including a curved front wall, a substantially straight back wall, an upstanding rib on said back wall, said rib extending into contact with said front wall and dividing said compound member into said pair of ducts, longitudinal extending rows of perforations in said pair of ducts in said curved front wall thereof with said perforations in one of said pair of ducts extending angularly with respect to the perforations in the other of said



pair of ducts to form a pair of series of diverging nozzles, air pumps in said spaces, each of said pumps delivering air to the duct adjacent to the space containing the respective pump from the space in which the pump is con-

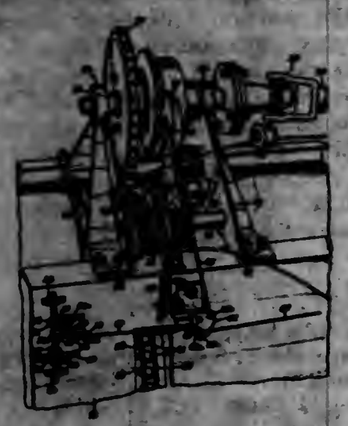


tained whereby a pair of slightly diverging air curtains of differing temperatures will be formed across said opening, said curtains diverging to substantially eliminate mixing of the air of the curtains.

2,775,188
**MEANS FOR HEATING AND VENTILATING ROOMS, PARTICULARLY SCHOOL ROOMS AND THE LIKE**
Russell R. Gunsaus, Cincinnati, Ohio
Application November 19, 1952, Serial No. 321,461
1 Claim. (Cl. 98—38)

A heating and ventilating unit having front, rear and side walls, a top and bottom; grill work in the front wall adjacent the top for receiving air from within the space in which the unit is located; means to heat the air received in said unit through said grill work, said heating means being located near the top of the unit; blower means in said unit beneath said heating means; a damper between said heating means and said blower means; a fresh air conduit in said unit below said blower means and leading to the out of doors; a damper for said conduit; grill work through which air may be discharged from said unit as motivated by said blower means, said last mentioned grill work being located in said top adjacent said rear wall; a damper for said last mentioned grill work; a damper motor for controlling the positions of the said dampers, the third mentioned, discharge damper being towards its wide open position when the second mentioned, fresh air damper is towards its full closed position, said damper motor being responsive to a thermostat located within the said space; a vent located adjacent the front and bottom of said unit below said blower means, said vent and said fresh air conduit communicating with a common compartment located below said blower means; a damper for said vent, said damper being hinged so as to open said vent by suction in said compartment created by said blower means when said fresh air damper closes and to close said vent by gravity when said fresh air damper opens; and linkage connecting said damper motor with said first, second and third mentioned dampers only, said linkage being such that said third mentioned discharge damper and said first mentioned damper are moved towards their closed position when said second mentioned fresh air damper is moved towards its open position and vice versa so that when cold fresh air is being discharged from said unit such cold fresh air leaves in a relatively small stream having high velocity and when heated air is being discharged from said unit such heated air leaves in a relatively large stream having slow velocity.

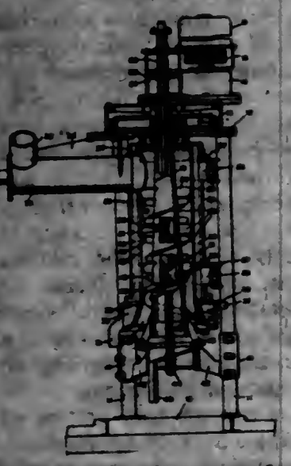
2,775,189
**WIENER BARBECUING MACHINE**
Raymond E. Schell, Pittsburgh, Pa.
Application March 27, 1953, Serial No. 345,180
1 Claim. (Cl. 99—427)



A wiener barbecuing machine comprising a base, a pair of laterally spaced vertical rotor members rotatably supported by said base on a horizontal axis, a plurality of hook-like carriers supported by the rotor members and swinging on parallel axes from their upper ends between said members at circumferentially spaced intervals, each carrier being formed from a plurality of laterally spaced hooks, the lower part of each carrier being formed to support a wiener, means for rotating said rotor members continuously to move the carriers in a circular path, the side of the carriers facing the up-going side of the rotor members being open for reception and discharge of wieners, an inclined chute at the up-going side of said rotor members extending down toward the rising carriers and having means at its lower end for keeping a row of wieners from rolling off the chute, the lower end of the chute being recessed to permit the lower part of each carrier to pass up through it and lift a wiener from the chute, heating means adjacent said path for cooking wieners on the traveling carriers, vertically extending unloading means below said chute projecting into said path and having an upwardly extending surface positioned to have the lower ends of the rising carrier hooks slide upward along it for swinging the lower part of each successive rising carrier inward to dump out the cooked wiener carried by it, and a ramp inclined downward from the top of said unloading means for receiving cooked wieners from the carriers.

2,775,190
**WIRE TWISTING MECHANISM FOR HAY BALERS**
Howard F. Bardwell and Patrick L. May, Memphis, Tenn., assignors to International Harvester Company, a corporation of New Jersey
Application December 17, 1952, Serial No. 326,492
13 Claims. (Cl. 100—9)

1. In a baler comprising an elongated bale forming chamber, means delivering material to be baled to said chamber, means within said chamber for compressing material delivered thereto, means supplying bale encircling wires to and around the compressed material, means intertwisting said wires at one end of said compressed material, said last named means including a ring member positioned intermediate the ends of said cham-

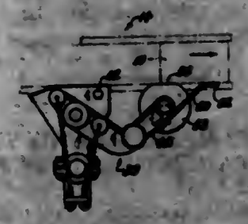


ber and transversely of the chamber, said ring member having inwardly projecting wire engaging hooks fixedly

mounted thereon, and means for rotating said ring member.

---

2,775,191
PRESS
James Thomas Yeoi, Honolulu, Territory of Hawaii, assignor to Hawaiian Pineapple Company, Limited, Honolulu, Territory of Hawaii, a corporation of Hawaii
Application February 8, 1954, Serial No. 408,796
5 Claims. (Cl. 100—145)

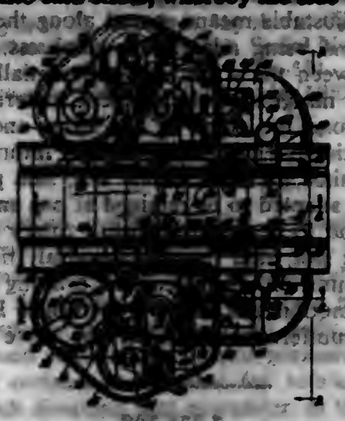


1. In a press having rotatable screw feeding and pressing means, a housing therefor provided with an outwardly flaring conical discharge orifice, and an axially adjustable, non-rotatable pressure cone mounted coaxially within said orifice and forming therewith a discharge passage of annular cross section having conical surfaces, means for preventing clogging of said passage including a non-planar spiral member connected with said screw feeding and pressing means for rotation therewith and having a portion spaced and extending therefrom into said discharge passage to move between and relative to its conical surfaces over said non-rotatable pressure cone.

---

2,775,192
MARKING DEVICES
Malcolm Blanchey, Woodside, N. Y., assignor to Adolph Gottscho, Inc., Hillside, N. J., a corporation of New York
Application May 21, 1953, Serial No. 356,375
2 Claims. (Cl. 101—35)

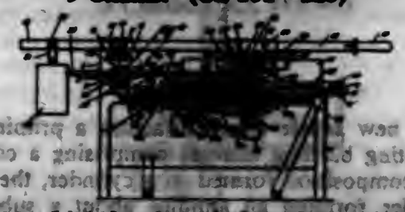
1. A marking device for association with a conveyor carrying successive rectangular containers past the device to apply markings to the front wall surface and a side wall surface of each of the successive containers; said marking device comprising support means adapted to be mounted adjacent one side of the associated conveyor, a pivoted arm swingably mounted adjacent one end on said support means for horizontal swinging and extending from the latter generally in the direction of movement of the conveyor, two balanced springs each connected between said support means and said pivoted arm at locations on the latter disposed at opposite sides of the swinging axis of the pivoted arm and acting to yieldably urge the latter to an inner position determined by the balancing of the forces exerted by said springs and in which the free end of said pivoted arm extends across the path of travel of the containers on the conveyor, and a marking wheel mounted on said free end of the pivoted arm for rotation about a vertical axis so that the front wall of each successive container engages said marking wheel and pushes against the latter to swing said pivoted arm away from said inner position to the side of the path of travel at which said support means is located while said marking wheel rolls across the front wall surface and along the side wall surface of the container which is adjacent the support means to apply markings to said surfaces, said marking wheel having a flattened peripheral portion so that the marking wheel is rotated by rolling contact first with the front wall surface and then with the side wall



surface of the container being marked until said flattened peripheral portion of the marking wheel comes into contact with the side wall surface and prevents further rotation of the marking wheel; and further comprising a retaining bar extending longitudinally from said free end of the pivoted arm and projecting beyond the periphery of said marking wheel to slidably engage the side wall surface of the marked container when said flattened peripheral portion of the marking wheel engages the side wall surface, so that said retaining bar prevents return of said pivoted arm to its inner position until the marked container has moved out of contact with said marking wheel thereby avoiding rotation of the latter from the position established by contact of the flattened peripheral portion with the side wall surface of the marked container, said retaining bar being formed with an elongated longitudinal slot therein, and securing bolts extending through said slot and tapped into the free end portion of said pivoted arm to secure said retaining bar to said pivoted arm in a longitudinally adjustable manner for varying the projection of said retaining bar beyond the periphery of said marking wheel.

---

2,775,193
MECHANISM FOR APPLYING INDICIA TO PACKAGES OR THE LIKE
Louis Mastello, Chicago, Ill., assignor to Wm. Wrigley, Jr. Company, Chicago, Ill., a corporation of Delaware
Application March 30, 1953, Serial No. 345,993
4 Claims. (Cl. 101—37)



1. Apparatus for applying indicia upon packages, said apparatus comprising a source of packages arranged side-by-side, a chute receiving said arranged packages at one end thereof, means for continuously impelling the packages along the chute, a wheel having spaced teeth around the periphery thereof, said teeth extending into the chute and being spaced apart a distance such that the corresponding parts of adjacent teeth encompass two packages, and the extension of a tooth into the chute being less the height of a package in the chute such that every other package contacts the outer surface of a tooth and is displaced above the chute a distance equal to the extension of the tooth into said chute, whereby the side of a package

adjacent the displaced package may contact a tooth and impart movement to the tooth and wheel.

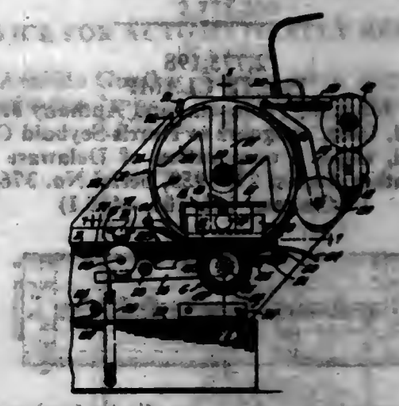
---

2,775,194
DEVICE FOR PRINTING IN REGISTER
Louis Gilbert Dubuit, Paris, France
Application August 24, 1954, Serial No. 451,897
Claims priority, application France June 9, 1954
9 Claims. (Cl. 101—123)

1. In a machine for the printing of materials in sheets, in register, by the silk screen process and comprising an arm carrying the squeegee, moving and pivoting on a rail arranged longitudinally on one of the larger sides of the table of the machine, a round section rail, a carriage for carrying the squeegee-holding arm, moving and pivoting on said rail, two bell crank levers articulated at the two ends of the machine for pivoting about an axle parallel with said rail, an upper control bar connecting the two upper arms of said bell crank levers, two bars parallel with said rail connecting the central articulation portion of said bell crank levers, two adjustable arms on said parallel bars and carrying the frame for the silk screen, a lower control bar connecting the lower arms of said bell crank levers, margin setting elements connected with said lower control bar by rods, a system for holding the sheet to be printed, a control element for said holding system connected by a rod with said lower control bar, the unit being so arranged that the squeegee-carrying arm, when raised to a certain height, comes in contact with said upper control bar and drives it along with it thereby causing a pivoting movement of the two bell crank levers as well as of the parallel bars and of the lower control bar they carry for successively causing the screen carrying frame to raise, the margin setting elements to be set in an active position and the action of the system for holding the printed sheet to be interrupted, the squeegee-carrying arm causing all the converse effects when being lowered.

---

2,775,195
METHOD OF DAMPENING A LITHOGRAPHIC PLATE OR STONE AND A DAMPING ROLLER FOR USE IN THAT CONNECTION
Hermanus Hubertus Wierda, Wassenaar, Netherlands
Application May 16, 1953, Serial No. 355,298
Claims priority, application Netherlands May 17, 1952
2 Claims. (Cl. 101—148)

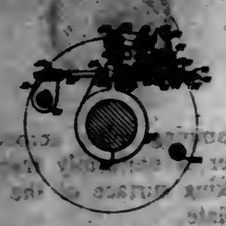


2. A method of dampening the ink free areas of a lithographic plate comprising the steps of wetting a damping roller having an outer seamless, water absorbing cover that consists of a tubular knitted cut velour fabric having a dense and deep pile of single threads with free ends providing a felted, homogeneous working surface,

and rolling the damping roller across the lithographic plate so that water is uniformly transferred from the homogeneous working surface of the roller to the ink free areas of the plate.

---

2,775,196
ROTARY PRINTING MACHINE WITH FLAT PRINTING PLATE
William B. Miles, Bedford, Va.
Application September 3, 1952, Serial No. 307,619
2 Claims. (Cl. 101—212)

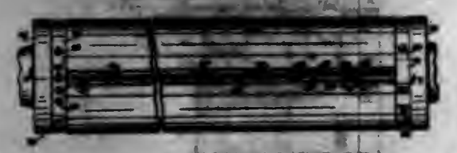


1. In a printing machine in combination, a rotary printing cylinder having a segment removed therefrom to provide a flattened surface thereon, printing members removably mounted exclusively on said flattened surface, all of the type element thus being disposed substantially in the same plane, an impression cylinder, pivotally mounted means supporting said impression cylinder for bodily movement toward and away from the axis of said printing cylinder, means urging said impression cylinder into contact with said printing cylinder, cam means carried by said printing cylinder for maintaining said impression cylinder out of engagement with the major portion of the cylindrical surface of said printing cylinder but permitting engagement with the flattened portion thereof to effect a printing operation, said impression cylinder being freely rotatable with respect to its supporting means and during a printing operation being rotated solely by frictional engagement with said printing cylinder, a stop for the leading edge of a sheet to be printed positioned on the delivery side of said couple and means actuated by the movement of said pivotally mounted means to render said stop ineffective when said printing and impression members move into printing relationship.

---

2,775,197
GRIPPER MECHANISM
Robert K. Norton, Twinsburg, Ohio, assignor to Harris-Seybold Company, Cleveland, Ohio, a corporation of Delaware
Application August 26, 1953, Serial No. 376,637
8 Claims. (Cl. 101—409)

1. In a sheet handling machine, sheet gripper means adapted to engage the forward edge of a sheet, said means comprising a gripper shaft, sheet grippers mounted on said shaft, gripper pads with which said sheet grippers



are adapted to cooperate, a crank keyed to said shaft, a second shaft the axis of which is fixed with respect to the axis of said gripper shaft, a toggle connection between said crank and said second shaft comprising an arm on said second shaft and a link pivotally connected with said arm and crank, the substantial alignment of said

arm and link constituting toggle on position and corresponding to the closed position of said sheet grippers, and gripper-operating means comprising cam means and spring means, one for turning said arm to break the toggle connection, and the other for returning the toggle connection to toggle-on position and the grippers to said gripping positions.

---

**2,775,198**
**PLATE CLAMP**
**Thomas H. Johnson, Pasadena, and Anthony J. Mueller, Cleveland, Ohio, assignors to Harris-Seybold Company, Cleveland, Ohio, a corporation of Delaware**
**Application August 27, 1953, Serial No. 376,800**
**19 Claims. (Cl. 101—415.1)**

1. For a printing machine, a cylinder having a lengthwise gap therein, a flexible printing plate wrapped around said cylinder, a pair of bars within said gap secured to the respective ends of said plate, a pivot for connecting an intermediate point of one of said bars to said cylinder within said gap, means for tieing the unpivoted bar to said pivoted bar crosswise of the gap effective to prevent bodily movement of the unpivoted bar away from the pivoted bar while permitting endwise movement of the unpivoted bar, and means for skewing the pivoted bar about its pivot.

---

**2,775,199**
**FLEXIBLE PRINTING PLATE LOCKING DEVICE**
**Clarence Lloyd Cluff and Carl A. Mueller, Randolph, Mass., assignors, by mesne assignments, to M. E. Cluff & Sons, Inc., Randolph, Mass., a corporation of Massachusetts**
**Application February 24, 1953, Serial No. 338,330**
**1 Claim. (Cl. 101—415.1)**

In a rotary printing press, the combination of a plate cylinder having a transverse slot in its surface adapted to receive the interned ends of a printing plate of thin flexible material, said slot having substantially parallel walls, a projection in one end of the slot, and plate locking means comprising a pair of elongated flexible strips narrower than the width of the slot and adapted to be disposed therein with their edges adjacent the slot walls, resilient material capable of developing friction with the plate interposed the said strips, and a number of individually adjustable means spaced along the strips, each of said means being adapted to compress the resilient material between the strips in a substantially local area to cause the margins of the resilient material to extend laterally beyond the edges of the strips and thereby to provide frictional engagement of the interned ends of the plate against the sides of the slot, said plate locking means being adapted to be retained at one end under said projection and to be lowered with a rotary motion until it lies in the slot, said resilient material frictionally engaging the interned margins of the printing plate during said rotary motion and thereby exerting a laterally progressive circumferential pull on the plate around the cylinder.

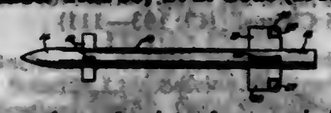
**2,775,200**
**PRIMING DEVICE**
**Richard G. Gessler, Lawrence, Kans., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware**
**Application December 3, 1952, Serial No. 323,856**
**5 Claims. (Cl. 102—27)**

1. As a new article of manufacture a priming device for detonating blasting charges comprising a compacted explosive composition formed as a cylinder, the walls of said cylinder forming an annulus about a substantially coaxially disposed perforation extending through at least a major extent of the length of the cylinder and adapted to contain a detonating means, said explosive consisting essentially of at least 75 percent cyclonite and at least 15 percent nitrocellulose to form an independent cohesive body.

---



**2,775,201**
**SAFETY DEVICES FOR APPARATUS CONTAINING STORED PRESSURE ENERGY**
**Hugh Graham Conway, Gloucester, England, assignor to British Monitor Limited, Gloucester, England, a British company**
**Application August 28, 1952, Serial No. 306,940**
**Claims priority, application Great Britain August 31, 1951**
**11 Claims. (Cl. 102—49)**

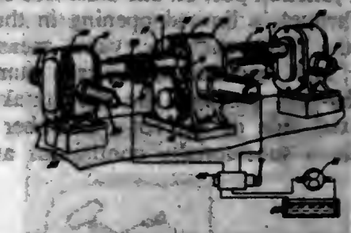
1. In a rocket or other self-propelled missile or like power unit comprising a pressure chamber, a pressure release sleeve fixed in said pressure chamber, a safety plug positioned and adapted to close off the distal end of said sleeve, a spring collet connection between said sleeve and plug capable of yielding to permit displacement of the plug, and an annular member movable into engagement with said collet, when desired, to prevent said collet from yielding as aforesaid to permit displacement of said plug.

**2,775,202**
**GYROSCOPIC ROLL CONTROL SYSTEM FOR AIRCRAFT**
**Sydney B. Cresciet, Inyokern, Calif.**
**Application October 26, 1951, Serial No. 253,438**
**12 Claims. (Cl. 102—50)**
**(Granted under Title 35, U. S. Code (1952), sec. 266)**

5. Roll control mechanism for a missile having an elongated body with its longitudinal axis in the line of flight, comprising a frame fixed to said body and extending radially therefrom, a control surface hinged to said frame and spaced radially from said body, a gyro-wheel carried by said surface with its axis normally perpendicular to said surface, and means for rotating said gyro-wheel in such direction that precession of the gyro-wheel due to roll of the missile will deflect the surface in a direction to tend to arrest said roll.

---

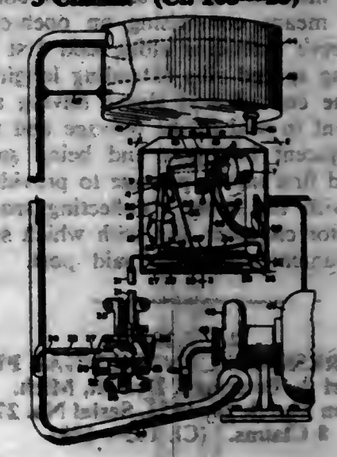
**2,775,203**
**FUEL INJECTION PUMP**
**Carl F. High, Detroit, Mich., assignor to American Bosch Arma Corporation, a corporation of New York**
**Application November 24, 1953, Serial No. 394,058**
**3 Claims. (Cl. 103—2)**



1. In a device of the character described, a housing having a bore, a fuel inlet communicating with said bore for supplying fuel thereto, a pumping and distributing member mounted for reciprocation and rotation in said bore in said housing, said pumping and distributing member having a bore, port means for supplying fuel to said bore in said pumping and distributing member, said pumping and distributing member having a distributing port communicating with said bore in said pumping and distributing member, a plurality of outlets in said housing communicating with said bore in said housing and adapted to deliver fuel to each of said plurality of outlets successively upon rotation of said pumping and distributing member and a metering valve member for controlling the quantity of fuel supplied to said bore from said inlet, said valve member being in said bore in said housing and in alignment with said pumping and distributing member, and a fuel passage connecting said metering valve to said bore in said housing between said valve and said pumping and distributing member.

---

**2,775,204**
**DUAL PUMP DRIVE WITH OVERRUNNING CLUTCHES**
**Webster R. Batten and Donald Haddon, Rockford, Ill., assignors to Geo. D. Roper Corporation, Rockford, Ill., a corporation of Illinois**
**Application March 23, 1953, Serial No. 344,019**
**3 Claims. (Cl. 103—11)**

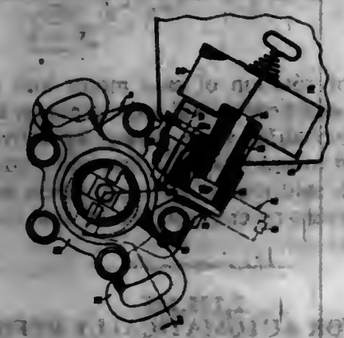


1. A pumping apparatus comprising a rotary hydraulic motor having first and second fluid passages communicating therewith, first and second rotary shafts driven in unison by said motor, a first rotary pump having a drive shaft, a second rotary pump having a drive shaft, a first overrunning clutch means disposed between said first shaft and the drive shaft for said first pump for establishing a driving connection therebetween when said motor rotates in one direction, a second overrunning clutch means disposed between said second shaft and the drive shaft for said second pump for establishing a driving connection therebetween when said motor rotates in the other direction, and control valve means connected to said first and second fluid passages of said motor for selectively passing fluid in either direction to said motor to control

the direction of rotation of said motor and thereby selectively drive said first or said second pump, said control valve means including valve means operative to block the flow of fluid to and from said first and second passages to thereby lock said motor against rotation in either direction and prevent reverse rotation of said first and said second pumps.

---

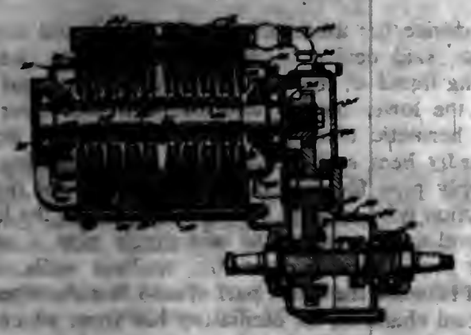
**2,775,205**
**DEVICE FOR AUTOMATICALLY REFILLING TANKS**
**Arnoldo Gunther, Buenos Aires, Argentina**
**Application January 24, 1952, Serial No. 268,057**
**3 Claims. (Cl. 103—25)**



1. A device for automatically refilling liquid containing tanks, said device comprising a hermetic chamber containing liquid of the tank in the upper part and mercury in the lower part, a duct between the upper part of said hermetic chamber and a tank supply pipe, a downwardly bent end on said duct and projecting into said supply pipe for detecting pressure changes therein, a connection tube opening into said tank below the lowest liquid level and connected to said supply pipe, a second chamber provided with extensible, resilient walls, a second duct between the lower part of said first chamber and said second chamber, an oscillatory bar from which said second chamber is suspended, mercury switches operatively associated with said bar, and a pump operatively connected to said mercury switches for actuation thereby, whereby said pump is automatically actuated upon a reduction in pressure in said supply pipe to refill said tank.

---

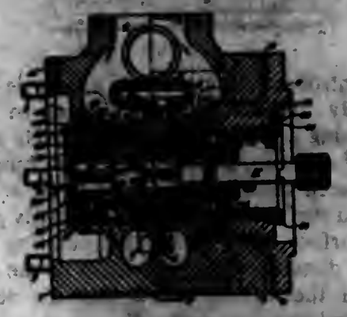
**2,775,206**
**PUMP**
**La Vern R. Connolly, Marshall, Mich., assignor to Eaton Manufacturing Company, Cleveland, Ohio, a corporation of Ohio**
**Application March 7, 1955, Serial No. 492,717**
**5 Claims. (Cl. 103—42)**



1. In a rotary pump, a housing having therein a rotor chamber, two intake passages and a discharge passage

communicating with said rotor chamber, rotor means operable in said rotor chamber for producing a pumping action, said housing also having a valve chamber communicating with the discharge passage and a by-pass passage connecting said valve chamber with the intake passages through a junction port on one axial side of the rotor chamber and through a limited opening in the opposite axial side of the rotor chamber, valve means in said valve chamber and operable to by-pass pumped fluid through said by-pass passage, the first intake passage on said one axial side of the rotor chamber having a side wall which is substantially continuous and imperforate between said junction port and said rotor chamber for confining in said first intake passage the fluid being supplied therethrough to said rotor chamber, and flow directing means comprising an open-ended sheet metal insert sleeve extending along said first intake passage and having spaced ribs extending longitudinally of said sleeve, one end of said sleeve having a relatively tight engagement in said intake passage and the wall of said sleeve adjacent its other end being spaced from the wall of said first intake passage to provide a venturi and defining with the latter a deflecting space opening toward said rotor chamber and with which said by-pass passage communicates through said port.

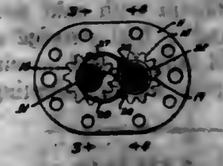
---



**2,775,207**
**HIGH PRESSURE CENTRIFUGAL PUMP**
**Earl A. Peterman, Detroit, Mich.**
**Application March 24, 1952, Serial No. 278,200**
**8 Claims. (Cl. 103—109)**

1. In a centrifugal pump, a rotatable shaft having a plurality of rotors thereon, said rotors being of substantially identical shape, a plurality of passageways in each of said rotors extending in a generally radial direction, each passageway having an axially facing intake section at its inner end and an axially facing discharge section at its outer end, a plurality of stators interposed between said rotors and having vanes adjacent said rotors to form passageways for directing the fluid from the discharge of one rotor to the intake of the next adjacent rotor, said stators being separable and of substantially identical shape, and a plurality of vanes on the back surfaces of said rotors, said vanes extending radially outwardly at least to the outermost portions of said rotor discharge sections.

---

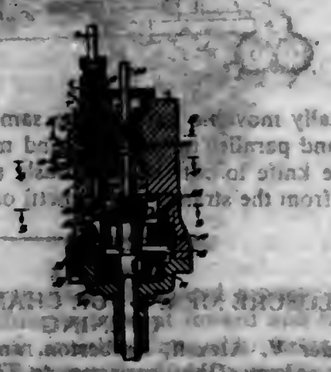


**2,775,208**
**ROTARY PUMPS**
**Paul M. Mueller, West Hartford, Conn., assignor, by mesne assignments, to Pratt & Whitney Company, Incorporated, West Hartford, Conn., a corporation of Delaware**
**Application April 20, 1953, Serial No. 349,605**
**5 Claims. (Cl. 103—111)**

1. A rotary pump for volatile liquid comprising: a housing, a pair of ball bearings packed with a lubricant and seated in said housing in selected spaced relation thereto; a shaft supported by said bearings in selected spaced relation to said housing, a pumping impeller rotor fixedly mounted on said shaft between said bearings; a plurality of running seals between said rotor and housing; a pair of communicating annular spaces formed by said spaced relation of said shaft and housing and providing a fluid flow passage from one of said bearings to the other; an air passage connecting each of said annular spaces with the atmosphere outside said housing, and an air impeller on said shaft for drawing a current of air in through one of said air passages and one of said annular spaces and discharging said current through the other of said spaces and said air passages, thereby removing from said spaces the vapor of any liquid which has leaked past said seals and thus preventing said vapor from reaching said bearings; whereby said lubricant is protected from the dissolving action of said vapor.

---

**2,775,209**
**LUBRICATION MEANS FOR ROTARY PUMPS**
**John R. Albright, Rockford, Ill., assignor to Geo. D. Roper Corporation, Rockford, Ill., a corporation of Illinois**
**Original application June 14, 1946, Serial No. 676,818, now Patent No. 2,612,113, dated September 30, 1952. Divided and this application September 4, 1952, Serial No. 307,881**
**6 Claims. (Cl. 103—126)**



1. A rotary pump or fluid motor comprising a casing defining a fluid displacement chamber and having pressure and exhaust passages at opposite sides of the fluid displacement chamber, a rotary driving gear in said chamber, means supported within the casing defining a bearing supporting the driving gear for rotation, a rotary driven gear located within the fluid displacement chamber in meshing relation to the driving gear, and means defining a pair of lubrication grooves in the bearing extending longitudinally thereof and communicating with each other at one end thereof and with the pressure and exhaust passages respectively at the other ends thereof for recirculating through the lubrication grooves a portion of the fluid displaced through the fluid displacement chamber to lubricate the bearing for the driving gear, said grooves being each angularly spaced substantially less than 90°

from the mesh point of the gears and located remote from the point at which the thrust is placed on the bearing due to the radial hydraulic thrust on the gears produced by the fluid pressure acting on the periphery of the driving gear.

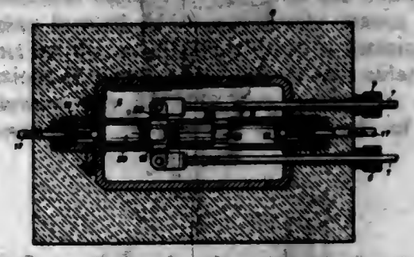
**2,775,210**
**PISTON PUMP**
**Albin Buchmann, Solothurn, Switzerland, assignor to Scintilla Ltd., Solothurn, Switzerland**
**Application April 8, 1952, Serial No. 281,216**
**Claims priority, application Switzerland April 10, 1951**
**17 Claims. (Cl. 103—154)**



1. A pump, comprising, in combination, supporting means; at least one cylinder member mounted in said supporting means, said cylinder member being closed at one end and formed with at least one inlet passage and at least one outlet passage; spring-loaded check valve means located in said outlet passage of said cylinder member; a piston member turnably and reciprocably mounted in said cylinder member and having a cylindrical outer surface and a transversal end face located oppositely the closed end of said cylinder member and defining in said cylinder member an operating chamber communicating with said outlet passage, said piston member being formed with at least one elongated inlet slot in said cylindrical surface thereof ending in said transversal end face thereof; driven shaft means rotatably mounted in said supporting means; a cam wheel fixedly mounted on said shaft means and engaging said piston member, and moving said piston member during rotation of said cam wheel toward the closed end of said cylinder member; spring means for urging said piston member toward said cam wheel; movable actuating means connected to said piston member for turning said piston member in said cylinder member between a first position in which said inlet slot coincides with said inlet passage, and a second position in which said inlet slot is angularly spaced from said inlet passage; and adjustable control means connecting said actuating means with said shaft means for operating said actuating means in a timed sequence with said cam wheel in such manner that at least during part of the reciprocating movement of said piston member in the direction away from said closed end of said cylinder member said inlet slot is in said first position thereof, and that at least during part of the reciprocating movement of said piston member in the opposite direction said inlet slot is in said second position thereof.

---

**2,775,211**
**DOUBLE ACTION PUMPS**
**Alfred Lebede, Munich, Germany, assignor to Gesellschaft fuer Linde's Eismaschinen Aktiengesellschaft, Hoellriegelskreuth, near Munich, Germany, a corporation of Germany**
**Application May 29, 1952, Serial No. 290,913**
**Claims priority, application Germany June 11, 1951**
**2 Claims. (Cl. 103—175)**

1. In a double action installation for pumping liquefied gases, an insulated outer casing, a cylindrical casing surrounded by that insulated casing to hold the liquefied gases, a pump cylinder extending along the center axis of said cylindrical casing, a piston displaceably located in said pump cylinder, slots in said pump cylinder connecting said cylindrical casing and said pump cylinder,

a cross bar oscillatingly located in said piston and extending with its ends through said slots, said cross bar being spherically shaped at its thrust faces with said piston, two piston rods in said cylindrical casing and connected with the ends of said cross bar.

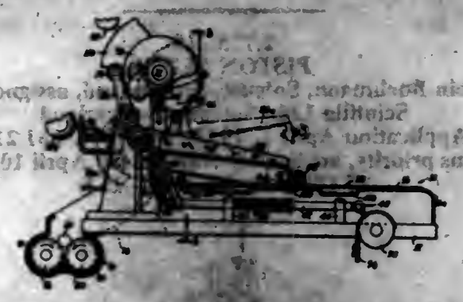
**2,775,212**
**PUMPING EQUIPMENT FOR WELLS**
**Lewis D. Hilton, Houston, Tex.**
**Application June 13, 1952, Serial No. 293,991**
**6 Claims. (Cl. 103—225)**

1. In well equipment the combination of a well tubing and a reciprocable sucker rod in the tubing to operate a pump beneath, said rod being formed in sections each having an externally threaded pin at its opposite ends terminating in an external enlargement providing a pin-shoulder and also having an externally enlarged bead, internally threaded coupling of larger external diameter than said enlargement and bead connecting the adjacent ends of successive sections of the rod, and a tubular stager surrounding the rod and movable longitudinally in the tubing, said rod being movable longitudinally relative to the stager, said coupling being engageable with the lower end of the stager to close the stager upon upward movement of the rod and being movable downwardly out of engagement with said lower end to open the stager upon downward movement of the rod, and means on the stager positioned for engagement with said bead to limit downward movement of the rod relative to the stager, said stager having a lateral opening mediate its ends positioned to lie opposite said bead when the stager reaches the limit of its upward movement relative to the rod.

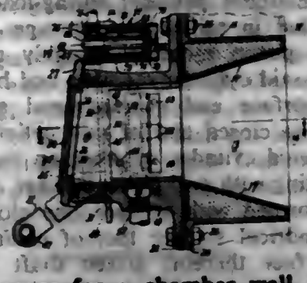
2,775,213
**DISPENSER**
Earl S. Neal, San Francisco, Calif.
Application February 10, 1954, Serial No. 409,491
3 Claims. (Cl. 107—14)

1. A doughnut dispensing head for a flexible dough container, said dispensing head including a tubular body member terminating at one end in a sharp edge to facilitate the cutting of dough extruded through said body member, a guide fixedly carried within said body member, a stem guidingly carried by said guide for reciprocatory movement, a doughnut forming valve disk carried by said stem intermediate its ends, said valve disk being retractible into said body member and being of a size to form a seal of said body member, a removable cover receivable in the lower end of said tubular member to seal a dough container carried by said tubular body, said cover being of a size to be received in and form a seal with said body member, and an annular connector surrounding the upper end of said tubular body, said connector being connectable to a dough container and retaining said guide in place, said connector and said guide being removable, said cover being insertable in the upper end of said tubular body to force dough remaining in said tubular body therethrough to minimize the wasting of dough.



2,775,214
**DRAW-PLATE FOR ALIMENTARY PASTE FORMED INTO LONG SHAPES**
Sandro Lonzar, Milan, Italy
Application June 13, 1952, Serial No. 293,252
Claims priority, application Italy June 23, 1951
1 Claim. (Cl. 107—14)

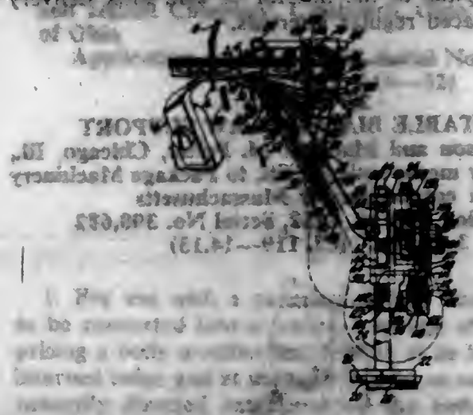
A die construction for continuously extruding filaments of alimentary paste; said die construction comprising a die plate having a series of spaced apart openings therein for the extrusion of alimentary paste through said openings, a wall disposed above said die plate and having projections depending into the proximity of the latter to define a plurality of chambers above said plate with each of said chambers encompassing at least a related one of said openings, a compression chamber having a circular cross section for receiving alimentary paste under pressure, and a pipe extending from each of the aforementioned chambers to said compression chamber for carrying alimentary paste from the latter to the related one of said first chambers, said pipes being of the same cross-sectional area and having their longitudinal centre lines extending from said first chambers to a plurality of points symmetrically arranged on a circumference concentric with the circular cross section of said compression chamber.



2,775,215
**SPAGHETTI-CUTTING MACHINE**
Aldo Cerioni, Palisades Park, N. J., assignor to himself and Frank Marinai, New York, N. Y., jointly
Application April 2, 1952, Serial No. 280,130
8 Claims. (Cl. 107—21)

1. A spaghetti-cutting machine for simultaneously cutting the bights or elbows from a plurality of strands of spaghetti looped about a rod, comprising a base, a table on said base, a fixed knife at one end of the table, means for holding the spaghetti-loaded rod at said end of the table parallel to and immediately above said fixed knife,

a vertically movable knife at the same end of the table, above and parallel to said rod, and means to move said movable knife to cut simultaneously all of the bights or elbows from the strands of spaghetti on said rod.



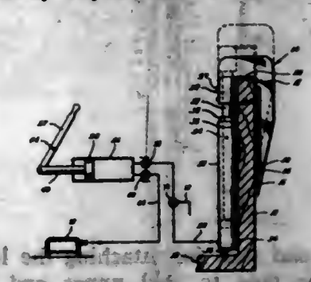
2,775,216
**CLOSURE MEANS FOR CHAMBER WALL OPENING**
Alexander V. Alexeff, Barberton, and Russell L. Godshalk, Akron, Ohio, assignors to The Babcock & Wilcox Company, New York, N. Y., a corporation of New Jersey
Application September 12, 1952, Serial No. 309,304
8 Claims. (Cl. 110—179)

1. Closure means for a chamber wall opening comprising interrelated members one of which is formed as a frame providing a passage therethrough for registry with said opening, another of said members constituting a door for said passage at the outer end of said frame, means including a guide bar on one of said members for restricting total opening and closing movement of said door substantially to a single upright plane, said other member being formed with a guide slot in which said guide bar is slidably received throughout its path of travel therein, said guide bar in the closed position of said door being arranged to releasably engage only that side of said slot which is nearer said outer end of said frame, the outer end of said frame being formed with a door seat inclined with respect to the length of said passage, said guide slot being formed with substantially parallel sides arranged in diverging relation to said seat in the direction of closing movement of said door, and means for releasing said guide bar from engagement with said side of said slot prior to opening movement of said door.

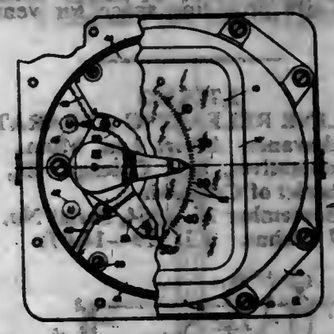
2,775,217
**SHOE SEWING MACHINES**
Heinrich Richard Rehe, Frankfort am Main, Germany, assignor, by mesne assignments, to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Application September 1, 1954, Serial No. 453,586
Claims priority, application Germany September 26, 1953
10 Claims. (Cl. 112—46)

1. A shoe machine having a main frame, fastening devices in the frame, a main welt guide mounted in the frame close to the point of operation of the fastening devices for engagement with a shoe being operated upon by the fastening devices, a supplemental welt guide located along the path of the welt leading to the main welt guide more remote from the operating point than the main welt guide, knife means carried by the supplemental welt guide for performing a severing operation on the welt before it enters the main welt guide and a carrier on which

the supplemental welt guide is secured mounted on the main frame for shifting movement toward and from the main welt guide, in combination with feeler means mounted on the supplemental welt guide carrier and engageable with the first end of welt already attached to a shoe for locating the position along the welt running to the main welt guide at which the severing operation is performed.



2,775,218
**BOAT HAVING MULTIPLE FLOATS**
Frank Kapuscak, Winnipeg, Manitoba, Canada
Application March 10, 1955, Serial No. 493,450
1 Claim. (Cl. 114—61)

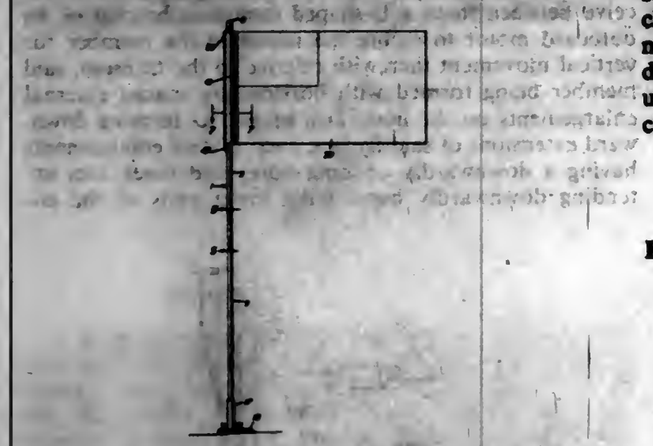


An outrigger-type boat for general water amusement purposes comprising a boat body having a bottom, side walls, front and rear end walls and seating facilities, a pair of spaced parallel coplanar floats positioned outwardly of and spaced from the respective lengthwise side walls of said body, and a plurality of transversely disposed longitudinally spaced parallel inverted U-shaped trusses, the bight portions of said trusses being adjustable and adjustably connected to and underlying the bottom of the boat body, the vertical end portions depending and being attached to the upper crown portions of the respective floats, a third float arranged between the rear end of the boat body and trailing ends of the first named floats and having its rear end projecting beyond the rear ends of the first named float, and braces connecting said third float with the rear end portions of the first named floats whereby it is positioned in spaced parallelism intermediate said rear end portions.

2,775,219
**OUTBOARD MOTOR MOUNTING MEANS FOR BOATS**
Gerald J. Cuccia, Houston, Tex.
Application March 3, 1954, Serial No. 413,843
1 Claim. (Cl. 115—41)

A motor mount for boats comprising an elongated motor supporting member of inverted U-shape in cross-section adapted to be positioned over the transom of a boat, for vertical sliding movement on the transom, with one arm of the U lying along the outer surface of the transom and the other arm thereof lying along the inner surface of the transom, laterally spaced, external, substantially parallel, reenforcing flanges on the member extending longitudinally of the arms positioned to receive between them a U-shaped mounting bracket of an outboard motor to secure the motor to the member for vertical movement therewith relative to the transom, said member being formed with horizontally spaced external enlargements on the inner arm of said U forming downward extensions of said flanges, each of said enlargements having a downwardly opening bore, said inner arm extending downwardly beyond the lower ends of the enlargements between the enlargements, vertically disposed pressure fluid cylinders mounted on the transom beneath said enlargements, pistons movably disposed in said cylinders, piston rods on the pistons and extending upwardly beyond the upper ends of the cylinders, for engagement with said enlargements in said bores, means for releasably securing the piston rods in the bores of said enlargements and means for introducing fluid under pressure into said cylinders beneath said pistons to move the pistons upwardly to elevate said member relative to the transom.

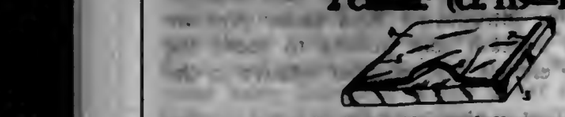
2,775,220
**ILLUMINATION OF INDICATING APPARATUS**
Maxwell Dorn, Jersey City, N. J., and Werner Rosenhaus, New York, N. Y., assignors to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware
Application June 25, 1954, Serial No. 439,445
18 Claims. (Cl. 116—129)



1. In indicating apparatus, a dial, a pair of adjacent relatively movable elongated indicator members composed of material which conducts radiant energy, and radiant energy generating means located adjacent to one end of each of said indicator members to direct radiant energy into said one end of each member so that radiant energy passes through said indicator members to the opposite ends thereof to illuminate said opposite ends.

2,775,221
**FLAG DISPLAY MEANS**
Harry M. Olson, Clear Lake, Iowa
Application August 2, 1955, Serial No. 525,951
4 Claims. (Cl. 116—173)

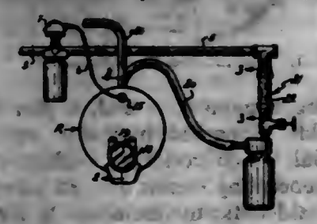
1. Means for displaying a flag comprising an upright flagstaff, a flag having a hem slidably sleeved onto said staff, a tape secured intermediate its transverse center and one end to said hem to provide long and short portions on



said tape at opposite sides of its point of securement to said hem, and terminal means on said tape and the

upper end of said staff for attaching the long and short portions of the tape to said upper end selectively to lower and raise the flag on the staff.

---



2,775,222
DOG BED
Eugene Kruck, Huntington Station, N. Y.
Application November 9, 1954, Serial No. 467,701
2 Claims. (Cl. 119—1)

1. In a dog bed a substantially rectangular pillow, a blanket fastened on three sides of said pillow said blanket being of a larger dimension in length and width than that of said pillow, an arcuate spring member enclosed in a marginal portion of the free side of said blanket, providing an oval opening to the space between said blanket and said pillow, whereby a dog upon entering said opening would raise and enlarge said opening after which upon the bedding of the dog the opening would return to its previous size providing space for ventilation and observation.

---

2,775,223
MILK LINE RELEASING APPARATUS
William T. Pickavance, Albert Lea, Minn., assignor to National Cooperatives, Inc., Chicago, Ill., a corporation of the District of Columbia
Application September 16, 1954, Serial No. 456,357
7 Claims. (Cl. 119—14.07)

1. Milk handling apparatus comprising a milk line, a milk-receiving chamber having a milk inlet connected to said milk line and receiving milk therefrom and having a vacuum inlet and a milk outlet, a source of vacuum connected with said vacuum inlet, a valve interposed between said source of vacuum and said vacuum inlet and movable between open and closed positions and maintaining the vacuum within said chamber at a lower value than at said source of vacuum, a weight connected to said valve and urging it toward closed position, a pressure-sensitive valve element extending across said outlet and opening and closing the same, a milk-delivering chamber connected to said outlet in milk-receiving relation and having a milk discharge outlet, and having a vacuum inlet connected to said source of vacuum, a pressure sensitive valve element extending across said milk discharge outlet and opening and closing the same, and mechanism connected with the vacuum inlet of said milk-delivering chamber for causing said last mentioned vacuum to be applied to the interior of said milk delivery chamber at spaced regular intervals.

---

2,775,224
ADJUSTABLE BIASED CLAW SUPPORT
Emanuel Rawson and Marshall M. Fuller, Chicago, Ill., assignors, by mesne assignments, to Package Machinery Company, a corporation of Massachusetts
Application July 24, 1952, Serial No. 300,682
3 Claims. (Cl. 119—14.13)

1. Apparatus of the character described for supporting milking equipment below the udder of a cow, comprising a support, means operatively associated with said support for adjusting the position of the support vertically, a cantilever spring carried by the support and extending therefrom, milking equipment supported by said spring, and a gauge carried by the spring and measuring the flexure thereof.

---

2,775,225
MILKING MACHINE CLAW ASSEMBLY
Clifford R. Brown and Robert L. Bohlken, Albert Lea, Minn., assignors to National Cooperatives, Inc., Chicago, Ill., and Albert Lea, Minn., a corporation of the District of Columbia
Application December 15, 1954, Serial No. 475,485
6 Claims. (Cl. 119—14.54)

1. A milking machine claw assembly comprising a rigid body having an air inlet and a hollow interior, at least one milk nipple mounted on said body and extending outwardly therefrom and being in fluid communication with the hollow interior of said body and being adapted to be connected to the milk tube of an inflation to conduct milk from the latter into the hollow interior of said body, a milk outlet nipple mounted on said body and extending outwardly therefrom and being in fluid communication with the hollow interior of said body and being adapted to have a flexible milk tube under suction connected thereto, the outer end portion of said milk outlet nipple having a milk tube crimping surface, and a rigid milk-tube-shut-off arm mounted on said body and extending away therefrom in the same general direction as said milk outlet nipple to a position almost directly ahead and beyond but adjacent to the outer end portion of said milk outlet nipple whereby such a flexible milk tube when connected to said milk outlet nipple may extend in milk conducting position while at one side of said arm and will be crimped against the crimping surface of said milk outlet nipple when swung to the other side of said arm to effectively shut off the fluid flow through the milk tube.

---

2,775,226
COMBINED CONTAINER AND FEEDER
Robert Lee Early, Cincinnati, Ohio, assignor to The Early and Daniel Company, Cincinnati, Ohio, a corporation of Ohio
Application August 2, 1955, Serial No. 526,017
8 Claims. (Cl. 119—52)

1. For use with a paperboard feed container adapted to be converted into a feeder, a trough attachment comprising a body member terminating at its lower end in an inturned ledge and at its upper end in an outturned perch, inwardly directed extensions on the ends of said body member, said extensions having upwardly directed points for puncturing the walls of the container with which the attachment is used, the lower edges of said extensions having teeth therein for engagement with the bottom of the container, said extensions being adapted to coact with said inturned ledge to grip the bottom of the container therebetween.

---

2,775,227
DROP DELIVERY TYPE POULTRY FOUNTAIN
Henry Miller, Hillside, Ill.
Application September 8, 1953, Serial No. 378,865
2 Claims. (Cl. 119—72.5)

1. In a fountain for poultry, or the like, the combination of a substantially horizontal conduit, and a water dispensing valve provided at the underside of said conduit, said valve comprising a substantially tubular body having upper and lower ends, a valve seat provided in the upper end portion of said body, and a gravity actuated valve stem slidable in said body, said valve stem being provided with water passages and having an enlarged head engageable with said seat, said passages being closed by said body when said head is engaged with said seat, said body having a concave constantly open lower end facilitating the formation of drops of water therein from water dripping from said passages when said head is engaged with said seat.

---

2,775,228
RETRACTABLE BALL PEN
Blanchard D. Smith, Atlanta, Ga., assignor to Scripto, Inc., Atlanta, Ga., a corporation of Georgia
Application November 4, 1953, Serial No. 390,185
9 Claims. (Cl. 120—42.03)

7. A retractable ball pen comprising a barrel, a ball point and reservoir unit housed within said barrel for sliding movement between forward projected and rearward retracted positions with respect thereto and yieldably biased therein rearwardly toward said retracted position, a latching sleeve disposed over the rear end of the reservoir portion of said unit and having a rearwardly facing latching notch therein, a latching lever rockably supported in said barrel for rocking between a latching position and a free position with respect to said latching sleeve, said latching lever extending forwardly in said barrel and engageable at said latching position with said latching sleeve notch when said latching sleeve and unit are moved to projected position, a plunger member slidably contained at the rear end of said barrel and depressible within said barrel for operating directly to project said latching sleeve and unit to said latching position, yieldable means arranged within said plunger member and biasing said plunger member rearwardly, and a positioning lever rockably actuated by depression of said plunger member for engaging and rocking said latching lever to said latching position in engagement with said latching sleeve notch upon projection of said latching sleeve and unit by depression of said plunger member and for engaging and rocking said latching lever to said free position upon a subsequent depression of said plunger member.

---

2,775,229
BALL POINT PEN AND RETRACTING MEANS THEREFOR
Herbert W. Sloan, Atlanta, Ga., assignor to Scripto, Inc., Atlanta, Ga., a corporation of Georgia
Application August 14, 1953, Serial No. 374,393
4 Claims. (Cl. 120—42.03)

1. In a ball point pen, a rear barrel portion having a retracting means assembled therewith, said retracting means comprising a tubular operating cap mounted externally at the rear end of said barrel portion for rotation, an alignment sleeve fixed within said barrel portion intermediate the length thereof, a plunger slidably disposed within said cap and projecting rearwardly therefrom, a push tube carried by said plunger and extending forwardly therefrom for sliding movement within said alignment sleeve, said push tube being keyed against rotation in said alignment sleeve, and a cam tube fixed on said cap and extending forwardly therefrom adjacent said push

tube, said cam tube being formed with a cam slot shaped with two symmetrical leg portions spreading rearwardly from a forwardly facing central notch, and said push tube being formed with a lateral cam lug portion positioned in following relation within said cam slot, whereby latching of said cam lug portion at said cam slot notch results upon forward movement of said plunger and rotation of said cap results in displacing said lug portion from said notch.

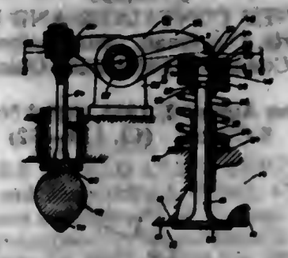
---

2,775,230
PEN DESK SET
Burnie J. Craig, Pasadena, Calif.
Application December 1, 1954, Serial No. 472,414
3 Claims. (Cl. 120—108)

1. In a pen desk set, a base having a well open at the top surface, a cover member, means pivotally mounting the cover member for movement about a horizontal axis to and from well closing position, a pen receptacle adapted to receive a pen, means supporting the receptacle on the lower face of the cover, means to releasably hold the cover in either of its two positions when moved about its horizontal axis, an operating member, a pivotal mounting for the operating member, a link member pivotally connected at one end to the operating member at a location below the axis of the operating member's pivotal mounting, means pivotally connecting the other end of the link member to the cover at a location below the axis of the cover's pivotal mounting, to thereby rock the cover member to well closing position when the operating member is actuated.

---

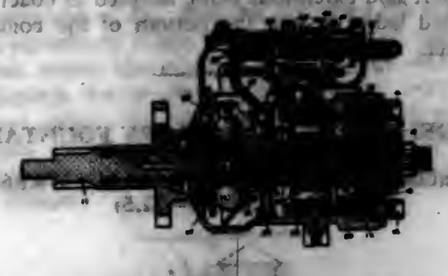
2,775,231
PNEUMATIC CONTROL APPARATUS
Alexander Silver, Canoga Park, Calif., assignor to The Garrett Corporation, Los Angeles, Calif., a corporation of California
Application August 25, 1952, Serial No. 306,139
10 Claims. (Cl. 121—38)



1. Control apparatus, comprising: a sonic flow pressure divider having an inlet connected to a fluid pressure source to provide an intermediate pressure, and an outlet pressure; movable wall means acted on one side by said intermediate pressure and an evacuated bellows exteriorly subject to said intermediate pressure, and acted on the opposite side by spring means and said outlet pressure; a control device varied in response to movements of said wall means; and means for varying said intermediate pressure in accordance with variations in static and dynamic characteristics of said fluid pressure source.

---

2,775,232
VALVE ROTATOR
Julius E. Winsky, Royal Oak, Mich.
Application June 19, 1953, Serial No. 362,828
20 Claims. (Cl. 123—90)



1. A valve actuating mechanism for an engine having a freely rotatable poppet valve including a stem comprising a cage secured to the valve stem to rotate in unison therewith and a cup positioned on the cage and movable axially relative thereto, cooperating cam surfaces between the cage and cup, a series of balls positioned in the cams, and a spring associated with each ball to maintain it in

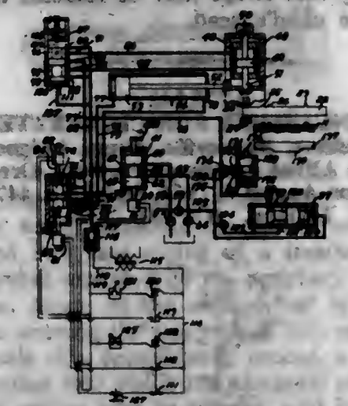
contact with its associated cam surfaces, and motion transmitting means engaging the cup non-concentrically of the valve stem.

---

2,775,233
FUEL INJECTION PUMP
Waldemar O. Bischoff, Holyoke, and Kenneth I. Faucher, Springfield, Mass., assignors to American Bosch Arma Corporation, a corporation of New York
Application June 24, 1954, Serial No. 439,117
3 Claims. (Cl. 123—140)

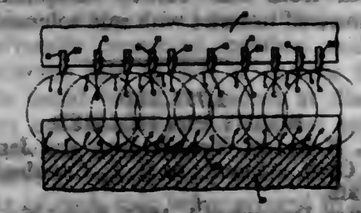
1. In a device of the character described, a governor for a fuel injection pump, said governor having an operating lever operatively connected to the control for the injection pump and a governor spring for positioning said lever, a full load stop adapted to be engaged by said lever for controlling the normal maximum fuel quantity to be delivered by the pump, said full load stop having a movable portion for allowing the positioning of said lever at a position to provide additional fuel for starting, and spring means for urging said movable portion into said position to allow additional fuel for starting, said spring being slightly weaker than said governor spring and adapted to be totally inactive except during starting of the engine.

---



2,775,234
PACKING FOR INTERNAL COMBUSTION ENGINE
Wytze Beye Smits, Veerburg, Netherlands, assignor to Smitsveek N. V., Leidschendam, Netherlands, a research laboratory
Application November 25, 1953, Serial No. 394,469
6 Claims. (Cl. 123—169)

1. A combined head gasket and spark plug for an internal combustion engine comprising, insulating to semi-conductive material disposed between the head and block of said engine, and at least one electrode clamped in said material and extending at least to the interior of a cylinder.



2,775,235
BOOSTER FOR TEMPLATE CONTROLLED TRUING MECHANISM
Wilbur F. Jump, Cincinnati, Ohio, assignor to The Cincinnati Milling Machine Co., Cincinnati, Ohio, a corporation of Ohio
Application August 22, 1955, Serial No. 529,827
9 Claims. (Cl. 125—11)

1. In a truing device having a traversible slide mounted on a support, a cross slide carrying a truing tool mounted on the traversible slide for movement normal to the direction of movement of the traversible slide, a template mounted on said support, a follower mounted on the cross slide in engagement with said template, the combination of hydraulic means for feeding the traversible slide, means to hydraulically bias said cross slide to maintain engagement of said follower with said template and create a normal frictional load on said hydrauiic feeding means, and means responsive to variation in said load to vary said bias and cause movement of the cross slide in a direction to reestablish said normal load.

---

2,775,236
SAW BLADE FOR CUTTING STONE
Harold T. Blum, Millersburg, Ohio, assignor to The Briar Hill Stone Company, Glenmont, Ohio, a corporation of Ohio
Application October 6, 1955, Serial No. 538,847
10 Claims. (Cl. 125—18)

1. A saw blade for cutting stone, comprising an elongated straight blade having teeth along one longitudinal edge thereof, said teeth being arranged in a plurality of identical groups, the teeth in each group being variably spaced and conforming to the spacing of the teeth in each other group, the spacing of the teeth in each group progressively increasing from one end of the group to the other end thereof, and means for moving each tooth edge of said blade in a substantially circular path.

---

2,775,237
SHIFTABLE OVEN FOR COOKING STOVES OR RANGES
Lee S. Chadwick, Shaker Heights, Ohio, assignor, by mesne assignments, to Hupp Corporation, Detroit, Mich., a corporation of Virginia
Application November 21, 1950, Serial No. 196,823
16 Claims. (Cl. 126—19)

9. In apparatus of the class described, a body structure, an oven pivoted thereto for swinging movement about a horizontal axis between an idle position and a working position, the oven having a hinged door, a detent for holding the door closed, means retaining the detent in door holding condition when the oven is in any but

working position, and further means acting automatically to render the detent ineffective and retain it in ineffective condition thereby to release the door when the oven is in working position.

---

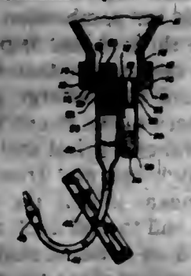
2,775,238
FUEL BURNING AND AIR HEATING APPARATUS
Donald J. Clark and Maurice S. Decker, Jr., Columbus, Ohio, assignors to Surface Combustion Corporation, Toledo, Ohio, a corporation of Ohio
Application January 29, 1953, Serial No. 334,602
3 Claims. (Cl. 126—110)

1. Combustion apparatus for burning normally liquid fuel with air, which comprises: first wall means forming a tubular duct for containing the combustion chamber, said duct having a front end and a discharge end; a first cylindrical shell in said duct next adjacent said front end: annular end wall means joining the end of said shell toward said discharge end to said tubular duct; an aperture formed in the tubular duct adjacent said shell for delivering a first stream of air for combustion to the space between the duct and the shell; means disposed between the shell and the duct for causing air therein to whirl about the axis of the duct and to discharge substantially uniformly over the periphery of the sleeve towards the front end of the duct; a second cylindrical shell in said duct disposed towards said discharge end from said first shell; second annular wall means joining the end of said shell towards said discharge end to said duct; a second aperture formed in the tubular duct adjacent said second shell for delivering a second stream of air to the space between the second shell and said duct; means disposed between the second shell and the duct for causing air therein to whirl about the axis of the duct in a direction opposed to the direction of whirl of the first stream of air and to discharge substantially uniformly over the periphery of the second sleeve towards the front end of the duct; wall means for closing the front end of said tubular duct and comprising wall means forming a circular tube adjacent said front end and axially centered in said tubular duct; means for delivering normally liquid fuel to said first air stream whereby a rich mixture of fuel and air flows adjacent the circular tube at a relatively slow velocity as compared to the bulk of the fuel and air mixture stream, thus stabilizing combustion in said tubular duct; and means for igniting the mixture in said first stream in a manner to initiate combustion before said first stream meets said second stream.

---

2,775,239
SMOKE CONTROL FOR FIREPLACES
Sam Bucci, Greenwich, Conn.
Application July 14, 1952, Serial No. 298,729
1 Claim. (Cl. 126—135)

A fireplace comprising walls forming a combustion space, a chimney flue leading from the upper part of said



space and a front opening leading to said space with a wall over said opening and extending upwardly therefrom, a control device comprising a frame structure including a housing comprising spaced connected upright front and rear walls located in the wall over the fireplace opening immediately above this opening and open at the bottom so as to be open over said opening, guide members forming a part of and extending downwardly from said housing located at the opposite upright edges of the fireplace opening and including connected spaced front and rear walls,

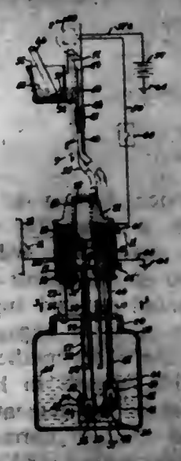
a control member comprising an upright sheet metal closure projecting at its upper edge into the housing and at its opposite upright side edges into said guide members between the walls thereof, mounting means for the closure mounted thereon and guided in said guide members to permit up and down movement of the closure, means on the mounting means to retain the closure in different adjusted positions, handle means on the closure for shifting the closure, and the closure being provided with a series of air inlet openings.

---

2,775,240
GAS VALVE
Edward J. Morrisey, Jr., and Howard A. Richards, Waukegan Township, Lake County, Ill., assignors to Abbott Laboratories, North Chicago, Ill., a corporation of Illinois
Application February 9, 1953, Serial No. 335,746
12 Claims. (Cl. 128—214)

1. A gas pervious liquid barrier comprising a body member having a passage therethrough adapted to be used in combination with a venoclysis fluid container, and a compact mass of fiberous material having the surface of the fibers of said mass repellent to the liquid placed in contact therewith disposed transversely of said passage intermediate the ends thereof, said mass being impervious to the liquid placed in contact therewith and pervious to gases.

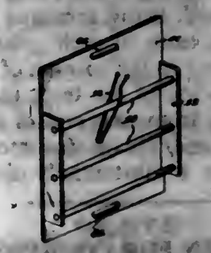
---



2,775,241
OBSTETRICAL INSTRUMENT
Joel S. Price, Oklahoma City, Okla.
Application February 21, 1955, Serial No. 489,507
5 Claims. (Cl. 128—352)

5. An obstetrical instrument for engaging the head of an unborn child, comprising a U-shaped strap of a size to extend under the child's chin and over the sides of the head, a second U-shaped strap of a size to extend around the back of the head and around the sides of the head in crossing relation to the first-mentioned strap, said straps being arranged to cross below the largest portion of the head, and means for locking the outer ends of said straps, whereby said straps may be retained in crossing relation on the child's head.

---



2,775,242
EXTINGUISHER FOR CIGARETTES
George M. Webber, Bonneville, Oreg., assignor of one-half to Alfred Funkhouser, Portland, Oreg.
Application August 5, 1954, Serial No. 447,999
1 Claim. (Cl. 131—256)

A cigarette extinguisher for an automobile having an instrument panel and a battery comprising, a water reservoir having a cap, a solenoid operated pump unit mounted on said cap and projecting into the bottom of said reservoir, a pump discharge connection on said cap, a quenching tray mounted on said panel, a conduit between said pump discharge connection and said tray for supplying water to said tray when said pump is operating, an automatic intermittent switch, a manual push button switch on said instrument panel unit, and a circuit for energizing said solenoid from said battery comprising said two switches connected in series with said solenoid.

---

2,775,243
BOBBY PIN HOLDER
Gertrude E. Kennedy, Youngstown, and Jesse Hawkins, Alliance, Ohio, assignors to R. E. Cunningham, Locust Grove, Okla.
Application December 1, 1953, Serial No. 395,479
1 Claim. (Cl. 132—1)

A holder for holding bobby pins, comprising a body, vertical supports extending along the side edges of the body and projecting forwardly therefrom, supporting rods connecting the vertical supports, said rods being spaced substantial distances from the body providing clearances between the rods and body for bobby pins positioned over the rods, holding said bobby pins in open positions with their open ends disposed upwardly for removal from the bobby pin holder, in open positions.

2,775,244
DEVICES FOR DYEING, BLEACHING, AND COOL WAVE PERMANENT CURLING OF HAIR
Merle Pottle, New York, N. Y., assignor to Clairol Incorporated, Stamford, Conn.
Application December 30, 1953, Serial No. 401,136
4 Claims. (Cl. 132—33)

1. In a hair treating device a casing having an open end, an elongated open ended tubular member for mounting selected strands of hair for treatment and enterable into the casing for a portion of its length, the unentered end thereof being accessible for the introduction therethrough and into said casing of a treatment liquid, a closure member mounted on the periphery of said tubular member, means at the entered end of said tubular member for securing the free ends of hair strands leading from the scalp of a person being treated, a notch in said closure member into which the aforesaid strands of hair at the scalp region may be entered, said hair strands at the zone of the closure member notch being frictionally locked between the closure member and the open end of the casing when the same are in juxtaposition whereby the device as assembled may be suspended from the scalp by such locked strands of hair.

2,775,245
LADY'S HAIR ORNAMENT
Siegfried Bohr, Flushing, N. Y.
Application February 27, 1956, Serial No. 568,018
1 Claim. (Cl. 132—46)

A hair ornament comprising an annular endless metal band composed of a plurality of pair of links, the links of each pair being pivoted to each other midway their ends, the ends of adjacent links of said pairs of links being overlapped and pivotally connected together, said pairs of links being disposed side by side in annular formation, and transverse metal bands connected at diametrically opposite points on one peripheral edge of said endless band, said transverse bands being disposed in cross relation, said transverse bands being composed of pairs of links, the links of each pair being pivoted to each other midway their ends, the outer ends of adjacent links of said pairs of links being overlapped and pivotally connected together, said pairs of links being disposed side by side in arcuate formation, the links of said transverse bands being joined to each other midway the ends of said transverse bands, the end links of said transverse bands being pivotally connected to the peripheral edge of the endless band at points 90 degrees apart.

2,775,246
COSMETIC APPLICATORS AND PACKAGE
Jacque C. Morrell, Chevy Chase, Md.
Application July 28, 1951, Serial No. 237,809
3 Claims. (Cl. 132—79)

1. A cosmetic package unit adapted to dispense cosmetic items of different shape, size and use comprising an envelope consisting of front and back elements divided at least into two compartments directly between the said front and back elements of said envelope, said compartments being of different widths adapted to receive a lipstick comprising a relatively narrow stiff rod in one of the said compartments and adapted to contain face powder applicator in another compartment and a

backing for said envelope comprising a separate sheet of material fastened to said envelope.

---

2,775,247
COSMETIC PACKAGE
Jacque C. Morrell, Chevy Chase, Md.
Application April 13, 1951, Serial No. 220,936
6 Claims. (Cl. 132—79)

1. A cosmetic package comprising an integral base, cover and lip formed from a relatively thin sheet, said thin sheet being folded over the base at one end of the base to form the cover and being folded over the base at the opposite end to form the lip, said lip engaging and retaining said cover, a depression in said base to form an open cell in said base to carry face powder, fastening means at spaced intervals to secure said lip to said base, a pocket intermediate said fastening means and between said lip and said base to receive and hold the lower end of a lipstick rod, and a plurality of soft, absorbent sheets fastened within said package.

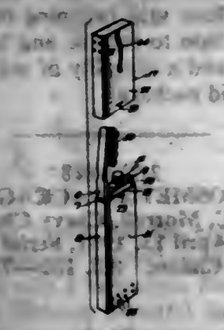
---

2,775,248
COSMETIC PACKAGE
Jacque C. Morrell, Chevy Chase, Md.
Application April 13, 1951, Serial No. 220,935
6 Claims. (Cl. 132—79)

1. A cosmetic package comprising an integral base, cover and lip formed from a relatively thin sheet, said thin sheet being folded over the base at one end of the base to form the cover and being folded over the base at the opposite end to form the lip, said lip engaging and retaining said cover, a relatively thick sheet overlying the inside of said base and covering said base at least in part, said relatively thick sheet being perforated to form an open cell with said base to carry face powder, fastening means at spaced intervals to secure said lip to said base, a pocket intermediate said fastening means and

between said lip and said base to receive and hold the lower end of a lipstick rod, and a plurality of soft, absorbent sheets fastened within said package.

---



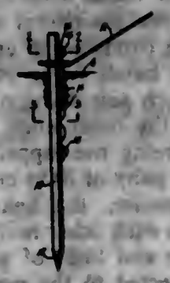
2,775,249
**COSMETIC PACKAGE**
Jacque C. Merrell, Chevy Chase, Md.
Application June 15, 1951, Serial No. 231,780
5 Claims. (Cl. 132—79)

1. A cosmetic package comprising an integral base, cover and lip formed from a relatively thin sheet, said thin sheet being folded over the base at one end of the base to form the cover and being folded over the base at the opposite end to form the lip, said lip engaging and retaining said cover, fastening means at spaced intervals to secure said lip to said base, a pocket intermediate said fastening means and between said lip and said base to receive and hold the lower end of a lipstick rod, and means fastened to the inside of said cover of said package to carry an applicator for face powder.

---

2,775,250
**HYGIENIC DENTAL PACKAGE**
Ella C. Ossenkop, Chicago, Ill.
Application June 13, 1955, Serial No. 514,887
1 Claim. (Cl. 132—84)

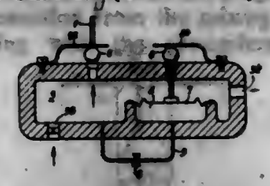
A hygienic dental package comprising an elongated thin walled casing, rectangular in cross-section, closed at one end, and open at the other; a dentifrice compartment held within said casing, substantially rectangular in cross-section, and having its dispensing end adjacent the open compartment end and extending slightly thereabove; a passage in said casing, formed between an endwall of said casing and an endwall of said compartment; a toothbrush having its handle inserted in said passage with its bristles positioned above said compartment; a cover, rectangular in cross-section and adapted to fit over the open end of said casing and cover said compartment and said bristles; embossments on the inner front and rear walls of said cover; indentations in the outer front and rear walls of said casing for matingly receiving said embossments and releasably retaining said cover on the casing, said indentations further providing on the casing inner front and rear walls bosses engageable with the walls of said compartment for releasably seating said compartment within said casing; ventilating air-holes in the walls of said casing and said cover; and a clip on the cover outer wall for retaining the package in a pocket or the like.



2,775,251
**FOUNTAIN COMB**
J. B. Newton, Oklahoma City, Okla.
Application May 11, 1954, Serial No. 429,034
2 Claims. (Cl. 132—119)

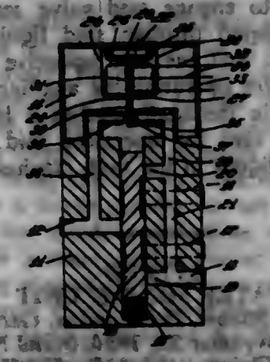
1. A fountain comb comprising a barrel having a bore extending longitudinally thereinto through one end thereof, a row of longitudinally spaced comb teeth carried by the barrel and extending radially outwardly therefrom, said barrel having longitudinally spaced ports extending therethrough and communicating with the spaces between the comb teeth, a hollow cylinder mounted in the bore to move longitudinally therein, said cylinder defining a reservoir for containing a hair dressing liquid, said cylinder having longitudinally spaced liquid discharge ports extending therethrough for registration with the ports in the barrel when the cylinder moves longitudinally within the barrel, a spring mounted within the barrel and engaging the cylinder for holding the ports in the cylinder out of registration with the ports in the barrel, means carried by the barrel and operatively connected to the cylinder for moving the cylinder against the effort of the spring and the ports in the cylinder into registration with the ports in the barrel, a piston carried by the barrel and entering the cylinder for expelling liquid therefrom when the ports therein register with the ports in the barrel, the cylinder having an air inlet port, and a check valve covering the air inlet port and arranged to permit flow of air into the cylinder to replace liquid expelled therefrom.

---



2,775,252
**ADJUSTABLE TENT STAKE**
Donald M. Finch, Hayden, Ariz.
Application March 27, 1956, Serial No. 574,155
4 Claims. (Cl. 135—18)

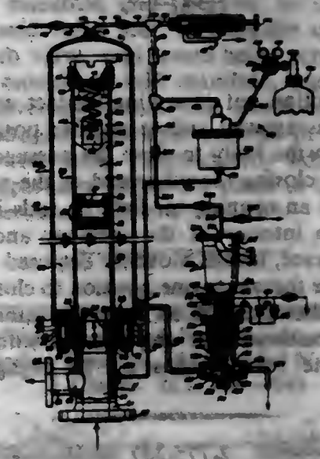
1. A tent stake including an elongated body portion adapted to penetrate the ground; a plurality of fins spaced longitudinally of said body portion; and a collar having a center opening receiving said body portion, said collar having a slot communicating with said center opening and alignable with the fins responsive to rotation of the collar to a selected position, whereby to permit adjustment of the collar along the length of the body portion, said collar being rotatable in selected positions to which it is adjusted to offset the slot from the fins, whereby to engage the collar between adjacent fins in the selected position of adjustment of the collar, for looping of a tent rope about the body portion below the collar.



2,775,253
**AUTOMATIC FLUID OPERATED CONTROL APPARATUS HAVING A DERIVATIVE ACTION RESPONSIVE TO A RATE OF CHANGE**
Friedrich Viktor Anton Ernst Esser, Park Royal, London, England, assignor to Electrolo Motors Company Limited, London, England
Application December 27, 1954, Serial No. 477,884
4 Claims. (Cl. 137—82)

1. Fluid-pressure operated automatic regulating apparatus comprising, in combination with a chamber having connections for communication with a supply of fluid at substantially constant pressure and with operating means responsive to the static pressure in the said chamber, two separate valve units acting upon restricted outlets from the said chamber for controlling the static pressure in the latter, one of the said valve units comprising a first valve device controlling the degree of opening of one of the said restricted outlets and a valve-actuating device movable in dependence upon deviation of a measured value from a predetermined value and arranged to act upon the said valve device for varying the degree of opening of the said outlet and thereby, primarily, the static pressure in the said chamber in dependence upon the said deviation, while the other valve unit, constituting means for introducing a derivative action whereby the static-pressure variation in the said chamber is enhanced in dependence upon the rate of change of the deviation and therefore of the pressure in the said chamber, comprises a freely movable pressure-responsive device directly bounding a part of the said chamber and a second valve device actuated directly and solely by the said pressure-responsive device and controlling the degree of opening of the other of the said restricted outlets.

---



2,775,254
**ELECTROMAGNETIC DEVICES FOR CONTROLLING FLUID PRESSURE**
John Herbert Stanbury, Gloucester, England, assignor to British Messier Limited, Gloucester, England, a British company
Application August 29, 1952, Serial No. 306,995
Claims priority, application Great Britain September 5, 1951
3 Claims. (Cl. 137—82)

1. An electromagnetic device for controlling a fluid pressure circuit comprising in combination a valve casing, a pressure chamber within the casing, a fluid pressure inlet connection thereto, a fluid pressure outlet connection therefrom, the inlet and outlet connections having ports to the chamber which face one another and the area of the inlet port being several times greater than that of the outlet port, a movable obturating member located between said ports to move to and fro between them, an armature carrying said obturating member, electromagnetic means to operate said armature, spring means to urge the obturating member toward the inlet port thereby tending to balance the force exerted upon it by the incoming fluid, piston means open to the pressure in the pressure chamber so as to be moved thereby, yielding return means therefor, and a sliding fluid pressure control valve operatively connected to the said piston means so that the control valve takes up one of an infinite series of positions dependent upon the amount of current in the electromagnet.

---

2,775,255
**APPARATUS FOR CONTROLLING HYDRAULIC SURGE**
Robert E. Snyder, Pasadena, Calif.
Application July 19, 1952, Serial No. 299,896
13 Claims. (Cl. 137—87)

1. A relief-type hydropneumatic surge absorber comprising: a gas-tight vessel; a gas port in said vessel opening into the interior thereof, through which port said vessel may be pre-charged with gas at a predetermined pressure; a cylindrical member having one end connected to said vessel; a by-pass port from said cylindrical member to the interior of said vessel; a liquid port opening into the other end of said cylindrical member; means connecting said liquid port to a liquid line, whereby the line liquid may enter said cylindrical member; a piston slidably mounted within said cylinder, the side of said piston toward said liquid port contacting the line liquid, and the other side of said piston contacting the pre-charge gas, said piston being adapted to open and to close said by-pass port to the entry of the line liquid into the interior of said vessel against the pre-charge gas at a predetermined position of the stroke of said piston within said cylinder; and a gas relief valve connected to said gas port whereby gas may escape from said vessel when the entry of liquid thereinto through said by-pass port shall have raised the gas pressure to a predetermined value and means for draining liquid from said vessel.

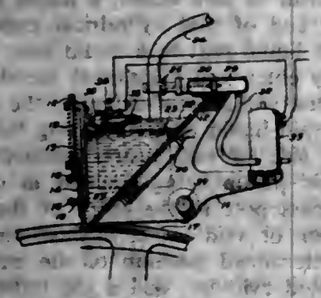
---

2,775,256
**VALVED FITTING**
Hugh D. Hanson, Houston, Tex.
Application August 13, 1954, Serial No. 449,635
1 Claim. (Cl. 137—220)

A fitting for pressure fluid equipment comprising a body having a flowway therethrough and a valve seat surrounding the flowway, means on the body for connecting the body to a source of fluid under pressure with said

flowway in communication with said source, valve means movably mounted on the body for movement into engagement with the seat to close the flowway and out of engagement with the seat to open the flowway, yieldable means carried by the body in position to coact with the body and valve means to yieldingly urge the valve means into engagement with the seat, said body having an external groove, a tubular member threadably connected to the body and in communication at one end with the flowway, said member being positioned to form with said groove an escape passageway in communication with said flowway and with the exterior of the body and being mov-

able to one position out of sealing contact with the body to open said passageway and to another position in sealing contact with the body to close the passageway, means on the member closing the other end of the member, said member having an opening mediate its ends in communication with the interior of the member and leading to the exterior thereof, means movably disposed in the member and movable therein to one position to close said opening and to another position to open the same, said valve means being positioned for engagement with said member to move the valve means out of engagement with said seat.



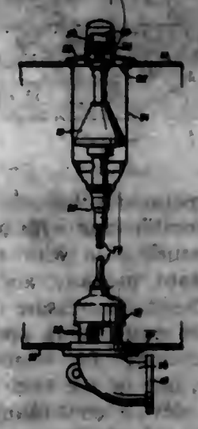
---

2,775,257

## GELATIN FILM CASTING MACHINE

Frank Edwin Sikra, Evans Park, Pearl River, and Arthur Sinclair Taylor, Spring Valley, N. Y., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

Application September 2, 1950, Serial No. 182,960
3 Claims. (Cl. 137—341)



1. A gelatin composition casting apparatus for a gelatin composition film casting machine comprising heat conducting walls forming an open hopper, heating means for said walls, thermostat means controlling the rate of flow of heat to said heating means, an inert, non-volatile, non-toxic, gelatin composition immiscible, liquid layer exposed to the air in said hopper, the liquid of said layer being lighter than said gelatin composition, a flexible feed duct for supplying a gelatin casting composition to said hopper, a non-clogging valve means adapted to control the flow of gelatin composition through said feed duct, and a thermostat means at a desired liquid level, in part exposed to the ambient air and in part contacting said liquid layer in said hopper controlling the operation of said valve means.

2,775,258

## VALVES FOR CONTROLLING THE FLOW OF LIQUIDS

John Fraser, Tolworth, Surbiton, England, assignor to Avery-Hardoll Limited, Tolworth, Surbiton, England

Application March 8, 1954, Serial No. 414,805
Claims priority, application Great Britain March 11, 1953
11 Claims. (Cl. 137—413)

1. A valve for controlling the filling of a tank with liquid, comprising a body defining a liquid supply passage, a valve seat in said body surrounding said passage, a valve closure member in said body for cooperation with said seat and displaceable from the seat by supply liquid entering the tank through said liquid supply passage, said body and valve closure member jointly defining a control chamber, means defining an inlet passage leading to the control chamber from the upstream side of said valve closure member, means defining an outlet passage leading from the control chamber to the tank, auxiliary valve means movable between open position permitting maximum flow through said outlet passage and closed position establishing a reduced flow through said outlet passage so that when said auxiliary valve means is in open position, pressure is relieved from said control chamber and said valve closure member is fully opened by supply liquid pressure thereon but when said auxiliary valve means is closed, pressure is increased in said control chamber to move said valve closure member toward closed position in which flow through said inlet passage to said control chamber is reduced and the supply liquid pressure holds said valve closure member in a partially open position, control valve means to shut off said outlet passage and prevent escape of liquid from the control chamber to thereby cause the valve closure member to engage said valve seat to stop the flow of supply liquid through said liquid supply passage to the tank, and means responsive to the liquid level in the tank for operating the auxiliary valve means when the liquid in the tank reaches a lower predetermined level and also for operating said control valve means when the liquid in the tank reaches a higher predetermined level.

---

2,775,259

## WATER MIXING UNIT

Theodor Stiebel, Holzminden, Germany

Application November 23, 1950, Serial No. 197,116
11 Claims. (Cl. 137—599.1)

1. A water mixing unit comprising a source of hot water, a body, a water closure valve in the body, a source of cold water connected to the closure valve, a cavity having a circular cross section, a fitted rotatable plug filling the cavity, an axial bore through an end region of the plug, a radial bore through an intermediate portion of the plug connecting to the axial bore within

the plug and terminating in one port in the curved surface of the plug, the curved surface of the plug being circumferentially recessed to both sides of the port, a first connection from the closure valve to the cavity registering with and opening into the axial bore of the plug, a second connection from the source of hot water to the cavity registering with the circumferentially recessed curved surface region of the plug, a mixing chamber, a third connection from the mixing chamber to the cavity registering with the circumferentially recessed

curved surface region of the plug, and a fourth connection from the hot water source to the mixing chamber, whereby the water from the cold water source released on opening the closure valve flows through the first connection to the plug and is divided by the plug into two portions depending on the setting of the plug, one portion flowing directly through the third connection to the mixing chamber and the other portion flowing through the second connection, the hot water source and the fourth connection to the mixing chamber.

---

2,775,260

## SPOOL VALVES

John H. Drennen, Girard, Ohio, assignor to The Commercial Shearing & Stamping Co., Youngstown, Ohio, a corporation of Ohio

Application October 30, 1952, Serial No. 317,670
16 Claims. (Cl. 137—631)

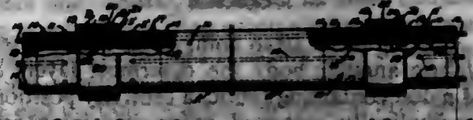
1. A valve comprising a case having an opening therethrough, a spool movable lengthwise in said opening, said case having a passage for fluid under pressure including a circular valve-seating surface around the pool through which said fluid passes, and said spool having a fixed circular valving flange slidable through said annular surface, the spool being effective to block said passage while the fixed flange is in the annular surface and to free said passage when the spool is shifted to remove the fixed flange from the passage, and a second circular valving flange extending around the spool and slidable along the spool toward and from the fixed flange, the movable flange having a portion adjacent the fixed flange whose diameter is substantially equal to that of the fixed flange and which is slidable through said annular surface, said movable flange forming a continuous valving surface with the fixed flange when the two flanges are together, whereby flow through the annular passage is variably controllable by component movement of the spool relative to the case and of the movable flange relative to the fixed flange.

2,775,261

## VALVED MANIFOLD FOR FIELD SPRAYING EQUIPMENT

Lester C. Ziller, Kansas City, Mo., assignor to Comfort Equipment Company, a corporation of Missouri

Application March 8, 1951, Serial No. 214,567
2 Claims. (Cl. 137—625)



1. Manifold construction of the character described including, in combination, a manifold having an elongate manifold chamber, an inlet port and a plurality of outlet ports for said chamber, said outlet ports being arranged in a row along one side of said chamber, a valve seat member mounted in each outlet port and presenting a valve seat within the chamber, a row of valves mounted within said manifold and operable to close upon and open from said valve seat, a manually operable pivotal lever for each valve, said levers being arranged in parallel relation outside of said manifold, and a tie rod extending transversely across said levers and slidably received in slinged apertures formed in the respective levers, said rod being longitudinally adjustable in and out of said apertures selectively so as to tie two or more levers together to operate as a rigid unit.

2,775,262

## SEMI-STEEL REINFORCED CONCRETE PIPE

William E. Wrend, Los Angeles, Calif.

Application June 26, 1953, Serial No. 364,276
1 Claim. (Cl. 138—94)

A pipe of reinforced concrete, comprising a plurality of pipe lengths connected together and laid end to end with the joint member of one pipe length abutting the joint member of an adjacent pipe length, each pipe length including a pair of metal end joint members having a sleeve like part extending toward the opposite end of the pipe, and a radially outwardly extending peripheral flange; reinforcing tie rods secured to said sleeve like part and connecting said joint members; a helical coil of reinforcing rod extending from the sleeve portion of one end joint member to the sleeve portion of the other joint member; a wall of cementitious material covering one side of the sleeve like portions of said joint members and embedding said helical coil and reinforcing tie rods, but leaving the exterior periphery of said flanges exposed and extending beyond the outer diameter of the finished pipe; and means cooperating with abutting joint members to connect adjacent pipe lengths together.

---

2,775,263

## TENSION-RESPONSIVE CONTROL

Dale B. Rush, Columbus, Ind., assignor, by mesne assignments, to The Reliance Electric and Engineering Company, Cleveland, Ohio, a corporation of Ohio

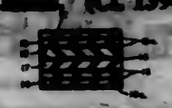
Application July 9, 1953, Serial No. 367,849
16 Claims. (Cl. 139—110)

1. Means for automatically controlling the rate of rotation of a storage roll for flexible material, comprising in combination with such a roll, a length of flexible material wound on said roll, means for forwarding said material relative to said roll, rotary means driven at a constant ratio with respect to said forwarding means, variable-speed

transmission means connecting said rotary means to drive said roll and comprising an input shaft connected to be driven from said rotary means, an output shaft connected to drive said roll, an expansible V-pulley on each of said shafts, edge-active belt means providing a driving connection between said pulleys, and an element shiftable to vary inversely the effective diameters of said pulleys, an arm mounted for oscillation about a fixed axis in a

common plane with the axis of said roll, means operatively engaging said arm and bearing against the inner surface of said material at a point within the sector defined between the current point of tangency of said material with the effective surface of said roll and a plane including the axis of said roll and normal to the plane of movement of said material, means yieldingly resisting movement of the arm in response to an increase in the tension on that reach of the material between the forwarding means and said means bearing against the material, and means connecting said arm to shift said shiftable element.

---



2,775,264

**PICKER STICK CHECKING APPARATUS**

Joseph Rechsteiner, Dayton, Ohio, assignor to The Dayton Rubber Company, a corporation of Ohio

Application June 19, 1953, Serial No. 362,901

11 Claims. (Cl. 139—161)

1. A loom check strap comprising a laminated rubber and fabric annular body the outermost layers of which are of nylon containing fabric, a centrally positioned layer of longitudinally arranged nylon-containing reinforcing cords and a thin coating of fused nylon about the edge portion of said body.

---

2,775,265

**VENETIAN BLIND LADDER AND LIKE WEBBING**

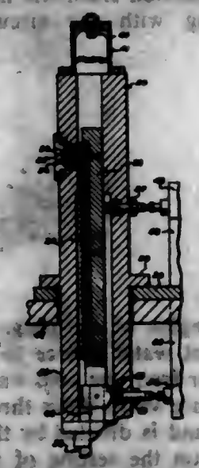
George Frederick French and Roger French, Hale, England; Roger French, Alfred Hanson, and Neville Christopher O'Brien, executors of the estate of George Frederick French, deceased, assignors to said Roger French

Application November 6, 1951, Serial No. 255,868

Claims priority, application Great Britain November 7, 1950

10 Claims. (Cl. 139—384)

3. A ladder webbing comprising at least two outer main bandings and at least one row of cross straps bound in at their ends between any adjacent two main bandings, successive cross straps being of such length that in-line portions thereof overlap longitudinally, so that one set of warp threads initially cross over through another set, each successive cross strap being at least partially woven with picks of at least two different common wef threads.



2,775,266

**APPARATUS FOR INTERTWISTING WIRES**

Armin F. Fick, Downers Grove, Clarence R. Rasmussen, La Grange, and Harry C. Thayer, Jr., Maywood, Ill., assignors to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

Application January 27, 1954, Serial No. 406,484

3 Claims. (Cl. 140—115)

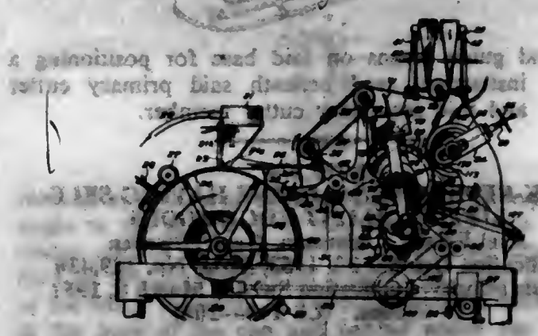
3. A wire twisting apparatus for interconnecting two wires comprising a rotatable twisting gear having a slot for receiving the intermediate portions of a pair of straight overlapping wires, a pair of wire gripping devices for receiving the end portions of said overlapping wires, means for supporting the gear for rotation and for supporting said wire gripping devices in fixed relation to each other on opposite sides of said gear, a rack mounted for reciprocation on said supporting means for actuating said gear, means for reciprocating said rack through two predetermined strokes in opposite directions to rotate said gear alternately in opposite directions through a predetermined number of revolutions whereby one pair of wires may be twisted during movement of the rack in one direction and another pair of wires may be twisted during movement of the rack in the opposite direction, means for actuating said wire gripping devices to closed position to grip the end portion of the wires, control means for effecting the sequential actuation of said wire gripping devices to said closed position to grip the wires and to actuate said rack through one stroke to effect the twisting of the wires and to move said wire gripping devices to open position on completion of the wire twisting operation, said wire gripping devices each comprising a fixed jaw on which said wires are laid, a movable jaw mounted for movement toward and away from said fixed jaw, a member yieldably mounted on the movable jaw for movement therewith and for limited movement relative thereto, and means for stressing said member for movement toward said fixed jaw for yieldably engaging and clamping the wires against the fixed jaw in response to actuation of said movable jaw to its closed position.

---

2,775,267

**METHOD AND APPARATUS FOR FILLING CAPSULES**

Frank E. Stein, Pearl River, and Arthur S. Taylor, Spring Valley, N. Y., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine



Original application March 23, 1948, Serial No. 16,584, now Patent No. 2,663,128, dated December 22, 1953. Divided and this application April 27, 1953, Serial No. 351,106

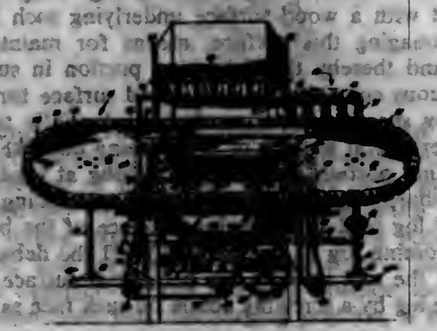
6 Claims. (Cl. 141—1)

1. The method of filling flowable powder into soft plastic capsule shells which comprises: continuously moving in a circular path a continuous plastic strip having a plurality of capsule shells formed therein, sealing a

group of flowable powder sources in a filler head block adjacent to a moving group of such capsule shells, one such source for each such shell, with said block resting on the plastic strip which itself forms a resilient part of the seal, reducing the pressure within each of the sealed shells whereby powder flows into said each sealed shell, and restraining the flow of powder outwardly from each

shell by foraminous material in the filler head block adjacent each of the flowable powder sources, until each of said shells is filled with powder, discontinuing the reduction in pressure, removing said group of flowable powder sources, and emplacing said group of flowable powder sources adjacent a subsequent, adjacent group of capsule shells.

---



2,775,268

**PICKLE CANNING MACHINE**

Robert H. Eckart, Corydon, Ind., assignor to Food Packers, Inc., Corydon, Ind., a corporation of Indiana

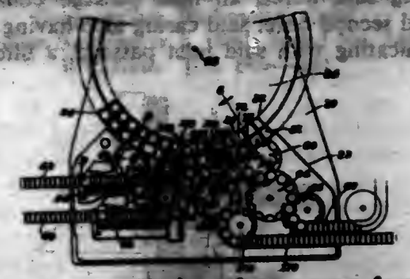
Application July 31, 1953, Serial No. 371,615

14 Claims. (Cl. 141—78)

6. A machine for feeding and compacting elongated food commodities into containers comprising a food commodity supply station, means for intermittently advancing a plurality of open containers sequentially by said station in commodity-receiving relation thereto, means for gravity feeding food commodities in end-to-end aligned relation from said supply station into the containers adjacent the same, means for spinning said containers at high speed in one direction and then in the reverse direction about the axes of said containers intermediate intermittent advancement of said containers to centrifugally urge the food commodities in said containers in erect position outwardly of the same, and means for jogging said containers in the direction of their axes continuously during spinning of said containers.

---

2,775,269



**FILLING MACHINES**

Rudolph H. Brasback, Baltimore, Md., assignor to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York

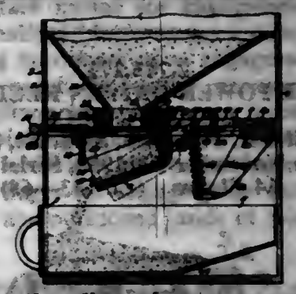
Application February 12, 1954, Serial No. 409,805

26 Claims. (Cl. 141—99)

1. In a filling machine, a base, a filling table rotatable on said base about a vertical axis, stationary table means fixed to said base adjacent said filling table, means to support containers on said filling table in two circular rows concentric with the axis of rotation of said filling table,

and means to move containers in two rows from said stationary table means to said container supporting means.

---



2,775,270

**DISPENSING APPARATUS**

Clinton J. McKillop, Jr., Oxnard, Calif.

Application May 12, 1954, Serial No. 429,148

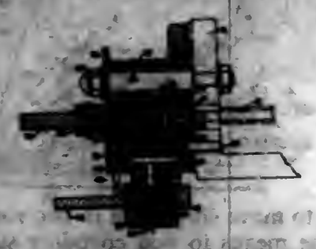
5 Claims. (Cl. 141—373)

1. Apparatus for dispensing a measured quantity of fluent material comprising: a canister including a front wall having a horizontal valve slot and a drawer opening below said slot; a receiving drawer in said opening; means within said canister defining a pair of slideways disposed in a common horizontal plane with said valve slot; a hopper within said canister, having, at its lower extremity, a discharge nozzle terminating substantially at said plane; a measuring spoon including a receiving body of elongated channel form, open at its forward end and having a closed rear end portion including an integral arm projecting upwardly and pivotally mounted within the canister on a transverse horizontal axis immediately rearwardly of said hopper nozzle and above said slideway plane, for movement between an elevated receiving position wherein said receiving body is horizontal and disposed immediately below said slideway plane, and a discharge position wherein said receiving body is inclined downwardly at an angle such as to discharge the contents through its open end into said drawer; means yieldingly acting upon said spoon to normally maintain the same in said elevated receiving position; fixed means carried by the canister, closing said open forward end of the spoon in the raised receiving position thereof; and a valve slide of plate form disposed in said slideway plane with its side margins supported in said slideways for horizontal sliding movement between a forwardly projected, nozzle opening position wherein the material within the hopper may flow downwardly through the nozzle into said spoon and a nozzle closing rearwardly extended position wherein the rear extremity of said valve slide projects rearwardly of said nozzle and engages said spoon arm to swing said arm rearwardly and thereby cause said receiving body to be tilted to said downwardly inclined discharge position.

---

2,775,271

**LAMP EXHAUST HEAD**

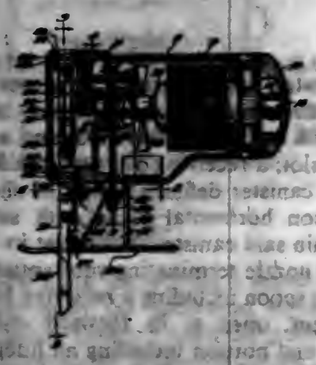


Ernest E. Yee, Wenham, and David F. Drown, Beverly, Mass., assignors to Sylvania Electric Products Inc., Salem, Mass., a corporation of Massachusetts

Application June 16, 1955, Serial No. 515,852

3 Claims. (Cl. 141—394)

3. An exhaust head for lamp-making machinery, com-

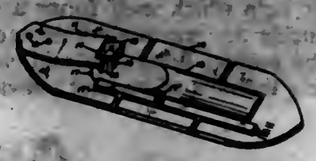


prising a casing having a first bore for receiving the end of an exhaust line, and a second bore, an apertured wall separating said bores, an inlet passage communicating with said second bore, said casing also having a chamber communicating with said inlet passage, a filter mounted

in said chamber, a valve plunger received in the second bore, sealing means mounted on said plunger for closing the aperture in said wall when the plunger is thrust inwardly, cam operated means for reciprocating the plunger, and means for clamping the exhaust tube of a lamp into communication with said chamber.

---

**2,775,272**
**PORTABLE POWER DRIVEN RECIPROCABLE CUTTING TOOL**
**Walter A. Papworth, Syracuse, N. Y.**
**Application November 27, 1953, Serial No. 394,537**
**14 Claims. (Cl. 143—68)**



3. A power driven reciprocable cutting tool comprising: a casing; vertically positioned cutter means mounted for endwise movement in said casing, said cutter means including a tool plunger and a toothed cutting tool secured thereto; yielding bearing means supporting said tool plunger in the casing, whereby the cutting tool may move fore and aft through a small distance; drive means in the casing for imparting endwise movement to said tool plunger; a bell crank pivoted at the bottom of the casing which has a guide roller in one arm bearing on the rear of the cutting tool; and a push rod extending from the bell crank into engagement with a portion of the driving means, whereby the cutting tool is pressed forwardly on its cutting stroke and released on its return stroke.

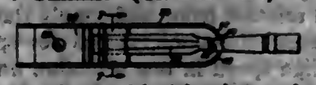
---

**2,775,273**
**MEANS FOR SOFTENING MUSICAL INSTRUMENT REEDS**
**Albert G. Yost, Waterford, Conn., assignor of two-thirds to Louis G. Sokol and John P. Janovic, New London, Conn.**
**Application November 9, 1951, Serial No. 255,602**
**4 Claims. (Cl. 144—196)**

1. In a device for softening reeds for musical instruments, a base, a primary cutter member fastened to said base and having a free end extending over said base, a primary cutter tooth on said free end of said primary cutter member, said tooth extending from said primary cutter member toward said base, said tooth being resiliently held normally away from said base, a secondary cutter member connected to said primary cutter member and overhanging said free end thereof, said secondary cutter member being provided with a tooth projecting toward said base and normally held out of contact there-

with, and guide means on said base for positioning a musical instrument reed beneath said primary cutter member and said secondary cutter member.

---



**2,775,274**
**BARK-REMOVING MACHINE HAVING SELF-LIFTING BLUNT-EDGE TOOLS**
**Axel Erland Andersson, Gavle, Sweden**
**Application October 30, 1953, Serial No. 389,436**
**Claims priority, application Sweden March 8, 1951**
**19 Claims. (Cl. 144—208)**

12. In a machine for debarking logs, comprising in combination a rotatable annular frame through which a log is axially fed, a plurality of debarking tools carried by said frame and means mounting the tools for movement toward and away from the axis of rotation of the frame, each tool including a bark-penetrating and debarking portion constituted by a blunt edge adapted to make contact with a wood surface underlying such bark without damaging this surface, means for maintaining the tools and thereby the debarking portion in substantially continuous contact with such wood surface for removing bark by shearing force exerted substantially tangentially to a peripheral surface of a log being debarked, and the debarking portion of each tool having at least one relatively sharp edge integral therewith and facing the direction of log feed for engaging the face of the butt end of an oncoming log to automatically lift the debarking portion of the tool up onto the peripheral surface of an oncoming log by a screwing action on such face as the frame rotates.

---

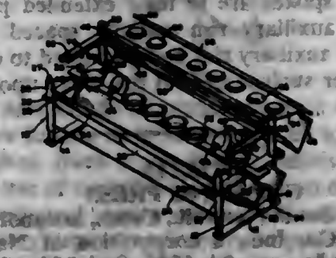
**2,775,275**
**CHISEL GUARD**
**Clarence H. Forbes, Salt Lake City, Utah**
**Application September 21, 1954, Serial No. 457,435**
**7 Claims. (Cl. 145—34)**

1. A chisel guard for a chisel having a shank with rear shoulders and a handle portion comprising a channel member adapted to receive the chisel therein, and said channel member including an abutment at its rear end for engagement by the shoulders, and means at the front portion of said channel member lockably overlying the front end of the chisel and clamping the shoulders of the chisel against said abutment.

---

**2,775,276**
**HANDLE FOR SCREW DRIVERS OR THE LIKE**
**Albert G. Reamer, Westminster, Mass.**
**Application July 29, 1954, Serial No. 444,540**
**1 Claim. (Cl. 145—61)**

A tool handle comprising a main handle part, a cap at the rear end of the main handle part, and means rotatably connecting the cap to the main handle part and



including a pin having one end anchored axially in the main handle part and projecting rearwardly therefrom, a diametrically enlarged flange on the rear end of the pin, said cap having a dead end bore in which the pin is received in a concealed position and said bore having an inwardly tapering counterbore at its dead end overlying the flange and in which the flange is received the sur-

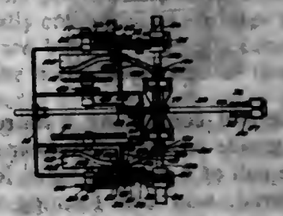
face of said tapered counterbore being arranged at an angle to the periphery of the flange and with the rear corner only of the flange in contact with the tapered surface of the counterbore to reduce the point of contact of the flange therewith to a minimum, and a bushing fixed in the bore of the cap and behind which the flange is positioned to retain the cap on the pin.

---

**2,775,277**
**EGG SEPARATOR**
**Paul Christen, Philadelphia, Pa.**
**Application November 1, 1954, Serial No. 465,817**
**5 Claims. (Cl. 146—2)**

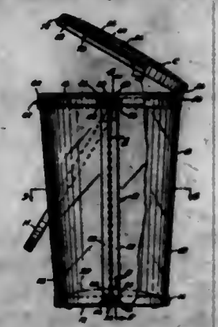
1. An egg separator comprising an elongated frame, an elongated laterally disposed yolk tray pivotally mounted adjacent the top of the frame, said tray being provided with a plurality of integrally formed laterally spaced arcuately slotted egg-receiving yolk-retaining pockets or depressions, said tray being pivotable from a generally horizontal right-side-up egg receiving position to a generally upside-down yolk discharging position, a laterally inclined yolk receiving trough mounted adjacent the top of the frame and extending underneath the yolk discharging position of the yolk tray, a laterally disposed cup arm pivotally mounted on the frame below the level of the yolk tray, said cup arm having a plurality of laterally spaced individual egg-white receiving cups mounted thereon, said cup arm being horizontally positioned with the individual receiving cups disposed in upright position below and in vertical alignment with the corresponding tray pockets when the tray is in its horizontal egg receiving position whereby the egg-white is capable of dripping down through the slots in the pockets and into the corresponding individual cups, a laterally inclined egg-white receiving trough mounted on the frame below the level of the cup arm, said cup arm being pivotable to a generally vertical position so as to move all of the cups simultaneously to egg-white discharging position above the egg-white receiving trough, a laterally inclined mixed-egg receiving trough mounted on said frame alongside of the egg-white receiving trough, each of the individual cups being pivotally mounted on the cup arm to tilt in a direction opposite to the pivoting direction of the cup arm whereby, when the cup arm is in its normal horizontal position, individual cups can be tilted independently from their upright receiving position to discharge mixed-egg into the mixed-egg receiving trough.

---



**2,775,278**
**PEACH PITTER**
**Earl R. Anderson, Campbell, Calif., assignor to Flippr Corporation, Richmond, Calif.**
**Application September 1, 1951, Serial No. 244,795**
**8 Claims. (Cl. 146—28)**

1. In a peach pitter, a pitting head comprising a member having surface means for engagement by the half pit of a peach half, yieldable means mounting said member for receding movement upon engagement of a peach half therewith, peach supporting means comprising opposed pit grasping elements, means providing a common floating pivotal mounting for said grasping elements, one of said elements comprising a pitting knife, and a locating finger for engaging the end of the pit at the stem cavity and positioned inside of said pitting knife.



---

**2,775,279**
**DRUPE PITTER**
**Joseph Parrelli, Richmond, Calif., assignor to Flippr Corporation, a corporation of California**
**Application December 19, 1952, Serial No. 326,832**
**5 Claims. (Cl. 146—28)**

1. In a drupe pitter that includes a support for supporting a drupe at a predetermined point with the outer surfaces of opposite halves of said drupe exposed for gripping by drupe gripping devices, a pair of drupe gripping devices at opposite sides of said point each comprising a plurality of elements spaced about an axis extending through said point and common to said halves of a drupe supported at said point, each of said elements having an elongated concavely curved drupe engaging surface facing generally radially inwardly toward said axis and extending substantially tangentially from one end of each element in the same direction outwardly of a circle coaxial with said axis, said drupe engaging surfaces being adapted to engage the outer surfaces only of a drupe, means mounting said elements for movement radially inwardly and toward said axis, a pivot connecting each element with said last mentioned means for swinging of said elements to positions in which their said drupe engaging surfaces are substantially concentric with said axis, whereby said surfaces will accommodate themselves to variations in the contours of the outside surfaces of the said halves of drupes positioned at said point, and means connected with said elements for so moving them radially inwardly toward said axis and into engagement with said opposite halves of a drupe on said support.

2,775,280
LADY'S HANDBAG
Nathan Kaplan, Fitchfield, Conn., assignor to Majestic Metal Specialties, Inc., Monroe, Conn., a corporation of Connecticut
Application March 1, 1955, Serial No. 491,279
15 Claims. (Cl. 150—28)

1. A container comprising a body, and a cover hinged thereon, said body including a circular upwardly flanged bottom, a ring having an inverted U-section at the top, and a plurality of columns connecting the bottom to the ring, each column being H-shaped in section to provide outer flanges, inner flanges and cross web, and arcuate wall members having side edges received in said columns and a top edge received in said ring and a bottom edge received inside the flange of the bottom.

2,775,281
DEFORMABLE PLASTIC NUT HAVING WIRE COIL INSERT THREADS RETAINED THEREIN
Byron J. Smith, Danbury, Conn., assignor to Heli-Coil Corporation, Danbury, Conn., a corporation of Delaware
Application July 3, 1953, Serial No. 365,907
3 Claims. (Cl. 151—7)

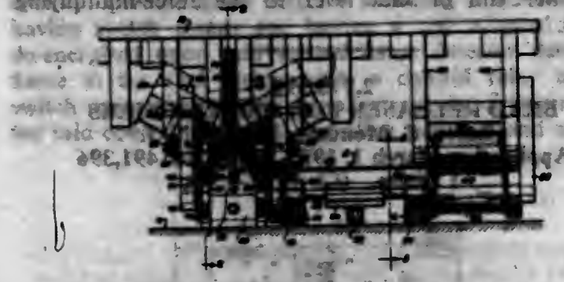
1. A composite nut comprising a barrel of a plastic material of high tensile strength and shear resistance, and a cylindrical wire coil of a material being less elastic than said plastic material, said coil forming with its inner portion a female screw thread and being immovably embedded with its outer portion in said barrel so that the latter extends a distance beyond at least one of the ends of said coil, said barrel extension throughout its length being provided with an interior thread constituting the continuation of and being of the same pitch and shape as said female thread, and said extension having a bottom face exposed to bear on the surface of an external element of a screw connection whereby said barrel extension will be compressed between said surface and said coil when said nut is used in such connection.

2,775,282
VEHICLE WHEEL
Charles T. Kennedy, Riverside, Ill.
Application March 10, 1955, Serial No. 493,319
9 Claims. (Cl. 152—158)

1. A tire and wheel assembly comprising a pneumatic tubeless tire comprising a casing having a tread and side walls terminating in spaced rim-engaging means; a drop-center type wheel rim having axially spaced side walls for engaging said tire beads and a central depressed annular portion radially spaced inwardly of the outer marginal edges of said wheel rim side walls; a central annular flange fixed and projecting radially outwardly with respect to said wheel rim depressed annular portion, said flange terminating radially inwardly of the base of said wheel rim side walls; a safety auxiliary rim disposed within said tire casing having an outer diameter less than the inner diameter of said tire tread when said tire is inflated and an inner diameter greater than the diameter of the outer marginal edges of said wheel rim side walls; a plurality of circumferentially spaced spokes, each of said spokes having one end pivotally connected to said annular flange and being pivotal between a retracted position wherein said spoke lies adjacent the base of said annular flange and is completely disposed radially

inwardly of the base of said wheel rim side walls and an extended position wherein said spoke projects radially outwardly into the interior of said tire casing; and means for detachably connecting the ends of said spokes opposite the pivotally connected ends thereof to said auxiliary rim when said spokes are in their extended positions to maintain said auxiliary rim radially spaced from said wheel rim, said auxiliary rim being adapted to operatively engage the inner surface of said tire tread upon deflation of said tire.

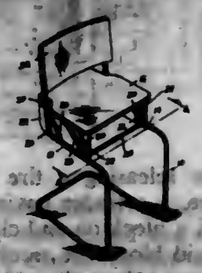
2,775,283
CRIMPING PRESS
Leonard Greer, South Norwalk, Conn., assignor to Burndy Engineering Co. Inc., a corporation of New York
Application January 24, 1956, Serial No. 561,024
6 Claims. (Cl. 153—1)



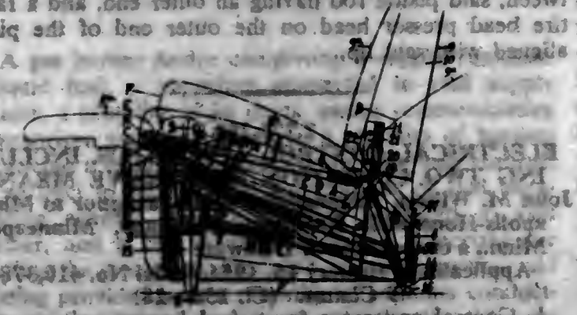
1. A press for crimping an electrical connector to a conductor, which comprises a contact positioned adjacent the end of the electrical connector in the crimping position, operating means for controlling the motion of the press, connecting means from the contact to the operating means and connecting means from the operating means to the metal of the press whereby the circuit is closed to the operating means when a conductor inserted into a connector engages the contact.

2,775,284
MACHINE FOR MAKING ARCHED PANEL SHEETS
Leroy N. Heitmann, Chicago, Ill., assignor to Inland Steel Products Company, a corporation of Delaware
Application January 21, 1952, Serial No. 352,283
11 Claims. (Cl. 153—7)

1. A machine having a horizontally reciprocating bed and a stationary frame above said bed adjacent one end of the same, a sheet carrier mounted on said bed and reciprocal therewith, said sheet carrier having a longitudinally extending triangularly shaped forming die thereon, guide rollers disposed to grip a sheet on both sides of said forming die and hold the sheet thereon, said forming die having alternating ridges and slots throughout its length and rotatable forming rollers positioned on said



stationary frame having peripheral teeth adapted to press a sheet metal blank having a V-ridge carried on said

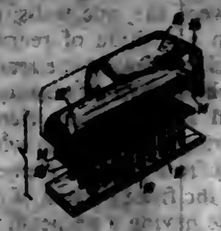


forming die between said alternate ridges to form crimps in the legs of the V-ridges of said blank.

2,775,285
CONVERTIBLE CHAIR
Clifford D. Morsland, Des Moines, Iowa
Application July 16, 1953, Serial No. 367,221
7 Claims. (Cl. 155—38)

1. As a new article of manufacture, a chair, comprising, a frame having at least two spaced apart side members extending from front to rear relative to the usual position of use of said chair, a pair of rod members spaced apart between and secured to said side members, a seat, plate members depending from two opposite sides of said seat, each plate having two slots parallel to each other and spaced apart a distance coinciding with that of said rod members each slot extending from a point near the lower edge of said plate member upward and rearwardly in a curved path to a point near the upper edge thereof, notches in each slot, said seat mounted on said frame so that one rod member extends transversely through the corresponding slots on each plate and the other rod member is similarly arranged relative to the other corresponding slots, said seat manually movable in two directions respectively by passing said slots past said rod members, and said notches engageable at times with said respective rod members for holding said seat at a desired position relative to said rod members.

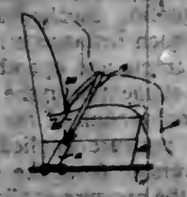
2,775,286
CONVERTIBLE RECLINING CHAIR
Joseph M. Vallone, Hamburg, N. Y.
Application August 8, 1955, Serial No. 526,835
6 Claims. (Cl. 155—106)



1. A convertible reclining chair having chair and reclining phases and comprising, in combination: a main frame having vertical side walls and transverse connections between them; a rectangular seat element extending horizontally between the side walls; and in the reclining phase elevated in a position of rearward and downward inclination; a back element at the rear of the seat element and in the chair phase having a position in which it projects vertically upward from the seat element and in the reclining phase having a position in which it projects rearward and upward from the seat element; a leg supporting element adjacent the front portion of the seat element and in the chair phase having a perpendicular position below the front portion of the seat element and in the reclining phase having a position in which it projects horizontally forward; supporting legs arranged under the seat element and comprising a front pair in unattached relation to the main frame and a rear pair rigidly attached to the side walls of the main frame; the legs of the rear pair fulcruming during conversion from either phase to the other about their lower ends in forward or rearward swinging movements; actuating mechanism arranged under the seat element, the actuating mechanism being provided in duplicate and in each instance arranged adjacent a side wall of the main frame and operable by pressure applied either to the back element or to the leg supporting element for effecting the conversion of the chair from one phase to the other, the pressure applied to the back element effecting the conversion from the chair phase to the reclining phase and the pressure applied to the leg supporting element effecting the conversion from the reclining phase to the chair phase, each actuating mechanism comprising a lever which in the chair phase is positioned vertically and extends from a point adjacent the lower edges of the side walls, the lever being connected functionally to the main frame by a pivot located adjacent the upper end of a corresponding rear leg and about which it is movable in a longitudinal plane, the lever having an alining extension which projects upward beyond its pivot and is rigidly connected to the back element, lower and upper motion transmitting links positioned longitudinally and at their rear ends pivotally connected to the lever at spaced points, both of which are below the pivotal connection between the lever and the main frame and at their forward ends pivotally connected at lower and upper spaced points to the leg supporting element adjacent that portion thereof which is its upper portion in its position in the chair phase, a toggle comprising pivotally connected lower and upper links arranged and movable in a longitudinal plane, the lower link being pivotally connected functionally to a corresponding front leg and the upper link being pivotally connected functionally to the main frame, one of the toggle links having an alining extension beyond its pivotal connection to the other toggle link and one of the motion transmitting links being connected pivotally to the toggle link extension and effecting the extension of the toggle in the conversion to the reclining phase and its contraction in the conversion to the chair phase; and means for maintaining the stability of the front legs during the conversion of the article from either phase to the other, the means having an anchored connection to an appropriate part of the chair and an operative connection to the corresponding front leg.

2,775,287
SEAT CUSHIONS
Arturo Montagna, Milan, Italy
Application July 29, 1953, Serial No. 371,985
Claims priority, application Italy August 8, 1952
5 Claims. (Cl. 155—179)

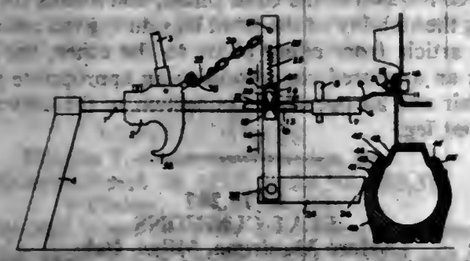
1. A seat cushion comprising, in combination, a rigid base member, a plurality of coil spring members uniformly arranged and spaced on said base member, each of said springs having one end thereof connected to said base member; and a resilient member extending substantially over the entire base member and being sup-



ported by the free ends of said coil spring members, said resilient member including a layer of foam plastic

material and a metallic screen secured thereto over at least one face unattached to said rigid base.

---



2,775,288
**SAFETY BELT FOR VEHICLES**
Angelo Anastasio, Monterey, Calif.
Application April 15, 1955, Serial No. 501,563
2 Claims. (Cl. 155—189)

2. The combination with a vehicle frame and a seat supported upon the frame, of a safety belt comprising a hollow standard arranged at an angle with respect to the vertical and forwardly of said seat secured to said vehicle frame at each end of the seat adjacent the rear edge thereof, a flexible strap extending over and spaced from said seat adapted to restrain movement forwardly or to either side of said seat of a person seated thereon, a member carried by each end of said strap removably received in the adjacent standard, a pair of converging spring arms arranged one on each side of said member and having their converged ends pivotally connected to the other end of said member for movement toward and away from each other, spring means urging said arms away from each other, cooperating releasable locking means on the complemental faces of said standard and said arms releasably securing each of said members in the adjacent standard, and means releasably securing an intermediate portion of said strap of said seat intermediate the ends of the latter.

---

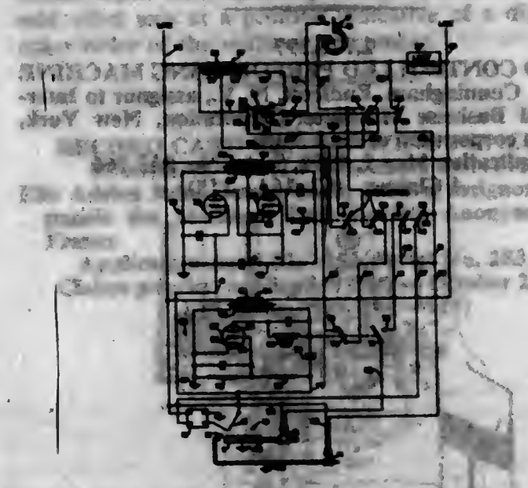
2,775,289
**JACK ACTUATED DEVICE FOR REMOVING TIRES FROM VEHICLE ATTACHED WHEELS**
Walter A. Anderson, Worcester, Mass.
Application February 16, 1954, Serial No. 411,088
4 Claims. (Cl. 157—1.1)

1. Apparatus for dismounting tires from the wheels of automotive vehicles while the wheels are still attached to their respective vehicles, comprising a horizontal bar, a substantially vertical support means attached to one end of said bar, a connecting means mounted on the other end of said bar and adapted to secure said bar to the hub portion of a wheel upon which a tire is mounted, a force-multiplying means mounted on said bar, a lever pivotally mounted on said bar at a pivot point located intermediate the ends of said lever, a tire-engaging thrust member mounted at one end of said lever, and means connecting the other end of said lever to the force-multiplying means.

---

2,775,290
**BEAD RELEASER FOR VEHICLE TIRES**
Charles C. Meadows, Passaic, N. J.
Application March 1, 1955, Serial No. 491,396
1 Claim. (Cl. 157—1.17)

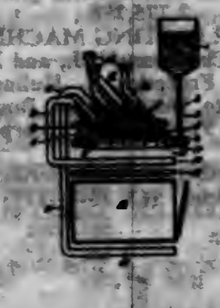
In a device for releasing a tire bead from beneath a wheel rim flange, a cylinder having an outer end and an open inner end, a block on and closing said outer end, a projection on said block for receiving an air pressure hose fitting, a passage through said projection and said block leading into said cylinder, a cylinder head secured to the open inner end of said cylinder and having a tubular portion extending axially away from the head of the cylinder, said tubular portion having an outer sleeve secured in said tubular portion, said outer sleeve having an outer end reaching outwardly beyond the outer end of said tubular portion and a bore, an inner sleeve within said bore of the outer sleeve, first means on said outer sleeve engaging said inner sleeve to thereby secure the inner and outer sleeves together, second means traversing said tubular portion of the cylinder head and said outer sleeve and engaging said inner sleeve and serving to lock said outer sleeve in said tubular portion and to lock said inner sleeve in place in the bore of the outer sleeve, a piston working in said cylinder, a piston rod connected to the piston and slidably extending through said inner sleeve, third means on the inner sleeve engaging the piston rod and precluding rotation of the piston rod relative to the inner sleeve, air vent means for said cylinder between the piston and said cylinder head, a longitudinal projection on one side of said outer end of the outer sleeve, an enlargement on the outer end of the inner sleeve beyond the outer end of the outer sleeve, said enlargement comprising a lip aligned with and spaced outwardly from said longitudinal projection so as to provide a rim flange receiving space therebetween, said piston rod having an outer end, and a radial tire bead presser head on the outer end of the piston aligned with said lip.



---

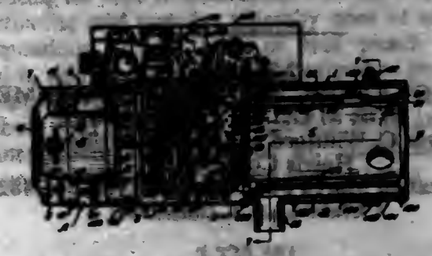
2,775,291
**ELECTRICAL CONTROL APPARATUS, INCLUDING TWO CONDITION RESPONSIVE MEANS**
John M. Wilson, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application February 16, 1954, Serial No. 410,378
9 Claims. (Cl. 158—28)

1. Control apparatus for a fuel burner unit comprising, a first electrically operable flame detector including



a first relay having switch means and having a coil adapted to be energized upon said first flame detector detecting flame at the fuel burner unit, a second electrically operable flame detector including a second relay having switch means and having a coil adapted to be de-energized upon said second flame detector detecting flame at the fuel burner unit, a control relay having switch means and a coil, initial energizing circuit means for said control relay coil including said first and second

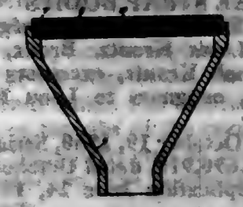
relay switch means and adapted to be completed when said first relay coil is deenergized and said second relay coil is energized, and a control circuit including said first second relay switch means and said control relay switch means and adapted to be connected to an electrically operable fuel control for the fuel burner unit and completed only when said first relay coil is in energized condition and said second relay coil is in de-energized condition and said control relay coil is in energized condition.



---

2,775,292
**SELF-GASIFYING PETROLEUM GAS BURNER**
Albertus van der Lee, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application May 6, 1953, Serial No. 353,316
Claims priority, application Netherlands July 14, 1952
2 Claims. (Cl. 158—62)

1. A gas burner device comprising a supply container for liquid fuel, a vaporizer connected to said supply container, a plurality of jet ducts, means communicating said vaporizer with said jet ducts, a plurality of burners each having a mixed-gas duct transporting fuel through each jet duct to each of said burners, one of said burners being adapted to give off heat produced to said vaporizer, and a cap mounted over said vaporizer for collecting the hot gases produced by said burner, said cap being provided with a plurality of conduits conducting the gases adjacent to at least one of said mixed-gas ducts.



2,775,293
**LIQUID FUEL FIRED HEATING APPARATUS FOR USE, ESPECIALLY ON AUTOMOTIVE CONVEYANCES**
David L. Raymond, Lyndhurst, and Richard C. Spencer, Fairview Park, Ohio, assignors, by mesne assignments, to Hupp Corporation, Detroit, Mich., a corporation of Virginia
Application September 16, 1952, Serial No. 309,762
5 Claims. (Cl. 158—91)

1. A liquid fuel pot type burner comprising an imperforate end wall and a peripheral wall, the latter wall being provided with air admitting openings in substantially spaced relation to said end wall and spaced apart circumferentially of the peripheral wall, a cylindrical wick support projecting inwardly from the end wall substantially axially of the burner, said support having a circumferential fuel distributing groove spaced from said end wall, a fuel feed tube extending into the burner with its discharge end closely adjacent said groove and in a position to deliver fuel directly thereto, a tubular wick surrounding and sustained by said support and enclosing said groove, and an electrical igniter including a resistance wire, said igniter extending into the burner and arranged with the resistance wire in fuel vaporizing and igniting relation to the wick.

---

2,775,294
**RADIATION BURNERS**
Günther Schwank, Ghezisburg (Ostsee), Germany; Rheinisch-Westfälische "Therme" Transmit Aktiengesellschaft (Treuhand Aktiengesellschaft) and Wilhelm Fruehauf, executors of said Günther Schwank, deceased, assignor to American Infra Red Radiant Co., Inc., New York, N. Y., a corporation of Delaware
Application March 8, 1951, Serial No. 214,468
Claims priority, application Germany March 11, 1950
5 Claims. (Cl. 158—116)

1. A burner member, comprising a block of refractory material provided with passages therethrough for a combustible fuel mixture, said passages being substantially uniformly distributed throughout a portion of the area of said block and each having a cross sectional area of not more than about four square millimeters and a length not less than about five millimeters and each extending substantially in the same direction throughout its length from one side of the block to the outer side thereof, said passages collectively occupying not less than about 20 percent of the total radiation area at said outer side of the block, said block of refractory material having a heat-retarding medium of substantially lower thermal-conductivity than said refractory material distributed therein to reduce the thermal-conductivity of the block, the latter having a thermal-conductivity of less than 0.5 kilocal./hr. m. °C., said passages being defined

by integral internal wall surfaces of said block and said heat-retarding medium being disposed adjacent to said passage-defining surfaces, said passage arrangement and dimensions and said heat-retarding medium in said block and adjacent to said internal wall surfaces of said passages being jointly operable to confine the combustion of the fuel mixture to the outer zone of said passages and to inhibit said combustion from traveling in said passages inwardly of said zone and producing a backfiring effect.

---

2,775,295

**ARTICLE OF FABRIC AND METHOD AND MEANS FOR MAKING THE SAME**

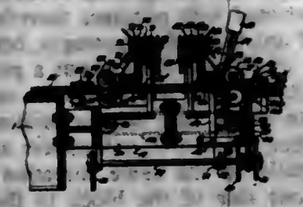
Alvin C. Williford and Fred R. Williams, Harris County, Tex.

Application March 30, 1953, Serial No. 345,482

2 Claims. (Cl. 160—348)

1. The method of making an article of drapery which comprises forming a piece of flexible fabric into folds, a portion of the fabric connecting said folds on one side of said piece, positioning the edges of the folds in opposing parallel relation, providing a channel shaped backing plate of deformable material having longitudinally spaced openings in the bottom wall thereof and a support element having openings therethrough corresponding to the openings of the backing plate, positioning the outer face of the bottom wall of said backing plate in contact with said folds on one side of said piece, positioning one side of said support element in contact with the folds on the other side of said face, inserting deformable fastening means through corresponding openings in said plate and element and between said edges deforming said means into clamping engagement with the inner face of said bottom wall and with the other side of said element, folding said connecting portion into pleats, inserting said pleats between the sides of said plate and bending said sides inwardly into clamping engagement with said pleats.

---



2,775,296

**MACHINE FOR SCORING APPAREL BELT AND LIKE STRAP BODIES**

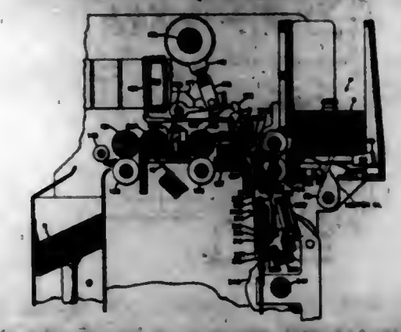
James Allen Tuck, Kissimmee, N. Y., assignor, by mesne assignments, to Louis Krantz, Bronx, N. Y.; Leon Krantz and Hannah Krantz, executors of said Louis Krantz, deceased, assignors to Leon Krantz, Bronx, N. Y.

Original application October 19, 1950, Serial No. 191,001, now Patent No. 2,690,910, dated October 5, 1954. Divided and this application June 24, 1954, Serial No. 440,732

9 Claims. (Cl. 164—39)

1. In a machine of the kind described, means for scoring marginal edge portions of the face of a stock strip, said means comprising opposed bed and scoring rolls, means for driving said rolls, releasable stop means spaced a predetermined distance inwardly from said rolls in the path of stock strip advancing movement therebetween, a driven timing cam actuated means to temporarily separate the scoring rolls from the bed roll, cooperative feeding and gripper rollers spaced outwardly from the bed and scoring rolls for initially advancing a stock strip therebetween while they are separated and thence into arrested engagement with the stop means, a second driven timing cam actuated means to control the stock strip advancing operation and release of the feeding and gripper rollers, and means to release the stop means when the scoring and bed rolls are brought into scoring and advancing engagement with the initially advanced stock strip and the feeding and gripping rollers are released.

---



2,775,297

**RECORD CONTROLLED PERFORATING MACHINE**

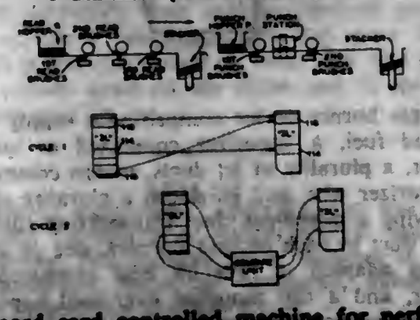
James M. Cunningham, Endicott, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application May 1, 1952, Serial No. 285,566

4 Claims. (Cl. 164—115)

1. In a cyclically operable machine for perforating records having rows of index point positions for data designations, perforating means, a first sensing means disposed a predetermined distance from said perforating means for sensing rows of data designations, a second sensing means disposed a different predetermined distance from said perforating means for sensing different rows of data designations, storage means, a first control means under control of said first sensing means, a second control means under control of said second sensing means, said first and second control means being spatially disposed to operate in synchronism with the sensing of the index point positions by the respective first and second sensing means for entering into said storage means at respective time intervals data represented by the sensed designations, and means under control of said storage means for operating said perforating means to reperforate the sensed data.

---



2,775,298

**LEDGER POSTING MACHINE**

David W. Rabbidge, Chatham, N. J., and John R. Natvig, Great Kills, and Frederick S. Hoiling, Binghamton, N. Y., assignors to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application November 17, 1953, Serial No. 392,696

8 Claims. (Cl. 164—115)

1. A record card controlled machine for perforating a rectangular coordinate system posting field arranged on a record card comprising a plurality of record card perforating means positioned along one axis of a rectangular coordinate system, record card feeding means for moving the posting field relative to said perforating means along the other axis of a rectangular coordinate system, multi-order digit manifesting means, selecting network circuit means controlled by said manifesting means to condition for operation a selected one of said perforating means indicative of a digit in one order of a multi-order number, and other means controlled by said manifesting means for operating the selected recording means when said recording means is located along the said other axis at a position indicative of a digit in another order of the multi-order number.

---

2,775,299

**RECORD CARD REPRODUCING PUNCHING MACHINE WITH PROGRAM CONTROL**

Elie Adrien Jules Deury, Paris, France, assignor to Compagnie des Machines Bull (Société Anonyme), Paris, France

Application April 22, 1952, Serial No. 283,788

Claims priority, application France October 2, 1951

12 Claims. (Cl. 164—115)

1. In a card punching machine having a card sensing device, and a card carriage for feeding one control master card and a detail card step by step respectively past said sensing device and past one columnar row of punches, said control master card having columns of index-point positions with perforations representative of constant data, the columns of a so-called "program" field bearing a special perforation in a position non-used for the data recording, some of the columns of the program field bearing a further perforation, a duplicating arrangement to automatically reproduce constant data from said control master card on a plurality of detail cards, a relay storage device containing another data, a first control means prepared to be operative upon sensing of said special perforation, a second control means rendered operative when the first column with said further perforation is sensed, both control means enabling, when operative, the automatic punching of said other data from the storage device on the same plurality of detail cards, control means operated manually when said other data is to be changed for inhibiting the duplicating arrangement and setting the storage device from read-out condition into receiving condition.

**TAPE PUNCHING APPARATUS**

Paul R. Hoffman, Woodlyn, Pa., assignor to Burroughs Corporation, Detroit, Mich., a corporation of Michigan

Application September 21, 1955, Serial No. 535,559

10 Claims. (Cl. 164—115)

4. In an apparatus for making a tape in accordance with code signals received by the apparatus, a plurality of solenoids for receiving the code signals, a plurality of punch interposers normally positioned in a first position and adapted to be permanently positioned between said first position and a second position in accordance with said signals, means controlled by said solenoids for tending to prevent movement of the punch interposers from their first positions, means for moving said punch interposers to said second position to form permutations of positions of said plurality of punch interposers in accordance with the signals received by said solenoids, a plurality of punches cooperable with said punch interposers for perforating the tape in accordance with said signals, means for actuating said punches whereby ones of said punches corresponding to said ones of said punch interposers moved to said second position are caused to perforate said tape, means for adjusting said interposers comprising a cam shaft, said shaft being adapted to be rotated whereby said interposers are positioned for interjection between said punch actuating means and said punches.

2,775,301

**DIE MEMBERS**

Albert C. Gangloff, Natrona Heights, Pa., assignor to Allegheny Ludlum Steel Corporation, Brackenridge, Pa., a corporation of Pennsylvania

Application September 25, 1953, Serial No. 382,263

7 Claims. (Cl. 164—118)

7. A split die member for use in making laminations comprising, in combination, a pair of cooperating die sections disposed in assembled relation to form a die having a leading die face and a trailing face and a die opening extending therebetween, the die opening having edges in a common plane in the leading die face of a configuration and size corresponding to the configuration and size of the lamination to be formed, the die opening having a bore increasing in size as it extends from the leading die faces to the trailing face, each of the die sections having a rib disposed in the bore to extend from an associated portion of the edge of the die opening in the leading die face in a perpendicular direction therefrom towards the trailing face, each of the ribs having an outer surface within the bore disposed in a plane common to the associated portion of the edge of the die opening in the leading die face from which the associated rib extends, the outer surfaces of the ribs of the cooperating die sections cooperating to frictionally engage the laminations formed in the die member until the laminations are forceably removed therefrom.

2,775,302

**PROCESS AND DEVICE FOR INHIBITING CORROSION IN WELLS**

Willard H. Kirkpatrick, Sugar Land, Tex., assignor to Visco Products Company, Houston, Tex., a corporation of Delaware

Application August 4, 1954, Serial No. 447,878

2 Claims. (Cl. 166—1)

1. A process of inhibiting corrosion in a well containing corrosive fluids which comprises depositing in the

well a compartmented container comprising a plurality of compartments, each containing a corrosion inhibiting chemical, and which are so constructed as to dissolve successively and periodically in the well fluids thereby to discharge said corrosion inhibiting chemicals from said compartment successively and periodically.

2,775,363

## METHOD FOR CONTROLLING SAND IN WELLS

Gene F. Abendroth, Shreveport, and William T. Elroy, New Orleans, La., and Gilbert H. Tausch, Houston, Tex., assignors, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware

Application May 22, 1953, Serial No. 356,824
4 Claims. (Cl. 166—15)

1. A method for gravel packing a well having a casing traversing a producing formation and having a tubing string arranged in said casing terminating in an open end at a point above the bottom of said casing which comprises perforating said casing at a point below the open end of said tubing string corresponding to said producing formation, flowing fluid from said formation to wash out a cavity in said formation, lowering a screen and liner having closed upper and lower ends through the open end of said tubing string, arranging said screen and liner in said casing adjacent the perforations with its upper end in the tubing, flowing gravel downwardly through said tubing string and depositing said gravel in said casing, squeezing said gravel through said perforations into the ends of said cavity while maintaining said screen and liner closed and free of gravel to form a pack in said cavity and around said screen and liner, opening the upper end of said screen and liner, and thereby establishing a path of flow from said formation through said pack and into said screen and liner and tubing string.

---

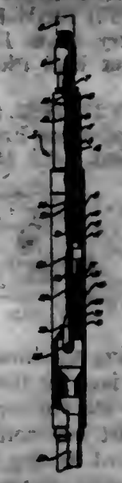
2,775,364

## APPARATUS FOR PROVIDING DUCTS BETWEEN BOREHOLE WALL AND CASING

Solis Myron Zandmer, Calgary, Alberta, Canada

Application May 18, 1953, Serial No. 355,770
2 Claims. (Cl. 166—100)

1. In apparatus for use in a bore hole traversing a porous stratum to be tapped, a duct-forming device adapted to be supported by a bore hole casing of smaller diameter than that of the bore hole to provide an annular space between said casing and the wall of the bore hole adapted to receive a sealing material; said device comprising, an open-ended tubular bushing mountable in a hole through the wall of said casing, a plunger mounted in said bushing for outward movement to engage the wall of the bore hole to provide with said bushing a core to be surrounded by the sealing material, means releasably locking said plunger against outward movement in said bushing, and means constraining said plunger to an outward movement, said plunger being of a material dissolvable in acid whereby said plunger may be dissolved to provide a passage between the interior of said casing and the wall of the bore hole.



---

2,775,365

## FORMATION TESTER WITH PRESSURE EQUALIZING MEANS

Boyd R. McKinley, Long Beach, Calif.

Application May 11, 1953, Serial No. 354,118
6 Claims. (Cl. 166—149)

1. A formation tester with pressure equalizing means comprising a control head, said control head having ports extending through the wall thereof, a sampling tube extending longitudinally through said control head, a plug closing the lower end of said sampling tube, said sampling tube having an intake hole therein alignable with said ports, a control tube rotatable in the control head for attachment to a drill pipe, coengaging thread means on the sampling tube and the control tube in the control head, said sampling tube being movable longitudinally in the control head to move said intake hole relative to said ports on rotation of the drill pipe and control tube, a tubular by-pass assembly mounted on the control head and below the same, said by-pass assembly comprising a tubular body and a tubular packing mounted in the tubular body, a pipe mounted on the lower end of the sampling tube and below said plug and extending through the by-pass assembly, said tubular packing sealingly engaging said pipe, said tubular body having circulation holes extending through the wall thereof, and said pipe having an upper hole therein alignable with the circulation holes to permit flow of fluid around the packing, and the lower end of said pipe having holes therein positioned below said packing, said upper hole in the pipe being closed by the packing when the intake hole in the sampling tube is aligned with said ports, said tubular body being provided with an intake duct communicating at one end with the ports in the control head and at the other end with the exterior of the by-pass assembly below said tubular packing.

---

2,775,366

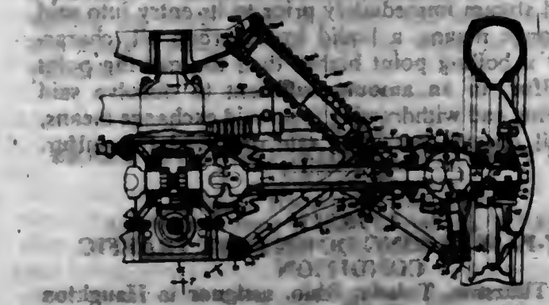
## RELEASABLE COUPLING FOR WELL TOOLS

William H. Middleton, Hobbs, N. Mex., and Charles W. Bast, Seminole, Tex.

Application August 24, 1953, Serial No. 375,875
2 Claims. (Cl. 166—319)

1. A releasable coupling for connecting well tools and a well string or cable, said coupling comprising a hollow cylindrical body, an internal tapered shoulder adjacent the lower end of said body, means at the upper end of said body for connecting a well string or cable, an annular groove in the inner wall of said body intermediate the length thereof, said groove having an outwardly and downwardly sloping top wall, diametrically opposed apertures in the wall of said body above said groove, a shear pin disposed in said apertures and extending across said body, a dog carrier slidably disposed in said body between said shear pin and said shoulder, said dog carrier comprising a disk-shaped portion having diametrically disposed spring fingers depending therefrom, said fingers terminating in

dogs having downwardly and inwardly inclined upper and lower faces, a radial bore in said portion open at one side, a pin slidably disposed in said bore, resilient means urging said pin outwardly of said bore into engagement with the inner surface of said body and a tool connecting member having an elongated stem terminating in an enlarged cylindrical head with a downwardly and inwardly inclined shoulder connecting said head and said stem, said head being received between said fingers with the upper faces of said dogs engaging the inclined shoulder between said head and said stem and with the lower faces of said dogs engaging the tapered shoulder on said body.



---

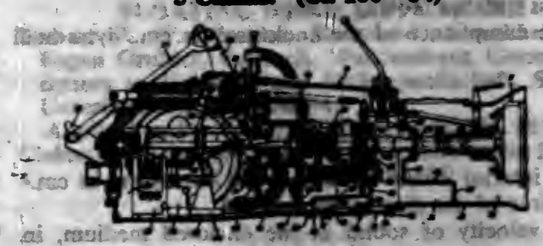
2,775,367

## FRONT WHEEL SUSPENSION FOR MOTOR VEHICLES

Claude Hill, Kenilworth, England, assignor to Harry Ferguson Research Limited, Coventry, England, a British company

Application January 23, 1953, Serial No. 332,793
Claims priority, application Great Britain January 25, 1952
11 Claims. (Cl. 180—43)

2. In a suspension and axle arrangement for an individually suspended, steerable, front traction wheel of a vehicle, the combination of a medially and universally jointed axle assembly having a pivot joint at the inboard end of said axle assembly connecting the same to the vehicle for vertical swinging movement, said wheel being carried on the outboard portion of said axle assembly a medially and pivotally jointed linkage having its extremities pivotally connected respectively to the vehicle and said outboard portion, and means connecting the joint of said linkage to the inboard portion of said axle assembly with freedom of such joint to shift substantially axially along the half axle assembly, to thereby compensatingly cant said ground wheel relative to the inboard portion of said axle assembly as an incident to vertical swing of the latter.



---

2,775,368

## TRACTOR BODY GEARING COMPARTMENT ARRANGEMENT FOR GEARING AND LUBRICATING OIL SUPPLY

Alexander Senkowski, Earlsdon, Coventry, and Frederick D. Cooper, Stoke, Coventry, England, assignors to Massey-Harris-Ferguson (Sales) Limited, a British company

Application May 14, 1953, Serial No. 354,906
Claims priority, application Great Britain May 16, 1952
5 Claims. (Cl. 180—54)

1. A tractor body comprising a series of three hollow castings joined together in end to end relation, a first partition in the front casting defining a dry clutch compartment, a second partition in the intermediate casting cooperating with the first partition to define an oil sump, a third partition in said intermediate casting cooperating with said second partition to define a change-speed gear compartment, said rear casting and the portion of said intermediate casting to the rear of said third partition defining a compartment for the tractor differential and a hydraulic unit including a pump, and conduit means connecting said pump with said oil sump.

---

2,775,369

## SOUND TRANSLATING DEVICES

Edgar M. Villchur, Woodstock, N. Y., assignor to Acoustic Research, Inc., Cambridge, Mass., a corporation of Massachusetts

Application March 15, 1954, Serial No. 416,287
10 Claims. (Cl. 181—31)

1. A sound translating device comprising a transducer of the type in which a voice-call and associated diaphragm, supported from a frame, execute excursions in the presence of a magnetic field, elastic supporting means for supporting said voice-coil and diaphragm in centered relationship with respect to the frame, said elastic supporting means providing a fluid seal between the forward and rear surfaces of the diaphragm, and establishing, in combination with the moving mass of the transducer, a resonant frequency according to the relationship

$$F_T = \frac{1}{2\pi\sqrt{MC_M}}$$

where

$F_T$ is the resonant frequency of the transducer in free air, in cycles/sec.

M is the moving mass of the transducer, in grams

$C_M$ is the compliance of the elastic supporting means, in cm./dyne;

means for applying an elastic restoring force to the diaphragm, comprising an essentially fluid-tight enclosure

containing said voice-coil and diaphragm and defining, in connection with the rear surface of the diaphragm and the elastic supporting means attached thereto, a sealed cavity containing an elastic, fluid medium, the stiffness reactance of the moving system comprising the acoustical stiffness reactance of the enclosed fluid medium and the mechanical stiffness reactances of the elastic supporting means for the voice-coil and the elastic supporting means for the diaphragm, according to the relationships

$$C=\frac{C_M C_A}{C_M+C_A}$$

where

C is the total compliance, in cm./dyne (reciprocal of stiffness) of the moving system

$C_A$ is the compliance of the enclosure, in cm./dyne and

$$C_A=\frac{V}{\rho c^2 S^2}$$

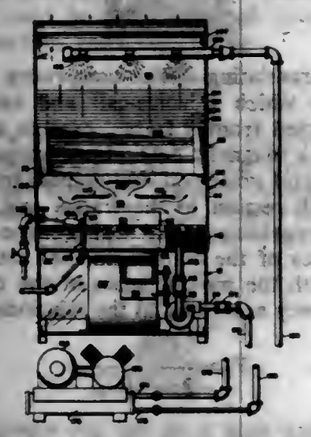
where

V is the interior cubic volume of the enclosure, in $cm.^3$

S is the area of the diaphragm, in $cm.^2$

c is the velocity of sound in the enclosed medium, in cm./sec.

$\rho$ is the density of the enclosed medium, in $gm./cm.^3$;



the magnitude of the stiffness reactance of said enclosed fluid medium constituting more than half of the total stiffness reactance of the moving system, the remaining stiffness reactance being that of the said elastic supporting means for the voice-coil and diaphragm, and the combined stiffness reactance of said elastic supporting means and said enclosed fluid medium establishing, in combination with the mass reactance of the moving system, a natural resonant frequency according to the relationship

$$F_{TS}=\frac{1}{2\pi\sqrt{M\left(\frac{C_M C_A}{C_M+C_A}\right)}}$$

where $F_{TS}$ is the resonant frequency of the transducer when contained in the enclosure.

---

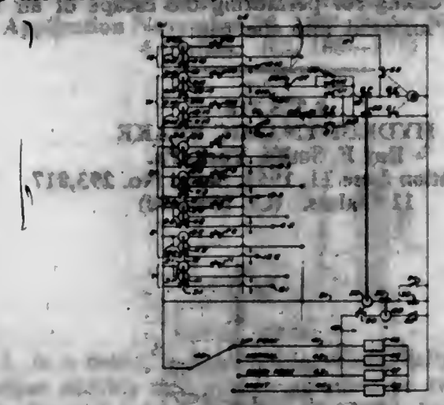
2,775,310
**COOLING TOWER**
Jack F. Shelton, Memphis, Tenn.
Application June 1, 1953, Serial No. 358,688
8 Claims. (Cl. 183—26)

1. A cooling tower comprising a lower section, a blower including means forming a discharge outlet therefor, an upper section supported on said lower section, means forming a collar in said upper section, said collar surrounding said discharge outlet, a vibration dampening gasket interposed and supported between said collar and said discharge outlet, said collar being open at its upper end, said upper section having a bottom and sides upstanding therefrom forming together with said collar a water reservoir, a removable panel extending substantially vertically across said upper section inwardly of at least one of said sides and cooperating with the other of said sides to form an enclosure for baffles and fluid spray nozzles and dividing said reservoir, when said reservoir is filled with fluid to a normal level, into a main reservoir, and a fluid level control reservoir in communication therewith, fluid level control means mounted in the last named reservoir, said panel having portions projecting outwardly at an angle thereto adjacent the perimeter thereof received within means forming a recess connected with the other of said sides and opening outwardly of said enclosure, baffles mounted in said enclosure above said collar for directing the flow of air delivered by said blower downwardly into said reservoir, spaced filler elements extending across said enclosure above said baffles and providing passageways for air delivered by said blower, fluid spray nozzles mounted above said filler elements, fluid eliminators mounted above said spray nozzles and providing passageways for the exit of air from said enclosure, and a pump for supplying liquid from at least one of said reservoirs to said spray nozzles.

---

2,775,311
**SULFUR REMOVAL IN GAS COOLING**
Wallace E. Vereck, Jr., Chicago, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application September 26, 1955, Serial No. 536,383
4 Claims. (Cl. 183—120)

1. In a process wherein a gas stream containing $H_2S$ and free-oxygen in an amount sufficient to produce appreciable amounts of free-sulfur oxidation product and sulfur vapor produced by the oxidation of $H_2S$ is passed through an indirect heat exchange means whereby the stream temperature is lowered to a point below the melting point of free-sulfur, causing said free-sulfur to coat the indirect heat exchange means thereby decreasing exchanger efficiency, the improvement which comprises adding to said stream immediately prior to its entry into said heat exchange means, a liquid hydrocarbon oil, characterized by a boiling point higher than the melting point of free-sulfur, in an amount sufficient to dissolve said sulfur coating and withdrawing from said exchange means, a liquid oil stream containing said dissolved free-sulfur.



---

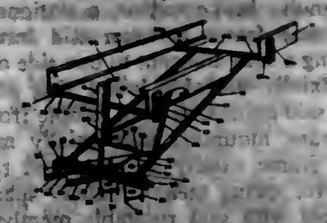
2,775,312
**UP BY-PASS DURING DOWN PEAK TRAFFIC CONDITION**
Ernest B. Thurston, Toledo, Ohio, assignor to Haughton Elevator Company, Toledo, Ohio, a corporation of Ohio
Application March 16, 1954, Serial No. 416,663
6 Claims. (Cl. 187—29)

1. In an elevator system having a plurality of cars serving a plurality of floors of a building and having passenger operated controls effective for registering car and hall calls, in combination, program control means for varying the service of the elevators according to expected passenger demands, conditioning means operable when said program control means is set for heavy traffic in a first direction for conditioning the stop circuits of certain of said elevators serving all floors to by-pass hall calls for service in the opposite direction, means for

canceling up and down hall calls when a stop is made in the first direction, and at least one elevator that is

independent of said conditioning means and that serves all floors.

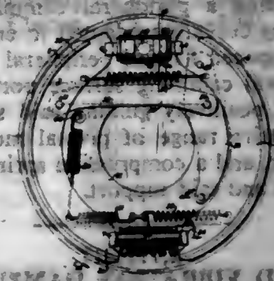
---



2,775,313
**RETRACTABLE CASTER WITH BRAKE**
Robert J. Karvers, North Hollywood, and Gerald F. Schaller, Pasadena, Calif., assignors to Lockheed Aircraft Corporation, Burbank, Calif.
Application November 17, 1953, Serial No. 392,638
6 Claims. (Cl. 188—2)

1. Caster means comprising a supporting member, a plate carried by the member to swivel about an axis, a rotatable wheel, shock absorbing means mounting the wheel from the plate for movement with the plate about said axis and for relative vertical movement, and brake means including an axially movable rod associated with the plate to swivel therewith and having a longitudinal axis coincident with the first named axis, a shoe on the rod cooperable with the wheel, and manually operable multi-position means on the member for moving the rod a plurality of selected definite distances to force the shoe against the wheel when the plate and wheel are in various relative positions and with the wheel in any castered position.

---

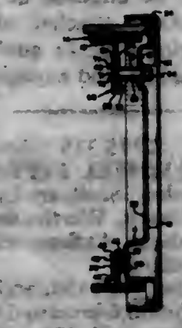


2,775,314
**BRAKE AND ANTI-SKID ATTACHMENT FOR A VEHICLE**
John C. Hiemstra, Pella, Iowa
Application June 2, 1951, Serial No. 229,635
1 Claim. (Cl. 188—5)

A brake and anti-skid attachment for a vehicle comprising a hydraulic cylinder assembly, means for pivotally suspending said cylinder assembly from said vehicle for pivotal movement about an axis extended transversely of said cylinder assembly, a ground engaging unit comprising a horizontal frame member pivotally attached intermediate its ends to the free end of the piston of said cylinder assembly such that when said cylinder assembly is in a substantially upright position and said piston is extended said ground engaging unit engages the ground, a pair of forwardly converging upright ground engaging side portions extended downwardly from the bottom of said frame member, an upright front portion common to the forward ends of said ground engaging side portions, and means adapted to be attached at one of its ends to said vehicle and pivotally attached at its opposite end to said ground engaging unit to guide said unit in its downward travel to said ground engaging position.

---

2,775,315
**FLOATING WHEEL TYPE BRAKE**
Herbert F. W. Maruhn, Stuttgart-Unterturkheim, and Eugen Grubler, Fellbach, Wurttemberg, Germany, assignors to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Application December 18, 1950, Serial No. 201,268
Claims priority, application Germany December 21, 1949
3 Claims. (Cl. 188—78)



1. A brake comprising a backing plate, a rotating brake drum having an annular, inwardly directed braking surface, a first brake shoe extending over a portion of said braking surface, a second brake shoe extending over another portion of said braking surface, supporting means stationarily supported on said backing plate and interposed between the one end of said first brake shoe extending in the main direction of rotation of said brake drum and the adjacent end of said second brake shoe to tangentially transmit limited rotational movement of each of said brake shoes to the other of said brake shoes, means operative to urge said brake shoes outward into braking engagement with the related portions of said braking surface, first spring means yieldably retracting said brake shoes with different forces out of engagement with said braking surface and mutually supporting said brake shoes through said supporting means, said first spring means being further operative to urge said brake shoes to rotate to a limited extent in the direction opposed to said main direction of rotation of said brake drum, and second spring means acting in the direction opposed to the action of said first spring means on said second brake shoe and of sufficient strength so as not to be compressed by the action of said first spring means on said second brake shoe and to maintain said brake shoes in released condition at a predetermined distance from said supporting means, the force of said second spring means being smaller than the servo-action acting in the direction opposed to said second spring means on said second shoe during a reverse braking operation.

---

2,775,316
**BRAKE SHOE ADJUSTER AND GUIDE**
Walther F. Schoel, Detroit, Mich., assignor, by mesne assignments, to Rockwell Spring and Axle Company, Coraopolis, Pa., a corporation of Pennsylvania
Application May 26, 1952, Serial No. 289,956
3 Claims. (Cl. 188—79.5)

1. In a vehicle brake assembly, a support, an anchor member on said support, a brake shoe having a web piv-

oted near one end on said anchor member, a pin rotatably adjustably mounted on said support near the other end of said shoe and projecting through said support, an enlarged operating head on said pin on the side of the support opposite said brake shoe, a spring adjustment retainer compressed between said pin head and the support, a cam fixed on said pin having two substantially cup-shaped members integrally fixed to each other and

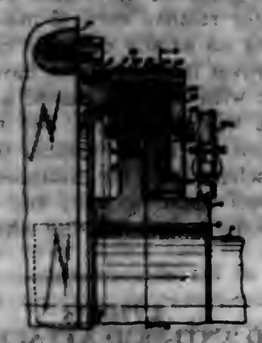
together providing a peripheral camming surface portion of changing curvature adapted to engage an edge of said shoe and spaced flanged peripheral portions formed integral with said camming surface portion for slidably embracing and positively guiding said shoe web during its entire operative range of pivotal movement on said anchor member, and a compression spring interposed between said cam and said support.

---

2,775,317
**SHOCK AND VIBRATION DAMPING DEVICE**
Federico Staisterna, Sete, France
Application July 18, 1951, Serial No. 237,310
Claims priority, application France November 24, 1950
1 Claim. (Cl. 188—90)

A device for damping the relative motion between two bodies comprising a casing connectable to one of the bodies and internally having smooth exposed bottom and peripheral faces and defining a cylindrical cavity of circular cross-section, a collar having an inner face, engaging said casing and covering said cavity, said collar defining a central cylindrical opening coaxial with said cylindrical cavity, a rotor having a cylindrical drum portion of circular cross-section and smooth faces, at its inner end, of slightyl smaller proportions than said cylindrical cavity and extending therein so as to define a minimum gap of substantially constant dimension of from five tenth to three millimeters between the inner smooth peripheral face of said casing and the outer smooth peripheral face of said drum portion, and a stepped shaft portion of reduced circular cross-section outwardly extending from said drum portion, at its outer end, and coaxial with said drum portion and fitted for coaxial rotation in said central cylindrical opening, washer means for sealingly engaging the shaft end face of said drum portion with said inner face of said collar, a material in the gap having a dynamic viscosity of substantially 300,000 poises at 20 degrees centigrade and adherable to said casing and said drum portion at a critical applied pressure, externally adjustable spring controlled means for applying the critical minimum pressure, the outer end of said shaft portion being connectable to the other of said bodies, and a closable escape vent in said casing for permitting the escape of air for the entry of material into the gap.

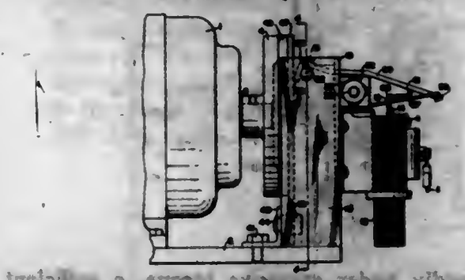
---



2,775,318
**HYDRODYNAMIC BRAKE**
Roy F. Smith, York, Pa.
Application June 11, 1952, Serial No. 293,017
11 Claims. (Cl. 188—90)

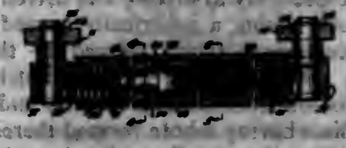
1. Retarder especially for motor vehicles comprising: a case for liquid, a liquid pump means communicating on its intake side with the lower part of said case, a vaned rotor, a liquid conduit between the delivery side of said pump means and the intake side of said rotor, a liquid conduit between the discharge side of said rotor and the interior of said case so as to return liquid leaving the rotor to the intake side of said pump means, the moving parts of said pump means and rotor being designed for connection to a transmission such as a transmission leading to wheels of a vehicle so that liquid circulated by the pump means through the rotor exerts a retarding effect on said transmission.

---



2,775,319
**SPRING APPLIED WHEEL BRAKE**
Robert G. Friedman, Tiffin, Ohio, assignor to The National Machinery Company, Tiffin, Ohio, a corporation of Ohio
Application July 19, 1952, Serial No. 299,089
3 Claims. (Cl. 188—170)

1. A brake for a shaft mounted on a frame and projecting therefrom comprising a rotatable brake member mounted on said projecting shaft for rotation therewith having an annular brake section, a stationary brake ring mounted on said frame between said frame and brake member having a face adjacent to one side of said annular section, an axially movable brake ring adjacent to the other side of said annular section remote from said frame, mounting means mounting said axially movable brake ring on said frame axially movable and rotatably fixed relative thereto, spring means radially spaced from and radially aligned with said rotatable member urging said movable ring toward said member, and fluid motor means on the other side of said axially movable ring remote from said frame operably connected to said axially movable brake ring for over-coming said springs and moving said axially movable brake ring away from said rotatable member.



2,775,320
**MOTOR BRAKE**
Earl Jacob Vallieu, Akron, Ohio
Application November 30, 1951, Serial No. 259,053
4 Claims. (Cl. 188—171)

1. In a brake, a plate with a substantially flat braking surface slidably and tiltably mounted on two horizontal pins located below the portion of the brake which is adapted to be brought into braking contact with a rotatable element, the plate being mounted substantially perpendicularly to the axis of said rotatable element and being tiltably supported on the pins so that it can tilt away from said plate when not being pressed against it and can gradually slide toward said plate as the braking surface of the plate becomes worn away, and means for pressing the plate at a level above the pins toward the rotatable element.

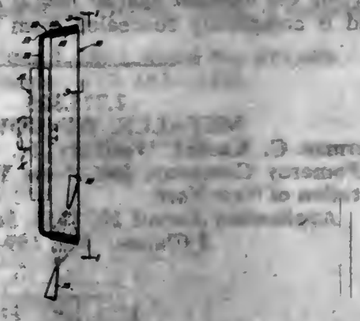
---

2,775,321
**BRAKE ADJUSTMENT MECHANISM**
Roy Phillips, Chagrin Falls, Ohio
Application July 1, 1953, Serial No. 365,317
4 Claims. (Cl. 188—196)

1. A brake adjusting mechanism comprising a tube, first and second members within said tube in end-to-end relationship, said members closely fitting said tube and at least one being adapted for axial movement with respect thereto, one of said members projecting from one end of said tube and the other of said members projecting from the other end of said tube, a threaded member threaded into said first member and having a portion engaging the second member, thereby spacing said first and second members, spring means for rotating said threaded member in a direction for moving it toward said second member to increase the spacing between the first and second members, means preventing the rotation of said threaded member when said second member is less than a predetermined distance away from engagement with said portion.

---

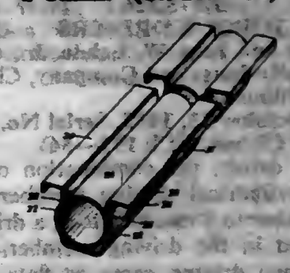
2,775,322
**BRAKE ROTOR**
Fred E. Buchanan, Granite City, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey
Application March 10, 1953, Serial No. 341,518
4 Claims. (Cl. 188—218)



1. A brake rotor comprising a hub, a bell-shaped concavo-convex web flaring axially radially from said hub, an outer ring plate supported on the outer peripheral end of said web and integral therewith, an inner ring plate axially spaced from said outer plate and radially spaced from and encircling said web to define therewith an annular fluid inlet, radially extending circumferentially spaced blades interconnecting said plates to define therewith a plurality of radially extending fluid passages communicating with said inlet, fluid deflectors provided on said blades adjacent the inner ends of the latter operative to deflect fluid toward and to increase the flow of fluid

along the inner opposed sides of said plates responsive to rotation of the rotor, adjacent deflectors being spaced from each other centrally of their respective passages.

---



2,775,323
**FRICTION ELEMENT AND METHOD OF MAKING THE SAME**
Hordis G. English, La Grange, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application February 23, 1950, Serial No. 145,799
3 Claims. (Cl. 188—234)

1. The method of making a friction element which consists in providing a metallic disc; cutting a plurality of V-shaped notches in the periphery of the disc to provide a plurality of spoke-like members; bending the spoke-like members toward the axis of the disc and at one side of the plane of the disc to define a substantially uninterrupted frusto-conical peripheral portion of the disc; spraying the radially inner and outer surfaces of the frusto-conical portion of the disc with a metallic alloy having a high coefficient of friction and the characteristic of adhering when in a molten state to the metal of the frusto-conical portion of the disc and, upon cooling, to be integrally attached thereto; and cooling the sprayed alloy to provide friction facings adhering to the frusto-conical portion of the disc.

---

2,775,324
**RAFTER**
William F. Tate, Mineola, N. Y., assignor to Kool Vent Metal Awning Corporation of America, Pittsburgh, Pa., a corporation of Pennsylvania
Application July 2, 1953, Serial No. 365,633
1 Claim. (Cl. 189—34)

For use in a sheet metal awning having roof members and cross runners, a structural rafter member comprising a light sheet metal channel-like member having an out-

wardly extending flat flange at each of its two top edges providing bearing surfaces for the cross runners and accessible from below the awning for the reception of screws or bolts by which the member flanges are connected to the cross runners, and for reinforcing the rafter member against lateral bending and weaving, each flange having a downwardly turned outer edge to strengthen the flange against vertical deflection and buckling, the side walls of the member extending vertically downward from said flanges in subetantial parallelism with divergent portions extending from the lower boundary of the parallel side wall portions, and convergently from the lower boundary of the divergent wall portions to the bottom wall of the member, the interior of the member being of generally hexagonal form with the top of the hexagon being open, the side walls of said member being laterally resilient and a pipe of circular section inside the member, the diameter of said pipe being greater than the transverse dimension of the open side of the generally hexagonal interior, the adjacent sides of the hexagon being generally tangential along the length of the pipe, said pipe being frictionally retained within the channel of said channel-like member by its frictional engagement with said resilient side walls, whereby the pipe is effective for reinforcing the member against lateral and vertical deflection and is completely concealed from beneath the member.

2,775,325

## METALLIC WINDOW SASH

Herman C. Knebel, Westbury, N. Y., assignor to S. H. Pomeroy Company, Inc., New York, N. Y., a corporation of New York

Application August 20, 1953, Serial No. 375,337
2 Claims. (Cl. 189—76)

1. A metallic window sash comprising top and bottom members having a box-like configuration, the interior of said top and bottom members each being defined by two vertical walls each terminating at horizontal walls, two side members each having a flat portion, two vertical tabs struck out of said flat portion at each extremity of said side members and projecting substantially perpendicular thereto, the two vertical walls of each of said box-like members formed to be contiguous to said tabs upon the assembly of said members, each of said vertical tabs being of a height equal to the width of the vertical wall contiguous thereto, the horizontal upper and lower edges of each of said tabs abutting the horizontal walls at which the vertical walls terminate, and means for securing said tabs to said vertical walls.

---

2,775,326

## TORQUE DRIVERS

Bernard R. Botter and John W. Lohde, Jr., Chicago, Ill., assignors to Scully-Jones and Company, Chicago, Ill., a corporation of Illinois

Application October 23, 1952, Serial No. 316,506
7 Claims. (Cl. 192—56)

1. In a torque driver, the combination of a metallic integral, elastic cylindrical driving member, means for attaching the member to a machine tool, a driven member rotatively mounted in the driving member, said driven member having two driving cams or flats arranged at 180° apart the sides of which are elevated with respect to the adjacent surfaces and rollers interposed between the driving member and the driven member which serve to drive the driven member when they are positioned on the flats but which may override the elevated surfaces at the sides of the flats and consequently stretch the driving

member outwardly under excesive torque, a sufficient amount to relieve the turning moment on the driven member but not beyond the elastic limit of the driving member.

---

2,775,327

## OVERLOAD CLUTCH

Roy E. Gearhart, Kansas City, Mo., assignor of one-half to Robert F. Dickson, Overland Park, Kans.

Application November 20, 1953, Serial No. 393,256
6 Claims. (Cl. 192—56)

1. An overload clutch comprising a pair of clutch discs secured together for relative coaxial rotation and adapted to be secured respectively to driving and driven members, one of said discs having a spherically curved recess of less than hemispherical extent formed in the surface thereof mating with the other of said clutch discs in spaced apart relation from the axis thereof, and the other of said clutch discs having a bore formed therein parallel to the axis thereof and normally registering with said recess, a ball carried for movement longitudinally in said bore and normally extending into said recess, a pressure member carried by said bored clutch disc for relative rotary and axial sliding movement and normally bearing against said ball, a spring carried by said bored clutch disc and operative both to exert an axial load on said pressure member, whereby to urge said ball yieldably into said recess, and to exert a rotary torque on said pressure member, means normally preventing relative rotation of said pressure member and said bored clutch disc, said last named means becoming inoperative when said pressure member is retracted against the spring as the relative torque between the discs forces said ball out of said recess, whereupon said pressure member is turned by the torsion of said spring, said pressure member and said bored clutch disc having cooperating surface operative as said pressure member turns to increase the distance between the recessed clutch disc and the effective portion of the pressure member to an amount greater than the diameter of said ball, whereby said ball is relieved of the spring pressure, and to secure said pressure member in the retracted position.

---

2,775,328

## SLIP OPERATING CLUTCH AND COOLING MEANS THEREFOR

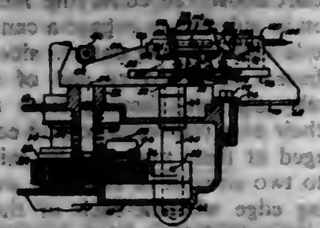
Edward C. Yokel, Racine, Wis., assignor to Twin Disc Clutch Company, Racine, Wis., a corporation of Wisconsin

Application November 17, 1953, Serial No. 392,548
7 Claims. (Cl. 192—57)

1. In a marine gear, the combination of an input shaft, an output shaft, and an oil pressure system including an

oil actuated, multiple plate clutch fully engageable to connect the shafts to provide a normal speed of the output shaft, means for bleeding actuating oil to determine a fixed slipping condition of the clutch and a selected

less than normal speed of the output shaft and including means for regulating oil pressure on the slipping clutch, and means for directing the bled oil between the slipping clutch plates for cooling and the transmission of torque by oil drag.



---

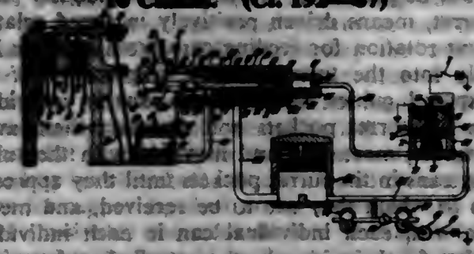
2,775,329

## POWER CLUTCH ACTUATORS

Charles R. Stelljes, Fayetteville, N. Y., assignor, by mesne assignments, to The Murray Corporation of America, Detroit, Mich., a corporation of Delaware

Application May 7, 1953, Serial No. 353,656
9 Claims. (Cl. 192—82)

3. In a washing machine transmission, a casing having a top wall, a clutch actuating rod slidably mounted in and projecting through said wall, and having a cam follower on its end, a power-driven oscillating stub shaft projecting through said wall, and having a radial arm keyed thereto, a bar mounted for sliding movement on said wall, having a cam adapted to engage said follower, and disposed in chordal relation with respect to the arc of movement of said arm, a pair of pivotal members mounted on said bar, each having a shoulder adapted to project into the path of movement of said arm, and interengaging means on said members whereby one or the other of said shoulders may at will be projected into the said path by pivotal actuation of the other member.



---

2,775,330

## TRANSMISSION AND CONTROL SYSTEM

Hans O. Schjolin, Birmingham, and Helmuth Guentsche and Millis Vincent Parshall, Pontiac, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application November 21, 1952, Serial No. 321,764
16 Claims. (Cl. 192—87)

1. In a clutch control system, a pair of selectively operable clutches, a clutch actuator, a fluid pressure responsive servo, a spring member operably connecting said clutch actuator to said servo effective to position said actuator to establish drive through one of said clutches upon admission of fluid pressure to said servo, said spring member being effective to bias said clutch actuator to establish drive through a second of said clutches upon exhaust of fluid pressure from said servo, a fluid pressure source, a valve for controlling said servo operable to selectively establish neutral and drive through either of said clutches, means yieldably biasing said valve to establish drive through said second clutch, a piston operatively associated with said valve, a second valve effective in one position to connect said piston to exhaust and effective in a second position to connect said piston to said fluid pressure source, said first-mentioned valve being movable responsive to fluid pressure admitted to said piston to establish drive through said first-mentioned clutch, and manually operable means for positioning said first-mentioned valve to select neutral operation irrespective of the position of said second-mentioned valve.

---

2,775,331

## CLUTCH WITH COOLANT METERING

Victor W. Peterson, Indianapolis, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application June 2, 1951, Serial No. 229,600
9 Claims. (Cl. 192—113)

1. A friction clutch comprising, in combination, a driving member including an annular clutch plate, a driven member including an annular clutch plate, means for engaging and disengaging the clutch plates; a fluid metering device located radially inwardly of the clutch plates comprising a body formed with passages therethrough rotatable with one of the members and two valve parts slidingly engaging the surface of the body rotatable with the other member, the parts being formed with circumferentially displaced ports successively registering with the said passages during relative rotation of the members; and means for supplying fluid to the body by way of one of the valve parts; the fluid escaping from the body by way of the other valve part and flowing to the clutch plates.

---

2,775,332

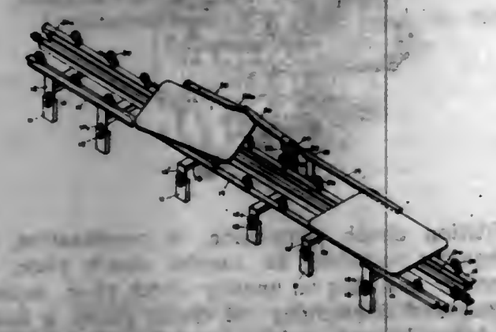
## LINE SPACE DEVICE FOR OFFICE TYPING MACHINE

Günther Wühlbier, Wilhelmshaven, Germany, assignor to Olympia Werke A. G., Wilhelmshaven, Germany

Application November 18, 1955, Serial No. 547,694
Claims priority, application Germany April 21, 1955
3 Claims. (Cl. 197—114)

1. A line space device for advancing the platen of office typing machines selectively by hand and also automatically as the platen carriage reaches the end of its

travel comprising a line space wheel secured to the platen shaft for advancing the platen, a shift pawl carrier rotatably mounted coaxially with the common axis of the line space wheel and platen, a shift pawl secured to said carrier for engaging said line space wheel to advance the same and hence also said platen as said shift pawl carrier is rotated, a hand operated line space lever, a dual arm transmission lever mounted for rotation on a hub whose axis is parallel to the platen axis, means connecting one arm of said transmission lever to said line space lever, a cam plate mounted for rotation on said hub, said cam plate having a slot therein, a coupling rod pivotally connected at one end to said shift pawl carrier, said coupling rod including a pin engaged in the slot of said cam plate, said pin also being engaged by the other arm of said transmission lever, spring means loading said coupling rod and shift pawl carrier to their starting positions, and a power drive connected to said cam plate for rotating said plate when said platen carriage reaches the end of its travel, said pin and hence also said coupling rod and shift pawl carrier being actuatable by said cam plate and also by said transmission lever acting independently of one another.



---

2,775,333

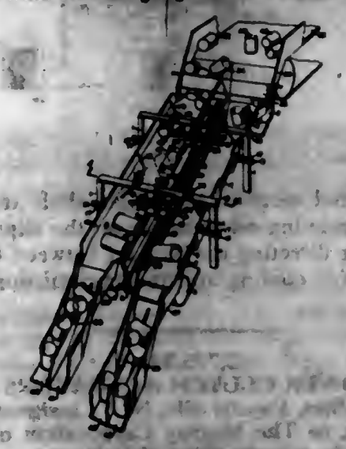
## AUTOMATIC GUIDE RAIL FOR ROTATABLE-PALLET CONVEYOR SYSTEMS

Daniel Lee Hayes, Edenwold, Tenn., assignor of fifty percent to Rudolf W. Cisco, Jr., Nashville, Tenn.

Application July 17, 1953, Serial No. 368,601
14 Claims. (Cl. 198—19)

1. In combination, a horizontally traveling conveyor mechanism, a plurality of horizontally disposed elongated work-supports mounted on said conveyor mechanism for travel therewith and for rotation about a vertically disposed axis whereby work material carried thereby will be accessible from all sides thereof to a worker stationed beside said conveyor mechanism, guide railing for normally alining and holding alined said work-supports, at least a portion of said guide railing being movably mounted whereby the same can be moved out of normal alining position to permit said rotation of said work-supports, and means tending to return said movably mounted portion of said guide railing to alining position automatically upon cessation of application of intentionally produced forces causing displacement thereof from said alining position.

---



2,775,334

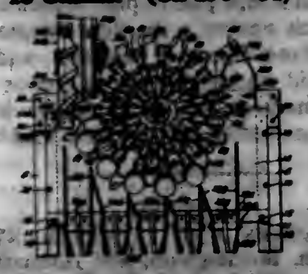
## CAN UNSCRAMBLER

Earl Jeremiah, Hayward, Calif., assignor to United Can and Glass Company, Hayward, Calif., a corporation of Delaware

Application November 24, 1953, Serial No. 394,053
12 Claims. (Cl. 198—30)

12. A device for aligning empty cans having their bottoms already attached but their tops open, comprising means for conveying cans from a loading station to a delivery station and defining a path of travel, said conveying means being inclined transversely to said path of travel, a guide rail adjacent the low side of said conveying means whereby said cans tend to ride against said guide rail, said guide rail being shorter than the radius of the can whereby a can with its axis parallel to the guide rail will project further over the guide rail than a can with its axis perpendicular to the guide rail, an endless chain adjacent the guide rail having lugs projecting over the guide rail, said lugs projecting far enough to engage a can with its axis parallel to the guide rail but not far enough to engage a can with its axis perpendicular to the guide rail,

said chain traveling in the same direction but at a rate considerably less than that of said conveying means, can tumbling means above the conveying means adapted to clear a can on its side but to engage a can standing on its end and tumble said can over onto its side, and a balancing edge adjacent the delivery end of said conveying means whereby the cans issuing from said conveying means with their axes transverse to said conveying means will be engaged at their midpoint by said edge and be separated into two streams of cans one on either side of said balancing edge wherein each of the cans will be aligned with its open end up.



---

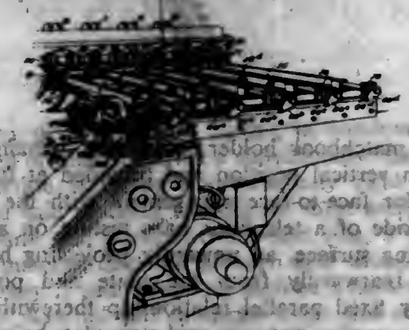
2,775,335

## CAN DIVIDER

Justin Simpson, Elmhurst, Ill., assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York

Application May 13, 1952, Serial No. 287,539
15 Claims. (Cl. 198—31)

1. In apparatus of the character described, a rotary turret rotatable about a horizontal axis and having individual well defined can receiving pockets equidistantly spaced about its periphery, means for continuously rotating the turret, means driven positively in timed relation to the turret rotation for feeding cans from a single line individually into the turret pockets, a plurality of upwardly disposed guides for receiving cans in individual lines from the turret pockets and directing them away from the turret, means on and movable with the turret for holding cans in the turret pockets until they approach the guides in which they are to be received, and means engageable with each individual can in each individual turret pocket for bringing about controlled and positive ejection discharging of cans from the turret pockets into said guides.



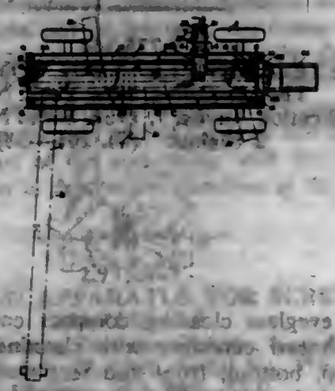
2,775,336

## SLITTER FOR FORMING BODY BLANKS FROM SHEETS

Frederick W. Rockwell, Milwaukee, Wis., assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York

Application December 4, 1952, Serial No. 323,971
6 Claims. (Cl. 198—34)

2. A sheet feeding mechanism for body blank forming machines comprising a table having spaced guide bars for receiving the strips and directing the same, feed dogs uniformly spaced a greater distance than the width of the strips for engaging the trailing edge of each strip and feeding said strips sidewise in succession and in spaced relation along said table, rocker bars extending across the guideway for receiving and supporting the strips, transfer rolls for simultaneously feeding a group of strips arranged side by side and in an endwise direction onto said rocker bars and means for independently rocking said bars for releasing the strips one at a time in succession and in timing with the feed dogs which engage the strips for feeding them along the table.



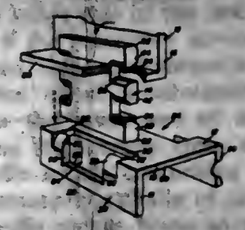
---

2,775,337

## DRIVES FOR CONVEYORS

Ormond E. Hokari, Hood River, Oreg.

Application October 21, 1955, Serial No. 541,885
8 Claims. (Cl. 198—89)



1. In combination a main conveyor having a conveyor belt, driving means and longitudinally positioned driven rollers, a transfer conveyor for transferring material therefrom to the belt of the main conveyor, and means for releasably and adjustably supporting the transfer conveyor from the main conveyor comprising: a frame supporting the main conveyor, a bracket having a hook portion engaging the frame, means for adjustably supporting the bracket in relation to the frame, a U-shaped frame carried by said bracket, a frame carried by said U-shaped frame for supporting the transfer conveyor, and a friction wheel revolvably mounted in said U-shaped frame and positioned to be engaged by the driven roller of the main conveyor and to engage and drive the belt of the transfer conveyor.

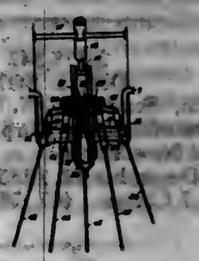
2,775,338

## CHANNEL BARS CONNECTING LINK

Harry L. Schumacher, Wabash, Ind.

Application May 16, 1955, Serial No. 508,565
2 Claims. (Cl. 198—189)

1. A conveyor including a plurality of link elements having a U-shaped cross-section defining a web and connecting side flanges, said side flanges including an upwardly opening notch portion intersecting a transverse slot portion in said web, said flanges including a relief portion extending from said slot in said web into an outer surface of said side flanges, and a connector element removably received in said transverse slot in said web and including a portion reciprocably received within the upwardly opening notch portion in said side flanges, said connector links including pairs of lug elements on opposite ends thereof, a pair of central lug elements extending between the first mentioned lug elements defining between said first mentioned lug elements, base notches engageable on opposite sides of the flanges of said link elements and opposite sides of the upwardly opening notch portion therein.



---

2,775,339

## BALER MECHANISM

Paul Louis Edouard Cadier, Orleans, France, assignor to Etablissements R. Rousseau, Société Anonyme, Orleans, France, a body corporate of France

Application January 21, 1953, Serial No. 332,203
Claims priority, application France January 31, 1952
3 Claims. (Cl. 198—223)

1. In a feeding device for use in connection with a high pressure baling mechanism having a compression feeding chamber, in combination, a series of fingers disposed in advance of said chamber and being partly eccentrically located, each finger including a feeder portion being movable to describe an endless predetermined path in opposite directions towards and from said chamber, means operable for moving and guiding said fingers, said means comprising a crank including a crank shaft journalling said fingers between the ends thereof, a lever connected to the end of each finger, said eccentrical fingers being pivoted with relation to said shaft for movement at an angle to the axis of said shaft, cam and cam follower means between said crank shaft and at least two of said eccentrical fingers, the remaining of said eccentrical fingers being linked to said two fingers.

---

2,775,340

## TYPOGRAPHICAL SLUG CASTING MACHINE

Melvin R. Glee, Concord, Calif.

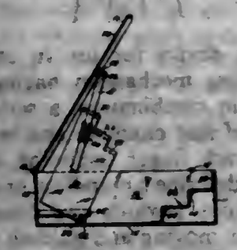
Application July 1, 1955, Serial No. 519,527
5 Claims. (Cl. 199—61)

1. In a typographical slug casting machine having a movable spring plate, a galley tray, and a chute for guiding

a slug from the spring plate to the galley tray; yieldable means extending diagonally substantially the length of the

chute and into contact with the spring plate whereby movement of the spring plate adjusts the diagonal angle of the yieldable means.

---



2,775,341
**HAND BIT ASSEMBLY HOLDER**
Richard J. Williams, Portland, Oreg.
Application July 13, 1953, Serial No. 367,497
3 Claims. (Cl. 206—16)

1. A tool holder for a bit and bit wrench comprising a tube having means to receive and secure the screw tip of a bit therein, a strap loop on one side of said tube to receive the handle of the bit wrench in parallel relation with said tube, and a releasable detent projecting from said one side of said tube engageable with said wrench to retain said wrench in said loop.

---

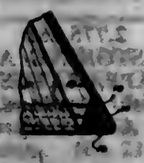
2,775,342
**DRILL BOX**
Joseph C. Smith, Scarsdale, N. Y., assignor to Durex Hardware Manufacturing Corp., New York, N. Y., a corporation of New York
Application December 12, 1955, Serial No. 552,510
7 Claims. (Cl. 206—17)

3. A drill container having a bottom wall, side walls, a front wall, rear wall and a cover hingedly mounted on said rear wall; a unitary housing for drills, said container having a rail at each side parallel to and spaced from the bottom wall, normal to the rear wall and extending to a point adjacent the rear wall, roller means at the front lower end of the housing below and engageable by the rail on each side and movable below the rail to form a translatable pivot for said front lower end of the housing; the housing being thus retained in the container said said roller means being retained intermediate said rails and said bottom wall and engageable with said bottom wall and a connection between the housing and the cover for erecting the housing when the cover is swung open and rotating and translating the housing on its side when the cover is closed.

2,775,343
**MATCHBOOK HOLDER**
Earl W. Carson, Thomasville, Conn.
Application May 29, 1953, Serial No. 358,437
7 Claims. (Cl. 206—31)

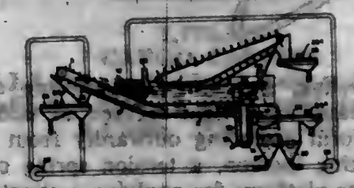
3. A matchbook holder comprising a main plate normally in vertical position and provided at its rear with means for face-to-face engagement with the outer face at one side of a telephone base resting on a horizontal supporting surface, an upwardly projecting holding wall spaced rearwardly from the plate and positioned in normally fixed parallel relationship therewith, said wall and the engaging means on said main plate being so formed and related that they provide a horizontal channel between them which is entirely open at its ends and is adapted to receive the downwardly extending flange at said side of said telephone base with the said holding wall engaging and fitting the inner or rear face of said flange, supporting means at the bottom of the plate and in normally fixed relationship therewith for engaging said horizontal supporting surface to prevent downward movement of said plate and said wall relatively to said telephone base, means in normally fixed relationship with the plate near the bottom thereof for providing a transverse horizontal groove at the front thereof which groove is closed at its bottom and is open at its top and is of such size as to constitute a seat for receiving and closely fitting the lower portion of an upright matchbook, and means fixedly located on the plate near the top thereof and at the front thereof forming a narrow vertical slot for receiving and loosely fitting the upper rear portion of the cover of a matchbook to prevent relative forward movement of the upper portion of a matchbook having its lower portion held by the said seat.

---



2,775,344
**EYEGLASS CLEANING COMPACT**
Thor Benedikz, New York, N. Y.
Application August 7, 1953, Serial No. 372,888
2 Claims. (Cl. 206—38)

1. An eyeglass cleaning compact comprising a rectangular-shaped container with cleaning tissues therein having top, bottom, front and rear walls and one side wall and being open at the other side, mechanism in said container for releasably holding cleaning tissues therein, a container of similar shape for holding cleaning liquid hingedly connected to said tissue holding container along one long edge thereof, said liquid container having top, bottom, front, rear and side walls, the side wall adjacent the tissue container serving as a closure for the open side of said tissue container when the containers are juxtaposed, the top wall of said liquid container having an opening therein for removably receiving an eyeglass lens to be cleaned seated on said top wall, means in said liquid container for spraying liquid through said opening onto the lens seated thereover, and an integral laterally extending plate on the top wall of the tissue container adapted to overlie the top wall of the liquid container when the containers are in juxtaposed relation.



2,775,345
**PROTECTIVE DEVICE FOR LAMP SHADE**
Jerome H. Fingrey, Minneapolis, Minn.
Application December 4, 1952, Serial No. 324,101
3 Claims. (Cl. 206—45.33)

1. A lamp shade structure having in combination, a shade portion of sheet material, a substantially rigid frame for said portion including a substantially rigid ring, a wrapping for said shade of transparent sheet material extending around said portion, frame and ring, a body of evaporable material disposed between said wrapping and frame, whereby if said wrapping shrinks, evaporation of said body of material will compensate for said shrinkage and said frame or shade will not be distorted.

---

2,775,346
**METHODS AND APPARATUS FOR SEPARATING SOLIDS HAVING DIFFERENT SPECIFIC GRAVITIES**
Klaas F. Troost, Bilthoven, Netherlands
Application July 29, 1953, Serial No. 371,105
Claims priority, application France August 6, 1952
5 Claims. (Cl. 209—172.5)

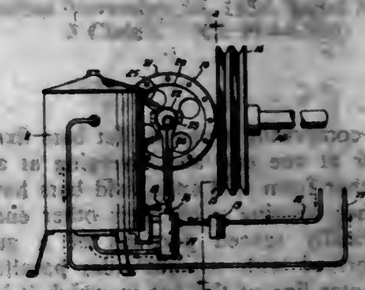
1. A process for separating solid materials having different specific gravities by means of a suspension contained in a tank, consisting in creating substantially horizontal rectilinear currents in said suspension by supplying thereto suspensions of different densities at different heights at the front end of the tank, removing the floats and the sinks from the tank, hydraulically discharging the middlings by deflecting the upper part of the suspension with the middlings suspended therein in an upwardly inclined direction at the rear end of the tank and by deflecting the lower part of the suspension with the middlings suspended therein in downward direction at the rear end of the tank.

---

2,775,347
**METHOD AND APPARATUS FOR SCREENING MATERIALS**
David Weston, Toronto, Ontario, Canada
Application July 28, 1953, Serial No. 370,785
5 Claims. (Cl. 209—314)

1. Apparatus for screening materials comprising: a plurality of sloping screens arranged in series, each successive screen being arranged below the next higher in the series to provide a space between a lower end region of the next higher screen and an upper end region of the successive screen; means for imparting reciprocating movement to said screens; a fixed transverse baffle extending between the lower side of the next higher screen and the upper end of the successive screen, defining said space on its forward side; and rotatable baffle means mounted for rotation about a substantially horizontal axis, disposed below the lower end of the next higher screen and extending transversely from side to side of said space, said baffle means comprising a plurality of baffles disposed substantially radially of the axis of rotation thereof, said baffle means being so positioned that said baffles during rotation of said baffle means extend beyond the lower end of the next higher screen to intersect the path of travel of material discharged therefrom.

---



2,775,348
**FILTER WITH BACKWASH CLEANING**
Burdell S. Williams, Larchmont, N. Y., assignor to Taco Heaters, Incorporated, Greenwich, Conn., a corporation of New York
Application September 30, 1953, Serial No. 383,281
4 Claims. (Cl. 210—94)

4. In a filter assembly, an annular screen for screening liquids, means for effecting flow of a liquid to be screened inwardly through the side walls of the screen and then endwise therein, means for keeping the screen clean including a power-operated shaft disposed substantially coaxial of the annular screen and extending axially therein, and a substantially elliptical plate extending across the screen oblique to said shaft and secured to the shaft to be rotated thereby and having its outer edge disposed close to the inner face of the screen throughout the major portion of its screening surface, and operable as it rotates to force liquid adjacent its outer edge out through the screen to progressively free the screen walls of dirt.

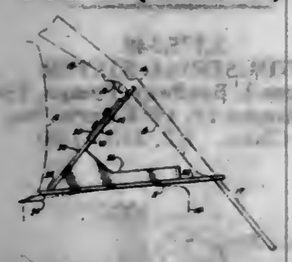
---

2,775,349
**INDUSTRIAL FILTER**
Thaddeus J. Beadway, Pampa, Tex.
Application August 18, 1953, Serial No. 374,893
1 Claim. (Cl. 210—150)

A filter unit for interposing in a lubricating system and for operation from a grooved pulley connected with a drive shaft, said unit comprising an upright filter having a lower intake and an upper outlet, a lower bracket fixed to said filter and projecting laterally therefrom, an upright reciprocating pump fixed to said bracket, a piston rod extending from the upper end of said pump, a pipe connecting the outlet of said pump with said lower intake,

an upper bracket fixed to said filter, a crankshaft bearing carried by said upper bracket, a crankshaft journaled in said bearing, a pitman connected between said crankshaft and said piston rod, a driven wheel fixed on said crankshaft disposed at right angles to the adjacent face of said pulley for frictional contact with said pulley, and an outlet pipe connected to said upper outlet.

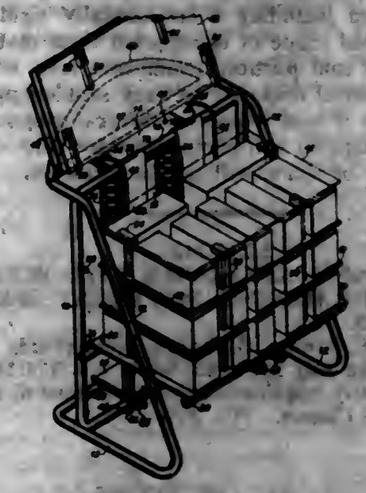
---



2,775,350
**FILTERS**
Hugh A. Jones, Bessemerle, Anglesey, England
Application December 28, 1953, Serial No. 400,507
1 Claim. (Cl. 210—157)

A coupling construction for use in combination with a pair of specimen bottles and a filter comprising, a double-ended coupling having an outer peripheral wall and a partition extending transversely of the outer wall and being integral therewith at the midsection of said coupling, the partition of said coupling being formed to have an outer annular portion and an inner annular portion concentrically thereof and having an annular skirt depending axially therefrom toward one end of said coupling, the inner surface of the outer peripheral wall at opposite ends of said coupling being threaded for receiving the threaded open ends of the specimen bottles, the inner annular portion of the partition of said coupling being provided with openings for directing liquid within and through the confines of the inner annular portion of the partition.

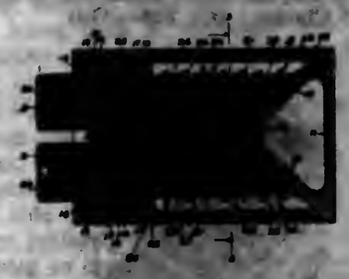
---



2,775,351
**GUN RACK FOR AUTOMOBILE SEATS**
Richard L. Johnson and Gerald E. Johnson, Bucyrus, N. Dak.
Application February 27, 1953, Serial No. 339,412
1 Claim. (Cl. 211—64)

A gun rack comprising a pair of flat bars fixedly connected together at one end and diverging at acute angles to each other from said ends, said bars having longitudinal notches opening upon their other ends to receive longitudinally spaced portions of a gun, each notch being formed with straight sides paralleling the longitudinal center line of the bar in which it is formed for substantially the full length of the notch; and a plate mounted on one of the bars for sliding movement in a path paralleling said longitudinal center line and formed with a longitudinal notch opening upon one end of the plate, the notch of the plate being aligned longitudinally with the notch of said one bar and having straight sides paralleling those of the bar notch, the sides of the plate notch being spaced apart a distance less than the distance between the sides of the bar notch and the plate being slidable into a position registering the notches of the plate and of said one bar, thus to substitute the notch of the plate for the notch of said one bar as a means for receiving an adjacent portion of the gun.

---



2,775,352
**SELF-LEVELING, STORING AND DISPENSING APPARATUS**
Fred Lee Waite, Fresh Meadows, N. Y., assignor to American Machine & Foundry Company, a corporation of New Jersey
Application February 9, 1952, Serial No. 270,796
4 Claims. (Cl. 211—134)

1. A self-leveling, storing and dispensing apparatus comprising a base, an upright secured to said base, a cantilever platform extending outwardly from said upright and tracking thereon, a tension spring connected to said cantilever platform for applying a counterbalancing force thereto which is proportional to the amount of weight supported on said platform to maintain the top thereof at a constant level despite changes in the amount of material stacked on the dispenser, separating partitions adapted to be stacked at the top of the self-leveling dispensing apparatus, and guides mounted on said upright to which said partitions are slideably connected to restrain said partitions to a vertical path of travel when placed in between layers of material stacked on said self-leveling, storing and dispensing apparatus.

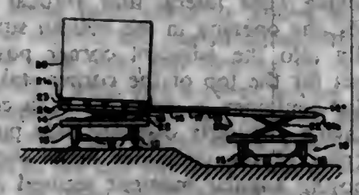
---

2,775,353
**SHOCK ABSORBING MECHANISM FOR RAILWAY CARS**
Richard G. Tillou, Lombard, Ill., assignor to W. H. Miner, Inc., Chicago, Ill., a corporation of Delaware
Application December 13, 1952, Serial No. 325,783
7 Claims. (Cl. 213—34)

6. In a friction shock absorbing mechanism, the combination with a friction casing having a closed rear end and interior friction surfaces adjacent its open front end; of friction shoes telescoped within the casing in sliding engagement with the friction surfaces thereof; and a yielding cushioning element within the casing bearing on said closed end and on said shoes, said element in-

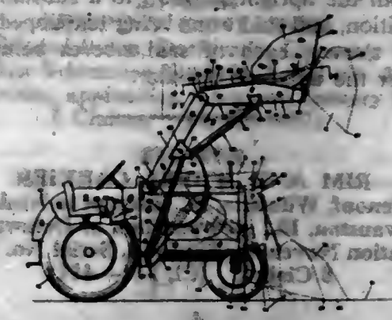
cluding a unit comprising front and rear spacing plates having forwardly converging side portions and a rubber mat interposed between and bonded to said plates, said converging side portions of said front spacing plate engaging forwardly converging wedge faces on the rear ends of said shoes.

---



2,775,354
**CURTAIN-TYPE CLOSURE**
Henry N. Staats, Chicago, Ill.
Application February 9, 1953, Serial No. 270,810
6 Claims. (Cl. 214—21)

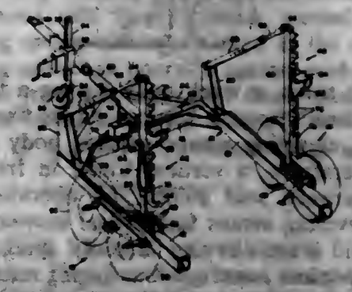
1. In an article treating apparatus including means defining an article treating chamber and conveying means for transporting articles to be treated through said chamber, a curtain-type closure comprising a plurality of individual curtains successively movable with respect to said conveying means to provide an end closure for said treating chamber each of said curtains being of flexible sheet material having a weighted free end gravity urged into cooperative relationship with said conveyor means.



---

2,775,355
**CARGO CARRIER**
Lionel J. Leitner and Irving A. Leitner, Bronx, N. Y.
Application April 19, 1954, Serial No. 424,129
1 Claim. (Cl. 214—38)

A cargo carrier, having a chassis superstructure comprising in combination a platform member, multiple transverse grooves spacedly provided in the face portion of said platform member, bars slidable within said grooves and substantially adjacent to the side walls thereof, said bars extendable beyond said grooves, said extended bars defining the side margins of each of said grooves beyond the terminal end thereof, said bars adapted to interengage corresponding grooves in a second, like platform member spaced apart from the first platform member, rail sections disposed upon said bars and transversely interlocking said bars to form a track, said track being of substantially the same dimensions as said grooves and traversing the space gap between the spaced apart platform members, cargo sections, means provided on the bottom of said cargo sections for engagement with and movement in said groove and on said track respectively, said cargo sections adapted to be moved from platform member to platform member, and corresponding means provided on the lateral side surfaces of said cargo sections and said platform members adapted to permit fixed locking engagement between said cargo sections and the platform member by means of a locking pin to prevent lateral movement of said cargo sections with respect to the platform member while the platform member is in rail transport.



2,775,356
**LOADER MACHINE**
Herbert F. Lorenzen, Des Moines, Iowa, assignor, by mesne assignments, to A. C. Anderson, Inc.
Application March 9, 1951, Serial No. 214,822
2 Claims. (Cl. 214—140)

1. A front-end-loading portable power shovel including a power-propellable frame, a pair of lift-arms arranged on opposite sides of said frame and having their rear ends pivoted to said frame for up and down movement, a pair of hydraulic cylinder-assemblies operatively interposed between said frame and said lift-arms, one end of each such assembly being pivotally connected to the frame, on opposite sides thereof, at points below the point of pivotation between said frame and said lift-arms and the other end of said assembly being pivotally connected between said lift-arms at a point intermediate the ends thereof, forward extension-arms pivotally connected to said lift-arms for up and down movement, a pair of hydraulic cylinder-assemblies operatively interposed between said lift-arms and said extension-arms, with the rearward ends of said assemblies pivotally connected to said lift-arms at points intermediate the ends thereof and with the forward ends of said assemblies pivotally connected to said extension-arms at points intermediate the ends thereof, a shovel having its rearward portion pivotally connected to the forward ends of said extension-arms, and a hydraulic cylinder-assembly operatively interposed between said shovel and said extension-arms; said first pair of hydraulic cylinder-assemblies and said second pair of hydraulic cylinder-assemblies being operable independently of each other and said hydraulic cylinder-assembly intermediate the shovel and the extension-arms being operable independently of the first two pairs of hydraulic cylinder assemblies.

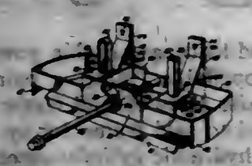
---

2,775,357
**CABLE REEL DOLLY AND LIFTING APPARATUS**
John E. De Armond, Miami, Fla., assignor to Beaver Cable Dolly Corporation, Miami, Fla., a corporation of Florida
Application November 16, 1954, Serial No. 469,150
3 Claims. (Cl. 214—390)

1. In a cable reel dolly, a frame, a pair of spaced hydraulic cylinders mounted for pivotal movement on said frame, bracing means secured to said frame for supporting said hydraulic cylinders in an upright position, said bracing means including a pair of spaced sleeves pivotally mounted on said frame, and a pair of arms each of

which telescopically engage a sleeve and being pivotally secured at the upper end thereof to an adjacent cylinder, said arms being disengageable from the upper end of said cylinders when said cable reel dolly is to be transported unloaded, said cylinders being pivotally moved from the upright position to a substantially horizontal position, and said arms being telescoped within the associated sleeves, each of said sleeves being pivotally folded over the adjacent cylinder.

---



2,775,358

**RIM AND WHEEL CARRIER**

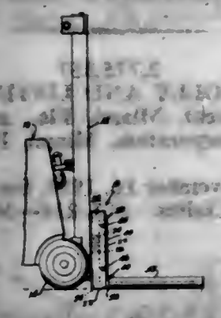
William Roneof, Wilmette, Ill., assignor to Nash Bros. Co., Evanston, Ill., a corporation of Delaware

Application November 27, 1953, Serial No. 394,554

8 Claims. (Cl. 214—451)

1. A carrier structure, comprising a perimetric frame, a shaft rotatably mounted in said frame, cables secured to said shaft and extending through said frame member, a lifting bar secured to the ends of said cables and equipped with bolts having upper threaded ends, a suspension support for said frame comprising a strap having a vertical portion extending to the rear of said frame and forwardly across said frame and having an inverted U portion within said frame providing a vertical guide channel open at its lower end, and a diagonal connecting the vertical portion of said strap and said inverted U portion, said brace and strap at said inverted U-shaped portion being apertured to receive a bolt carried by said bar and a nut engaging the upper threaded portion of the bolt for securing the same within said strap and brace member.

---



2,775,359

**PAPER ROLL HANDLING ATTACHMENT FOR INDUSTRIAL ELEVATING TRUCKS**

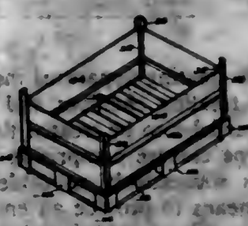
Russell J. Carpenter, Silsbee, Tex.

Application July 22, 1955, Serial No. 523,654

1 Claim. (Cl. 214—653)

In a lift truck, a truck body having a forward end, a pair of laterally spaced vertical guides fixed on said forward end, elevating means on said body extending forwardly therefrom, a vertical frame in front of and extending between said guides and operatively connected to said elevating means for vertical movement along said guides, said frame having laterally spaced vertical side plates, upper and lower guide engaging means on said side plates supportably engaging said guides, a pair of L-shaped arms having vertical portions and horizontal portions extending forwardly from said vertical portions, upper and lower guide rods in said frame extending between and secured to said side plates, said vertical arm portions being slidably supported on said guide rods for movement therealong, a pair of horizontal hydraulic cylinders each fixed at one end thereof to a related frame side plate and having a piston rod extending from its other end and secured to the vertical portion of one of said arms, and hydraulic actuating means severally connected to the hydraulic cylinders and operable to move said arms individually crosswise of the frame and toward and away from each other, said horizontal portions of the arms having rotatable tubular cylindrical rollers journaled longitudinally thereon.

---



2,775,360

**MATERIAL HANDLING CONTAINER**

James M. Phillips, Pittsburgh, Pa., assignor, by mesne assignments, to Salem-Brosius, Inc., a corporation of Pennsylvania

Application September 12, 1952, Serial No. 309,287

7 Claims. (Cl. 220—4)

1. A knock-down container adapted for vertical stacking and for disassembly for re-shipment as a substantially flat assembly to points of loading or for use of the container base as a pallet, comprising a rigid base portion having spaced top and bottom surfaces connected by rigid corner and intermediate side posts providing openings for reception of the forks of a lift truck, the top and bottom base surfaces at each corner thereof having suitably shaped bottomed openings therein for reception of corner stakes, the openings in the upper surface extend downwardly into the adjacent corner posts of the base to provide both lateral and vertical support for corner stakes, the opening in the bottom surface extending upwardly into the adjacent corner posts providing stacking seats for the top of the corner stakes of an adjacent similar container, a stake for each corner of the container having angularly disposed side portions forming the corners of the container body above the base and an opposing angular member secured in spaced relation to the angle of the stake to provide channels for reception of the side walls of the container, and container body side walls for spanning the space between the corner stakes at each side of the container and received within the said stake channels to complete the body of the container.

---

2,775,361

**METAL BOUND BOX OR BASKET**

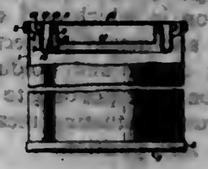
Nathan Kaufer, Plainfield, Conn.

Application March 30, 1953, Serial No. 345,603

9 Claims. (Cl. 220—4)

3. An ornamental box comprising corners made up of elongated longitudinally slidably related outer and inner members, the outer member having elongated perpendicularly related side walls integrally joined together along one of their longitudinal edges, each of said side walls having a portion projecting inwardly to form retainer rails extending longitudinally of the said walls and intermediate the corner formed by said side walls and the free edges of said side walls, the parts outside said rails acting as outer flanges, the inner member having elongated perpendicularly related corner walls integrally joined together along one of their longitudinal edges and fitting within the outer member between its corner and the retainer rails, said inner member having inturned parts within the rails, and inner flanges extending from said inturned parts parallel to but offset inwardly from the outer flanges, panels acting as side walls of the box, the generally upright edges of said panels being received between the aforesaid inner and outer flanges at the corners, generally horizontal top and bottom parts receiving the top and bottom edges of the panels, the top part being a channel having an inverted U-shaped cross-section receiving the top edge of a panel, and the bottom part having an L-shaped cross-section receiving the bottom edge of said panel, assembly rods passing through said top and bottom parts at the corners of the box in order to hold all of the parts in assembled relation, said assembly rods passing collaterally through said corner pieces within the corner walls and the inturned parts of the inner members.

---



2,775,362

**TRIPLE TIGHT METAL CAN CLOSURE**

John Heuchert, River Forest, Ill., assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York

Application December 22, 1954, Serial No. 476,997

2 Claims. (Cl. 220—42)

1. A triple tight metal can comprising a body portion, a ring shaped top end seamed thereto, said top end having a U-shaped channel spaced inwardly from the seam and having inner and outer parallel friction walls, said inner friction wall being inset inwardly above the frictional contact portion thereof and curled outwardly and downwardly into an open bead and forming on its inner face a frictional contact wall, and a cover having a U-shaped channel depending therefrom, said channel being spaced inwardly from the edge of the cover and lying directly over a channel in the can top, said channel being dimensioned so that the outer walls thereof frictionally engage the friction walls of the channel in the can top end making tight seals therewith, said cover having a central depression surrounded by a vertical wall, the outer surface of which makes frictional contact with the friction wall on the inner face of the bead making a tight seal therewith and with the raw edge of the metal can top disposed outside of said last named seal.

---

2,775,363

**VENTED CLOSURE PLUG**

Elvin A. Taylor, Plymouth, Mich., assignor to Plymouth Stamping Company, Plymouth, Mich., a corporation of Michigan

Application July 5, 1955, Serial No. 520,631

4 Claims. (Cl. 220—44)

1. A hollow plug having a frustoconical upper portion with an aperture through the top thereof, an umbrella cap covering said aperture and depending about the conical portion of said plug, being also provided with a depending stem portion passing through said aperture and headed at its lower end to prevent withdrawal, said cap having a plurality of spaced downward projections for resting on the top of said plug and holding the intervening portions slightly spaced therefrom.

---

2,775,364

**SHIPPING CONTAINER**

Eduard Isaias, Dortmund, Germany

Application September 29, 1951, Serial No. 248,917

Claims priority, application Germany January 17, 1951

5 Claims. (Cl. 220—97)

1. Shipping container including wall elements, a bottom, a top frame, and a bottom frame, said frames being horizontally supported by the wall elements and being of rectangular cross section, the lower frame being arranged downwardly of the bottom and at least partly inwardly of the wall elements, the upper frame being arranged at least partly outwardly of the wall elements, the lower frame, with the container stacked upon a companion container, freely receiving the upper frame of the companion or lower container, the median plane of the lower frame of the upper container extending below the median plane of the upper frame of the lower container, the frames permitting the lower frame of the upper container, upon a lateral displacement of the superposed container, to slide at least partly under the upper frame of the lower container.

---

2,775,365

**BAG DISPENSER**

Percy W. Mostman, Van Nuys, and Jay J. Ross, Culver City, Calif.

Application March 6, 1953, Serial No. 340,878

8 Claims. (Cl. 221—44)

1. In a dispenser for paper bags comprising a frame having a bottom wall means and side wall means and defining a front opening, the novelty comprising: finger means extending laterally inwardly from a fixed one of said side wall means, first pressure means including spring means for normally biasing said bags forwardly in said frame and against said finger means, second pressure means including spring means mounted in the frame for normally urging said bags laterally against said fixed one of said side wall means, and another finger piece on said second pressure means directed laterally towards and complementary to said first mentioned finger means.

---

2,775,366

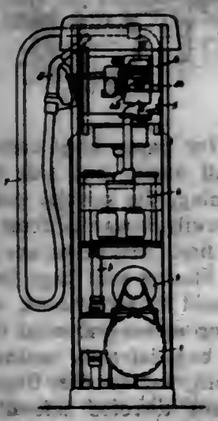
**RAZOR BLADE CONTAINER**

Oscar F. Wilhelm, New London, Conn., assignor to Durham-Enders Razor Corporation, a corporation of New York

Application April 29, 1950, Serial No. 158,999

5 Claims. (Cl. 221—232)

1. A razor blade dispenser for flat single edge razor blades having a cut-out portion at either end, providing longitudinally extending shoulders, said dispenser hav-



ing side walls and a top and bottom, abutments in said dispenser engaging said shoulders to locate a stack of blades therein by the engagement of said abutments with said shoulders and the engagement of one side of the dispenser with the rear edge of the blades, thus eliminating any guiding engagement with the cutting edge portion, an ejecting element mounted adjacent the top of said dispenser and in sliding contact with said stack of blades, means accessible from the exterior of said dispenser for imparting ejecting movement to said element, a shallow recess in the bottom face of said ejecting element having the same profile as the blade, and also having abutment means engaging said blade shoulders to locate the blade transversely without engagement with

the cutting edge thereof, said recess being of a depth no greater than the thickness of one blade, a resilient element on the bottom of said dispenser to urge said stack of blades upwardly towards said ejecting element, a slot at one end only of the dispenser through which said ejecting element may be manually protruded, said slot having a depth just sufficient to permit passage of said ejector and the blade in its recess without permitting any other blades to pass, said ejecting element having a cutaway portion on the protruding corner of the ejecting element corresponding to the back edge of the blade so that the blade may be readily removed from the ejecting element without exposure of the edge where it may cause injury.

---

**2,775,367**
**FLUID DISTRIBUTING AND METERING APPARATUS**
Jean Gustave Antoine Marie Joseph Meyer, Neuilly-sur-Seine, France, assignor to S. A. T. A. M., Societe Anonyme pour Tous Appareillages Mecaniques, La Courneuve (Seine), France, a society of France
Application July 24, 1951, Serial No. 238,210
Claims priority, application France July 25, 1950
4 Claims. (Cl. 222—29)

3. A fluid dispensing and metering apparatus comprising, in combination, a main distributing conduit; a valve means controlling the passage of fluid through said conduit; a presetting device; means for moving said presetting device from a zero position to a preset position corresponding to the quantity of fluid to be delivered; means connecting said presetting device to said valve means and opening said valve means during movement of said presetting device to a preset position; a metering device in said main conduit means and actuated by the delivered fluid, said metering device being connected to said presetting device and moving the same from said preset position into the zero position during fluid delivery; indicating means actuated by said metering device; a shaft; means for resetting said indicating means from indicating position to zero position connected to and actuated by said shaft; a circular cam formed with a notch on its periphery and mounted on said shaft; a member turnably mounted on said shaft adjacent said cam, said member having a length slightly greater than the radius of said circular cam; resilient means attached to said cam and to said member and tending to move said member into a position covering said notch; a pivoted lever; a stud secured to said lever and located opposite said notch when said cam is in a position corresponding to the zero position of said indicating means, and located opposite said circular periphery of said cam when said indicating means are not in zero position; a pump for circulating fluid through said main conduit means; pump actuating means movable between a pump starting position and a pump stopping position; a connecting member secured to said pump actuating means and moving with the same, said connecting member being connected to said lever; spring means urging said pump actuating means into said pump starting position and also urging said lever to pivot into a position in which said stud is located on the periphery of said cam and tends to drop into said notch; a flexible hose communicating with said main conduit means; means for attaching said hose to said lever, the weight of said hose tending to pivot said lever into a position in which said stud is located outside of said notch; and means connected to and actuated by said presetting device and holding said connecting member in a position corresponding to said pump stopping position of said pump actuating means when said presetting device is in zero position.

---

**2,775,368**
**DISPENSER APPARATUS**
Gerrit de Vries, Boone, Iowa
Application April 16, 1954, Serial No. 423,775
6 Claims. (Cl. 222—61)

1. In a device of the class described, a body member having an inner and outer side respectively, said body member provided with an opening or window, a punch member integral with said body member extending from the inner side thereof adjacent said window, hook means integral with said body member extending therefrom in the same direction as said punch member, a spring clip means consisting of an arm portion and a hook portion, said arm portion provided with a slot, a set screw on the outer side of said body portion spaced from said window, said arm portion slidably disposed on the outer side of said body member by engagement of said slot with said set screw whereby said clip means can be selectively projected beyond one end of said body member, and a closure means for said window on said body member.

---

**2,775,369**
**DISPENSING TUBE CLOSURES**
Ralph B. Wahl, Springville, N. Y.
Application April 6, 1955, Serial No. 499,574
11 Claims. (Cl. 222—92)

1. The combination with a collapsible dispensing container provided with a neck having an outlet passage and formed with a cylindrical container portion, of a dispensing closure slidably disposed in the outlet passage of said neck, said closure having a longitudinal material

passage opening into the container and formed with a lateral dispensing port near its upper end, said closure having a cylindrical portion at its inner end of sufficient length to engage said cylindrical container portion dur-

ing its predetermined stroke, and spaced sealing rings formed on the cylindrical portion of said closure at positions which will bring each ring into engagement with the cylindrical portion of said neck at each extreme position of said closure.

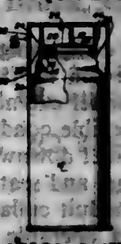
---

**2,775,370**
**DISPENSING DEVICE AND HOLDER FOR TOOTHPASTE OR THE LIKE SUBSTANCE**
John Tripoli, Jackson Heights, N. Y.
Application August 23, 1954, Serial No. 451,433
3 Claims. (Cl. 222—100)

1. A dispenser for the contents of collapsible tubes comprising a generally vertical casing, a removable lower end wall thereon, a discharge conduit mounted in said lower end wall, a sealing and tube-supporting sleeve circumposed about one end of the discharge conduit and adapted to engage about the neck of a collapsible tube, means on the casing for collapsing the tube to force out of the same the contents thereof, and valve means on the other end of said conduit, the discharge conduit being vertically disposed, with one end of the conduit projecting above the general plane of the removable lower end wall, the other end of the conduit extending below said plane, said sealing sleeve being of open-ended formation, to receive a discharge conduit and tube neck respectively, the conduit-receiving end of the sleeve being resiliently expanded to grip the associated end of the conduit, the tube-neck-receiving end of the sealing sleeve including a metallic, internally threaded disc receiving the tube neck, the sealing sleeve having a flexible internal lip engageable by the tube neck when the tube neck is threaded into said disc, with said lip being adapted to be forced by the tube neck against the inner surface of the conduit to provide a seal between the conduit and tube neck.

---

**2,775,371**
**ROTATING BIN FEEDER**
Morris D. Isserlis, New Brunswick, N. J.
Application October 6, 1951, Serial No. 250,150
8 Claims. (Cl. 222—168)



1. A rotating bin feeder, comprising a rigid frame structure, supporting and having journaled therein a vertical shaft, said shaft adapted to rotate a concentric bin structure at varying speeds, means for driving said shaft, said bin structure comprising a shell having a cylindrical lower portion, a receiving plate for a mass of material mounted upon said shell in spaced relationship below the lower end thereof to define an annular discharge opening substantially all around said plate, and having mounted thereon a means at an angle to the vertical and also to the horizontal adapted to urge the material during operation of said bin toward said annular discharge opening, said

plate having at least one plow adjacent to its upper surface and in sliding contact therewith, said plow having its operating end, located intermediate the said shaft, and the peripheral edge of said plate and adapted for operation nearer to said shaft than to said edge.

---

**2,775,372**
**PROTECTIVE COVER FOR DISPENSING CONTAINERS**
Jack P. Jordan, Roslyn, N. Y., assignor, by mesne assignments, to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York
Application August 6, 1953, Serial No. 372,703
2 Claims. (Cl. 222—183)

1. In a dispensing package, a cylindrical container having an inwardly and upwardly tapered neck portion terminating in a bead, a protective cover for said container comprising a flat circular top portion, an outer cylindrical skirt element extending downwardly from the outer edge of said top portion, said outer skirt element having an outer diameter substantially equal to the outer diameter of said container and an inwardly and upwardly tapered lower edge arranged to engage the outer periphery of said neck portion whereby the covered container presents a substantially smooth cylindrical outer surface extending ubtantially the entire length thereof, and an inner concentric cylindrical skirt element extending downwardly from said top portion a distance substantially less than said outer skirt element, the lower edge portion of said inner skirt element surrounding said bead and having integral lugs extending inwardly thereof for engaging the outer surface of said bead to detachably secure said cover to said container.

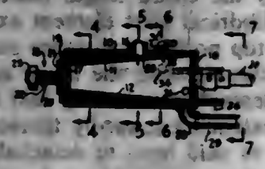
---

**2,775,373**
**POURING SPOUT CONSTRUCTION FOR PAPER CONTAINERS**
Mark Cornillon, Milwaukee, Wis.
Application August 25, 1952, Serial No. 306,113
7 Claims. (Cl. 222—189)

1. The combination with a carrier provided with a

handle, of a cardboard carton interchangeably mounted therein and provided above such carrier with a wall having a dispensing aperture.

---



2,775,374
FLUID MILK DISPENSER
William J. Tennessen, Goshen, N. Y., assignor to Monitor Process Corporation, Jersey City, N. J., a corporation of New Jersey
Application October 25, 1954, Serial No. 464,464
23 Claims. (Cl. 222—185)

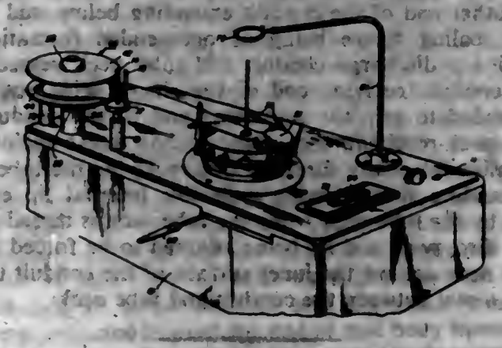
1. A milk dispenser comprising: an open-front cabinet having a floor provided in its front edge with a niche, and an open-front channel extending downwardly below the niche whereby a flexible conduit may be passed from the interior of the cabinet downwardly through the niche and through the channel and seat within said channel, in combination with a conduit collapsing member forwardly of the channel and operable against the conduit in the direction of the forwardly facing front surface of the channel to collapse the conduit against the flow of milk therethrough, and means for moving the conduit collapsing member into and out of engagement with the conduit.

---

2,775,375
DISPENSING DEVICE
Jacob Haller, San Francisco, Calif.
Application November 23, 1953, Serial No. 393,681
2 Claims. (Cl. 222—362)

1. In a dispensing device, a cylindrical housing having a conical bore and having axially spaced and diametrically opposed ports in the wall thereof, means for horizontally supporting the housing, with one of the ports presented upwardly to form an intake and the other port presented downwardly to form an outlet, means for admitting a liquid to the intake port, and a hollow valve member adapted for holding a measured quantity of liquid and having a conical wall dimensioned to have a revolving fit in the housing and having intake and outlet ports adapted for selective registering with the corresponding ports in the housing, means for rotating said valve between receiving and dispensing positions for alternate filling and dispensing operations, one end of the valve member being flush with the corresponding end of the housing so as to form an annular joint therewith, a sealing ring covering said joint, and spring means urging the sealing ring upon the end of the housing and the end of the valve upon the sealing ring, said spring means comprising a threaded stud projecting axially from said end of the valve, a U-shaped washer straddling the stud and bearing on the sealing ring, a coiled spring surrounding the stud and bearing on the washer, and a nut threaded on the stud and bearing on the spring.

---



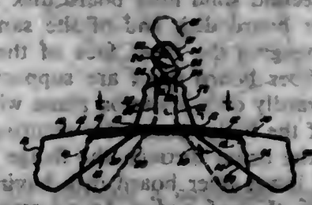
2,775,376
POWDER DISPENSING CONTAINER STRUCTURE
John Hanchett, River Forest, Ill., assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York
Application November 9, 1953, Serial No. 390,843
4 Claims. (Cl. 222—486)

1. A container for packaging and dispensing powdered materials comprising a body, a top secured on the body and having a large area central raised or plateau portion equipped wtih dispensing openings, and a cover mounted on the body over the top and having a large area central depressed portion held in tension and tightly against the underlying plateau portion in a manner for preventing inadvertent sifting of powder from the plateau openings outwardly between said tightly engaging large area portions, said top being seam secured on the body and said cover being rotatably mounted on the seam and having a dispensing opening therein selectively presentable over multiple arcuately spaced dispensing openings in the underlying container top by turning of the cover about said seam, said cover including a channel embracing said seam and having therein a sealing compound engaging on the seam and preventing outward sifting of powder from between the contacting large area central portions of the cover and the underlying top.

---

2,775,377
MACHINES FOR PRODUCING BOWS AND POMPONS FROM RIBBONS
Harold M. Cook, Dallas, Tex., assignor to Burlington Industries, Inc., a corporation of Delaware
Application October 4, 1954, Serial No. 459,941
8 Claims. (Cl. 223—46)

1. In a pompon and bow-forming machine, mechanism for forming a plurality of undistinct loops, means for feeding ribbon to said mechanism comprising a reel spindle mounted on the machine and having revolvable reel-supporting means thereon, a ribbon guide through which said ribbon passes from the reel to said mechanism, a ribbon-carrying reel supported on the reel-supporting means, means to hold said reel on said reel-supporting means, and means to retard the rotation of said reel as ribbon is drawn from the reel and to oppose overrunning comprising a spring pressed element engaging the surface of the reel to frictionally retard rotation of the reel.



2,775,378
SUIT HANGER
Philip S. McLean, Bloomfield, N. J.
Application May 27, 1954, Serial No. 432,742
3 Claims. (Cl. 223—91)

1. A suit hanger comprising a hanger arch having shoulder forms at opposite ends and a supporting bar extending horizontally from the lower outer end of one shoulder form toward but terminating short of the lower outer end of the other shoulder form, providing a gap at that side of the hanger through which a folded garment may be slipped edgewise over the end of said bar into fully supported position on the bar, and a clamp bar loosely confined beneath the hanger arch, in position to rest on a garment on said supporting bar, said clamp bar having thin, flat, elongated upward extensions at opposite ends of the same and the shoulder forms of the arch having narrow vertical slots therein elongated and in line with the ends of said clamp bar and in which said upward extensions are closely guided, the intermediate lower edge portion of said clamp bar being relieved upwardly to admit the fingers of a hand gripping the hanger arch, and the upper edge of the clamp bar being spaced below the underside of the arch and clear of obstructions so as to admit the fingers of a hand over the top of the clamp bar for pressing said clamp bar downwardly against a garment on the supporting bar.

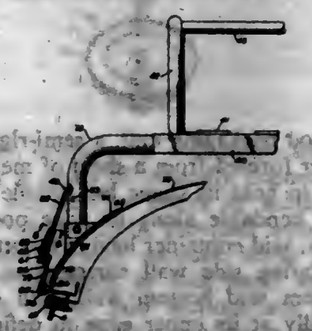
---

2,775,379
GARMENT HANGER
Murray A. Gordon, Brooklyn, N. Y., assignor to Berkeley Industries, Jersey City, N. J., a corporation of New Jersey
Application January 11, 1955, Serial No. 481,126
9 Claims. (Cl. 223—95)

1. A garment hanger comprising a pair of complementary interfitting members, each of which is formed of a single integral length of resilient material and includes a first upwardly and inwardly directed arm and a second laterally extending arm intersecting said first arm, the outer ends of said first arm and said second arm being joined and having the inner ends thereof resiliently urged toward each other, means hingedly connecting said first arms adjacent to their inner upper ends, and means carried adjacent to the outer ends of each of said second arms slidably engaging the other of said second arms.

---

2,775,380
COMBINATION DARNER BALL AND SEWING KIT HOLDER
Louis H. Campos, New York, N. Y.
Application December 21, 1953, Serial No. 399,440
2 Claims. (Cl. 223—109)

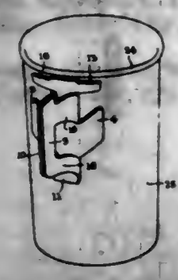


2. In a darner and sewing kit formed of a darner ball and a handle, the combination of a darner ball of smooth exterior and of hollow construction, a handle to be assembled with said darner ball, a small diameter tube carried by said handle and adapted to extend into the darner ball end and being hollow for receiving needles and pins,

a second tube for sliding over the first tube, a series of spools of thread positioned over the outside of said second tube, and a thimble engaging the top series of said spools for holding them in position.

---

2,775,381
ATTACHING AND SUPPORTING MEANS FOR AUTOMOBILE LUGGAGE CARRIER
Terence G. Hare, Detroit, Mich., assignor to Miller Manufacturing Co., Detroit, Mich., a corporation of Michigan
Original application November 6, 1951, Serial No. 255,055, now Patent No. 2,643,046, dated June 23, 1953. Divided and this application May 6, 1953, Serial No. 353,346
1 Claim. (Cl. 224—42.1)



Means for securing a luggage carrier to the top of an automobile, which luggage carrier has a load supporting member for resting upon the top portion of the automobile comprising, a hook member of relatively wide metal stock for engaging under a drip trough of the automobile body, means connecting the hook member to the load supporting member, a lock member having a body part disposed against a flat face of the hook member and having tangs on opposite edges thereof fashioned loosely and slidably about the opposite edges of the hook member for slidably mounting the lock member on the hook member, said lock member having a projecting and offset finger at its lower edge, the lock member being slidable into a position with said finger projecting within the drip trough to engage an inner surface thereof and thereby hold the hook member in engagement with the under side of the drip trough.

---

2,775,382
HANDLE ATTACHMENT FOR PAPER CUPS
Ellas Kayat, Willow Cove, Ontario, Canada, assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York
Application October 5, 1954, Serial No. 460,469
1 Claim. (Cl. 229—1.5)

A handle attachment for preformed paper cups comprising a body blank having a center strip and a handle integrally and hingedly connected to each side of said

strip, cut-outs forming finger holds for the handles, said cut-outs being integrally connected to said strip, said strip extending above the hinge connections of the handles, and laterally projecting straps formed integrally with said strip extension at each side thereof, said straps terminating in said handles when in nested position with

the upper edges in alignment with the upper edge portion of the handles, said strip, cut-outs, and the straps being adhesively secured to the outer face of the cup, said handles being free to swing on said strip to a nested position adjacent the cup or to a substantially radial position relative to the cup for supporting the same.

---

2,775,383

**FOOD PACKAGING ASSEMBLY**

Jack Kollman, Chicago, and William A. Beck, Itasca, Ill., assignors, by mesne assignments, to Elco-Alcoa Containers, Inc., River Grove, Ill., a corporation of Illinois

Application June 18, 1952, Serial No. 294,242
2 Claims. (Cl. 229—3.5)

1. In a food packaging unit, a semi-rigid nestable pan-like container formed from a sheet of metallic foil that is stiff enough to hold its shape but pliable enough so that it is readily bendable along its edge portions by finger manipulation, said container having a bottom wall and an outwardly flaring side wall surrounding and extending upwardly from said bottom wall, said side wall being bent outwardly at its upper edge to define an upwardly facing peripheral seat extending about the margin of the container, said sheet at the outer edge of said seat being bent upwardly to provide an upstanding rim to define the outer edge of said seat, a cover member having a relatively rigid marginal portion shaped to conform to the shape of the seat and resting thereon, said sheet also having a remnant marginal portion about the rim bent inwardly to a retaining position over the border of said cover to secure the cover in position on said seat and to close and stiffen the container, said remnant marginal portion being readily bendable by finger manipulation to or toward an upstanding position to release such cover.

2,775,384

**DRUM FOR LIQUIDS AND SEMI-LIQUIDS**

Harold A. Bergstrom, Van Wert, Ohio, assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York

Application July 27, 1951, Serial No. 238,789
1 Claim. (Cl. 229—5.5)

A heavy duty fiber drum including a convolutely wound body wall comprising a sheet of fiber board forming one or more inner plies of the body wall, a sheet of fiber board forming one or more outer plies of the body wall and a sheet of light gauge steel forming at least one ply of the body wall, said ply of steel being disposed between the inner ply or plies of fiber board and the outer ply or plies of fiber board, said plies of fiber board and steel being in end to end relation and in intimate contact and glued together in a single puncture proof body unit, a bottom heading fitting within said body wall and secured thereto by rolling the body wall into a holding

bead, said sheet of steel in the body wall extending from end to end of the body wall and into said holding bead, said bottom heading having a tray of steel provided with a flange extending into and interlocking with the metal ply of the body wall in said holding bead.

2,775,385

**DRUM WITH SUPPORTED FIBER BOTTOM**

Thomas H. Gibbs, Jr., Van Wert, Ohio, assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York

Application February 24, 1955, Serial No. 490,290
2 Claims. (Cl. 229—5.5)

1. A fiber drum for film rolls and the like comprising a convolutely wound body, a heading for closing the bottom end of the drum including a kraft paper tray having a depending peripheral flange fitting within the body of the drum, a solid fiber board disk beneath and contacting with said tray and spaced upwardly from the bottom end of the body, a second solid fiber board disk beneath said first named fiber board disk and of the same diameter, a fiber collar engaging the inner face of the tray flange on which said fiber board disks are supported and terminating downwardly on a common plane with the lower end extremity of the body, means for securing said collar to the body of the drum through the flange of the kraft paper tray, said lower fiber board disk having a circular opening centrally thereof and a drawn steel supporting member disposed in said opening, said supporting member having a cylindrical wall provided with a laterally extending flange at its upper end, said flange being disposed to lie between the fiber board disks with its upper face contacting the underface of the upper fiber board disk and its lower face contacting the upper face of the lower fiber board disk, and said supporting member having a depth for extending below the upper fiber board disk the same distance the lower end extremities of the body and the collar extend below said upper fiber board disk so as to support said bottom heading against sagging under the weight of the film roll.

2,775,386

**TAPERED TOP CONTAINER DEPRESSOR**

James J. Cannon, San Francisco, Calif.

Application June 4, 1953, Serial No. 359,458
1 Claim. (Cl. 229—7)

A depressor for depressing the tapered top of a carton, which top is defined by upwardly converging walls, the side margins of which form eaves and wherein a

pouring spout is formed in one of said side walls, comprising a U-shaped bail member of substantially the same width as the width of the carton, said bail member having substantially parallel legs and a medial portion joining said legs, the length of said legs being less than the length of the converging walls, inwardly serrated lugs having upwardly directed teeth affixed to said legs, said lugs extending outwardly from one side of the bail and normal to the plane thereof in spaced relation to the free ends of the legs, the ends of said legs extending

inwardly toward one another to fit under the eaves formed by one of the converging walls of the container top at the lower portion thereof to provide a pivotal axis for the bail member, said bail member having its medial portion adapted to rest against the peak of the carton, whereby the top may be depressed substantially flat by applying pressure on the medial portion of said bail member, whereby said serrated lugs will engage the sides of said carton to retain said carton top and bail member in substantially flat position.

2,775,387

**CONTAINER MANUFACTURE**

Christiaan P. J. Boster, Midland, Cape Town, Union of South Africa, assignor to Herzberg Mullins Automatic Products Limited, Woodstock, Cape Town, Cape Province, Union of South Africa

Application November 1, 1954, Serial No. 466,181
Claims priority, application Union of South Africa December 2, 1953
5 Claims. (Cl. 229—15)

1. Means for forming a container comprising a first creased blank providing a floor, side and end walls bordering said floor, a lid hingedly connected with one of said walls, and a flap connected to said lid and engageable with the opposite wall, one of said walls defining an aperture; and a second creased blank formed for encompassing said side and end walls, the ends of said second creased blank being received in the aperture.

2,775,388

**POURING OPENING FOR CONTAINERS**

Robert W. Nerenberg, Middletown, Ohio, assignor, by mesne assignments, to The Bergstein Packaging Trust, a trust composed of Robert M. Bergstein and Frank D. Bergstein, trustees

Application October 23, 1953, Serial No. 387,910
3 Claims. (Cl. 229—17)

1. A one-piece liquid-tight carton comprising a tubular body rectangular in cross-section each wall of which lies in a single plane throughout its entire length, an end closure comprising a plurality of juxtaposed face contacting closure flaps connected to the end edges of each of said carton body walls and secured together in face-to-face relationship, an adjacent pair of said closure flaps being first folded flaps and a third of said closure flaps overlying said first folded closure flaps, said third closure flap being coextensive with the rectangular cross-section of said carton body and having a pouring opening formed in a corner thereof remote from the body wall to which

said flap is connected, the two sides of the said third closure flap defining said corner having integral extensions projecting outwardly therefrom beyond the planes of the underlying carton body walls and forming extending lip portions defining a projecting pouring lip for the said pouring opening, and a liftable closure member overlying and closing said pouring opening.

---

2,775,389

**CONTAINER CONSTRUCTION**

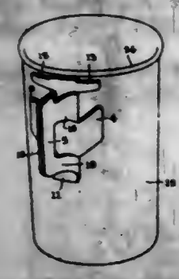
Meyer C. Weimer, Grand Rapids, Mich., assignor to Pennsal Corporation, Grand Rapids, Mich., a corporation of Michigan

Application December 20, 1952, Serial No. 327,072
2 Claims. (Cl. 229—23)

1. A container, comprising: collapsible sidewall panel means including a series of hingedly connected sections each having a plurality of layers of material secured together by "U"-shaped clips provided with prongs engaging said material, said sections being arranged to provide for the collapsing of said panel means into a position wherein all of said sections are substantially parallel; a bottom assembly including a frame having channel means receiving an end of said sidewall panel means including said clips, said bottom frame also having first and second sets of tabs formed from the material of said channel means, the tabs of each of said sets being in coplanar relationship, and the planes of said sets being spaced apart, substantially parallel, and disposed across the opening of said frame; a bottom panel positioned between said sets of tabs; a top assembly including a frame having channel means receiving an end of said sidewall panel means including said clips; and means locking said top and bottom frame means in engagement with said sidewall panel means, said locking means including an inwardly-turned portion on said channel means engaging the ends of and enclosing said clips, said inwardly-turned portion being substantially parallel to the adjacent sidewall panel means, and engaging said clips at the extreme inner edge of said inwardly-turned portion.

---

2,775,390



**CARTON**

Oscar L. Vinas, New York, N. Y., assignor to Alford Cartons, Ridgefield Park, N. J., a corporation of New Jersey

Application December 11, 1953, Serial No. 397,651
3 Claims. (Cl. 229—38)

1. A collapsible partitioned carton having a bottom panel, a pair of side panels extending upwardly from the

strip, cut-outs forming finger holds for the handles, said cut-outs being integrally connected to said strip, said strip extending above the hinge connections of the handles, and laterally projecting straps formed integrally with said strip extension at each side thereof, said straps terminating in said handles when in nested position with

the upper edges in alignment with the upper edge portion of the handles, said strip, cut-outs, and the straps being adhesively secured to the outer face of the cup, said handles being free to swing on said strip to a nested position adjacent the cup or to a substantially radial position relative to the cup for supporting the same.

**FOOD PACKAGING ASSEMBLY**

Jack Kollmen, Chicago, and William A. Beck, Itasca, Ill., assignors, by mesne assignments, to Elco-Alcon Containers, Inc., River Grove, Ill., a corporation of Illinois

Application June 18, 1952, Serial No. 294,242
2 Claims. (Cl. 229—3.5)

1. In a food packaging unit, a semi-rigid nestable pan-like container formed from a sheet of metallic foil that is stiff enough to hold its shape but pliable enough so that it is readily bendable along its edge portions by finger manipulation, said container having a bottom wall and an outwardly flaring side wall surrounding and extending upwardly from said bottom wall, said side wall being bent outwardly at its upper edge to define an upwardly facing peripheral seat extending about the margin of the container, said sheet at the outer edge of said seat being bent upwardly to provide an upstanding rim to define the outer edge of said seat, a cover member having a relatively rigid marginal portion shaped to conform to the shape of the seat and resting thereon, said sheet also having a remnant marginal portion about the rim bent inwardly to a retaining position over the border of said cover to secure the cover in position on said seat and to close and stiffen the container, said remnant marginal portion being readily bendable by finger manipulation to or toward an upstanding position to release such cover.

2,775,384

**DRUM FOR LIQUIDS AND SEMI-LIQUIDS**

Harold A. Bergstrom, Van Wert, Ohio, assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York

Application July 27, 1951, Serial No. 238,789
1 Claim. (Cl. 229—5.5)

A heavy duty fiber drum including a convolutely wound body wall comprising a sheet of fiber board forming one or more inner plies of the body wall, a sheet of fiber board forming one or more outer plies of the body wall and a sheet of light gauge steel forming at least one ply of the body wall, said ply of steel being disposed between the inner ply or plies of fiber board and the outer ply or plies of fiber board, said plies of fiber board and steel being in end to end relation and in intimate contact and glued together in a single puncture proof body unit, a bottom heading fitting within said body wall and secured thereto by rolling the body wall into a holding

bead, said sheet of steel in the body wall extending from end to end of the body wall and into said holding bead, said bottom heading having a tray of steel provided with a flange extending into and interlocking with the metal ply of the body wall in said holding bead.

2,775,390

**CARTON**

Oscar L. Vlaar, New York, N. Y., assignor to Alford Cartons, Ridgefield Park, N. J., a corporation of New Jersey

Application December 11, 1953, Serial No. 397,651
3 Claims. (Cl. 229—28)

1. A collapsible partitioned carton having a bottom panel, a pair of side panels extending upwardly from the

sides of the bottom panel, at least one top panel positioned laterally adjacent at least one of the side panels, the top panel being provided with a plurality of pairs of fold sections, each of said pairs of fold sections being defined by a spaced transverse cut line and a pair of bowed transverse fold lines in the top panel oppositely spaced from but communicating with the later extremities of the transverse cut line, each of the bowed transverse fold lines including a central cut portion having a contour such

as to project toward the central cut portion of the bowed transverse fold line defining the other fold section of each pair thereof, the extremities of said central cut lines extending inwardly of each fold section toward the intermediate transverse cut line seperating each pair of fold sections whereby said fold sections are capable of being folded downwardly and divergently inward into the erected carton without causing folding of the portion of the top panel defined by the aforesaid central cut portion of each transverse fold line.

**2,775,391**
**CARTON**
**Oscar L. Vines, New York, N. Y., assignor to Alford Cartons, Ridgefield Park, N. J., a corporation of New Jersey**
**Application December 11, 1953, Serial No. 397,652**
**1 Claim. (Cl. 229—28)**

A collapsible partitioned carton comprising a continuous bottom panel, a side wall panel extending upwardly from each side of the bottom panel, a top panel overlying the bottom panel and extending inwardly from the upper extremities of each of the side panels, each of the top panels being provided with a plurality of pairs of fold sections, an interior panel extending downwardly from one of the top panels and having a glue flap depending therefrom secured to the bottom panel, a second glue flap extending downwardly from the other top panel and secured in face-to-face contact with a portion of the interior panel so that both glue flaps resist loosening when the pairs of fold sections of the top panel are folded inwardly into the carton, said pairs of fold sections being defined by pairs of bowed transverse fold lines in the top panels and a transverse cut line intermediate each pair of said transverse fold lines, said transverse fold lines in each of the pairs thereof communicating with the lateral extremities of the transverse cut lines, the central portion of each transverse fold line comprising a cut line having a contour such that the central portion of each top panel between proximate transverse fold lines extends longitudinally of the carton over each cell formed within the boundaries of the aforementioned panels when the fold sections are folded downwardly and inwardly into the carton.

**2,775,392**
**DISPLAY CARTON**
**William P. Frankenstein, Cincinnati, Ohio**
**Application January 5, 1953, Serial No. 329,586**
**14 Claims. (Cl. 229—36)**

1. A blank for forming a display base for a display package comprising a display panel having length and breadth and a given area, a base panel having length and breadth but of less area than the area of the display panel, a first pair of panels integrally hingedly connected to one another of a length equal to, at least, the length of the base panel, one of said panels being integrally hingedly connected to one edge of the display panel, the other of said first pair of panels being integrally hingedly connected to one edge of the base panel, a second pair of panels integrally hingedly connected to one another with one of said second pair of panels integrally hingedly connected to the opposite edge of the base panel, said panel integrally hingedly connected with the display panel being adapted to overlie said display panel and secured in said position, and said remaining panel of said second pair of panels having one end free and having length and width and an area greater than the area of the base panel but of less area than the area of the display panel and being adapted to overlie the display panel with its free end disposed between the display panel and its integral first mentioned overlaid panel and be secured to the display panel.

**2,775,393**
**COLLAPSIBLE ASSEMBLY FOR BOX STRUCTURES**
**E. Melvin Rugg, Chicago, Ill., assignor to International Harvester Company, a corporation of New Jersey**
**Application November 15, 1954, Serial No. 468,817**
**1 Claim. (Cl. 229—41)**

A collapsible wall assembly for boxes, comprising a plurality of side walls disposed in rectangular relation, said side walls having hinged corner connections to provide a structure having oppositely disposed open ends, two of said side walls disposed in opposed relation comprising separate panels, each panel having adjacent edge portions extending substantially parallel to the corner connections, a hinge member connecting the adjacent edge portions of the panels of each side wall whereby the said panels may be hingedly moved inwardly for collapsing said structure, corner supports for said structure comprising triangular-shaped tubular members disposed in the corners of said structure and coextensive with the side walls, said tubular members each having a first wall connected to a panel and a second wall connected to an adjacent side wall, the first and second walls of the tubular members being hingedly connected, a third wall on each tubular member, said third wall including wall sections hingedly connected to the first and second walls, said sections having inner surfaces disposed within the tubular members, and means hingedly connecting said sections together, all of said hinged connections being substantially

parallel to each other whereby said corner supports may be positioned in flat collapsed relation with the inner surfaces of said sections in contiguous contact during collapse of said structure.

**2,775,394**
**COMPOSITE CAN WITH QUICK-OPENING SIDE WALL**
**Alexander H. Lasso, Jr., Van Wert, Ohio, assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York**
**Application February 1, 1954, Serial No. 407,374**
**8 Claims. (Cl. 229—51)**

1. A composite can with a top and a bottom and having a single ply of paper board or like material having the ends overlapped and sealed together at their edges with an intermediate adhesive coating to form a continuous side seam, the outer surface of the underlying end of the ply being scored inwardly along inclined lines spaced from said seam to form a tab which may be torn away from the ply intermediate the inner and outer surfaces thereof to the edge of the ply under the side seam.

---

**2,775,395**
**COMPOSITE CAN WITH QUICK-OPENING LAP SEAM**
**Harold A. Bergstrom, Van Wert, Ohio, assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York**
**Application March 22, 1954, Serial No. 417,865**
**6 Claims. (Cl. 229—51)**

1. A composite side-opening can with a top and a bottom and having a side wall of paper board or like material comprising an inner ply and an outer ply coextensive therewith, said plies being joined together at their ends only, and overlapping at the end of a single convolution, the outer ply at that point being cemented to the inner ply of the opposite end to form a continuous four-ply side seam, the outer ply being transversely scored at a point inwardly of the cemented end for guided severance and parting of the seam between the severed end of the outer ply and the underlying end of the inner ply.

**2,775,396**
**MAILING ENVELOPE**
**Joseph Lindner, Cincinnati, Ohio**
**Application November 12, 1953, Serial No. 391,521**
**1 Claim. (Cl. 229—73)**

An envelope construction consisting of a mailing envelope having a front wall with a window opening therein, a rear wall connected to said front wall along a side edge thereof, said rear wall at least having a designated space on the inner surface thereof for a statement, a neck portion connected to the remaining side edge of said front wall, and a return envelope having front and rear walls connected to said neck portion along a line for severance, the front wall of the return envelope being integrally connected to said neck portion along the said line for severance, the rear wall of said return envelope comprising a separate panel member having an attachment flap adhesively secured to the front wall of said return envelope immediately adjacent the said line for severance, said return envelope and said neck portion being foldable to overlie the inner surface of the front wall of said mailing envelope, said return envelope having a designated return address space on the rear wall thereof adapted to be juxtaposed to the window opening in the front wall of said mailing envelope to provide an address for the mailing envelope, the front wall of said return envelope having a designated space thereon for the address of the sender, said neck portion serving, when infolded along its line of connection to the front wall of said mailing envelope, to space the said line for severance inwardly from the side edge of said mailing envelope front wall, and a mating line for severance in the front wall of said mailing envelope coinciding in the folded structure with the line for severance between said neck portion and said return envelope, the front wall of said mailing envelope having end flaps at the ends thereof including lines for perforation formed in prolongation of the lines of perforation in the said front wall, and an attachment flap connected to the free side edge of said mailing envelope rear wall along a line for severance, said attachment flap having adhesive on the inner surface thereof for securing said flap to the said neck portion when the parts are juxtaposed, thereby bringing all of said lines for severance into coinciding relationship such that the mailing envelope may be opened by tearing the structure along a single line, said structure being otherwise free from lines of severance.

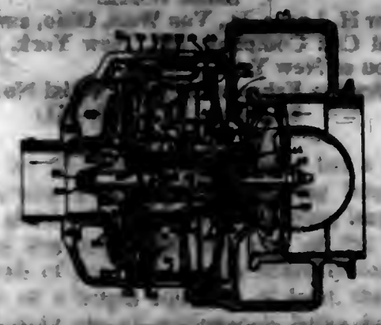
MERCURY BELLOWS PUMP
Eugene S. Robbins, Arthur C. Brinsmaster, and Berthus H. McMaster, Los Alamos, N. Mex., assignors to the United States of America as represented by the United States Atomic Energy Commission
Application August 19, 1955, Serial No. 529,592
3 Claims. (Cl. 230—95)



1. A gas transfer pump comprising in combination a bellows, a plug attached to and sealing one end of said bellows, a valve head sealed to the other end of said bellows, said valve head containing a gas inlet and gas outlet and a transfer chamber, said outlet being located higher than said inlet, said transfer chamber communicating with said other end of said bellows, valve means for controlling the flow of gas through said outlet and inlet, means attached to said plug for actuating said valve means, a quantity of liquid in said bellows, means for moving said bellows and plug with respect to said valve head whereby the liquid within said bellows is forced into said gas transfer chamber and said valve means is actuated to control the flow of gas through said chamber.

TURBINE DRIVEN FAN UNIT
Eugene S. Cox, Palos Verdes Estates, Calif., assignor to The Garrett Corporation, Los Angeles, Calif., a corporation of California
Application September 8, 1952, Serial No. 308,450
6 Claims. (Cl. 230—116)

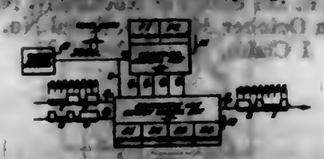
1. In a power driven fluid circulating unit: a casing including a turbine end section, a main fan end section and a chamber for lubricant; a bearing structure including spaced bearings and having a passage for circulation of a cooling fluid, said passage having an inlet, and outlet in communication with the casing exterior; means for lubricating said bearings; a rotor structure including a shaft rotatably mounted in said bearings, a fan carried by one end of said shaft and positioned in said fan end section, and a turbine wheel carried by the other end of said shaft; an inlet chamber contained in said turbine end section for supplying an actuating fluid to said wheel; a bleed connection between said inlet chamber and the

inlet of said passage for conducting turbine actuating fluid to said passage for cooling the bearing structure independently of the lubricating means; a valve in said bleed connection actuated in an opening direction by pressure of fluid from said inlet chamber; and means biasing said valve to closed position, said biasing means being adjustable to enable valve opening at a predetermined pressure of actuating fluid in said inlet chamber.

---

2,775,401
FOUNTAIN BRUSH
Fred O. Sterry, Huntington Park, Calif.
Application May 26, 1952, Serial No. 290,937
1 Claim. (Cl. 299—169)

A valve for a fountain brush comprising a body provided with a bore, said body having a seat at one end of the bore and a recess at the other end of said bore, a stem slidable in said bore, a valve member at one end of said stem coacting with said seat, a spring pressed head provided at the other end of the stem and disposed in said recess, a dome shaped resilient cover secured to said body and extending over said recess, said cover overlying said recess in said body and forming an air chamber, said cover having a vent aperture therein for venting said air chamber, said cover being depressible and deformable to engage and depress said head, said vent aperture being in alignment with said head so that said vent aperture will be closed upon depressing said cover and said head, said cover when depressed with said vent aperture closed forcing the air in said chamber through said bore, said head extending upwardly from said recess and providing a closure for said aperture when said cover is depressed.



---

2,775,402
CODED DECIMAL SUMMER
Eric Weiss, Los Angeles, Calif.
Application May 26, 1951, Serial No. 228,235
12 Claims. (Cl. 235—61)

10. A summing circuit for generating an outgoing coded decimal number which is the sum of a pair of incoming

coded decimal numbers comprising: a pair of inputs, each serially sensing binary signals representing said incoming numbers, a group of four binary signals on an input representing each of the decimal digits of said number, each of the binary signals in a group weighted to represent components of the decimal digit; a plurality of bistable state circuits; a first circuit means for registering information in said bistable state circuits concerning the combined weight count of the first three binary signals in the groups

representing the same order decimal digits of the incoming numbers; an output; a second circuit means responsive to the last two binary signals in said groups and the registered information in said bistable state circuits for deriving a group of binary signals to be fed on said output, said latter group representing the decimal digit of the outgoing number; and a third circuit means for registering in said bistable state circuits the last two signals in the output group prior to impressing them onto said output.

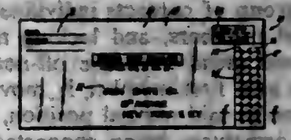
2,775,403
SIGN DETECTION MEANS FOR "CRAWL" CARRY REGISTERS
George V. Hall, East Orange, and Walter S. Oliva, Summit, N. J., assignors to Monroe Calculating Machine Company, Orange, N. J., a corporation of Delaware
Continuation of application Serial No. 255,645, November 9, 1951. This application October 3, 1952, Serial No. 313,012
7 Claims. (Cl. 235—61)

1. In a register including an ordinal series of numeral wheels and crawl tens transfer mechanism between said wheels; the combination of electric signaling circuit means, said circuit means comprising, a source of electrical power, two electrical conductor means each connected to an opposite side of said power source, switching means associated with each of said wheels, the switching means associated with the highest order wheel being connected to one of said conductor means, each switching means operable to make a first connection to the next lower order switching means to serially connect the successive lower order switching means with said one conductor means, and each successive lower order switching means operable to make a second connection from the second conductor means to said first connection from the next higher order switching means thereby completing a circuit, and an electroresponsive device in said circuit; with a switch controlling device operable by each of said wheels upon movement in a given direction from a first range of registration extending over a plurality of digital values to a zero control range of registration between 1 and 9 registering positions to control the operation of the associated switching means to make said first connection, upon movement from said zero range to a third range of registration extending over a second plurality of digital values to make said second connection, and upon movement from said third range to said first range of registration to break said first and said second connections.



2,775,404
NAVIGATIONAL COMPUTERS
Harold R. Lehr, Chicago, Ill., assignor to United Air Lines, Inc., Chicago, Ill., a corporation of Delaware
Application August 12, 1954, Serial No. 449,476
16 Claims. (Cl. 235—61)

1. A computer for the solution of navigation problems comprising a plurality of cooperating discs mounted on a common central axis, said discs rotatable with respect to each other, a first one of said discs having a logarithmic numerical scale thereon, and a second one of said discs having logarithmic trigonometric function scale means thereon, said scales being in side by side relationship capable of cooperating in slide rule fashion to resolve known navigational data into certain trigonometric components, one of said discs having rectilinear grid means thereon, indicia on said rectilinear grid means bearing a predetermined relationship to said trigonometric components whereby other navigational computed data is readable directly on said grid means as the measured length and direction of the hypotenuse of a right triangle whose legs correspond to said trigonometric components as set up on said grid means.

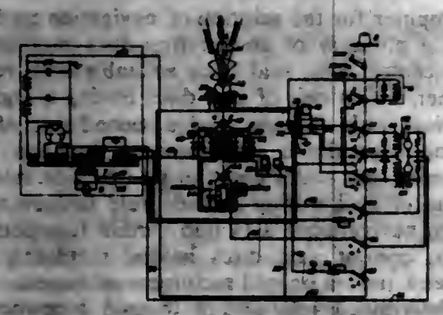
2,775,405
CODED ENVELOPE TO FACILITATE SORTING
Louis Pastor, New York, N. Y.
Application August 18, 1953, Serial No. 374,954
1 Claim. (Cl. 235—61.12)

A business reply envelope, comprising rectangular front and rear paper sheets, an adhesive layer secured to one end portion of one of said sheets at the inner side thereof to form a relatively stiffened strip portion, and a rectangular card inserted between said sheets and secured to said adhesive layer to reinforce said stiffened portion, said card being unattached to the other of said sheets so that the entire interior of the envelope defined by said sheets is open and available for use, said one sheet bearing coded marks at the exterior thereof along said stiffened portion, said marks being scannable by photosensitive means.

---

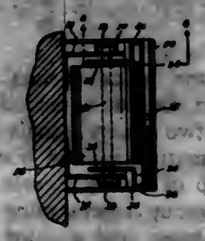
2,775,406
ODOMETER
Henri Redmer, Neuilly-sur-Seine, France
Application October 24, 1952, Serial No. 316,620
Claims priority, application France March 3, 1952
6 Claims. (Cl. 235—97)



1. An odometer for vehicles and the like, comprising a trip totalizer and a general totalizer, each totalizer

comprising a plurality of drums, a first member for supporting the drums of said trip totalizer, a second member for supporting the drums of said general totalizer, and one-way friction means for connecting said two members together whereby said connecting means is effective in one direction of rotation only.

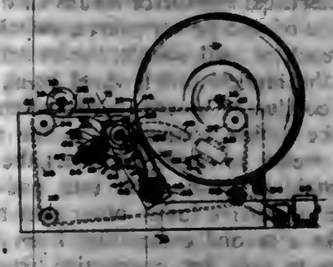
---



2,775,407
**DRIVING AND BRAKING SYSTEM FOR REELING MECHANISM**
Stanley J. Elliott, Summit, N. J., Frank M. Thomas, Port Washington, N. Y., and Osborn C. Worley, Whippany, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application June 15, 1953, Serial No. 361,702
4 Claims. (Cl. 242—55)

1. A reeling apparatus comprising a pair of reels, a flexible element disposed on said reels in such manner as to be transportable from either one to the other of said reels, a motor coupled to one of said reels, another motor coupled to the other of said reels, each of said motors comprising an armature, said armature having two terminals, a source of potential, a first impedance, a second impedance, a switch including a first contact actuating member having a normal position and first and second off-normal positions, a second contact actuating member having off-normal positions corresponding to those of said first member, a group of contacts individually associated with each of said members, and locking means for retaining said second member in the off-normal position it occupies when said first member is moved from said off-normal position to said normal position, one terminal of each of said armatures being connected to contacts associated with said second member, the other terminals of said armatures and one terminal each of said impedances being connected to a common point, the other terminal of each of said impedances being connected to contacts associated with said first member, said contacts being disposed in such relative positions by the contact actuating members associated therewith that when said switch is operated to an off-normal position the armature of one of said motors is connected to said source of potential to energize said motor and thereby impart motion to said flexible element, and the armature of the other of said motors is shunted with said first impedance whereby said other motor operates as a braking generator driven by said flexible element, said shunting impedance being of such value as to maintain the tension of said flexible element at the level required to prevent the rupture and throwing thereof while being transported, and when said switch is operated to its normal position from said off-normal position said source of potential is disconnected from said one motor, the armature of said motor is shunted with said second impedance and the armature of said other motor is short-circuited, both of said motors thereby operating as braking generators to differentially brake the reels coupled thereto, said shunting impedance being of such value as to maintain the tension of said flexible element at the level required to prevent the rupture and throwing thereof during the braking operation, the presetting of said second switch member in the braking position conditioning said apparatus in such manner as to maintain the tension of said flexible element at the level required to prevent rupture and throwing thereof while switching from the transporting operation to the braking operation.

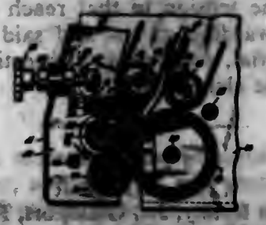
---



2,775,408
**TOILET TISSUE ROLL COVER**
Lewis E. Du Bon, Far Rockaway, N. Y.
Application October 30, 1953, Serial No. 389,420
1 Claim. (Cl. 242—55.2)

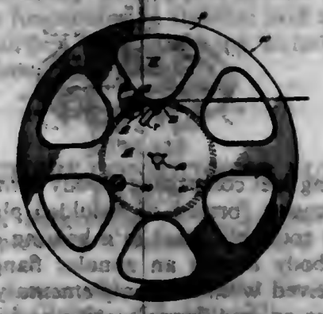
A toilet tissue cover comprising in combination, a pair of separate horizontally spaced angular metal plate brackets adapted to be secured to a supporting wall, said brackets having outwardly pressed socket portions adjacent their outer ends for receiving the ends of a roller member of a roll of tissue, a detachable cover for a supported roll of tissue including semi-circular end walls and an arcuate-shaped central wall connecting said end walls, said central wall having a lip depending from one end thereof, angularly shaped brackets secured at one end to the end walls of the cover and being disposed inside and in overlapping relation with the wall brackets, said angularly shaped brackets having notches in one edge thereof opening downwardly and being disposed at an angle to the vertical to detachably seat the angular brackets on the roller member of a roll of tissue for detachably holding the cover over a supported roll of tissue.

---



2,775,409
**WEB ROLL REPLENISHER**
Anthony W. Pomper, Piscataway Township, Middlesex County, N. J., assignor to John Waldron Corporation, New Brunswick, N. J., a corporation of New Jersey
Application February 10, 1953, Serial No. 336,035
17 Claims. (Cl. 242—58)

1. The method of accelerating a new roll of web material for attachment to a web traveling from an expiring roll comprising passing the traveling web over a rigid splicing roll, driving the splicing roll at a peripheral speed equivalent to the web speed, mounting the new roll for initial free rotation, advancing the mounted new roll rectilinearly into tangential contact with the portion of the travelling web supported on said splicing roll, rapidly increasing the contact pressure sufficiently to accelerate the new roll from zero to a peripheral speed equivalent to the web speed in slightly less than one revolution of the new roll, and moving the remainder of the new roll when nearly depleted in the same rectilinear path over the splicing roll to the expiring roll position.



2,775,410
**APPARATUS FOR WINDING LIMP MATERIAL INTO CORELESS ROLLS**
Morris A. Schwartz, North Plainfield, N. J., and Harland S. Fisher, Wilmette, Ill., assignors to Johnson & Johnson, a corporation of New Jersey
Application March 29, 1952, Serial No. 279,274
3 Claims. (Cl. 242—66)

1. Apparatus for winding limp material into a coreless roll, including a pair of opposed frames, a series of parallel rolls arranged one in one frame and the others in the second frame and defining a convoluting chamber, means for rotating all said rolls in the same direction so that limp material entering endwise into the chamber is rolled upon itself by such rotation of the rolls, means associated with one of said frames, including devices positively driven in a direction opposed to the direction of rotation of said rolls for guiding said material into the convoluting chamber, said second mentioned frame being mounted for pivotal movement relatively to the first mentioned frame to enlarge automatically the convoluting chamber to accommodate the material as it is rolled upon itself and to permit discharge from the convoluting chamber of the completed roll, and means mounted coaxially with the pivot of the second mentioned frame and from which the rolls in said frame are driven.

---

2,775,411
**REEL CONSTRUCTION**
Chester J. Tellon, Mount Prospect, Ill., assignor to The American Molded Products Company, Chicago, Ill., a corporation of Illinois
Application December 21, 1953, Serial No. 399,392
7 Claims. (Cl. 242—76)

1. A reel comprising two hollow cylindrical hubs, one of said hubs having a diameter larger than that of the other of said hubs and said hubs being telescoped into closely adjacent concentric relation with each other, each of said hub portions having a face flange at one end thereof, said face flanges being positioned at opposite ends of said concentric hubs at right angles to the longitudinal axes thereof and in parallel relation to each other, the inner small diameter hub having an offset portion extending radially outwardly therefrom and registering with a cut-away portion of the outer large diameter hub, said offset and cut-away portions cooperating to provide a substantially uniform outer peripheral hub surface for said outer large diameter hub, portions of said offset and said cut-away being spaced relative to each other to form an inclined slot extending through both of said hubs, transversely between said face flanges.

2,775,412
**DEMOUNTABLE FILM REEL**
Byron B. Haysworth, Los Angeles, Calif., assignor to Radio Corporation of America, a corporation of Delaware
Application October 16, 1952, Serial No. 315,168
The terminal fifteen years of the term of the patent to be granted has been disclaimed
8 Claims. (Cl. 242—70)

1. A film reel assembly for a driving spindle having a shaft portion comprising a hollow cylindrical hub adapted to be keyed to said spindle shaft portion, a film spool adapted to be keyed to said hub, said hub and spool being symmetrical about a plane through their centers and perpendicular to the axes of said hub and said spool, said hub having tapered annular grooves adjacent the ends thereof, and flanges adapted to be attached to each end of said hub adjacent the ends of said spool, said flanges each including resilient elements and latch members, said latch members having one end of each resiliently urged into one of said grooves at the end of said hub upon which it is mounted, the sides of the end of each latch member and said groove being tapered at an angle to prevent removal of said flanges from said hub by force applied thereto axially of said hub when the ends of said latch members are in said grooves.

---

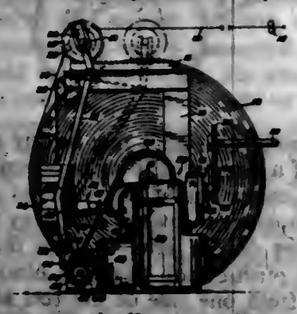
2,775,413
**REEL STRIP-END FASTENER**
Joseph N. Liebman, North Miami Beach, and Thomas Nelson Ryan, Miami, Fla.
Application April 25, 1955, Serial No. 503,521
3 Claims. (Cl. 242—74)

1. In combination with a reel having a hub, a fastener for an end of a flexible strip to be wound about the hub, said fastener comprising a pair of jaws supported within the hub for movement toward and away from each other, a spring acting on the jaws to urge them normally together, and a push-button having a head portion projecting outward from one side of the reel and an inner portion that extends between the jaws and that upon pressing the push-button inward operates to wedge the jaws temporarily apart against resistance of the spring to permit of inserting an end of the flexible strip between the jaws or withdrawing it therefrom.

---

2,775,414
**CONSTANT TENSION CONTROL MECHANISM**
Dale B. Rush and William E. Springer, Columbus, Ind., and John R. Thomas, Belmont, and Donald E. Wandy, Medford, Mass., assignors, by mesne assignments, to The Kollsman Electric and Engineering Company, Cleveland, Ohio, a corporation of Ohio
Application July 9, 1953, Serial No. 367,942
5 Claims. (Cl. 242—75)

1. Means for automatically controlling the rate of rotation of a storage roll for flexible material comprising,



in combination with such a roll, a length of flexible material wound on said roll, means for forwarding said material substantially in a plane at constant linear velocity, a differential gear including a first input element, a second input element, and an output element, means connecting input elements to control the speed of said output element in accordance with the differential between the speeds of said input elements, rotary means driven at a constant ratio with respect to said forwarding means, constant-ratio drive means connecting said rotary means to drive said first input element, variable-ratio drive means connecting said rotary means to drive said second input element, an arm mounted for oscillation

about a fixed axis in a common plane with the axis of said roll, means operatively engaging said arm and bearing against the inner surface of said material at a point within the sector defined between the current point of tangency of said material with the effective surface of said roll and a plane including the axis of said roll and normal to the plane of movement of said material, means yieldably urging said arm away from said normal plane and toward said current point of tangency, means connecting said arm to vary the ratio of said variable-ratio drive means in response to movement of said arm, and means providing a driving connection between said output element and said roll.

---

2,775,415
TENSION-DOMINATED CONTROL
Dale B. Rush and William L. Springer, Columbus, Ind., assignors, by mesne assignments, to The Reliance Electric and Engineering Company, Cleveland, Ohio, a corporation of Ohio
Application July 9, 1953, Serial No. 367,644
9 Claims. (Cl. 242—75)

1. Means for automatically controlling the rate of rotation of a storage roll for flexible material comprising, in combination with such a roll, a length of flexible material wound on said roll, means for forwarding said material relative to said roll, rotary means driven at a constant ratio with respect to said forwarding means, a variable-speed transmission driven by said rotary means, said transmission comprising an input shaft connected to be driven from said rotary means, an output shaft, a pulley on each of said shafts, belt means providing a driving connection between said pulleys, at least one of said pulleys being an expansible V-pulley, and an element shiftable oppositely to vary oppositely the effective diameter of said V-pulley and thus to vary oppositely the output speed of said transmission, a worm driven from said transmission output shaft, a worm wheel driven by said worm and connected to drive said roll, an arm mounted for oscillation about a fixed axis in a common plane with the axis of said roll, means operatively engaging said arm and bearing against the inner surface of said material at a point within the sector defined between the current point of tangency of such material with the effective surface of said roll and a plane including the axis of said roll and normal to the plane of movement of said material, means yieldingly resisting movement of said arm in response to an increase in the tension in that reach of the material between the forwarding means and said means bearing against the material, and means connecting said arm to shift said shiftable element.

---

2,775,416
COIL HOLDER
John Kyuby, Jr., Glenwood, Pa.
Application May 6, 1955, Serial No. 506,489
2 Claims. (Cl. 242—78)

2. A wire retaining device for use with a high speed wire drawing apparatus comprising a plate having two circular sector portions interconnected by a central ring portion, and spaced pairs of flanges secured to said sector portions and extending downwardly normal thereto, said ring portion having a centrally disposed aperture therethrough, each of said sector portions having at least one aperture therethrough, said apertures receiving upper ends of block extension pins of the wire drawing apparatus.

---

2,775,417
FISHING REEL
Benjamin E. Pruzaid, Chicago, Ill., assignor to Kleinway, Inc., Chicago, Ill., a corporation of Illinois
Application October 13, 1953, Serial No. 386,845
2 Claims. (Cl. 242—84.4)

2. A fishing reel comprising a body formed of moulded plastic, a housing formed of moulded plastic having an annular hub rotatably fitted in a bearing opening of said body, said body having an annular flange around said opening received within a complementary recess in said housing, a lug on said flange bearing against said housing in said recess to minimize bearing area between the housing and flange, a pinion gear formed of moulded plastic having a hub keyed to said annular hub, a line-storing spool supported by said body forwardly of said housing, means on said housing for winding line on said spool, and gear means carried by the body and operatively connected to said pinion gear for rotating the same.

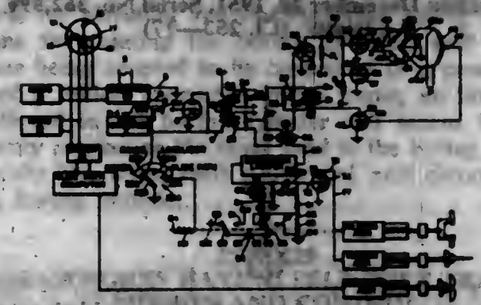
---

2,775,418
FISHING REEL ARBOR
William L. Clabaugh, Bronson, Mich., assignor to Higbie Manufacturing Company, a corporation of Michigan
Application November 4, 1952, Serial No. 318,707
1 Claim. (Cl. 242—119)

A pair of arbor sections for a shaft having convex end flanges, each of said sections comprising a substantially semi-cylindrical shell forming an outer material supporting wall with internal web structure for reenforcing the section and providing means for bearing against a shaft, means on each of the bearing means for keying each section to a shaft, means for securing the sections about a shaft to form an arbor therefor, the outer wall of each section having a slot therein for

receiving a line material so as to assist in securing the sections together, and each of said sections also having substantially identical concave end walls which are equally spaced from the center of the section and adapted to receive portions of the convex end flanges on the shaft so as to prevent recession of a line material between the end walls and end flanges.

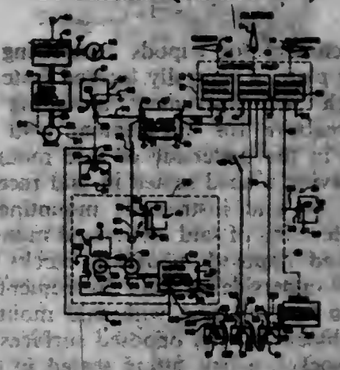
---



2,775,419
FRACTIONAL ASPECT RATIO AIRCRAFT
Josef S. J. Hlobil, Santa Monica, Calif.
Application January 26, 1952, Serial No. 268,373
9 Claims. (Cl. 244—35)

4. An aircraft comprising: a single wing, said wing comprising a single airfoil having a fractional aspect ratio of a value not greater than one-third, said wing providing an aerodynamic lift force for said aircraft; a pair of side airfoils affixed to the respective sides of said wing, said side airfoils extending above and below the upper and lower surfaces of said wing airfoil respectively, being substantially parallel to but slightly diverging to the rear symmetrically with respect to the vertical plane of the major longitudinal axis of said wing, and diverging upwardly symmetrically with respect to said major axis, said side airfoils functioning to stabilize said aircraft and to restrict the airflow over said wing airfoil to a substantially two-dimensional flow.

---



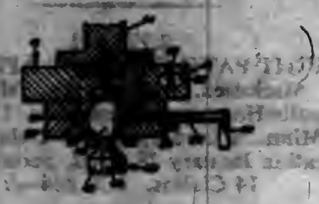
2,775,420
BEAM CHANGE PRE-CONDITIONER AUTOMATIC PILOTS
Charles R. Bell, Ruggenfield, N. J., assignor to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware
Application January 23, 1952, Serial No. 267,829
11 Claims. (Cl. 244—77)

1. In an automatic pilot responsive to various signal conditions for controlling the flight surfaces of an aircraft, comprising means to insert a signal condition on said automatic pilot and then to insert a different signal condition on said automatic pilot, and a means operatively connected with said inserting means and operable to block the control of the flight surfaces including a means connected with said last named means for gradually overcoming said blocking operation to allow control to be resumed upon change from one signal condition to another.

---

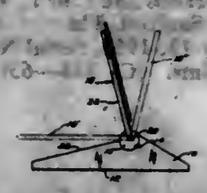
2,775,421
FLIGHT PATH CONTROL APPARATUS
David L. Markusen, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application January 28, 1952, Serial No. 268,481
14 Claims. (Cl. 244—77)

1. Flight path control apparatus comprising, in combination: means for giving a first signal in accordance with lateral deviation of a craft from a desired path; means for giving a second signal in accordance with the angular deviation of the craft from a desired roll attitude; motor-generator means connected to both the above named means for integrating the sum of said first and second signals to give a third signal; and means connected to said motor-generator means and to the first named means for changing the heading of the craft in accordance with the joint effect of said third and first signals.



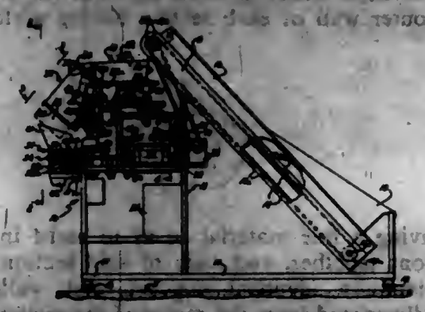
---

2,775,422
COMBINATION HANGER AND CLAMP
Robert W. Von Herbulis and Carl L. Von Herbulis, Sanford, Fla.
Application May 13, 1954, Serial No. 429,505
4 Claims. (Cl. 248—63)



1. A combination hanger and clamp for supporting a high voltage electric cable from a high voltage insulator comprising an elongated hanger body, means to secure one end of the hanger body to the insulator, a hook formed in the other end portion of said body providing a hook socket portion, a lever pivotally mounted on an axis adjacent the extremity of the hook socket portion, said lever having a laterally extending boss adapted to move in a path across the hook socket portion, a cooperating stop means on said lever and body for limiting the pivotal movement beyond a predetermined angle with respect to said body, a clamping jaw on said lever and having portions extending over said hook socket portion when said jaw is in clamping position, said boss being out of the cable receiving portion of the hook socket position when the lever is pivoted to position said jaw in clamping relation to said hook socket, cooperating means on said lever and said body when said jaw is in clamping position for maintaining said jaw in clamping relation to said socket.

2,775,423
**INSTRUMENT LEVEL**
Albert M. Stone, Wisconsin Rapids, Wis.
Application November 13, 1953, Serial No. 391,947
1 Claim. (Cl. 248—180)



A level attachment for tripods comprising an instrument mounting plate, a centrally located fastener extending up through said instrument mounting plate and projecting thereabove for engagement with an instrument, a recess in the underside of said mounting plate, said fastener having a head seated in said recess, leveling means carried by said instrument mounting plate for facilitating the leveling of said instrument mounting plate, a pair of spaced opposed mounting blocks removably secured to the underside of said instrument mounting plate in face to face relation with said mounting plate, said mounting blocks having opposed surfaces forming a ball receiving socket, a ball fitting seated in said socket and being retained therein by said mounting blocks, said ball fitting having means for attachment to a tripod, said ball fitting directly underlying said fastener and preventing access to said head, another fastener adjustably carried by one of said mounting blocks clampingly engaging said ball fitting.

2,775,424
**ADJUSTABLE DISPLAY EASEL**
Carl C. Harris, Orange, Mass., assignor to The Stencil Co., Orange, Mass., a corporation of Massachusetts
Application September 19, 1952, Serial No. 310,454
7 Claims. (Cl. 248—195)

1. A device adapted to display clip-bearing articles with a minimum danger of loss due to thievery in any of a plurality of adjusted angular positions, said device comprising a base having a flat face adapted to rest upon a counter or shelf, a shaft rotatably mounted upon said base about an axis parallel to the plane of said support face, a generally flat relatively flexible display card fixed to said shaft in a plane parallel to the axis of rotation thereof, means coacting between said shaft and said base for retaining said shaft in its adjusted position relative to said base, said display card being formed with a rectangular aperture upon the lower edge of which clip bearing articles may be clipped for display purposes on said display card, an imperforate projection extending completely along the top edge of said aperture and projecting from one side of the display card so as to overlie said clip bearing articles attached upon said lower edge to prevent direct upward removal of said articles, said display card being formed of a deflectable material whereby, when pressure is inwardly applied adjacent said lower edge from said one side of said card, said lower edge will be deflected away from said one side sufficiently to permit removal of said articles through said aperture.

2,775,425
**WEIGHING AND BAGGING MACHINE**
Earl H. Engvall, Minneapolis, Minn.
Application October 18, 1954, Serial No. 462,713
4 Claims. (Cl. 249—46)

4. A machine for measuring and segregating accurately weighed quantities of a material composed of a mass of individual articles, said machine having in combination a scale mechanism including a weighing receptacle having inlet and outlet portions, a multi-speed material-feeding conveyor having a discharge end above the inlet end of said receptacle and discharging material therein, an outlet gate swingably mounted in the outlet portion of said receptacle, a shiftable inlet gate associated with the inlet portion of said receptacle and being inclined upwardly and outwardly from the discharge end of said conveyor in closed position, linkage mechanism interconnecting said gates for opening and closing the same, said outlet gate being in closed position when said inlet gate is in open position, actuating mechanism associated with said linkage mechanism for shifting the same, weight-responsive control means operatively associated with said scale mechanism and with said actuating mechanism and constructed and arranged to cause opening of said outlet gate when a predetermined quantity of material is contained in said receptacle, time-responsive control means operatively associated with said actuating mechanism and constructed and arranged to cause closing of said outlet gate after a predetermined time delay subsequent to the opening thereof, and weight-responsive control mechanism connected in controlled relation with said scale mechanism and in controlling relation with said conveyor, said control mechanism being constructed and arranged to cause high speed operation of said conveyor when less than a predetermined fraction of the quantity of material to be weighed is contained in said receptacle.

2,775,426
**BLADE STRUCTURE**
Lawrence D. Barrett, Jr., Glen Mills, Pa., and John R. Dennis, Bedford, Ohio, assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application December 20, 1951, Serial No. 262,596
2 Claims. (Cl. 253—77)

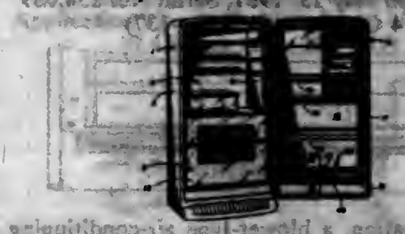
1. As a new article of manufacture, a blade structure of the type set forth including a plastic vane core and a metallic root core disposed in end-to-end abutting relation, a plastic covering for said vane and root cores, and a metallic shell enclosing and confining the cores and the plastic covering.

2,775,427
**SAMPLE RECEIVING PROJECTILE FOR SIDE WALL CORE SAMPLER**
Vincent Dembicki Lewis, Beaumont, Tex.
Application January 17, 1955, Serial No. 559,746
1 Claim. (Cl. 255—1.4)

In an instrument for taking samples of earth formations from the side walls of well bores, a sample receiving projectile capable of being shot from the instrument whereby it is forced into an adjacent formation, the projectile comprising an open ended tubular body, an inner lining consisting of a split sleeve received in the body and capable of receiving a sample of the material of the formation, upon firing the projectile, the sleeve being made of spring steel and being capable of being expanded, due to its inherent resilience, upon removing the sleeve from the body with the sample contained therein, whereby the sleeve is substantially disengaged from the sample and the sample may be recovered in one intact, unaltered piece, an annular closure member detachably connected to one end of the body, the adjacent ends of the body and the sleeve being received in an internally enlarged end portion of the closure member, the body and the closure member having mutually aligned annular grooves formed in the adjacent surfaces thereof, and a split O ring received in the annular grooves, the O ring being made of spring steel and being capable of being expanded, due to its inherent resilience, whereby it is disposed partly in one of the grooves and partly in the other, the depth of the groove formed in the body being such that the O ring, upon being compressed, may be disengaged from the groove formed in the closure member whereby the closure member may be detached from the body.

2,775,428
**TREE AND SHRUB FIELD BALLING MACHINE**
Carl Monthan, Tucson, Ariz.
Application May 19, 1953, Serial No. 355,983
5 Claims. (Cl. 255—19)

2. A tree and shrubbery removing device comprising a horizontally disposed frame, a vertically positioned boring cylinder mounted to travel vertically in the frame, means for elevating and lowering said boring cylinder, means for rotating the boring cylinder, said rotating means being adapted to be connected to a power take-off of a vehicle connected to the frame, an inner shell positioned in the boring cylinder and means for temporarily connecting the inner shell to the boring cylinder whereby the inner shell is lowered and elevated with said boring cylinder.

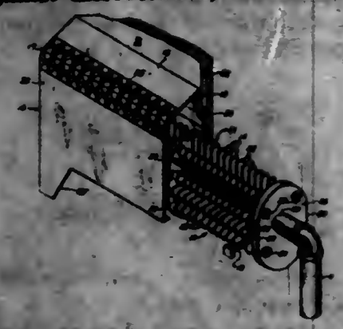


2,775,429
**DRAWWORKS HAVING SELECTIVE TRANSMISSION AND CONTROL**
Albert A. Ashton, Houston, Tex., assignor to Esmco Manufacturing Company, a corporation of California
Application March 26, 1951, Serial No. 217,530
6 Claims. (Cl. 255—19)

1. In a drawworks arranged to be driven from a power delivery means, said drawworks having a drum, a speed change mechanism having input shaft means connected to said power delivery means so as to be driven thereby and first and second speed transmissions; a drum drive connection from said speed change mechanism to said drum, said connection having a clutch; a control for said power delivery means; a movable control member; means defining for said control member first and second paths of movement away from a neutral position and a third path of movement away from one of said other paths of

movement; means responsive to movement of said control member in said first and second paths of movement to respectively actuate said first and second speed transmissions; means acting in response to movement of said control member in said third path of movement to actuate said clutch of said drum drive connection; and means acting in response to further movement of said control member to actuate said control for said power delivery means.

2,775,430
**BEVERAGE CONDITIONER**
Oscar E. Norberg, Cincinnati, Ohio, assignor to Avco Manufacturing Corporation, Cincinnati, Ohio, a corporation of Delaware
Application March 30, 1955, Serial No. 497,904
3 Claims. (Cl. 257—3)



1. In combination, a refrigerator cabinet, a main refrigerated food storage compartment within said cabinet, an evaporator within the lower portion of said compartment, an access door for said compartment, said door having an outer shell, an inner panel of said door spaced from said shell, insulation between said shell and said panel, said panel having a food storage area in open communication with the lower portion of said refrigerated compartment and located adjacent said evaporator, an electrical resistance heating means in thermal contact with said panel contiguous said food storage area, a thermostatic switch in electrical connection with and controlling the operation of said heating means, said switch mounted on a heat-conducting bracket, said bracket being in thermal contact with said panel adjacent said food storage area whereby said thermostat is responsive only to the temperature of said food storage area, said switch having means for varying its response temperature, said last-named means being adjusted by an extension shaft, said panel having a hole therein adjacent said switch, said extension shaft extending through said hole, and a control knob on said shaft.

2,775,431
**BASEBOARD HEATER**
Peter Krzyzowski, Boyertown, Pa.
Application March 24, 1954, Serial No. 418,274
1 Claim. (Cl. 257—153)

A baseboard heater comprising a series of horizontally spaced cast iron disks, each disk having a body member

arranged in abutting relation with a gasket and the body of the next adjacent disk to provide a heater of elongated form, each of said body members having a tapered heat medium passage therethrough, each of said disks further having a plurality of radially disposed spaced apart tapered fins, an end member abutting respective end disks and having a gasket therebetween, said end members being

apertured for reception of tie rods extended between certain pairs of fins of said disks, said tie rods including nuts for securing the disks in assembled relation, one end of said tie rods being formed with left hand screw threads, while the other end of said tie rods are formed with right hand screw threads, and each end member having a threaded axial opening for connection of standard pipe of a heating system.

---

2,775,432

**APPARATUS FOR AIR CONDITIONING**

John W. McHugh, Philadelphia, Pa., assignor to John J. Nesbitt, Inc., Philadelphia, Pa., a corporation of Pennsylvania

Application July 23, 1951, Serial No. 238,089

4 Claims. (Cl. 257—137)

1. In combination, a blower-type air-conditioning unit adapted for positioning along a wall of a room, said unit comprising a casing having top, bottom, front and end walls, an air inlet adjacent the bottom of said front wall and air outlet means in said top wall and a first heating element therebetween and a blower to blow air from said inlet to said outlet, an elongated convector unit longer than said blower-type unit casing extending laterally outwardly from one of said end walls of the blower-type unit casing and positioned on the face of the wall, said convector unit comprising a housing with a smaller cross-sectional area than said blower-type unit casing with the bottom face spaced above the floor of the room and having openings in the top and bottom faces thereof, a second heating element comprising a closed loop with the upper reach thereof positioned between said first heating element and said air outlet with a portion of said loop extending through said one of said end walls of said casing into said convector unit and spaced from the interior of said convector housing, and common supply and common discharge conduits in said blower-type unit casing for circulating a heating medium to both of said heating elements.

---

2,775,433

**FINNED TUBE SPACING SUPPORTS**

William F. Medwary, Tulsa, Okla.

Application August 31, 1953, Serial No. 377,388

2 Claims. (Cl. 257—262.16)

1. In a finned tube for heat exchangers, including a tube portion having a series of radial fins, a radial spacing support forming device, comprising a band of flexible metal encircling a portion of said tube and engaging the peripheral edges of a group of adjacent fins, a central annular channel extending around said band, spaced radially from the peripheral edges of said fins, the meeting edges of said band being interconnected by overlapping,

transverse flanges bent upon one another, and an opening through the web of said channel to facilitate the flowing of molten metal within the band and between said fins, to provide when hardened, a mass of metal extending radially from the tube to the inner face of said web.

---

2,775,434

**IMMERSION DEVICES FOR TREATING LIQUIDS**

Clemens Probst, Erlangen, Bavaria, Germany, assignor to Siemens-Schuckertwerke Aktiengesellschaft, Berlin-Siemensstadt, Germany, a corporation of Germany

Application April 26, 1952, Serial No. 284,659

Claims priority, application Germany April 28, 1951

2 Claims. (Cl. 259—1)

1. An immersion device for treating liquids, comprising an insulated handle rod, an electric immersion heater of hollow cylindrical shape and a piezoelectric oscillator both joined with said handle and a piezoelectric for joint immersion in the liquid to be treated, said oscillator being surrounded by said heater, and electric conductor means extending through said handle to said heater and said oscillator.

---

2,775,435

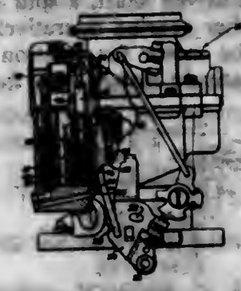
**CARBURETOR ACCELERATING PUMP WITH GAS VENT**

Fred A. Kemmer, St. Louis, Mo., assignor, by mesne assignments, to ACF Industries, Incorporated, New York, N. Y., a corporation of New Jersey

Application January 24, 1952, Serial No. 267,942

7 Claims. (Cl. 261—34)

3. In a carburetor, a throttle, a source of fuel, an accelerating pump including a pump chamber and a guide in said source, a pumping element in said chamber, a stem on said element slidable in said guide, resilient means under control of said throttle for operating said pump, and a vent for said pump comprising a passage within said guide communicating between said chamber and said source, open in one range of positions of said pumping element and closed within another range of positions thereof in response to change in throttle position.



2,775,436

**ACCELERATING PUMP INLET CHECK VALVE CLOSER**

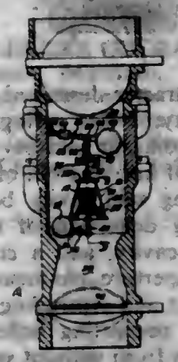
Albert W. Zeh, St. Louis, Mo., assignor, by mesne assignments, to ACF Industries, Incorporated, New York, N. Y., a corporation of New Jersey

Application November 23, 1953, Serial No. 393,692

2 Claims. (Cl. 261—34)

2. In an automotive carburetor, the combination of a mixture conduit, a movable throttle in said conduit, an accelerating pump having a piston in a chamber operated in response to opening movement of said throttle, an outlet for said pump in said mixture conduit exposed to suction during high rates of flow therethrough, a pump inlet, and an anti-siphoning type of device for said pump comprising, a valve seat in said pump inlet, a check valve for said seat closed by fuel pressure during the discharge stroke of said pump, a spring abutment surface in said chamber, a spring member supported adjacent said valve for bodily movement toward and from said seat with one end normally supporting said valve in spaced relation to said seat and the other end arranged to be engaged against said abutment surface during the discharge stroke of said piston to compress said spring and retain said valve seated to prevent siphoning action on said pump.

---



2,775,437

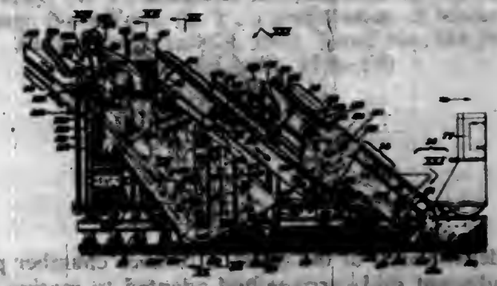
**METERING VALVE FOR A CARBURETOR**

James E. Baker, Jacksonville, Fla.

Application November 19, 1954, Serial No. 476,110

7 Claims. (Cl. 261—62)

1. In a carburetor having an air intake passage, a fuel and air mixing chamber communicating with said passage, and a liquid fuel inlet port between the air intake passage and the mixing chamber, means for preserving a correct ratio of fuel to air entering the mixing chamber, said means comprising a valve mounted in the air intake passage adjacent the port, gravity actuated means mounted within the mixing chamber and operatively connected to the valve for advancing it into closing relation to the port, and means mounted in the air intake passage and operatively connected to the valve for moving said valve against the effort of the gravity actuated means in response to increasing velocity of air passing through said intake passage toward the mixing chamber.



2,775,438

**METHOD AND APPARATUS FOR PROCESSING BALLAST**

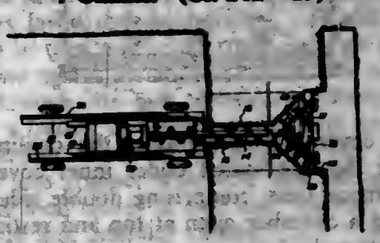
Harold H. Bach, Steubenville, Ohio, and Charles L. Towle, Philadelphia, Pa.

Application September 6, 1951, Serial No. 245,292

22 Claims. (Cl. 262—2)

1. Apparatus for removing ballast from the crib between track ties comprising a support movable along the track, a source of pressurized, compressable fluid on said support, pressure fluid directing means carried by said support and connected to said source, said directing means being located inwardly of the rails above the crib and aimed downwardly and outwardly toward the crib, ballast digging means carried by said support outwardly of the tie ends, and ballast collecting means carried by said support outwardly of said directing means and rearwardly of said digging means.

---



2,775,439

**CUTTER HEAD FOR DRIVING CROSSCUTS**

Timothy F. McCarthy, Indiana, Pa.

Application March 21, 1951, Serial No. 216,707

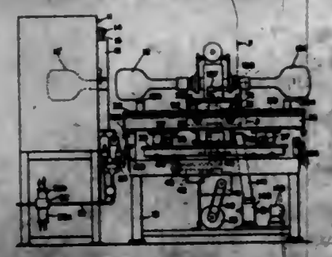
7 Claims. (Cl. 262—19)

7. In a rotary cutter head having an imperforate conical face, a securing member secured to said cutter head at the apex of said conical face, a drive member secured to said securing member for driving the same, said conical face receding from said securing member and said drive member, said cutter head having spaced cutter bit-carrying means mounted on said conical face, and facing substantially in the direction of said drive member, cutter bits projecting from said cutter bit-carrying means, certain of said cutter bits projecting beyond the periphery of said cutter head for cutting clearance therefor, said cutter bit-carrying means and bits being mounted on said conical face in the form of a conveying spiral, for progressing the cuttings inwardly along said conical face toward said drive member to be carried away thereby during the operation of cuttings.

---

2,775,440

**AUTOMATIC BATCH FURNACE APPARATUS**



Walter N. Young, Doylestown, Pa., assignor to International Resistance Company, Philadelphia, Pa., a corporation of Delaware

Application March 13, 1953, Serial No. 342,067

5 Claims. (Cl. 263—7)

1. In an apparatus for successively positioning carbon deposition flasks in a furnace chamber the combination of, a supporting base, a turntable rotatably mounted thereon, a carriage translatably mounted on said turntable,

means for independently supporting on said carriage a pair of carbon deposition flasks extending laterally outward in a horizontally angularly spaced relation, the supporting means embodying a rotatable element and means for releasably clamping the neck portion of the flask thereto, means for rotating each of said elements and its

flask independently of the other, a furnace chamber positioned adjacent said carriage and adapted to receive successively therein said flasks, means for rotating said turntable to predetermined angular positions appropriate to presenting the respective flasks to said chamber, and means for translating said carriage to move the corresponding flask into and out of said chamber.

---

2,775,441

## COOLING COVER FOR ANNEALING FURNACES

George I. Campbell, Sparrows Point, and Lewis G. Cascio, Lochearn, Md., assignors to Bethlehem Steel Company, a corporation of Pennsylvania

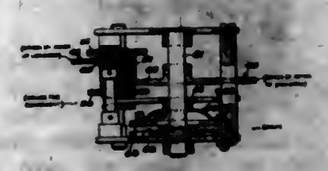
Application February 2, 1953, Serial No. 334,656

1 Claim. (Cl. 263—50)

An outer cover for accelerating the cooling of hot steel strip or the like sealed under inner covers on an annealing furnace base, comprising double side and end walls forming a chamber open at top and resting on the base surrounding the inner covers, vertical buckstays disposed at regular intervals within said side and end walls and defining air circulating passages therebetween, rigid circumferential top and bottom edge members attached to said buckstays, a plurality of open louvres having upwardly inclined vanes positioned near the bottom edges between adjacent buckstays, upwardly directed fans on motors mounted on the side and end walls above the louvres for forcing strong air streams inwardly between and around the inner covers to withdraw heat therefrom, and means for controlling the motor and fan speeds to regulate the rate of heat withdrawal in accordance with a predetermined time period.

---

2,775,442



## SPEED REGULATING MEANS

James E. Bevins, Ramsey, and Robert W. Hyde, Englewood, N. J., assignors to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware

Application March 13, 1950, Serial No. 149,927, which is a division of application Serial No. 588,600, April 16, 1945. Divided and this application October 27, 1951, Serial No. 254,137

1 Claim. (Cl. 264—10)

In a recording aircraft instrument of the character described including a driven chart and print means for effecting substantially continuous impressions on the chart indicative of certain variants affecting flight conditions during a specific period of flight, and further including a motor and a regulator system for the motor for driving the chart at a constant speed so as to move definite lengths of the chart beneath the print means, the regulator system comprising a main driven shaft carrying a brake drum, spring pressed friction means engaging the drum for controlling the speed of the shaft, a pivoted braking lever actuable to vary the pressure of the friction means with the drum, gearing operatively engaging the shaft with the motor, a second driven shaft, a spur gear carried by the second shaft, other gearing operatively engaging the second shaft with the motor for rotation of the second shaft at a speed relatively slower than that of the main

shaft, constant speed control escapement mechanism, an escapement drive gear geared to drive the escapement mechanism and threadedly carried upon the second shaft, a torsion spring about the second shaft and operatively engaging the escapement drive gear with the spur gear, and a hub unitary with the escapement drive gear and having an annular channel in which is tangently received a free end of the braking lever, whereby excessive rotation of the second shaft beyond that of the constant speed of the escapement mechanism is reflected by a winding of the torsion spring and consequent traveling of the escapement drive gear and its hub to vary the braking pressure of the spring pressed means upon the brake drum.

---

2,775,443

## CANTILEVER SPRING

Willard L. Zisko, Rochester, N. Y., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

Application January 28, 1955, Serial No. 484,859

1 Claim. (Cl. 267—1)

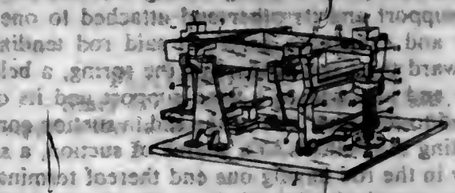
A device of the character described comprising a base provided with a cavity, a flat spring fixed at one end thereof to said base adjacent said cavity and deflectable at the other end thereof into and out of said cavity, and a resilient material filling said cavity beneath said spring for yieldably resisting deflection of said other end of said spring into said cavity, and a cover for said base and provided with an aperture, pin means attached on said other end of said spring and protruding upwardly through said aperture thereby permitting deflection of said end through said pin means from without said base.

---

2,775,444

## DAMPENING DEVICES

Harlan A. Hadley, Burlington, Vt., assignor to Metrogram Corporation of America, a corporation of Vermont



Application December 11, 1951, Serial No. 261,060

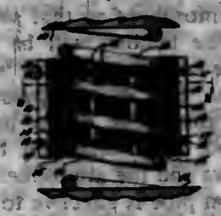
14 Claims. (Cl. 267—1)

1. In a weighing mechanism having a lever element and a base element, a dash pot for dampening the oscillations of said lever element, said dash pot comprising a cylindrical member and cooperating therewith a plunger member including a disc spaced from the inner wall of said cylindrical member, said members being mechanically disconnected from each other, one of said members being

rigidly attached to one of said elements, and a spring directly attached at one end to the other of said members for resiliently holding said other member in neutral equi-

librium so as to permit lateral movement of said other member, the other end of said spring being fixed to the other of said elements.

---



2,775,445

## DAMPENING MEANS FOR LOAD SUPPORTING SPRINGS

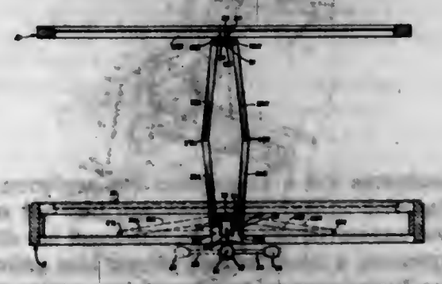
Alfred M. Goodloe, Westfield, N. J., assignor to Metal Textile Corporation, Roselle, N. J., a corporation of Delaware

Application August 12, 1955, Serial No. 527,998

5 Claims. (Cl. 267—9)

1. In combination, a load supporting spring and dampening means therefor, said dampening means comprising a plurality of dampener elements disposed in circumferentially spaced relation externally around the spring body substantially parallel to the axis of the latter, each dampener element comprising a rigid back plate, a resiliently compressible pad provided by a compressed and compacted molded body of metallic wire fabric mounted on the inner face of said back plate to bridge across the helices of the spring body, and means to thrust said dampener elements radially inward, whereby to frictionally engage the pads thereof with the helices of the spring body.

---



2,775,446

## CLOSURE OPERATOR

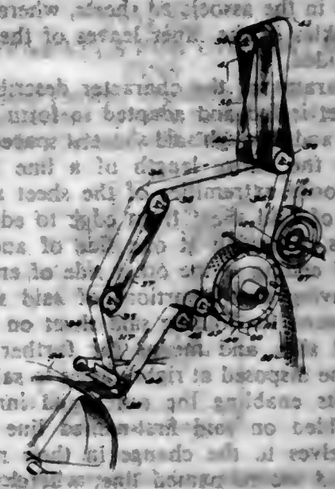
Harold L. Stevenson, Mankato, and Dan M. Park, Shakopee, Minn., assignors to Truth Tool Company, Mankato, Minn., a corporation of Minnesota

Application July 7, 1955, Serial No. 520,555

19 Claims. (Cl. 268—104)

1. A closure operator comprising a frame, an arm mounted on an arm pivot on the frame and extending therefrom for swinging movement relative to said frame, a manual member pivotally mounted on the frame for oscillatory rotation through less than one complete turn about an axis generally parallel to but spaced from the arm pivot and link means eccentrically connected pivotally to said manual member and pivotally connected to said arm for swinging the arm as said manual member is rotated, and connection means having freedom of motion about an axis parallel to the arm pivot and in a plane normal to said axis by which said arm may be attached to said closure.

---



2,775,447

## CAPSULE FORMING GELATIN STRIP HANDLING

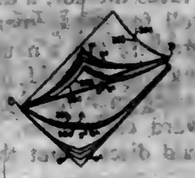
Frank E. Stirn, Pearl River, and Arthur S. Taylor, Spring Valley, N. Y., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

Application April 27, 1953, Serial No. 351,167

1 Claim. (Cl. 270—52)

An apparatus for turning over and laterally shifting a gelatin strip comprising, two rollers mounted on a horizontal axis, a first roller of said two rollers facing a means for supply, a second pair of rollers mounted above said two rollers, on an axis at right angles to the direction of the axis for the first two rollers, an endless belt of approximately the same width as the working surface of each of said rollers laced over said rollers, one side of the belt contacting in turn one roller from each set of two alternately, drive means for at least one of said rollers, which thereby through the belt, drives all rollers, means for supplying a freshly cast gelatin strip, with the casting surface contacting side of the strip uppermost, and directing said strip into contact with said belt for approximately half of the total travel of said belt, whereby said strip is turned over and laterally shifted.

---



2,775,448

## MACHINE FOR AND METHOD OF FOLDING SHEETS

Leonard Baker, Hillsdale, N. J., and Walter Holmes and Lee C. Williams, Pearl River, N. Y., assignors, by mesne assignments, to Mirable Printing Press & Manufacturing Company, Chicago, Ill., a corporation of Delaware

Application January 24, 1951, Serial No. 207,541

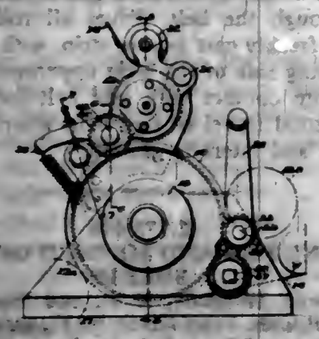
21 Claims. (Cl. 270—85)

1. The method of producing multi-page signatures, which consists in feeding a first unfolded sheet, forming a plurality of short slits in and through said sheet at spaced intervals along substantially the entire length of a transverse line intermediate opposite extremities of the sheet, said slits extending from a point at one side of and adjacent to said line across said line and terminating at a point at the opposite side of and adjacent to said line and being separated from each other by uncut portions of said sheet, feeding a second unfolded sheet and

associating it with said first sheet in register, imparting a first fold to the associated sheets on said transverse line so that the slitted first sheet will be disposed outwardly of said second sheet, and thereafter imparting additional folds successively to the once-folded associated sheets, at least one of said additional folds being at right angles to said first fold, said slits being adapted to weaken said first sheet at said transverse line sufficiently to allow the outer and inner leaves of said first sheet folded on said transverse line to shift relatively and adapt themselves to the change in their relation when said right angle fold is made in the associated sheets, whereby the formation of wrinkles in the inner leaves of the resulting signature is avoided.

8. In apparatus of the character described, means to which a sheet is fed and adapted to form a plurality of short slits in and through said sheet at spaced points along substantially the entire length of a line located intermediate opposite extremities of the sheet and extending transversely of said sheet from edge to edge of the latter, said slits beginning at one side of and adjacent to said line and ending at the other side of and adjacent to said line leaving unslit portions of said sheet between the same, means for folding said sheet on said line and through said slits, and means for further folding said sheet on a line disposed at right angles to said first-named line, said slits enabling the outer and inner leaves of the sheet folded on said first-named line to relatively adapt themselves to the change in their relation when folded on said second-named line, whereby wrinkles in the inner leaves of the resulting signature are avoided.

---



2,775,449

## PAPER FEEDING MECHANISM

Lamio M. Stumpel, Metuchen, N. J., assignor to John Waldron Corporation, New Brunswick, N. J., a corporation of New Jersey

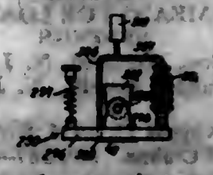
Application December 16, 1952, Serial No. 326,277

8 Claims. (Cl. 271—2.3)

1. Paper feeding apparatus of the type described including in combination, a large diameter feed roll, bearing blocks for said roll having concentric roll bearings and studs at the inner faces thereof, a disc journalled on each stud, a pressure roll for engagement with the feed roll, bearings for said pressure roll, a hanger fulcrumed to each disc and supporting one of said pressure roll bearings, resilient means biasing each hanger about its fulcrum to urge the rolls toward each other, and means to simultaneously adjust said discs about their stud bearings.

---

2,775,450



## ALIGNING MEANS TO BE USED IN THE PRODUCTION OF MAGNETIC SOUND RECORDING TAPE

William C. Speed, Riverside, and James J. Dwyer, Stamford, Conn., assignors to Audio Devices, Inc., New York, N. Y., a corporation

Application June 20, 1952, Serial No. 294,634

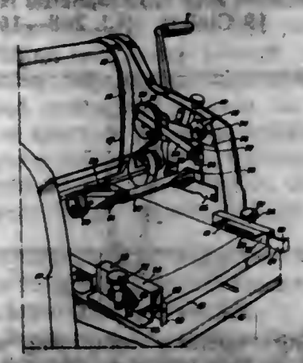
9 Claims. (Cl. 271—2.6)

1. In apparatus for producing magnetic sound-recording tape and the like, the improvement which comprises a guide rod for the tape disposed across its path of travel during a processing operation, means pivotally supporting the rod adjacent its mid-portion and intermediate the side edges of said path, a spring having one end attached to a fixed support and its other end attached to one end of the rod and exerting a force on said rod tending to move it toward the fixed support of the spring, a bellows having one end attached to a fixed support and its other end attached to the other end of the rod, a suction conduit for connecting the bellows to a source of suction, a small passageway in the rod having one end thereof terminating adjacent the marginal edge of the path of travel of the tape over the rod, a suction conduit connected to the other end of said passageway and to the suction conduit connected to the bellows, the suction conduit connected to said other end of the passageway and the passageway normally providing a path from the suction pipe to the

bellows to the atmosphere so that suction applied to the suction pipe to the bellows will be ineffective to cause contraction of the bellows, whereby when the tape creeps laterally over the end of the passageway terminating adjacent the marginal edge of the path of travel of the tape over the rod, communication between the suction pipe to the bellows and the atmosphere is cut off and suction in that suction pipe is effective to cause a contraction of the bellows with resultant swinging of the rod about its pivotal support, the end of the passageway which terminates adjacent the marginal edge of the path of travel of the tape over the rod being at that side of said path which, when covered by lateral creeping of the tape from its path of travel, will cause the bellows to move the rod about its pivotal support in a direction to cause the tape to move back to its path of travel and to again expose the passageway to atmosphere.

---

2,775,451



## SHEET FEEDING MECHANISMS

Leonard Walter Styles, Tottenham, England, assignor to Gestetner Limited, Tottenham, London, England, a British company

Application October 13, 1953, Serial No. 385,863

Claims priority, application Great Britain December 12, 1952

3 Claims. (Cl. 271—61)

1. An edge support for a paper stack comprising a frame, a flat substantially vertical pad to engage the edges of the stack, a rigid carrier to carry the pad on the frame for movement in a direction normal to the face of the pad and towards and away from the edge of the stack, a cam-and-follower device for the top and for the bottom of the carrier and common means for simultaneously actuating said devices so that they apply equal pressure to the top and bottom of the carrier whereby the pressure of the pad on the edge of the stack is substantially uniform throughout the height of the pad.

---

2,775,452

## PLAYGROUND DEVICE

Mary J. Libes, San Francisco, Calif.

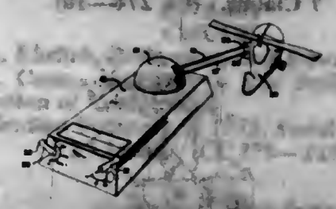
Application January 5, 1953, Serial No. 329,499

2 Claims. (Cl. 272—1)

1. A playground device of the character described comprising: a horizontally disposed air inflatable annular tube of flexible, relatively soft rubber-like material having smooth upper and lateral surfaces free from obstruction to sliding therearound of a child seated astride said tube at a side thereof relative to its central axis, said tube being about fifteen to about twenty-four inches in diameter at any such side when said tube is inflated whereby a child so seated at a side thereof may reach the ground at opposite sides of such tube with its feet for bouncing its way around said tube by springing its legs when its feet are on the ground, and said tube having an inside diameter from one side to the other of from about eighteen inches to about twenty-eight inches so that children around said tube and seated astride the latter may easily reach with substantially equal facility a support adapted to be positioned on the central axis of said tube at about the head level of such seated child during its bouncing around said tube, an annular horizontal mat of sheet material coaxial with said tube and secured to its underside, said mat extending beyond the radially inner and outer sides of said tube a sufficient distance to provide a pathway for the both feet of said child during its bouncing around said tube.

---

2,775,453



## TOY AEROPLANE ROUNDABOUT

Hans Biller, Nuremberg, Germany

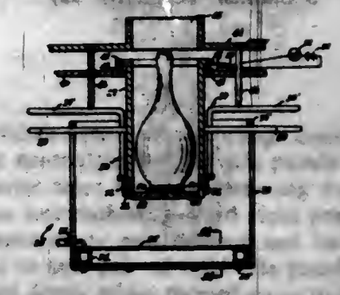
Application August 28, 1953, Serial No. 377,126

Claims priority, application Germany February 25, 1953

7 Claims. (Cl. 272—31)

1. An aeroplane toy comprising a toy aeroplane, carrier means for said top aeroplane, means drivingly connected with the inner end of said carrier means for selectively rotating said carrier means about a stationary axis to thereby rotate said aeroplane by rotation of said carrier means, said carrier means extending radially from said axis and being oscillatable in a vertical plane passing through said axis, means for pivotally securing said toy aeroplane to the outer end of said carrier means about a pivot axis extending at right angle to said vertical plane and parallel to the vertical central longitudinal plane of said aeroplane and with the longitudinal axis of said toy aeroplane substantially perpendicular to said plane, and means connected to said carrier means for selectively varying the angle of said carrier means relative to said axis and therewith the height of said toy aeroplane, whereby said toy aeroplane may rise and descend independently of the rotation thereof about said axis to simulate the take-off and landing of a helicopter type aeroplane, said connection between said carrier means and said last-mentioned means being such as to enable adjustment of said angle with respect to said axis while said carrier means rotates as well as while said carrier means is stationary.

---



2,775,454

## LIFTING APPARATUS FOR UPRIGHT BOWLING PINS

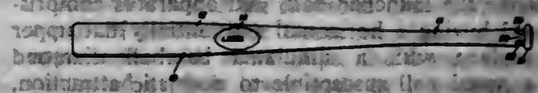
Sam Larkin, Brooklyn, N. Y.

Application May 3, 1954, Serial No. 427,217

14 Claims. (Cl. 273—42)

1. In bowling pin manipulating apparatus, a frame positioned above a bowling alley floor, means for moving said frame to and from said floor, a member depending from said frame over an initial pin position when the frame is lowered, a plurality of horizontal arms extending radially from said member, a vertically positioned tubular member having a plurality of openings through the wall thereof, positioned about said depending member; said arms being positioned through said openings respectively, whereby said tubular member is supported on said arms and is laterally movable thereon a predetermined distance in every direction and a bowling pin-gripping means carried by said tubular member below said depending member; the bottom portion of each of said openings through the tubular member being a V-notch respectively; the vertex of each such notch being vertically under the arm which is through the opening of which the notch is a part, when said tubular member is in a predetermined position on said arms and is concentric with the axis from which said arms extend radially; the extent of movement of the frame being such that when lowered towards the floor, the said tubular member will rest on said floor and each arm will rest in the vertex of the notch of the opening the arm is through; each of said openings having opposite side edges and the associated notch being from and between said side edges.

---



2,775,455

## AMBIDEXTROUS BAT

Ralph J. Liberti, New York, N. Y.

Application March 14, 1955, Serial No. 494,048

1 Claim. (Cl. 273—72)

An ambidextrous bat comprising an elongated handle of cylindrical cross-section, said handle tapering smoothly outwardly at one end thereof into a bat, the other end of said handle having a knob, a pair of opposed circumferential grooves in said handle adjacent said knob, each of said grooves extending less than one-half of the circumference of the handle, said bat being constructed of wood and having a label disposed thereon in generally right angular relation to the flat of the grain of the

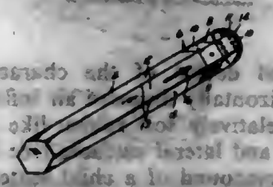
wood, said label thus enabling the batter to orientate the bat about the longitudinal axis for positioning the flat of the grain of the wood in facing relation to the point of contact with a ball, one end of each groove providing an abutment for the end of a little finger disposed therein, each of said grooves having one end thereof disposed in an angular relation to the label about the longitudinal axis of the bat for positioning the grain of the wood in proper position for contact with a ball when the bat is gripped for batting right or left handed.

---

2,775,456
**BOWLING PIN**
Kenneth K. Schroeder, Sr., Zion Ill., and Kenneth K. Schroeder, Jr., Kenosha, Wis.
Application December 29, 1954, Serial No. 478,412
3 Claims. (Cl. 273—82)

1. A weight controlled bowling pin comprising a wooden bulk including body, neck and head portions; an axial passage extending upwardly from the pin base and ending past the widest part of said body portion; a second axial passage extending from the top of said head portion downwardly, ending in the region of the neck portion to provide both predetermined weight and predetermined balance to said pin; a closure at the outer end of each passage providing a surface continuous with the surface of said pin; said closure being tapered and converging toward the center of said pin; a tapered strengthening insert set in said first passage at an elevation substantially that of bowling ball impact with said body portion; and a shock absorbing plastic binder surrounding the sides of said closures and said insert and binding each to the wall of the respective passage wherein it is set.

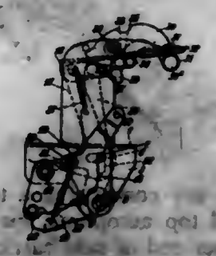
---



2,775,457
**SIMULATED BASEBALL GAME**
Ferdinand F. Galboe, Cleveland, Ohio
Application August 3, 1951, Serial No. 240,882
3 Claims. (Cl. 273—89)

1. Apparatus for playing a game of the type in which one contestant launches a ball to travel a course from a pitcher's box to a home plate across a flat horizontal playing surface and another contestant attempts to intercept or strike the launched ball, said apparatus comprising a board having a horizontal substantially flat upper playing surface with a simulated baseball diamond thereon, a metal ball susceptible to magnetic attraction, means carried by the board for launching the ball to travel across the playing surface of the board, a pair of magnets for deflecting the projected ball, first control and support means carried by the board and supporting one magnet of the pair beneath the board, second control and support means carried by the board and supporting the other magnet of the pair beneath the board, said first and second control and support means each being a manually adjustable lever pivotally mounted to swing about a vertical axis and adapted individually to move the respective magnets independently of one another over predetermined paths transverse to the course of the ball, wherein each magnet is carried on a respective lever to swing in an arcuate path, said levers having a common pivot point, the distances from the magnets to the pivot points being unequal so that the magnets may be alined on said course from said pitcher's box to said home plate.

---

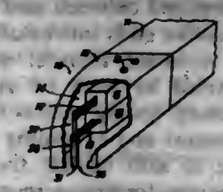


2,775,458
**MAGNETICALLY INDEXED ROTATING CHANCE DEVICE**
Horace H. Raymond, Berlin, Conn., assignor to Veeder-Root Incorporated, Hartford, Conn., a corporation of Connecticut
Application October 15, 1953, Serial No. 386,248
4 Claims. (Cl. 273—143)

1. An amusement device comprising a support having a shaft and a reference point, first and second discs rotatably mounted on the shaft in end-to-end relation and each having on its periphery equally spaced apart characters, each of said discs having a plurality of magnets corresponding in number to the characters and spaced at equal angles about said shaft, a like number of fixed magnets similarly positioned on said support, said magnets on said first disc being positioned in radial alignment with said characters and having poles adjacent said fixed magnets identical in polarity with the adjacent fixed magnet poles, said magnets on said second disc being positioned on radii midway between said characters and having poles adjacent said first disc identical in polarity with the adjacent poles of magnets in said first disc, whereby said discs are magnetically moved into a registration with the reference point when said discs come to rest after being rotated on said shaft.

---

2,775,459
**PHONOGRAPHS HAVING RECORD CHANGING MECHANISM**
Henry James Fortune, Swindon, England, assignor to The Garrard Engineering and Manufacturing Company Limited, Swindon, England
Application December 13, 1950, Serial No. 200,517
7 Claims. (Cl. 274—10)



1. Mechanism for supporting the marginal edges of, and for selectively discharging, 12", 10" or 7" records mounted on a central offset spindle of a phonograph record player, comprising, in combination, an upwardly extending platform support; a first platform rockably mounted on the upper end of said support and having a record supporting lip; said support being oscillatable about a horizontal axis spaced from its upper end for movement of said first platform between positions supporting the marginal edges, respectively, of 10" and 12" records; linkage connected to said first platform and to said support and effective to rock said first platform, upon oscillation of said support, to position the record supporting lip thereof in the correct vertical position for support of a record; a record feeding member, including a lever oscillatable about a horizontal axis in said support and carrying a feeding member having a tooth projecting through a slot in said first platform adjacent said supporting lip to contact the marginal edge of a record supported thereon in any position of said support for displacing the record relative to said first platform; a second platform swingably mounted on said first platform for movement about a horizontal axis, between a retracted position and a second position extending in aligned relation from said first platform toward the spindle to support the marginal edges of 7" records; a feeding element longitudinally reciprocably mounted on said second platform for contact with the marginal edge of a 7" record supported thereon in said second position; said feeding element being formed with an aperture aligned with said slot and closely embracing said tooth only in the second position of said second platform for operation of said feeding element by said feeding member to displace a 7" record relatively to said second platform.

2,775,460
**BINAURAL RECORDING SYSTEM**
Ian M. Stivach, Brooklyn, N. Y.
Application May 15, 1951, Serial No. 226,493
4 Claims. (Cl. 274—38)

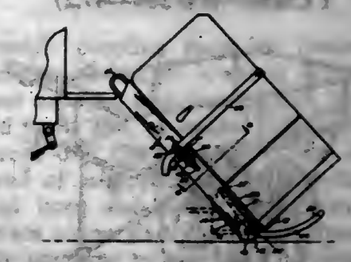
3. In a binaural system, means for reproducing recorded vibrations comprising a stylus including a pair of coaxial members, one of said members comprising a cylindrical shank portion terminating in an annular tip portion and being arranged to vibrate in a horizontal plane, the other of said members comprising an elongated shank portion disposed within the cylindrical portion of said one member and terminating in a tip portion projecting beyond the annular tip portion of said one member, said other member being arranged to vibrate in a vertical plane, and transducer means operatively connected to each of said members.

---

2,775,461
**CHUCK**
Walter A. Ehrlich, Bridgeport, and Edward A. Zukowski, Devon, Conn., assignors to The Ballard Company, a corporation of Connecticut
Application February 9, 1953, Serial No. 335,736
2 Claims. (Cl. 279—119)

1. In a two jaw chuck, a base; ways within said base lying along a diameter thereof; jaws in said ways; a work-supporting pilot rigidly mounted centrally of said base; a pivot pin mounted within said base in a plane including the axis of rotation of said base and at right angles thereto; a spoon having a groove pivoted on said pin such that the axis of the pin is diametrical to the groove and within the plane including said groove; and bell-crank levers each having a short and a long arm pivotally mounted within said base with the short arm of each engaging one of said jaws, and the long arm of each engaging said spool within the groove thereof, the length of the long arms being relatively large compared to the diameter of the spool, whereby a relatively high mechanical advantage of said bell cranks can be obtained.

---



2,775,462
**SIMULATED AUTOMOBILE BODY TOY**
La Verne R. Bissell, Detroit, Mich.
Application July 15, 1954, Serial No. 443,571
7 Claims. (Cl. 280—1.1)

1. A child's automobile mockage comprising: a pair of of spaced apart rigid vertical side panels having markings on the outer sides thereof simulating the outlines of the side of an automobile; a third rigid panels being folded at an intermediate part thereof and having one portion connected to said pair of rigid side panels along the front part of the upper edges thereof so as to form a simulated hood of an automobile, and having the other portion connected to the front ends of said pair of rigid side panels to form a simulated automobile grill; said third rigid panel having markings thereof to simulate the hood and grill of an automobile; the lower end portion of the simulated grill being foldable outwardly and up into engagement with said grill portion so as to form a bumper for said mockage; the lower ends of said pair of rigid side panels being foldable inwardly and up into engagement with the inner sides of said pair of side panels to form longitudinally extending stiffeners; and said pair of side panels extending rearwardly of the rearward end of the simulated hood portion to define a simulated passenger compartment in which a child may sit as though in the seat of an automobile.

---

2,775,463
**APPLIANCE HAND TRUCK HAVING ENDLESS TREAD STAIR CLIMBING DEVICE**
Joseph C. Chanetta, Hollywood, Fla.
Application December 13, 1954, Serial No. 474,783
1 Claim. (Cl. 280—5.22)

A hand truck of the character described that comprises a pair of parallel side frame members provided at their upper ends with hand grips, the frame members being connected at their lower ends by a projecting appliance support, ground wheels rotatably supported adjacent the lower ends of the frame members, endless tread trackways housed within the side frame members adjacent their lower ends and with the lower flight of each of said endless tread trackways projecting rearwardly therefrom, each of the endless treads being supported against upward flexing of the projecting portion by a plurality of rollers, the said side frame members being formed tubular and rectangular in cross-section, the rear edges of

each frame member adjacent their lower ends being slotted whereby the flight of the endless trackways projects outwardly and in parallelism with the frame members, the said tread supporting rollers being closely arranged and freely rotatable upon fixed shouldered stub-shafts that are connected to the opposite side walls of the frame members, and whereby to prevent flexing of the frame members against the rollers, the opposite ends of the trackways are supported and guided by rollers that are arranged in a guiding arc and whereby the endless tread is supported against flexing upon its bearing surface and at its opposite ends, the said end rollers being rotatable upon fixed shouldered stub-shafts that are rigidly connected to the side of the frame members, the upper flight of the treads being unsupported and wholly housed within the frame members.

---

2,775,464

**FOLDABLE CART FOR MAILBAGS**

Norman Bruce Williamson, Portland, Oreg., assignor to Jarman-Williamson Company, a partnership

Application May 10, 1954, Serial No. 428,670

5 Claims. (Cl. 280—36)

1. A cart for mail bags and the like comprising a longitudinal frame having retractible wheels adapted to fold together on opposite sides of said frame, a cross bar load carrying bracket pivotally mounted on said frame for swinging movement to a folded position parallel with said frame between said wheels when the wheels are retracted, and a stop member mounted on said frame at a distance from the pivotal mounting of said bracket to engage and support said bracket in load carrying position transversely of said frame when the wheels are extended.

---

2,775,465

**PORTABLE CART**

William F. Swingler, Chicago, Ill., assignor to Automatic Canteen Company of America, Chicago, Ill., a corporation of Delaware

Application April 10, 1953, Serial No. 347,989

1 Claim. (Cl. 280—47.2)

A portable two-wheeled hand cart comprising an article supporting structure including a tray portion, a handle portion on said structure, a pair of large wheels disposed towards one end of said cart, a pair of small auxiliary wheels at the other end of said cart and adjacent said tray portion, a supporting leg pivotally mounted adjacent said last-named end centrally thereof and independently of said auxiliary wheels, said leg being mounted for supporting said tray portion in a horizontal position upon said large wheels and for collapsing beneath said tray portion, said auxiliary wheels being adapted with said leg for positioning the auxiliary wheels on a raised loading platform with said leg in its supporting position, said structure being supportable by both of said pairs of wheels in an angular position upon collapsing said leg, a link pivotally secured to said leg for extending beneath said tray portion, and means mounted beneath said tray portion for adjustably securing said link in its positions corresponding respectively to the supporting and collapsed positions of said leg.

---

2,775,466

**TANDEM AXLE BOGIE FOR AUTOMOTIVE VEHICLES**

Edward A. Meewes, Greenfield, Wis., assignor to Chain Belt Company, Milwaukee, Wis., a corporation of Wisconsin

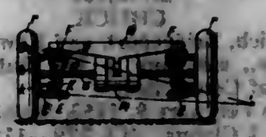
Application August 13, 1953, Serial No. 374,016

13 Claims. (Cl. 280—104.5)

1. In a tandem axle bogie for disposition beneath and attachment to the longitudinal frame members of a motor vehicle, the combination of a pair of longitudinally spaced transverse parallel axles; a pair of transversely spaced longitudinal beams disposed between said axles, each such beam having its respective ends universally pivotally connected to the axle adjacent thereto; spring-supporting means pendently carried by each of said beams intermediate the ends thereof; spring means mounted on said pendent supporting means and extending upwardly thereof; means attachable to said vehicle frame members in depending relation thereto for engagement with the upper portions of said spring means; and connections between said axles and said pendent spring-supporting means for maintaining verticality of the vertical axes of the axles and spring-supporting means.

---

2,775,467



**WHEEL SUSPENSION FOR MOTOR VEHICLES**

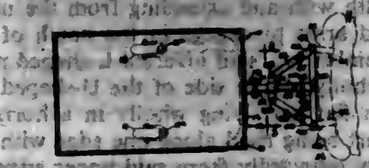
Ludwig Kraus, Stuttgart-Untertürkheim, and Josef Gazsabo, Stuttgart-Wangen, Germany, assignors to Daimler-Benz Aktiengesellschaft, Stuttgart-Untertürkheim, Germany

Application May 24, 1955, Serial No. 510,725

Claims priority, application Germany May 24, 1954

5 Claims. (Cl. 280—124)

1. A wheel suspension for vehicles comprising a vehicle body, a wheel on one side of said vehicle, a wheel carrier, an upper thrust arm, a lower thrust arm, articulated means for mounting one end of the upper thrust arm on the wheel carrier, articulated means for mounting one end of the lower thrust arm on the wheel carrier, articulated means for mounting the other end of said upper thrust arm on the vehicle body, articulated means for mounting the other end of said lower thrust arm on the vehicle body, said two last-mentioned means determining axes of oscillation of said thrust arms relative to said vehicle body which converge toward the side of the vehicle opposite to the said wheel, and the point of intersection of said axes of oscillation lying beyond the wheel of the opposite side of the vehicle with respect to the longitudinal vertical central plane of the vehicle.



2,775,468

**HITCH FOR TRAILERS HAVING INDEPENDENTLY PIVOTED WHEELS**

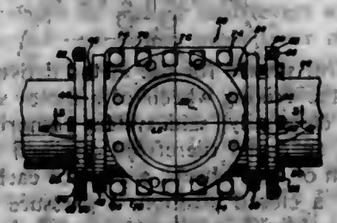
Charles H. Hoblitzell, Evansville, Ind.

Application January 25, 1954, Serial No. 405,762

4 Claims. (Cl. 280—457)

4. A hitch for coupling a trailer having a frame supported on a plurality of ground wheels independently pivoted about vertical axes to an automobile having a rear bumper, said hitch comprising, in combination, a crossbar adapted to be clamped to said bumper and having three ball fittings spaced therealong, a tongue adapted to be fastened in rigid forwardly extending relation to said frame, a first ball socket rigid on the end of said tongue for removable swivel connection to the center one of said ball fittings, a rotatably and axially slidable bushing on said tongue having diametrically opposed ears, a pair of struts pivoted at their rear ends to respective ones of said ears and diverging forwardly, second and third ball sockets rigid on the respective forward ends of said struts for removable swivel connection to the respective outer ones of said ball fittings, said ball and socket connections permitting relative rocking of the trailer and automobile about a transverse axis, rotation of said bushing permitting relative rocking of the trailer and automobile about a fore and aft axis, and said struts preventing relative jackknifing of said trailer and automobile about a vertical axis.

---



2,775,469

**SPLIT PIPE SLEEVE WITH MEANS TO PREVENT INCORRECT ASSEMBLY**

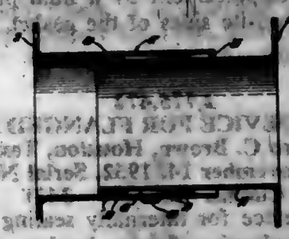
Oscar E. Brown, Chattanooga, Tenn., and Hugh L. Baker, Decatur, Ill., assignors to Mueller Co., Decatur, Ill., a corporation of Illinois

Application July 31, 1953, Serial No. 371,472

3 Claims. (Cl. 285—15)

1. In a substantially cylindrical pipe sleeve divided longitudinally into equal sections of identical edge portion configuration and adapted to embrace a pipe with their side edges in abutting engagement, one abutting edge of each section having a longitudinally extending substantially radially disposed flat sealing surface and the other abutting edge having longitudinally extending packing mounted thereon and projecting slightly therefrom for sealing engagement with the sealing surface of the one abutting edge of another section, and each section having longitudinal side flanges each adapted to be bolted to the corresponding flange on an adjacent section, the combination comprising: means defining a plurality of bolt holes in the side flanges of each section, the pattern of said holes being identical in all said flanges and each of said hole patterns being unsymmetrical with respect to the transverse center line of each section, whereby if the sleeve sections are improperly assembled about a pipe so that the packings on two adjacent sections abut each other and the sealing surfaces on two adjacent sections abut each other, bolts cannot be inserted through the bolt holes in adjacent flanges.

---



2,775,470

**EXHAUST STACK VIBRATION ISOLATOR**

George W. Bixler and Carl A. Bierlein, Cleveland, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application June 30, 1951, Serial No. 234,532

5 Claims. (Cl. 285—96)

1. In combination, a vibration isolating pipe connection including an outer pipe and an inner pipe loosely mounted therein and provided with longitudinally spaced groups of annular packing ring grooves in the outer surface and a pressure sealing groove intermediate the groups of packing ring grooves, resilient packing rings in the packing ring grooves, a fluid pressure sealing connection in the outer pipe registering with the pressure sealing groove in the inner pipe, said annular grooves being of sufficient depth to provide an annular space between the packing rings and the bottoms of the grooves to permit isolating of transverse vibrations between the pipes, and means continuously supplying fluid to said connection at a pressure in excess of the pressure within said inner pipe.

---

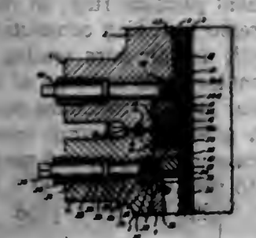
2,775,471

**TUBE COUPLING WITH SEALED CONICAL INTERFACE**

James L. Douglass, Cleveland Heights, Ohio, assignor, by mesne assignments, to The Special Screw Products Company, a corporation of Ohio

Application November 23, 1949, Serial No. 128,973

9 Claims. (Cl. 285—332)



1. A conduit coupling assembly comprising a first tubular member having an inwardly frusto-conical surface adjacent an open end thereof that flares outwardly toward said open end, a second tubular member provided adjacent one end with a portion insertable into the open end of said first tubular member and having a cylindrical bore and a concentric outwardly frusto-conical surface converging toward said one end so as to substantially conform to and have no greater angle of divergence than the inwardly frusto-conical surface of said first member when the two frusto-conical surfaces are concentrically juxtaposed, said outwardly frusto-conical surface having a circumferential groove dividing it into substantially aligned, axially spaced, frusto-conical surface portions having a common generatrix, an annular gasket seated in said groove and projecting above the top thereof, and means including a force producing connection for progressively moving said two frusto-conical surfaces concentrically toward each other to force said gasket into circumferential engagement with said inwardly frusto-conical surface intermediate its ends, the second member having its wall thickness reduced at

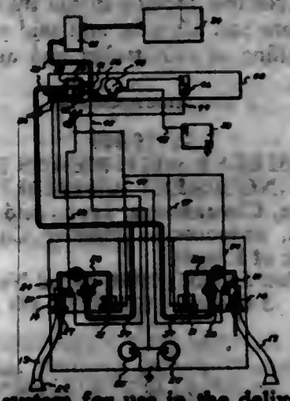
the groove where gasket-to-metal pressure is concentrated, the material of said gasket being plastically deformable but substantially incompressible, and the volume of said gasket slightly exceeding the volume of said groove so as to provide a small percentage of said volume of gasket material that cannot be forced into the groove, said percentage being limited to permit substantially circumferential metal-to-metal contact of said two frusto-conical surfaces on both sides of said groove as said force producing connection is progressively tightened and to produce substantially complete confinement of the gasket material against displacement by a fluid pressure differential between opposite sides of the gasket.

---

2,775,472
**SEALING DEVICE FOR FLANGED JOINTS**
Cicero C. Brown, Houston, Tex.
Application November 14, 1952, Serial No. 320,580
7 Claims. (Cl. 285—343)

1. A sealing device for internally sealing the joint between a pair of abutting flanges having coaxial bores, comprising, a resilient seal ring comprising a resilient seal portion interposed between a pair of metallic end rings, said seal portion being positioned in the bores of said flanges across the joint between the flanges and in direct sealing engagement with the bore walls of the flanges adjacent said joint, an annular abutment member circumferentially disposed in the bore of one of said flanges engaging one end of said seal ring to limit its axial movement, and an annular thrust member in the other flange radially compressible against the opposite end of said seal ring, said thrust member and said seal ring having complementary tapered engaging surfaces cooperable in response to radial compression by said thrust member to urge the seal ring axially toward said abutment member.

---



2,775,473
**ANGLE TUBE BRACKET AND HANGER ASSEMBLY**
Ellis B. Brewer, Nashville, Tenn.
Application August 21, 1953, Serial No. 375,593
1 Claim. (Cl. 287—54)

A quickly detachable coupling for joining a pair of angularly related, horizontal rails to a vertical post, comprising: a bracket member adapted to be affixed to a vertical post and formed of a length of strap metal material, said member including a pair of fixedly connected legs each lying wholly in a vertical plane, said legs being angularly related to each other and each leg having a horizontally extending top edge formed with an upwardly opening notch spaced from the notch of the other leg and communicating with the opposite faces of the leg in which it is formed; and a pair of like hanger members each formed from a length of strap metal, each hanger member including a U-shaped portion having a flat bight lying wholly in a horizontal plane to form a flat, horizontally disposed support for an adjacent end of a horizontal rail overlying the bight, said U-shaped portion having flat, wide arms extending upwardly in vertical planes from opposite ends of the bight for embracing the supported rail between them, each hanger member further including a portion of inverted L-shape coextensive in width with and extending from the upper edge of one of said arms to engage in the notch of an adjacent bracket member leg, said inverted L-shaped portion being disposed wholly to one side of the U-shaped portion and including a flat part lying wholly in a horizontal plane, said flat part being rigid along one edge with and extending laterally outwardly from said upper edge of said one arm, said inverted L-shaped portion further including a second flat part depending in a vertical plane from the opposite edge of said horizontal part in closely spaced, parallel relation to the plane of said one arm, said horizontal part removably engaging in and extending transversely of the associated notch, said vertically depending part and said one arm being spaced apart a distance substantially equal to the thickness of the bracket member leg in which the associated notch is formed, said depending part and said one arm lying in face to face contact with the opposite faces of said adjacent bracket member leg.

---

2,775,474
**SANDER ATTACHMENT FOR MOTOR VEHICLES**
Joseph A. Gendreau and Joseph Fuller, Fall River, Mass., and Everiste Dumaingne, Auburn, Maine
Application May 21, 1952, Serial No. 289,166
4 Claims. (Cl. 291—23)

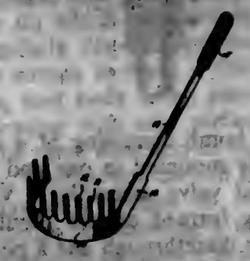
3. A control system for use in the delivery of sand to the path of the driving wheels of a motor vehicle having a source of electricity, said system comprising a source of sand and an outlet therefrom disposed in desired relation to each of said wheels, a gate for each outlet yieldably held in a closed position, a pressure operated element and a solenoid connected to each gate to open it when actuated, a circuit from said source of electricity in which each of said solenoids are in parallel and which includes a switch, a conduit including branch lines to each of said pressure operated elements and including a valve, said conduit being connected to the vehicle motor to be actuated by pressures developed by its operation, a common operator control for said switch and said valve, and a circuit for each gate, said circuit including said source of electricity, a normally open switch closed by the opening of said gate, and a signal light.

---

2,775,475
**LATCH EXTENSION UNIT**
Julius Miller, Valley Stream, N. Y., assignor to Miller-Deutscher Corporation, Lynbrook, N. Y., a corporation of New York
Application December 23, 1953, Serial No. 399,989
3 Claims. (Cl. 292—1)

2. An extension unit adapted for use between latch bolt and actuator mechanisms, said extension unit comprising, a centrally bored rod shaped link, a universally adjustable coupling member on said link consisting of a lateral opening communicating with the central bore near the latch bolt end of said link, a universally adjustable coupling member consisting of opposed grooves formed near the latch bolt actuator end of the link, said coupling members being in positive but swingable engagement with the latch bolt and actuator mechanisms.

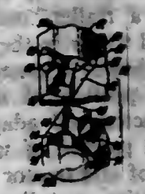
---



2,775,476
**SELF-TIGHTENING AND GRIPPING BATTERY LIFTER**
Felix E. Brown, Bethlehem, Pa.; Union Bank & Trust Company of Bethlehem, Administrator of said Felix E. Brown, deceased, assignor to East Penn Manufacturing Co., Inc.
Application August 10, 1953, Serial No. 373,198
2 Claims. (Cl. 294—29)

1. A battery lifter comprising a pair of vertically swingable levers adapted to be opposed to opposite sides of the battery and having relatively opposite operating ends, a flexible handle adapted to extend across and over the battery and pivoted to and connecting said operating ends to swing said levers vertically and oppositely with respect to each other when lifting force is applied to said handle, and a pair of U-shaped grips adapted to straddle opposite ends of the battery and to extend along the sides thereof, said grips each having one end pivoted to an intermediate portion of one of said levers and its other end pivoted to the end of the other lever remote from the operating end of said other lever whereby said grips will be pulled toward each other into tight engagement with the ends of the battery upon vertical swinging of said levers oppositely with respect to each other, the pivots of said handle and of said ends being in alignment on said levers whereby when said levers are swung toward vertical position the ends of the grips will be separated vertically to prevent the same from abutting and limiting pulling of the grips toward each other.

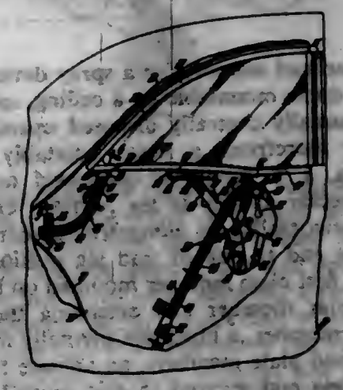
---



2,775,477
**SPAGHETTI AND NOODLE SCOOP**
Helene Inouye, Seattle, Wash.
Application March 14, 1955, Serial No. 495,153
1 Claim. (Cl. 294—49)

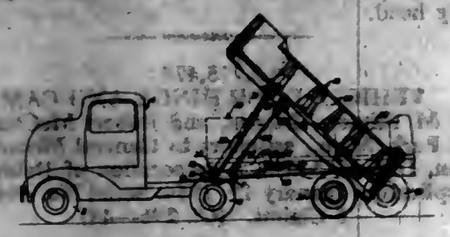
A culinary device for lifting spaghetti, noodles and like food-stuffs comprising an elongated sheet material member divided into a handle portion and a working head, said working head being in the form of an arcuate semicircular arm extending from the handle portion of the material and being formed therewith and a plurality of upstanding and spaced teeth on the upper edge of said working head.

---



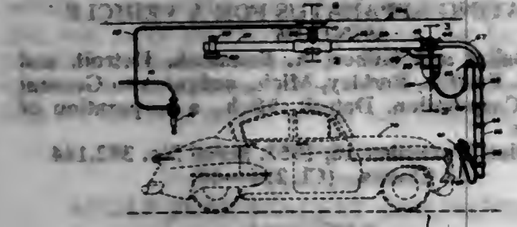
2,775,478
**VEHICLE DOOR HINGE AND CAM**
Joseph M. Stanetz, Detroit, and Robert McClure, Highland Park, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application January 19, 1954, Serial No. 404,871
5 Claims. (Cl. 296—44)

1. Apparatus of the character described, including: an automobile body having a side wall with a door opening and a roof with a downwardly sloping side edge over the door opening; a door; hinge means for mounting said door on said body in the doop opening for swinging movement between closed and open positions, the upper edge of said door being below the sloping side edge of the roof when the door is closed; and a cam in said hinge means for lowering said door as it swings from closed to open position so that the top edge of said door clears the downwardly sloping side edge of the roof.



---

2,775,479
**OPERATING APPARATUS FOR A VEHICLE WINDOW**
Julius J. Ballot and Gilbert A. Bannasch, Detroit, and David H. Bratton, Berkley, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application November 16, 1953, Serial No. 392,144
11 Claims. (Cl. 296—44)

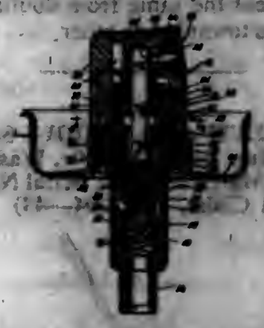


1. Operating apparatus of the character described for a vehicle window, including: a window frame which seats in a window opening in the vehicle body when the window is closed; a front guide track on the body below said opening, said track having a forward generally horizontal upper portion and a downwardly and rearwardly extending lower portion; a curved rear guide track on the body below said opening; means connecting said frame to said tracks for movement thereatong; and means for moving said frame along said tracks.

2,775,480
**DUMPING MECHANISM FOR SEMITRAILERS**
James B. Braswell and Frank L. Clement, Minden, La.
Application June 1, 1953, Serial No. 358,638
7 Claims. (Cl. 298—19)

1. In a dumping mechanism for semitrailers the combination of a tractor, a trailer, means connecting the front end portion of said trailer to the rear portion of said tractor and including power-actuated means extending between the front end portion of said trailer and the rear portion of said tractor and adapted when actuated to elevate the front end portion of said trailer vertically above said rear portion of said tractor to move said trailer to a tilted dumping position, a pulley means on the rear portion of said tractor, and flexible means comprising at least one cable connected at one end to the rear portion of said trailer, passing forwardly and under and around said pulley means and having its other end operatively connected to the front end portion of said trailer, whereby elevation of the front end of said trailer by said power-actuated means will simultaneously cause said flexible means to draw the rear portion of said trailer forwardly toward the rear portion of said tractor.

2,775,481
**PAINT SPRAY DEVICE**
Theodore Mitchell, Miami, Fla.
Application October 2, 1953, Serial No. 383,895
2 Claims. (Cl. 299—58)

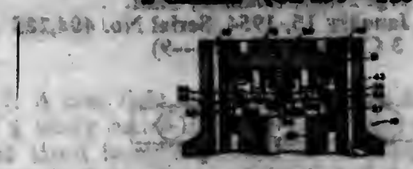


1. An overhead support for a spray device comprising an inverted dome mountable on a ceiling, said dome having a substantially centrally disposed opening extending downwardly therefrom, a sleeve rotatably mounted in said opening, a T connector connected to said sleeve, said T connector having its leg portions extending substantially horizontally, an elongated tubular member secured at one end to one of said leg portions of said T connector, a first plate member mounted on the other end of said tubular member and extending therebeyond, a second plate member, a hinge pin pivotally mounting said first and second plate members, an arcuate tubular member having one end secured to said second plate member, an air pressure hose extending through said dome, said sleeve, said tubular member and said arcuate tubular member, said air pressure hose having means mounted at the free end thereof for connecting said hose to a spray device, a container secured to said elongated tubular member, said container having an outlet, a second hose having one end connected to said outlet and the other end terminating in juxtaposiiton with said free end of said air pressure hose and connecting means mounted on said other end of said second hose adapted to connect said hose to said spray device.

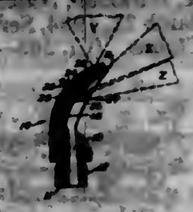
2,775,482
**MEANS FOR DISTRIBUTING LIQUIDS VERY FINELY**
Kurt Schütz, Vevey, Switzerland, assignor to Berthoud & Cie, Vevey-Corseaux, Switzerland, a corporation of Switzerland
Application November 22, 1952, Serial No. 321,974
5 Claims. (Cl. 299—86)

4. A spraying device comprising a distributor tube closed at one end, a series of closely spaced nozzles aligned in an axial direction along said tube, means to feed with compressed air the open end of said tube and means to atomize liquid into said air at a point upstream with respect to all of said nozzles, whereby the liquid atomized in said compressed air is deposited throughout the length of said tube on the inner wall thereof in a thin liquid formation which is fed into said nozzles, the latter being provided with terminal edges adapted to break up at least part of the liquid formations thus fed thereto into a succession of formations of fine droplets corresponding to a substantially uniform rate of delivery from each nozzle and the cross-sectional area of each nozzle being greatly in excess of the corresponding area of the liquid formation passing through said nozzle, whereby the stream of air is divided into jets of substantial cross-section by passing through said nozzles, each such jet successively entraining said formations of droplets, while giving the same a considerable kinetic energy, the outlet of each one of said nozzles being provided with an annular row of teeth extending radially inward and downstream, whereby the formations of liquid fed to said outlet flow along said teeth, while being split up into droplets, and whereby the droplets thus fed to the points of said teeth are embedded in said air jet and thus imparted with a considerable kinetic energy, and each one of said nozzles being provided, upstream said row of teeth, with an annular eddy chamber whereby substantially uniform distribution of the liquid formations fed into said nozzle is effected.

2,775,483
**AEROSOL BOMB FILLING AND DISPENSING VALVE**
Richard E. Treharne, Jr., Lindenhurst, and Adolph J. Wegmann, Glen Cove, N. Y., assignors to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut
Application January 20, 1955, Serial No. 483,114
3 Claims. (Cl. 299—95)

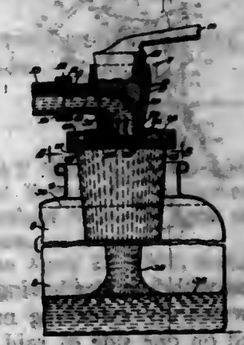


3. In an aerosol bomb consisting of a container having a valve assembly mounted in one end thereof and a cap closure for said valve assembly, a valve assembly comprising a casing formed of two tubular parts each having an axial bore therethrough and a peripheral flange with the flanges disposed and held in abutting facial fluid-tight contact and with the bores in axial alinement, one of said tubular parts extending outwardly of the container



and being formed of elastomeric deformable material, a check valve within said casing having a valve stem extending through the elastomeric tubular part, a cap member formed of elastomeric deformable material telescopically mounted on the elastomeric tubular part adapted to engage the valve stem to unseat the check valve, a discharge opening in the valve cap and cooperating parts on the valve cap and the elastomeric tubular part providing a fluidtight seal between said cap and tubular part as the cap is telescopically moved relatively to said tubular part and for limiting the telescopic movement of the cap.

2,775,484
**VISCOSITY COMPENSATING VARIABLE-AREA FUEL NOZZLE**
Homer M. Fox, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Application August 31, 1953, Serial No. 377,300
2 Claims. (Cl. 299—115)

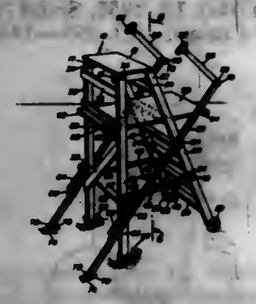


1. In a housed, variable-area fuel injection nozzle of the vortex type, including liquid fuel inlet conduit means to a nozzle housing and fuel-pressure-sensitive means to vary available area of a passageway for admitting liquid fuel from said inlet conduit means into a vortex chamber in response to liquid fuel inlet pressure, so as to control pressure drop through said passageway, thereby providing a predetermined degree of fuel atomization the improvement which comprises, in combination: temperature-sensitive means responsive to change in the temperature of said fuel; lever means operatively connected at one end thereof to said temperature-sensitive means, said lever means having fulcrum means attached to said housing and being operatively connected to said pressure-sensitive means so as to increase said pressure drop when said temperature decreases and decrease said pressure drop when said temperature increases.

2,775,485
**AUTOMOBILE WASHING MEANS**
William E. Miller, Mill Valley, Calif.
Application March 15, 1954, Serial No. 416,155
2 Claims. (Cl. 299—121)

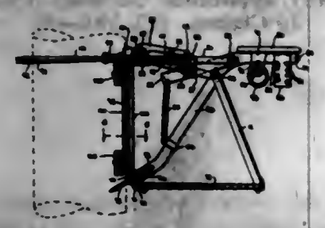
1. A nozzle comprising a body provided with means for securing the same to a source of water pressure and provided with an inlet adapted to conduct a stream of water therethrough, said body being integrally provided with a surface on which said stream is adapted to impinge and angularly disposed relative to the latter for deflecting said stream to form a first spray at an angle to said stream, said body being provided with an aperture communicating with said surface and extending in substantially the same direction as said inlet for forming a second spray, a projection carried by said body on said surface and having a surface on which said stream is adapted to impinge for forming a third spray, said surface on said projection being at a greater angle relative to said stream than said surface of said body whereby said first spray is between said second and third sprays.

2,775,486
**ANTI-FOAM FILLER MEANS**
Edward F. King, Three Oaks, Mich., assignor of thirty percent to Carley Daniel, thirty percent to Reuben W. Peterson, and ten percent to Eagle Milk Products Co., Inc., all of Galien, Mich.
Application May 13, 1955, Serial No. 508,123
5 Claims. (Cl. 299—144)



1. Anti-foaming attachment means for dispensing liquids of different viscosities, comprising a valve structure, and an anti-foaming attachment secured thereto, said anti-foaming attachment, including an enlarged casing open at its bottom portion and secured removably to said valve structure, and a plurality of perforate plates mounted loosely and in intimate contactual relationship within said casing, said casing being provided with a multiplicity of retaining lip portions at its bottom portion, said perforate plates being provided with a like number of recesses adapted to register with said retaining lip portions to facilitate inserting, changing, dismantling and removing said perforate plates.

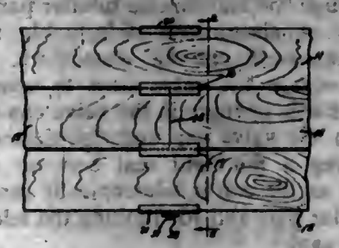
2,775,487
**DEVICE FOR BALANCING VEHICLE ROAD WHEELS**
Rudolf Hennecke, Esslingen (Neckar), Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Untertürkheim, Germany
Application April 8, 1952, Serial No. 281,197
Claims priority, application Germany April 11, 1951
10 Claims. (Cl. 301—5)



1. An arrangement for balancing a vehicle wheel having a rim and a tire mounted contiguous to a side portion of said rim, said rim being provided with at least one opening in said rim portion and said opening having radially inner and outer edge portions, a readily removable weight member having a hook-like attachment member integral with said weight member for balancing said wheel, said opening being of sufficient size to enable insertion and removal of said hook-like attachment member therethrough from the outside of said rim portion, and said hook-like attachment member having a bent end portion extending essentially outwardly of said outer edge portion between said tire and said rim portion to be clamped thereat to a large extent by the pressure of the side of the tire exerted on said rim and retained in position during rotation of the wheel by the centrifugal forces so as to prevent accidental loosening of said weight member while at the same time enabling ready exchange of said weight member.

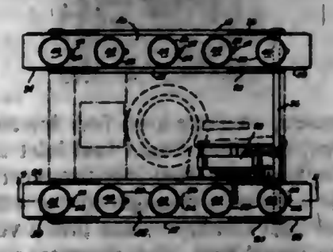
2,775,488
**WALKING LADDER CONSTRUCTION**
Claude O. Wingrove, Tucumcari, N. Mex.
Application June 8, 1955, Serial No. 513,999
10 Claims. (Cl. 304—9)

1. In combination with a ladder having a top platform, a first pair of downwardly extending mutually parallel support legs secured on one side of said top platform, a plurality of mutually horizontal steps extending between said support legs, a second pair of mutually parallel downwardly extending supporting legs secured on an opposite side of said top platform, wheels rotatably carried on the lower ends of said first pair of support legs; a pair of elongated force transmitting levers pivotally and slidably supported on said second pair of mutually parallel support legs, said force transmitting levers each including a lower portion engageable with the ground surface and an upper end portion pivotally secured to a handle portion, and a horizontal platform member supported in extending relationship between the first and second pairs of downwardly extending legs adjacent said handle portions.



2,775,489
**SCAFFOLD**
Elmore W. Hagadorn, Solvay, N. Y., assignor to Finishing Laboratories, Inc., Syracuse, N. Y., a corporation of New York
Application May 20, 1955, Serial No. 509,891
15 Claims. (Cl. 304—28)

1. A device of the character described comprising a frame, a pair of grab arms pivotally secured to said frame, mechanical means to move said arms into or out of engagement with an upright support, a plurality of spikes slidably mounted on said frame, mechanical means to move said spikes into or out of engagement with the upright support, and a plurality of spikes fixedly secured to said frame and engageable with the support at a point below said arms and slidably mounted spikes.



2,775,490
**SCAFFOLD BOARD SPLICER**
Martin E. Hofrichter and Hazel H. Hofrichter, Hot Springs, Ark.
Application July 29, 1955, Serial No. 525,161
3 Claims. (Cl. 304—38)

1. In a scaffold, a plurality of longitudinally extending boards, respective spacer bars between adjacent boards, flange elements on the spacer bars overlying the top surfaces of said adjacent boards, transversely extending telescoping elements secured to the portions of the bars beneath the boards, respective angle bars receiving the outer edges of the outermost boards, and tension means

connecting the angle bars and extending transversely beneath the boards.

2,775,491
**TRACK LAYING BELT FOR A CRAWLER TYPE VEHICLE**
Verge Ivory, Oakland, Calif.
Application January 15, 1954, Serial No. 404,285
3 Claims. (Cl. 305—9)

1. In a toy vehicle of the crawler type, frame means including a pair of laterally spaced side frames; rollers rotatably mounted on the ends of the respective frames; an endless traction belt trained about the rollers of each frame; an endless tread overlying said belt and trained therewith about said rollers, said tread including supporting-surface-engaging vacuum cups spaced about the full circumference thereof and said cups including elongatable necks connected to the traction belt, and means on each side frame for separating the belt and tread for a portion of the circumferences thereof, whereby to elongate said necks and in this manner increase said capacity of the cups.

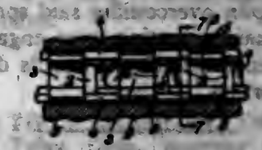
2,775,492
**CUSHIONED MOUNTINGS FOR GUIDE ROLLERS OF CRAWLER TRACKS**
Albert R. Wirtbale, Nanaile, Wash.
Application March 22, 1954, Serial No. 417,824
2 Claims. (Cl. 305—10)

1. A unitary cushioned mounting for supporting the mounting axles of a succession of rollers as employed for the backing and guiding of the round engaging run of a crawler track belt as employed on a tractor of the character described; said unitary cushioned mounting comprising a flat metal attaching plate of a length sufficient to span the succession of rollers, and adapted to be applied flatly against and bolted to the under surface of a longitudinal track frame beam beneath which the ground engaging run of the crawler track operates, a strip of cushioning rubber substantially of the length and width of said attaching plate, and applied against and vulcanized to its under surface, metal bearing plates for seating the ends of the axles of the rollers to be served, vulcanized to the under surfaces of the rubber strip, in spaced relation-

ship therealong, and an axle securing cap bolted to the outer face of each bearing plate, to coact therewith for securement of a roller mounting axle between them; said mounting being removable as a unit from the mounting beam upon release of its securing bolts and the said caps being independently removable from their plates for release of the axle held thereby.

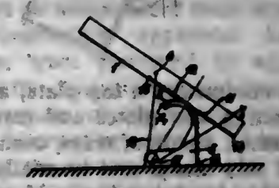
2,775,493
**PISTON WITH HEAD INSERT AND PROCESS OF MAKING IT**
Wendell C. Chaney, Lake City, Minn., assignor to Gillett & Eaton, Inc., Lake City, Minn., a corporation of Minnesota
Application November 27, 1953, Serial No. 394,696
11 Claims. (Cl. 309—9)

1. A cast, light metal piston having in the head thereof a heavy metal insert of greater breadth than depth, said insert being embedded in the head portion of the piston in light metal cast around it to form the piston, said insert having a top portion and a base portion, the said top portion having at least a top surface exposed at the top surface of the piston and so positioned as to protect the piston from deterioration due to high velocity jet impact when the piston is employed in a diesel-type internal combustion engine, said insert also having a bottom portion of greater external dimensions than the top portion and wholly embedded in the light metal of the piston so that removal of the said insert is prevented by portions of the said light metal overlying said base portion.



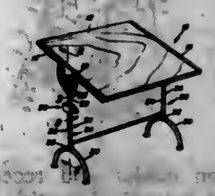
2,775,494
**PISTON CONSTRUCTION**
Richard H. Swart, Syracuse, N. Y., assignor to Carrier Corporation, Syracuse, N. Y., a corporation of Delaware
Application April 16, 1953, Serial No. 349,138
3 Claims. (Cl. 309—12)

1. In combination with a compressor having a cylinder, a piston movable in the cylinder, said piston having a thin metal wall with an uninterrupted exterior surface and pin support means disposed inside the wall, said pin support means being adapted to serve as bearings for a wrist pin that is attached to an eccentric strap, said wall having a groove in its inner side, and means disposed in the groove to force the wall outward to form a protuberance on the outer side of the wall.



2,775,495
**SPACER FOR PISTON RINGS**
Holly M. Olson, Muskegon, Mich., assignor to Sealed Power Corporation, Muskegon, Mich., a corporation of Michigan
Application November 1, 1954, Serial No. 466,057
1 Claim. (Cl. 309—44)

A parted, circular, piston ring rail spacer, support and expander comprising, a plurality of spaced U-shaped sections having upper and lower legs and vertical webs connecting said legs, said legs terminating at their free ends in upwardly and downwardly extending ledges, respectively, and resilient ties between adjacent U-sections each tie having a middle portion spaced from, between and in the same plane as the two next adjacent webs, and oppositely extending lateral end portions at right angles to

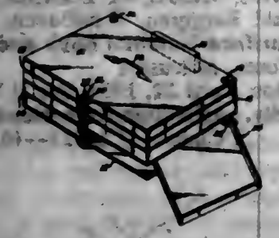


said middle portions integrally joined with said two next adjacent U-sections.

2,775,496
**TILTING X-RAY MEDICAL EXAMINATION TABLE**
Detlof Emanuel Berggren, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application April 22, 1954, Serial No. 424,997
Claims priority, application Netherlands May 13, 1953
1 Claim. (Cl. 311—6)

An X-ray medical examination table comprising a base having at least one curved surface, a table top rotatable on said curved surface, the radius of said curved surface not exceeding ½ the height measured from the bottom of said base to the bottom surface of said table top, a rotating disc, means mounting said disc on said base, and connecting means comprising at least one flexible tape fixed to points at opposite ends of said base and engaging said curved surface and said table top, and another flexible tape secured at both ends to spaced points on said table top, a part of the intermediate portion of said other flexible tape being passed around and in engagement with said disc.

2,775,497
**ADJUSTABLE DRAWING TABLE CONSTRUCTION**
Manuel M. Alvarez, Los Angeles, Calif., assignor of fifty percent to James E. Gonzales, Van Nuys, Calif.
Application October 27, 1955, Serial No. 543,173
4 Claims. (Cl. 311—39)



1. An extensible support leg construction for use in vertically adjustable drawing tables comprising a tubular support member telescopically receiving in one end portion a vertically adjustable support rod, said rod including an intermediate vertically disposed tooth rack portion, and a latch assembly carried on said one end portion of said tubular member, said latch assembly including a housing member secured on said tubular member in circumposed relationship to the rod member, a vertically pivotal actuating lever extending from one side of said housing member, a vertically pivotal dog element pivotally supported in said housing and including a latch portion intersectingly engageable with the tooth rack portion on said rod member, spring means engageable with a first lever portion of said dog element for urging the latch portion into locking engagement with said rack tooth portion, force transmitting linkage means operatively con-

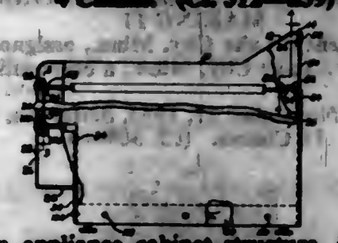
nected between said actuating lever and a second lever portion of said dog element for transmitting force to actuate the same upon overcoming said spring means, and brake means on said actuating lever engageable with the rod member when the latch portion is disengaged from the rack tooth portion.

---

2,775,498
VARIABLE TRAY BOX
Henry E. Gettel, Dallas, Tex.
Application December 3, 1953, Serial No. 395,913
4 Claims. (Cl. 312—201)

1. A tray box comprising a top plate, a bottom plate, means for connecting said plates and maintaining them in spaced relationship, a pair of trays, each pivotally connected to one of said means and normally positioned in abutting relationship to each other, said trays being normally received between said plates and being pivotal out of abutting relationship to a position in which the contents thereof are exposed, means for releasably retaining said trays in said normal position comprising a resilient distortable member connected to said plates and normally bearing against both of said trays to retain them in normal position, said member being distortable by urging one of said trays thereagainst to pivot the latter tray outwardly of said plates and said member retaining the other of said trays in said normal position during distortion thereof.

---



2,775,499
COMBINATION LADDER AND RECEPTACLE
Harold Gleitsman, New Rochelle, N. Y.
Application March 18, 1953, Serial No. 343,029
3 Claims. (Cl. 312—235)

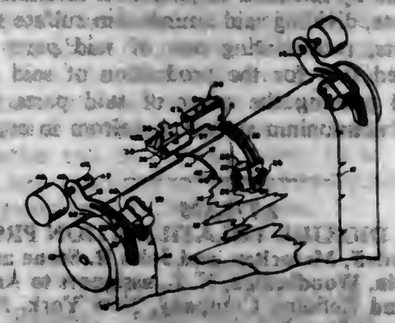
1. A combination ladder and receptacle, comprising a receptacle having a vertical partition member secured therein to define a pair of laterally adjacent different size compartments, the smaller of said compartments being open at one side thereof and the larger of said compartments being open at the top thereof, a movable cover for said top opening, and a ladder mounted for vertical and pivotal movement to and from a retracted position in which said ladder is disposed within said smaller compartment and to and from an extended position in which a length of said ladder is disposed outside said smaller compartment for support by a supporting surface and said receptacle, means mounting one end of said ladder to said receptacle for movement between said retracted and extended positions, said ladder in said extended position thereof having a top step vertically and horizontally spaced from said cover when the latter is disposed in covering relation with said top opening, whereby said cover constitutes a step for conjoint association with said ladder in said extended position thereof when said cover is disposed in covering relation with said top opening.

---

2,775,500
CABINET STRUCTURES
John F. Etherington, Syracuse, N. Y., assignor, by mesne assignments, to The Murray Corporation of America, Detroit, Mich., a corporation of Delaware
Application April 8, 1954, Serial No. 421,881
4 Claims. (Cl. 312—239)

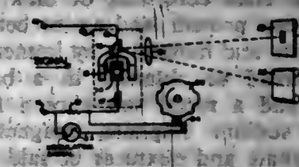
4. In an appliance cabinet structure, in combination, a base frame, upstanding mechanism rigidly mounted on said frame, a cabinet side panel assembly comprising front, side and rear panels arranged around said mechanism and frame, said side panels being secured to said frame and said mechanism, the front panel of said assembly being cut away near the bottom thereof to form a toe space, said front and side panels being flanged inwardly around their upper edges, and said rear panel projecting above said side and front panels, a deck member adapted to be seated on said flange and having an inclined rear panel adapted to embrace the upper edge of the projecting rear panel, said deck member having a side skirt, and inwardly directed flanges adapted to seat upon the flanges of said front and side panels, and means on said deck member for receiving the upper edge of said rear panel, and means associated with said side panel flanges adjacent the rear panel for gripping the deck member flange to restrain direct upward movement thereof, and fastening means associated with said front panel on the inside thereof extending from the bottom thereof and having a threaded end adapted to pass through said front panel flange and secure the front deck flange thereto.

---



2,775,501
TILTABLE FRONT DRAWER PANEL
Herman Kylie, Portland, Oreg.
Application August 11, 1952, Serial No. 303,749
3 Claims. (Cl. 312—320)

1. In a panel construction, a fulcrum, a panel mounted for tilting movement about the fulcrum and stops on opposite sides of the fulcrum to limit the movement of the panel, a pair of spaced relatively fixed members between which the panel is mounted and means pivotally attaching the panel to said members, said last means including fixed guides carried by the members and mounting plates on the ends of said panel and having slots receiving said guides.



2,775,502
MULTIPLE TRACE RECORDER PENS
George E. Sykora, Tulsa, Okla., assignor to Well Surveys, Incorporated, Tulsa, Okla., a corporation of Delaware
Application August 19, 1953, Serial No. 375,217
5 Claims. (Cl. 346—49)

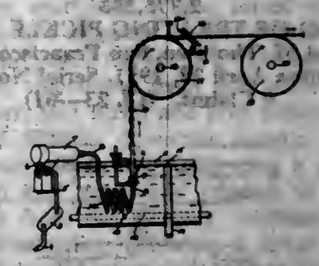
1. A multiple trace recorder having a support; roller platen means mounted on said support having a surface adapted to support succeeding portions of a strip chart; a plurality of pen carriages individually mounted on said support for motion substantially parallel to the axis of said platen in independent response to respective signals; a plurality of pen assemblies for mounting on respective pen carriages at least one of which assemblies comprises an arcuate pen track, an ink cup mounted on said track for sliding movement thereon, means to fix said cup in a desired position of adjustment on said track, and a writing tip affixed to said ink cup; and means for pivotally mounting said track upon one of said pen carriages with bias toward said platen and with said track substantially concentric to the chart supporting surface thereof to hold said writing tip in writing relation against a portion of chart on said platen.

---

2,775,503
MULTIPLE TRACE RECORDER
Glen Peterson, Tulsa, Okla., assignor to Well Surveys, Incorporated, Tulsa, Okla., a corporation of Delaware
Application July 10, 1953, Serial No. 367,302
4 Claims. (Cl. 346—109)

1. In a multiple-trace recorder wherein signals to be recorded are independently applied to a plurality of galvanometers and an independent trace is produced by each of said galvanometers, apparatus for intermittently broadening the trace produced by each galvanometer while retaining the character of said trace, said apparatus comprising a source of alternating current, means for applying said alternating current to said galvanometer while retaining the character of said trace, means for interrupting the application of said alternating current, and means for operating said interrupting means in accordance with a code whereby the trace is identified by said code.

## CHEMICAL



2,775,504
METHOD OF REMOVING HAIR AND WOOL FROM ANIMAL HIDES AND SKINS
Haskiel Zalcman, Braybrook, Victoria, Australia
No Drawing. Application April 14, 1951, Serial No. 221,115
Claims priority, application Australia October 18, 1949
6 Claims. (Cl. 8—94.16)

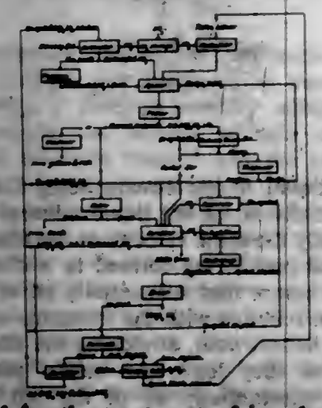
1. In the art of depilating lamb and sheep skins by applying a depilatory paint to the flesh side of the skins, the method of effecting depilation to obtain high quality wool while preserving the quality of the skin which consists in applying to the flesh side of the skin an aqueous composition which is substantially free of sources of monovalent metal cations and which comprises calcium hydrosulphide and lime, the calcium hydrosulphide being about 3 to 7% and the lime about 25 to 14%, each by weight of the composition, the proportion of calcium hydrosulphide decreasing and of lime increasing within the above ranges with the increasing thickness and fat content of the skin, the composition having a pH of not more than 12 and not less than about 11.7, and the source of hydroxyl ions being sufficient in quantity to provide an undissolved reserve thereof suspended in the composition; allowing the composition to remain on the skin until the wool is loosened, and then pulling the loosened wool from the skin.

---

2,775,505
SPINNING REGENERATED CELLULOSE FILAMENTS
John W. Pedlow, Chester, Pa., assignor to American Viscose Corporation, Philadelphia, Pa., a corporation of Delaware
Application June 5, 1952, Serial No. 291,933
5 Claims. (Cl. 18—54)

1. The method of producing artificial filaments which comprises continuously extruding viscose from a spinneret under conditions wherein the jet stretch ratio is from 0.2 to 0.9 into an acid coagulating and regenerating bath having a temperature between 80° C. and 95° C., directing the filament-forming streams in a generally upward direction and withdrawing the resulting filaments from the bath in said direction, forming the hot coagulating liquid at a point not more than 5 centimeters from the spinneret face into a stream associated with the filaments having substantially the same velocity as the filaments, continuously advancing the filaments and the liquid streams from this point through the air along an upward path a distance of between 15 centimeters and 75 centimeters and then through a helical path, the

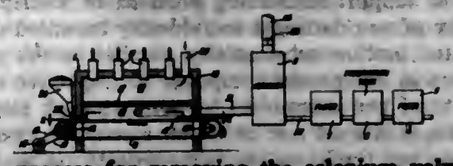
amount of liquid in the stream being limited to assure that substantially all of the liquid adheres to and travels at substantially the same velocity as the filaments, the laps of the helical path being formed to a diameter of sufficient size to assure that substantially all of the hot liquid in the stream remains with the filaments as they proceed through the helical path, stretching the filaments at least 50 percent as they leave the helical path and in the presence of substantially all of the hot liquid initially present in the stream, and then continuously removing liquid from the filaments, the filaments and the liquid stream being advanced from the bath to the point at which the stretch is applied and being stretched in a time interval not longer than about one second.



2,775,506
**PRODUCTION OF ARTIFICIAL FILAMENTS, THREADS, FIBRES, BANDS, AND THE LIKE**
Robert Louis Wormell, Coventry, England, assignor to Courtaulds Limited, London, England, a British company
No Drawing. Application April 1, 1954, Serial No. 420,439
Claims priority, application Great Britain May 3, 1950
15 Claims. (Cl. 18—54)

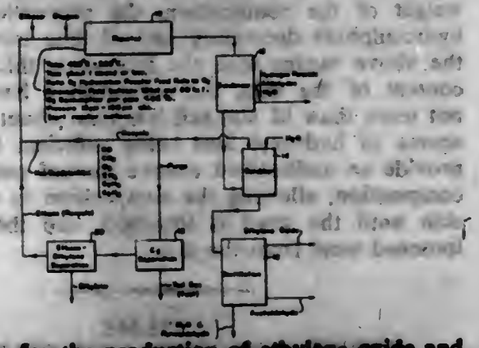
1. In a process for the production of artificial threads from proteins by extruding a solution of a protein selected from the class consisting of milk casein, peanut protein, soya bean protein, and castor bean protein into a setting medium, and hardening by immersing the freshly extruded thread so obtained in a bath containing formaldehyde and a metal salt chosen from the class consisting of sodium sulphate, magnesium sulphate, aluminium sulphate and mixtures of said salts, until the thread is resistant to the solvent action of cold water, the method of decreasing the swelling susceptibility of the thread by the steps of esterifying the thread in a bath comprising an alcohol chosen from the group consisting of methyl alcohol and ethyl alcohol together with an esterification catalyst, at a temperature between about 30° and about 50° C. for an esterification time of at least ½ hour and then subjecting the esterified thread to an insolubilising treatment consisting of applying to the esterified thread an aqueous solution containing cyanic ions and then heating the thus-treated thread at elevated temperature.

2,775,507
**MANUFACTURE OF FILAMENTARY MATERIAL FROM COPOLYMERS OF ACRYLONITRILE AND VINYLIDENE CHLORIDE**
John Downing and James Gordon Napier Drewitt, Spondon, near Derby, England, assignors to British Celanese Limited, a corporation of Great Britain
No Drawing. Application December 20, 1952, Serial No. 327,169
Claims priority, application Great Britain January 10, 1952
7 Claims. (Cl. 18—54)



1. Process for the manufacture of filamentary material, which comprises extruding an acetone solution of an acetone-soluble binary copolymer of acrylonitrile and vinylidene chloride into a coagulating bath of which at least 83% by weight consists of aliphatic hydrocarbon material.

2,775,508
**METHOD OF TREATING PICKLE LIQUORS**
Alfred M. Thomsen, San Francisco, Calif.
Application April 28, 1951, Serial No. 223,519
9 Claims. (Cl. 23—61)



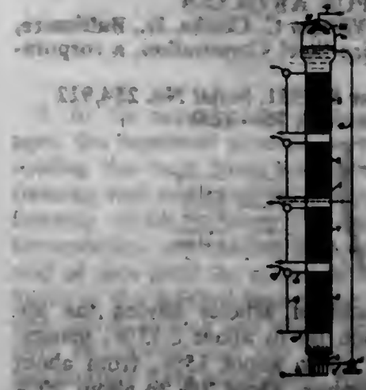
1. A method for the treatment of iron-bearing sulfate spent pickle liquor for the recovery of iron values therefrom and for the manufacture of ammonium sulfate, said method including the steps of forming a reagent solution consisting essentially of a mixture of a substantially iron-free aqueous solution of ammonium sulfate and the reaction products of ammonia and carbon dioxide, adding a slight excess of said reagent solution to pickle liquor to precipitate principally as iron carbonates the major part of the iron resident in said pickle liquor, removing the said iron precipitate by filtration to provide a solution of ammonium sulfate, dividing said ammonium sulfate solution into two parts, recirculating one of said parts to the first mentioned step for the production of said reagent solution, and treating the other of said parts for the separation of ammonium sulfate therefrom in crystalline form.

2,775,509
**SELENIUM DIOXIDE VOLATILIZATION PROCESS**
Yurii E. Lobodaff, Metuchen, and John R. Stone and Paul W. von Stein, Woodbridge, N. J., assignors to American Smelting and Refining Company, New York, N. Y., a corporation of New Jersey
Application March 3, 1953, Serial No. 340,888
7 Claims. (Cl. 23—139)

6. A process for removing the selenium values from slimes, sludges and anode muds from the electrolytic refining of copper, which comprises oxidizing said material without added acid by heating same below 1000° F. in the presence of an oxygen-containing gas under controlled heating and oxidation conditions for a sufficient length of time until an oxidized but unfused material capable of withstanding a temperature above 1000° F. without fusing is formed thereby forming a material in which substantially all of the contained selenium values are in the form of values which are thermally stable at temperatures below about 1000° F. but which are rapidly thermally decomposable at temperatures above 1000° F. to liberate selenium dioxide, and thereafter heating without fusing the thus oxidized material at a temperature above 1000° F. until substantially all the selenium values therein are volatilized therefrom.

2,775,510
**PRODUCTION OF CHEMICALS**
James H. Gardner, Cambridge, and Erwin F. Schoenbrunn, Needham, Mass., assignors to National Research Corporation, Cambridge, Mass., a corporation of Massachusetts
Application July 24, 1953, Serial No. 370,865
6 Claims. (Cl. 23—207)

1. A process for the production of ethylene oxide and hydrogen peroxide which comprises feeding a mixture of gases into a catalyst-free reaction zone having substantially inert surfaces, the mixture comprising ethane and ethylene, at least 20 percent by volume of the $C_2$ hydrocarbons in the mixture being ethylene, maintaining said reaction zone at a temperature between about 450° C. and about 550° C., feeding with said mixture a quantity of oxygen such that said mixture contains substantially less oxygen than $C_2$ hydrocarbons, maintaining said gaseous mixture at a pressure between about atmospheric and about 100 p. s. i., said gaseous mixture being passed through said heated reaction zone for a period of time on the order of one second, said time and temperature being adjusted to effect consumption of between about 30 percent and about 65 percent of the oxygen entering the reaction zone, the relative flow rates of $C_2$ hydrocarbons and oxygen into the reaction zone being controlled to give a ratio of $C_2$ hydrocarbon reactor feed rate to oxygen consumption rate of between about 10 to 1 and about 40 to 1, and separating oxygenated hydrocarbons and hydrogen peroxide from the exit gases.



2,775,511
**OXYGEN GENERATOR**
Robert Geffroy, Neuilly-sur-Seine, and Philippe le Chartier de Sedouy, Meudl-le-Roi, France, assignors to Traitement Cooperative Commerciale, Bern, Switzerland, a corporation of Switzerland
Application February 5, 1952, Serial No. 270,868
Claims priority, application France February 6, 1951
2 Claims. (Cl. 23—281)

1. Apparatus for generating oxygen from thermally decomposable oxygen-yielding candles, comprising a tubular retort, means for normally supporting said retort in inclined relation to the horizontal, cooling means in heat transfer relation to the exterior wall of said retort substantially throughout the length thereof, an outlet pipe connected to said retort adjacent the lower end thereof, means defining an inner tubular reaction chamber within said retort for receiving a candle in close fitting relation therein, said reaction chamber being open at its upper end and having imperforate side walls spaced from the walls of said retort to define therebetween a passage through which oxygen liberated in said reaction chamber may travel downwardly therethrough in heat exchanging relation to the walls of said retort and said reaction chamber to said outlet pipe, said imperforate side walls being formed of a heat conductive corrosion resistant material.

2,775,512
**APPARATUS FOR THE PRODUCTION OF HYDROCARBONS**
Heinz Leithäuser, Langenberg, and Willy Linder and Emil Sattler, Essen, Germany, assignors, by mesne assignments, to Koppers Company, Inc., Pittsburgh, Pa., a corporation of Delaware
Application March 2, 1953, Serial No. 339,625
2 Claims. (Cl. 23—288)

1. In an apparatus for the production of hydrocarbons by the reaction of carbon monoxide and hydrogen wherein a hydrogenation catalyst is maintained in a liquid column of circulating contact oil through which the synthesis gas is passed and wherein contact oil is moved from the bottom to the top of the liquid column and is returned to the bottom in an external circuit after separation of the gas therefrom, in combination a closed vertical cylindrical reaction vessel having a ratio of height to diameter greater than 10 to 1 for maintaining said liquid column, said vessel having an enlarged top section facilitating separation of contact oil and gas dissolved therein, contact oil distributing means disposed in said enlarged top section adapted uniformly to wash the walls of said enlarged section free of catalyst, a plurality of indirect cooling means internally disposed substantially equidistantly along the length of the column, synthesis gas-contact oil inlet means in the bottom of said reaction vessel comprising a gas inlet nozzle axially disposed within a concentric contact oil inlet venturi tube, said gas inlet nozzle having a tapering gas outlet terminating in said venturi and means for externally circulating contact oil from the enlarged top section of the reaction vessel to said contact oil inlet venturi tube.

2,775,513
**GASIFYING APPARATUS**
Frank J. Termaney, Lake Hiawatha, N. J.
Application January 27, 1955, Serial No. 484,352
6 Claims. (Cl. 48—107)

1. A liquid fuel oil gasifier comprising an upright cylindrical outer shell closed at its bottom, and having an annular top closure plate, an open bottom turret rising from said plate, a tubular primary combustion chamber depending out of said turret through said plate and having a lower apertured end, and a substantially closed upper end, a downwardly discharging atomizer in the upper end of said chamber, a pressure oil supply line extending into said turret and combustion chamber to said atomizer, a high voltage arc sparkplug in said turret with terminals directly beneath said atomizer to ignite atomized oil from said atomizer and gasify the same, a cylindrical post combustion chamber depending from said plate around said primary chamber, said turret and post combustion chamber forming an annular downtake passage around said primary chamber, means for discharging a downdraft of hot air through said turret and passage to evacuate by suction the gas from the primary combustion chamber into the post combustion chamber, a lower air and gas mixing chamber in said outer shell, means communicating said post combustion chamber with said air and gas mixing chamber, a gas discharge chamber surrounding said post combustion chamber and having an outlet, and means communicating said air and gas mixing chamber with said gas discharge chamber.

2,775,514
**PYROPHORIC COMPOSITION**
Eugene Weiser, Cleveland Heights, Ohio, assignor to Hardness Incorporated, Princeton, N. J., a corporation of New Jersey
No Drawing. Application March 26, 1953, Serial No. 344,983
11 Claims. (Cl. 52—2)

1. A pyrophoric composition which comprises a mixture of (1) a finely divided alloy composed essentially of

50 to 80% of at least one of the metals of the group consisting of titanium and zirconium and the balance essentially aluminum, and (2) from 2 to 50% by weight of a finely divided element of the group consisting of sulfur, selenium and tellurium.

3. A pyrophoric composition which comprises a mixture of (1) a finely divided alloy composed essentially of 50 to 80% of at least one of the metals of the group consisting of titanium and zirconium, 2 to 10% each of at least one metal of the group consisting of silicon and tin, and the balance essentially aluminum, and (2) from 2 to 50% by weight of a finely divided element of the group consisting of sulfur, selenium and tellurium.

---

**2,775,515**

**METHOD OF COLORED CLOUDS BY EXPLOSIVE DISPERSION**

Sidney J. Magram, Baltimore, Md., assignor to the United States of America as represented by the Secretary of the Army

No Drawing. Application December 10, 1953, Serial No. 397,492
4 Claims. (Cl. 52—23)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A method of producing a colored cloud by explosive dispersion which comprises detonating a missile containtaining an explosive dispersant and a finely divided inert powder of the group consisting of silica gel, titanium dioxide and aluminum oxide coated with a coloring material of the group consisting of 1-methylamino-anthraquinone, auramine and Rhodamine B, the inert powder, coloring material composition containing from 10% to 0.5% of the coloring material and from 90% to 99.5% of the inert powder.

---

**2,775,516**

**METHOD FOR PRODUCTION OF COMPOUND IRON POWDERS**

William M. Shafer, Johnstown, Pa., assignor to The National-U. S. Radiator Company, a corporation of Maryland

No Drawing. Application June 17, 1954, Serial No. 437,569
7 Claims. (Cl. 75—.5)

4. That method of making compound iron powder comprising mixing iron powder containing combined carbon with at least one finely divided oxide of a non-ferrous metal reducible by carbon, the proportions of said powder and oxide being such as to provide carbon in an amount to reduce said oxide with production of iron powder of low carbon content, heating the mixture under non-oxidizing conditions to a temperature at which said oxide is reduced by the carbon of said powder, and recovering iron particles of lowered carbon content surface coated with the metal of said oxide.

---

**2,775,517**

**PROCESSES FOR TREATING NICKEL BEARING IRON ORES**

Edgar B. Mancke, Bethlehem, Pa., assignor to Bethlehem Steel Company, a corporation of Pennsylvania

No Drawing. Application October 4, 1951, Serial No. 249,805
5 Claims. (Cl. 75—1)

3. In a process of beneficiating Mayari type iron ore containing chromium, nickel and cobalt, the steps of roasting the ore with alkali, leaching with water to remove chromium and alkali, and then leaching the ore with a solution containing ferric and ferrous salts of an acid contained in the group consisting of hydrochloric and sulphuric acids to remove nickel.

**2,775,518**

**MANGANESE RECOVERY**

Marvin J. Udy, Niagara Falls, N. Y., assignor to Strategic-Udy Metallurgical & Chemical Processes Limited, Hamilton, Ontario, Canada

Application March 10, 1953, Serial No. 341,415
7 Claims. (Cl. 75—11)

4. A two-stage process for the production of ferromanganese from manganese-bearing ores comprising oxides of manganese, iron, calcium and silicon that comprises, smelting a charge of the manganese-bearing ore and a controlled amount of carbonaceous reducing material sufficient, (1) to provide for the production of a molten slag product comprising silica and basic oxides including that proportion of the manganese oxide content of the ore necessary to establish a base-acid ratio within the molten slag equivalent to two moles of base for each mole of silica, (2) to effect reduction to the metallic state of at least a portion of the iron oxide content of the ore, and (3) to effect reduction to the metallic state of the manganese oxide content of the ore in excess of that necessary to satisfy the two to one base-acid ratio within the molten slag product, with the production of a molten ferromanganese product; separating and recovering the molten ferromanganese product and transferring the molten slag product to a covered open-arc electric furnace; adding calcium oxide and carbonaceous reducing material to the molten slag in controlled amounts sufficient, (1) to effect displacement of the manganese oxide content of the slag while maintaining the base-acid ratio of the slag at two moles of base for each mole of silica exclusive of manganese oxide, (2) to effect reduction to the metallic state of the manganese oxide content of the slag, (3) to effect reduction to the metallic state of any iron oxide present in the slag, and (4) to provide for the production of a small amount of calcium carbide within the slag; subjecting the molten slag, calcium oxide and carbonaceous reducing material to a smelting treatment within the electric furnace under action of combined arc-resistance and slag-resistance heating with the production of a molten metallic manganese-bearing product and molten residual slag low in manganese and iron and containing a small amount of calcium carbide; and separating and recovering the molten metallic manganese-bearing product from the molten residual slag.

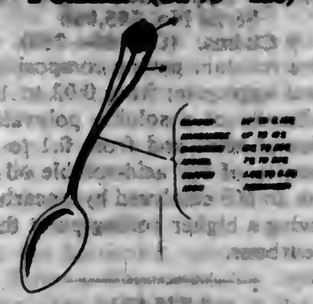
**2,775,519**

**COLD-SPUN ARTICLES**

Fredrick K. Bloom and William C. Clarke, Jr., Baltimore, Md., assignors to Armco Steel Corporation, a corporation of Ohio

Application November 5, 1951, Serial No. 254,922
2 Claims. (Cl. 75—125)

1. Cold-spun and machined articles having the approximate analysis, carbon up to about 0.15%, manganese incidental amounts up to about 15%, from about 10% to about 25% chromium, about 7% to about 20% nickel, about 1.0% to about 6.0% copper, one element of the group consisting of about 0.04% to 0.40% phosphorus and about 0.03% to 0.40% sulfur, and remainder iron.



**2,775,520**

**COLD-STAMPED ARTICLES**

Fredrick K. Bloom and William C. Clarke, Jr., Baltimore, Md., assignors to Armco Steel Corporation, a corporation of Ohio

Application November 5, 1951, Serial No. 254,923
2 Claims. (Cl. 75—125)

1. Cold-stamped and machined stainless steel articles analyzing approximately up to 0.15% carbon, up to 15% manganese, from about 10% to about 25% chromium, from about 7% to about 20% nickel, from about 1.0% to about 6.0% copper, one element of the group consisting of about 0.04% to 0.40% phosphorus and about 0.03% to 0.40% sulfur, and remainder iron.

---

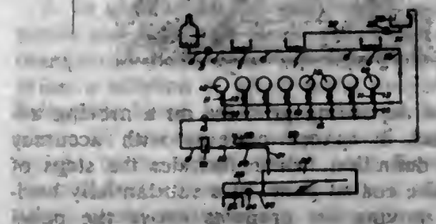
**2,775,521**

**METHOD OF FORTIFYING GRAIN PRODUCTS AND THE RESULTING PRODUCT**

Michael Mateles, Nutley, and Peter Fredrick Widmer, Hawthorne, N. J., assignors to Hoffmann-La Roche Inc., Nutley, N. J., a corporation of New Jersey

No Drawing. Application September 29, 1953, Serial No. 383,136
13 Claims. (Cl. 99—11)

1. A method for fortifying grain products which comprises applying a dry mixture comprising vitamin C and an edible higher fatty acid to the grain and coating the vitamin enriched grain with an edible, water-repellent coating.



---

**2,775,522**

**PROCESS FOR THE MANUFACTURE OF BEER AND THE LIKE**

Morton William Cowie, Auckland, New Zealand, assignor to Dominion Breweries Limited, Auckland, New Zealand, a corporation of New Zealand

Application August 6, 1952, Serial No. 302,964
Claims priority, application New Zealand September 28, 1951
6 Claims. (Cl. 99—52)

1. In the manufacture of beer and fermented beverages, the improved process for treating wort comprising cooling the wort from boiling to a temperature below freezing and not more than approximately 2° F. above freezing which is below that required for the start of fermentation and holding it at said temperature for a period of time until the materials inducing foam, body and flavor in the finished beer which have come out of solution during cooling and which are capable of redissolving have redissolved and the materials not soluble at said temperature have coagulated, removing from the wort all insoluble material at said temperature to stabilize the wort, and finally reheating the stabilized wort to the seeding temperature of fermentation and fermenting the wort.

---

**2,775,523**

**DECORATIVE HOUSE**

Madelyne Larson Green, Mount Prospect, Ill.

Application February 16, 1953, Serial No. 337,110
4 Claims. (Cl. 99—96)

1. A decorative house comprising a pair of end wall elements each having a door opening, a pair of side wall elements each having a window opening and a pair of roof elements, each of said elements comprising a member of metal foil defining a recess filled with an edible composition adhered to the inner surfaces thereof and having outwardly extending tabs that are secured to corresponding tabs of another element, the edges of each of said door and window openings and the meeting edges of said elements being covered by a frosting.

---

**2,775,524**

**METHOD OF PRODUCING CELLULATED ARTICLES**

Dominic D'Eustachio, Port Allegany, Pa., assignor to Pittsburgh Corning Corporation, Pittsburgh, Pa., a corporation

No Drawing. Application March 21, 1952, Serial No. 277,895
1 Claim. (Cl. 106—40)

A method of preparing cellular glass, which comprises absorbing on inert material selected from the group consisting of diatomaceous earth and silica and having a surface area greater than about 10 square meters per gram, a substance selected from the group consisting of polyhydric alcohols and an aqueous sugar solution, heating said inert material with said absorbed substance thereon to decompose said substance and form a black char containing carbon in an amount from 5 to 50 parts by weight to 100 parts of said inert material, grinding a mixture of glass cullet with an amount of said char to provide from 0.08 to 0.15% by weight of carbon based on the weight of said cullet, heating the ground mixture to a temperature sufficient to soften and cellulate the glass and cooling the product.

---

**2,775,525**

**COMPOSITE REFRACTORY MATERIAL**

Leslie W. Austin, San Jose, and James C. Hicks, Menlo Park, Calif., assignors to Kaiser Aluminum & Chemical Corporation, Oakland, Calif., a corporation of Delaware

No Drawing. Application December 18, 1951, Serial No. 262,336
17 Claims. (Cl. 106—59)

1. Nonfused crystalline refractory structure consisting essentially of agglomerated intergrown crystals of periclase and at least two magnesia spinels, in amounts calculated as from 10% to 75% periclase and from 25% to 90% of said magnesia spinels, and containing less than 2.0% CaO and not over 5.0% total impurities, the surfaces of said periclase and said spinel crystals at least partially abutting upon and bonding directly to surfaces of contiguous periclase and spinel crystals.

---

**2,775,526**

**REFRACTORY MATERIAL**

Leslie W. Austin, San Jose, and James C. Hicks, Menlo Park, Calif., assignors to Kaiser Aluminum & Chemical Corporation, Oakland, Calif., a corporation of Delaware

No Drawing. Application December 18, 1951, Serial No. 262,335
11 Claims. (Cl. 106—59)

2. Nonfused crystalline refractory material consisting

essentially of agglomerated, uniformly interdispersed, intergrown crystals of periclase, magnesioferrite and at least one second magnesia spinel, in amounts calculated as at least 10% of periclase crystals and at least 50% of said magnesia spinels, including from 10% to 90% of said spinels calculated as magnesioferrite and from 10% to 90% of said spinels calculated as said second magnesia spinel, said material containing not over 2.0% CaO.

---

2,775,527

**REFRACTORY MATERIAL**

Leslie W. Austin, San Jose, and James C. Hicks, Menlo Park, Calif., assignors to Kaiser Aluminum & Chemical Corporation, Oakland, Calif., a corporation of Delaware

No Drawing. Application December 18, 1951, Serial No. 262,334

14 Claims. (Cl. 106—60)

1. Non-fused crystalline refractory material consisting essentially of agglomerated intergrown crystals of periclase and magnesia spinels of iron oxide and alumina, in amounts calculated as from 10% to 90% periclase, from 5% to 85% magnesioferrite and from 5% to 85% magnesium aluminate, and containing not over 2.0% CaO.

---

2,775,528

**MANUFACTURE OF CELLULOSE**

Frank Roland Charles and Morris Wayman, Hawkesbury, Ontario, Canada, assignors to Canadian International Paper Company, Montreal, Quebec, Canada, a corporation of Canada

No Drawing. Application April 8, 1950, Serial No. 154,896

4 Claims. (Cl. 106—163)

1. A new article of manufacture consisting of a purified chemical pulp product having incorporated therein a polyoxyethylene ester derived from the group comprising abietic and hydroabietic acids.

---

2,775,529

**MANUFACTURE AND USE OF CELLULOSE ESTERS**

Harold Bates, Charles William Simmons, and James Wotherspoon Fisher, Spondon, near Derby, England, assignors to British Celanese Limited, a corporation of Great Britain

No Drawing. Application March 13, 1952, Serial No. 276,441

Claims priority, application Great Britain March 28, 1951

6 Claims. (Cl. 106—165)

1. A process for the manufacture of one- and two-dimensional shaped articles in which the starting material is a cellulose triester of an aliphatic acid containing 2–4 carbon atoms which has been made from cellulose by a process of the suspension type using a catalyst consisting of perchloric acid and retains the fibrous form of the cellulose, which comprises dissolving the fibrous cellulose triester in a mixture consisting of an aliphatic acid containing up to 4 carbon atoms in the molecule with a minor proportion of a compound of formula $C_nH_{2n+1}OH$, where $n$ is 0–4, which is substantially free from inorganic acids, to form a solution of 20 to 30% concentration of the cellulose ester, maintaining the solution at a temperature above 100° C. until the cellulose ester contains more than 0.2 free hydroxyl groups for each anhydroglucose unit of the cellulose, and spinning and coagulating the solution so obtained.

2,775,530

**BITUMEN AND AGGREGATE COMPOSITION AND A BUILDING BLOCK MOLDED THEREFROM**

Dennis W. Gegle and Charles E. Dofenbaugh, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Application August 18, 1952, Serial No. 305,068

9 Claims. (Cl. 106—280)

1. A moisture resistant paving composition comprising bitumen; mineral aggregate; from 0.02 to 15 weight percent of said bitumen of a soluble polyvalent metal salt of a strong mineral acid; and from 0.1 to 3 weight percent of said bitumen of HF acid-soluble oil obtained as a by-product from an HF catalyzed hydrocarbon conversion process and having a higher boiling point than any of the reactant hydrocarbons.

---

2,775,531

**METHOD OF COATING A METAL SURFACE**

Earle T. Montgomery, Arnold P. Welch, and Joseph L. Bitonte, Columbus, Ohio, assignors to The Ohio State University Research Foundation, Columbus, Ohio, a corporation of Ohio

No Drawing. Application May 10, 1949, Serial No. 92,986

3 Claims. (Cl. 117—22)

1. A process of plating a metal surface which comprises forming small particles of metal selected from the group consisting of aluminum, iron, nickel and cobalt, forming small particles of a metal oxide selected from the group consisting of alumina, magnesia and zirconia, mixing the metal and the metal oxide particles together, sintering said mixture, reducing the sintered mixture to particles of powder of extremely small size and flame-spraying the mixed sintered particles on the surface to be coated and thereby heating said particles of powder to a sintering temperature of at least approximately 2100° F.

---

2,775,532

**METHOD AND APPARATUS FOR MAKING PATTERNED SIDING**

Stanley H. Sallie, Mansfield, and Ernest J. Zitke, Brockton, Mass., assignors to Bird & Son, Inc., East Walpole, Mass., a corporation

Application September 24, 1952, Serial No. 311,224

10 Claims. (Cl. 117—25)

1. A method of depositing granules on a moving adhesive-coated panel in spaced patterns with accuracy and sharpness of definition, which includes the steps of moving the adhesive-coated panel in a substantially horizontal direction, moving the granules above the panel at a velocity having a horizontal component substantially equal to the velocity of said panel and in the same direction as the movement of the panel and dropping the granules onto the coated panel to cover spaced areas and thereby forming the patterns.

---

2,775,533

**METHOD OF TREATING LIQUIDS AND METHOD OF STERILIZING INSTRUMENTS THEREWITH**

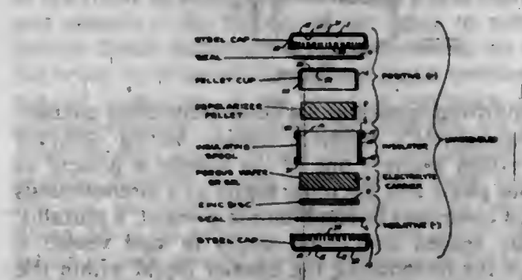
Thomas F. Healy, Lakewood, Ohio, assignor to H. S. D. Laboratories, Incorporated, a corporation of Ohio

No Drawing. Application November 29, 1951, Serial No. 259,021

6 Claims. (Cl. 117—64)

1. The method of treating surgical instruments in an aqueous solution containing hardening agents which comprises adding to the aqueous solution from approximately one-fourth ounce to two ounces per gallon of a composition which is soluble in the aqueous solution and then immersing the surgical instruments therein, said composition comprising a water soluble aliphatic amine having a higher boiling point than water and which contains at least two but not more than nine carbon atoms, a water soluble alkyl ether of a dihydric alcohol having a higher boiling point than water in which the alkyl group contains at least one but not more than four carbon atoms, and sodium nitrite, said amine and ether being present in the composition in proportions ranging from approximately 10% to 90% by volume of the ether to 10% to 90% by volume of the amine and the amine being present in the composition in an amount sufficient to combine with the hardening agent in the aqueous solution and to form a film upon the instruments being treated and the ether being present in the composition in an amount sufficient to cause dispersion of the amine in the aqueous solution and to influence in the presence of the amine the physical properties of the film that is formed on the instrument, and the sodium nitrite being present in the composition in an amount to provide approximately twenty grains to forty grains for each gallon of the liquid to be treated and sufficient to prevent the formation of rust upon the instruments, and then removing and polishing the instruments after a film has been formed thereon.

---



2,775,534

**PRIMARY DRY CELL**

William S. Herbert, Madison, Wis., assignor to Ray-O-Vac Company, Madison, Wis., a corporation of Wisconsin

Original application July 8, 1949, Serial No. 103,593, now Patent No. 2,656,945, dated September 1, 1953. Divided and this application August 31, 1953, Serial No. 377,321

9 Claims. (Cl. 136—139)

5. In an alkaline dry cell having an amalgamated zinc anode and a cathode-depolarizer containing graphite and manganese dioxide, an alkaline electrolyte which comprises a solution of alkali metal hydroxide in water, said hydroxide being initially present in an amount between about 20 percent, by weight, and about 75 percent, by weight, of the water present, and said solution containing dissolved alkali metal zincate and dissolved unreacted alkali metal hydroxide in proportions by weight which fall between the ratios of from about 3.1 parts to about 25 parts of alkali metal hydroxide for each part of alkali metal zincate.

---

2,775,535

**TREATMENT OF TINPLATE**

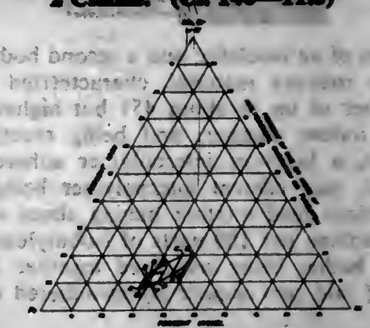
William David Poole, Baltimore, Md., assignor to Bethlehem Steel Company, a corporation of Pennsylvania

No Drawing. Application March 14, 1952, Serial No. 276,693

5 Claims. (Cl. 148—6.2)

1. In a method for treating electrolytic tinplate in strip form the steps comprising heating strip to a temperature above the melting point of tin, cleaning the strip cathodically in an aqueous alkaline solution of sodium carbonate in which the concentration of alkaline compound is approximately 0.5% to 5.5% at a current density of from 3 to 30 amp./sq. ft. and at a temperature of from 160° F. to 210° F. for a period of time in excess of 0.5 second, rinsing the strip with water and then passing the strip thru a chromic acid solution having a $CrO_3$ concentration of from 0.1% to 1.0% at a temperature of from 150° F. to 200° F., and rinsing the strip.

---



2,775,536

**BODIES HAVING LOW TEMPERATURE COEFFICIENTS OF ELASTICITY**

Morris E. Fine, Morristown, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application July 19, 1952, Serial No. 299,909

2 Claims. (Cl. 148—11.5)

2. The method which comprises cold-working an alloy to achieve a cold area reduction of at least 3 percent and annealing said alloy from the cold-worked state at a temperature between 150° and 600° C., said cold-worked and annealed alloy consisting of a composition defined within an area on a ternary diagram having as its coordinates, weight percent iron, weight percent nickel and weight percent of at least one element selected from the group consisting of molybdenum, chromium and tungsten, said area being defined by a hexagon having at its corners the six points defined by (1) 28 percent nickel, 64 percent iron and 8 percent of at least one of said elements selected from the group consisting of molybdenum, chromium and tungsten; (2) 28 percent nickel, 59 percent iron and 13 percent of at least one of said elements selected from the group consisting of molybdenum, chromium and tungsten; (3) 36 percent nickel, 44 percent iron and 20 percent of at least one of said elements selected from the group consisting of molybdenum, chromium and tungsten; (4) 39 percent nickel, 41 percent iron and 20 percent of at least one of said elements selected from the group consisting of molybdenum, chromium and tungsten; (5) 39 percent nickel, 45 percent iron and 16 percent of at least one of said elements selected from the group consisting of molybdenum, chromium and tungsten; and (6) 32 percent nickel, 59 percent iron and 9 percent of at least one of said elements selected from the group consisting of molybdenum, chromium and tungsten, the amount of said component selected from the group consisting of molybdenum, chromium and tungsten being not greater than 13 percent when said component consists of molybdenum and not greater than 13 percent when said component consists of chromium; and in addition to said composition up to .25 percent carbon, up to 2 percent manganese, and up to 5 percent silicon together with incidental impurities having no effect on the modulus of elasticity.

---

2,775,537

**DOUBLE CEMENTS FOR BONDING DISSIMILAR RUBBERY MATERIALS**

Howard L. Wilson, Raritan Township, Union County, and Samuel B. Robison and Winthrope C. Smith, Westfield, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application April 29, 1952, Serial No. 285,071

12 Claims. (Cl. 154—140)

1. An article of manufacture comprising a first body

of a low temperature interpolymer of a major amount of isobutylene with a minor proportion of a conjugated diolefin, the interpolymer being characterized by a low unsaturation within the range of a Wijs iodine number between about 0.5 and 50, a molecular weight above about 20,000 and reactivity with a curing agent to yield an elastic product, a layer of interpolymer adherent thereto as a cement, said cement interpolymer having a Wijs iodine number above about 50 and having been prepared from an olefinic feed mixture having about 20 to 100 parts of diolefin having from about 4 to 6 carbon atoms

per 100 parts of an isoolefin; and a second body of a high unsaturation rubbery material, characterized by a Wijs iodine number of up to about 451 but higher than said first-named iodine number, and being reactive with a curing agent, a layer of interpolymer adherent thereto as a cement, said cement interpolymer being prepared from an olefinic feed mixture having about 400 to 750 parts of butadiene per 100 parts of isobutylene, said first and second bodies being cemented together by a bond consisting of said two cement layers adhered directly together.

---

2,775,538

**STABILIZED HEXYLRESORCINOL THERAPEUTIC AGENT CONTAINING CASTOR OIL**

Arthur Beckamp, Lockstedter Lager, Holstein, Germany

No Drawing. Application April 30, 1952, Serial No. 285,331

Claims priority, application Germany June 4, 1951

4 Claims. (Cl. 167—55)

1. A stable hexylresorcinol therapeutic agent for internal administration consisting of a solution of hexylresorcinol dissolved in castor oil.

---

2,775,539

**PROCESS OF AND COMPOSITIONS FOR COMBATING EPILEPTIC SEIZURES WITH ATROLACTAMIDE**

Roger W. Stoughton, St. Louis, Mo., assignor to Mallinckrodt Chemical Works, St. Louis, Mo., a corporation of Missouri

No Drawing. Application September 6, 1952, Serial No. 308,299

10 Claims. (Cl. 167—65)

1. A composition in dosage form for controlling epileptic seizures, comprising not less than approximately 5% by weight of atrolactamide and not less than approximately 2% by weight of a pharmaceutical carrier.

---

2,775,540

**PRODUCTION OF DEXTRAN**

Ernest L. Wiseman, Springfield, and George D. Lakata, Philadelphia, Pa., assignors to The American Sugar Refining Company, New York, N. Y., a corporation of New Jersey

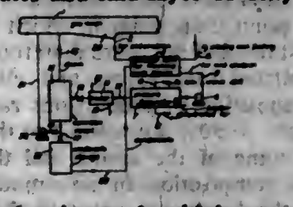
No Drawing. Application December 18, 1950, Serial No. 201,498

4 Claims. (Cl. 195—31)

1. The improvement in the production of dextran from sucrose by Leuconostoc fermentation which comprises carrying out the fermentation in a culture medium made of pasteurized, freshly prepared yeast bear to which sucrose and the Leuconostoc culture are added.

---

2,775,541



**PROCESS FOR DEHYDRATING OF TAR**

Alfred Karl, Essen, Germany

Application January 6, 1954, Serial No. 402,456

7 Claims. (Cl. 196—5)

1. A method of dehydrating water-containing tar derived from a tar-containing crude gas formed during the dry distillation of coal which comprises heating said water-containing tar under superatmospheric pressure in an enclosed separator zone to cause the formation therein of superimposed layers of dehydrated tar, tar-water emulsion and water; withdrawing a minor portion of said tar-water emulsion from said enclosed zone separately from said layer of water and said layer of dehydrated tar also

present therein; heating such withdrawn emulsion in an enclosed zone to a temperature exceeding that in the enclosed separator zone; passing said heated emulsion to an expansion zone maintained at a pressure below that obtaining within said enclosed zone thereby to cause vigorous ebullition of the water content of the emulsion and evaporation of a portion of such water content, and returning the non-evaporated component to said enclosed separator zone.

---

2,775,542

**LIQUID-LIQUID EXTRACTION TRAY**

John A. Carver, Scotch Plains, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware

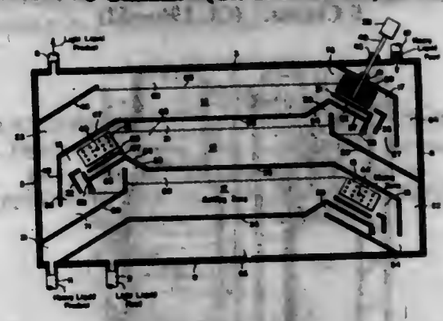
Application September 30, 1953, Serial No. 383,349

12 Claims. (Cl. 196—14.52)

1. An improved apparatus for countercurrently contacting two incompletely miscible liquids having different specific gravities wherein one of the liquids is present as a continuous phase and the other liquid as a discontinuous phase which comprises in combination a vessel; a plurality of vertically spaced contacting stages in said vessel; a first conduit for introducing the heavier liquid within the top of the vessel; a second conduit for withdrawing the heavier liquid from the bottom of the vessel; a third conduit for introducing the lighter liquid within the bottom of the vessel; a fourth conduit for withdrawing the lighter liquid from the top of the vessel; a vertically disposed, laterally confined mixing zone in each stage; the mixing zones of successive stages being on opposite sides of said vessel; the outlet ends of the mixing zones facing toward the end of the vessel where the continuous phase liquid enters the vessel; a horizontally disposed settling zone in each stage whereby mixtures of the two liquids are separated into separate phase layers; the outlet end of each mixing zone discharging directly into the entrance end of its respective settling zone; a fifth conduit in each stage; the fifth conduit in any given stage being adapted to convey continuous phase liquid from the continuous phase layer in the settling zone of a stage on one side of the given stage to the entrance end of the mixing zone in the given stage; a sixth conduit in each stage; the sixth conduit in said given stage being adapted to convey discontinuous phase liquid from the discontinuous phase layer in the settling zone of a stage on the opposite side of the given stage into the entrance end of the mixing zone of the given stage; a liquid seal in each said sixth conduit whereby a phase layer of discontinuous phase liquid is provided

in each settling zone; a weir intermediate the outlet end of each sixth conduit and the entrance end of its respective mixing zone; a baffle element laterally intermediate the discontinuous phase layer in the settling zone of each stage and the inlet end of the sixth conduit that conveys the discontinuous phase liquid to the next stage; each said baffle element forming a flow-rate stabilization chamber in its respective stage, said stabilization chamber lying laterally between the said baffle element and the inlet to the 6th conduit.

---



2,775,543

**LIQUID-LIQUID CONTACTING TOWER**

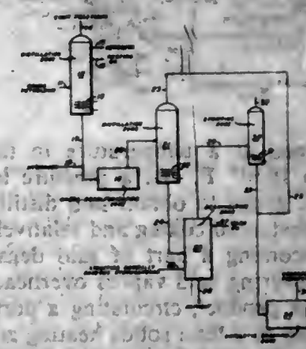
Robert B. Long, Wassenaar, John A. Carver, Scotch Plains, Clinton H. Holder, Westfield, and James R. Felix, Fieldfield, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application September 30, 1953, Serial No. 383,291

6 Claims. (Cl. 196—14.52)

1. An apparatus for countercurrently contacting two incompletely miscible liquids having different densities wherein one of the liquids is present as a continuous phase and the other liquid as a discontinuous phase which comprises a vertically disposed tower; a first conduit at the top of the tower to introduce the heavier liquid therein; a second conduit at the bottom of the tower to withdraw the heavier liquid therefrom; a third conduit at the bottom of the tower to introduce the lighter liquid therein; a fourth conduit at the top of the tower to withdraw the lighter liquid therefrom; a plurality of vertically spaced, superposed treating stages in said tower; an angularly inclined, laterally confined mixing zone in each stage with an inlet end and an outlet end; the mixing zones of successive stages being on opposite sides of said tower; mechanical means in each mixing zone adapted to mix said liquids; a horizontally disposed confined settling zone in each stage adapted to separate mixtures of the liquids into separate phase layers; the outlet end of each mixing zone discharging into the entrance of its respective settling zone; the outlet ends of the mixing zones being vertically nearer to the end of the tower where the continuous phase liquid enters the tower than are the inlet ends of the mixing zones; a fifth conduit in each given stage arranged to withdraw the continuous phase liquid from the continuous phase layer in the settling zone of a stage on one side of the given stage and to introduce said continuous phase liquid within the inlet end of the mixing zone of the given stage; a sixth conduit in each given stage arranged to withdraw the discontinuous phase liquid from the discontinuous phase layer in the settling zone of a stage on the opposite side of the given stage and to introduce said discontinuous phase liquid within the inlet end of the mixing zone of the given stage; baffle means in each stage whereby the heavier liquid entering the mixing zone of the stage is directed toward the upper portion of the inlet end of the mixing zone of the stage and the lighter liquid is directed toward the lower portion of the inlet end of the mixing zone; a liquid trap in each said sixth conduit; a weir intermediate the outlet end of each said sixth conduit and the inlet end of the mixing zone in each stage arranged to distribute the discontinuous phase liquid uniformly across the width of the mixing zone; and a seventh conduit in each stage arranged to recycle a portion of the continuous phase liquid from the settling zone of each stage to the inlet end of the mixing zone in the stage.

---



2,775,544

**PRODUCTION OF CATALYTIC CRACKING FEED STOCKS**

Hampton G. Cornell, Richard S. Manne, George R. L. Shepherd, and Armand M. Souby, Baytown, Tex., assignors, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware

Application February 28, 1955, Serial No. 490,744

6 Claims. (Cl. 196—24)

1. A method for increasing the yields of catalytic cracking stock obtainable from a reduced crude petroleum feed stock boiling above about 600° F. which comprises subjecting said crude to conditions of hydrodesulfurization to form a hydrodesulfurized product, removing a first gas oil fraction and lighter fractions from said products, subjecting said hydrodesulfurized product after removal of gas oil to deasphalting conditions to obtain a second gas oil fraction and combining said gas oil fractions to obtain augmented yields of catalytic cracking stock.

---

2,775,545

**PREVENTION OF SOURNESS OF SWEET NAPHTHAS DURING DISTILLATION BY DISTILLING IN THE PRESENCE OF AN ALKYLENE OXIDE AND A SALT OF AN ORGANIC ACID**

Walter J. Sandner, Carpentersville, and William L. Fierce, Algonquin, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

No Drawing. Application November 7, 1955, Serial No. 545,530

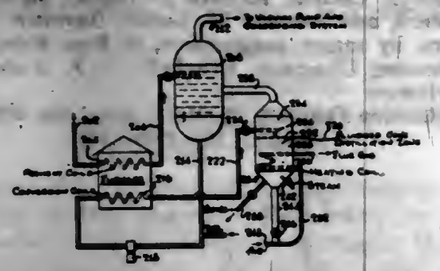
8 Claims. (Cl. 196—25)

1. In the distillation of an oxidatively sweetened hydrocarbon fraction containing organic sulfur compounds, including disulfides, at temperatures normally effective for the conversion of said compounds to produce doctor-positive products, the improvement which comprises carrying out the distillation in the presence of sufficient amounts of an admixture of an alkylene oxide having a boiling point at least about as high as the end boiling point of said fraction and an oil-soluble, basic salt of a high molecular weight organic acid to prevent said conversion and the development of a doctor-positive distillation effluent.

---

2,775,546

**CONVERSION OF HYDROCARBONS IN THE PRESENCE OF INERT SOLIDS**



Charles N. Kimberlin, Jr., and Robert W. Krebs, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application June 28, 1951, Serial No. 232,523

3 Claims. (Cl. 196—50)

1. A residual oil conversion process which comprises coking a residual oil in liquid phase in a coil and drum coking zone at a coking temperature in the range of 750°

to 950° F., a pressure in the range of 100 to 3000 p. s. i., and for a time in the range of 2 to 240 minutes while in admixture with 15 to 100 lbs./bbl. of coke particles of a size in the range of 5 to 250 microns and in admixture with 20 to 120 vol. percent of naphtha diluent boiling in the range within the limits of 250° to 500° F. to obtain coke, distillable oils and gas, flashing the total effluent from said coking zone directly into a distillation zone containing a dense turbulent bed of fluidized coke

particles maintained at a temperature in the range of about 800° F. to 1050° F. and a pressure in the range of 0 to 25 p. s. i. gauge to obtain said distillable oils as vapors without substantial coking and relatively dry coke, said dry coke becoming a part of said dense turbulent fluidized bed, recovering said vapors overhead from said distillation zone as product, circulating a portion of said dense turbulent bed to a fluid solids heating zone wherein the solids are heated by combustion, and returning heated solids to said distillation zone to supply heat thereto.

## HYDROCARBON LIFT SYSTEM FOR THE CONVERSION OF HYDROCARBONS AND THE SEPARATION OF FINES

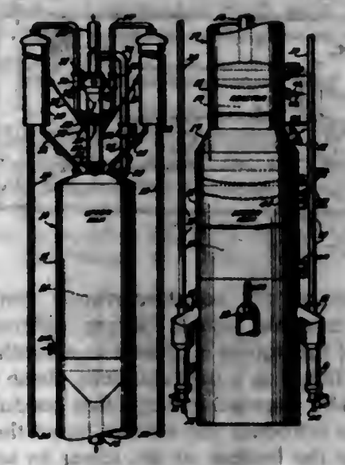
David B. Ardern, Moylan, Pa., and Robert M. Shirk, Wilmington, Del., assignors to Houdry Process Corporation, Wilmington, Del., a corporation of Delaware

Application May 3, 1951, Serial No. 224,324

7 Claims. (Cl. 196—52)

1. In a hydrocarbon conversion process wherein a body of granular catalyst is continuously circulated through a closed system including hydrocarbon conversion and catalyst regeneration zones through each of which said catalyst gravitates as a compact moving mass, and wherein regenerated catalyst withdrawn from said regeneration zone is elevated by a stream of gaseous hydrocarbons through a confined lift path for return to said conversion zone, the method of removing catalyst fines from said circulating body of catalyst which comprises the steps of: continuously removing a minor portion of fresh regenerated catalyst from said system; engaging said minor portion of regenerated catalyst with a stream of inert lift gas; conveying said minor portion of regenerated catalyst by means of said inert lift gas upwardly through a second confined lift path to an elevated elutriation zone; passing the catalyst-conveying stream of inert lift gas through said elutriation zone at such reduced velocity that the particles of catalyst other than fines become disengaged from the gas stream and settle to the bottom of said elutriation zone; discharging said inert gas together with entrained fines from the upper end of said elutriation zone; discharging the disengaged coarser particles of catalyst from the bottom of said elutriation zone; and returning said coarser particles to said circulating body of catalyst.

---



2,775,548

## HYDROCARBON CONVERSION SYSTEM

Reyner Kollgaard, Media, Pa., assignor to Houdry Process Corporation, Wilmington, Del., a corporation of Delaware

Application April 30, 1952, Serial No. 285,270

5 Claims. (Cl. 196—52)

1. In a hydrocarbon conversion process in which granular contact material gravitates successively through superimposed conversion and regeneration zones, and is thereafter pneumatically elevated through a lift pipe for return to said conversion zone, and in which the elevated temperature at which regenerated contact material is to be introduced into said conversion zone is of such magnitude as to be detrimental to the materials of construction usually employed in the fabrication of lift pipes, the method of transporting contact material from said regeneration zone to said conversion zone so that its temperature while being pneumatically lifted is substantially below, and its temperature of introduction to said conversion zone is at, said elevated temperature which comprises the steps of: effecting only partial regeneration of said contact material in the presence of oxygen-containing gas within said regeneration zone; introducing said partially regenerated contact material into said lift pipe at a relatively low temperature substantially below such detrimental temperature; elevating said low-temperature contact material through said lift pipe to an elevated location substantially above said conversion zone by means of lift gas comprising gaseous combustion products withdrawn from said regeneration zone; separating said partially regenerated contact material from said lift gas at said elevated location; passing said contact material by gravity flow through a second regeneration zone located above said conversion zone to complete the desired regeneration of said contact material in the presence of additional oxygen-containing gas, thereby raising the temperature of said contact material to said elevated temperature; and passing said regenerated contact material by gravity flow and without substantial reduction in temperature directly to said conversion zone.

2,775,549

## PRODUCTION OF COKE FROM PETROLEUM HYDROCARBONS

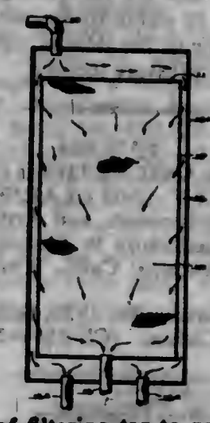
Frederick L. Shea, Jr., Arlington Heights, Ill., assignor to Great Lakes Carbon Corporation, New York, N. Y., a corporation of Delaware

Application January 25, 1954, Serial No. 405,979

11 Claims. (Cl. 196—52)

1. A process for producing needle-like coke which comprises removing from a high boiling petroleum residuum those components which readily form an insoluble phase upon heating at 350°–550° C., and coking the remaining residuum in a quiescent pool.

---



2,775,550

## REDUCTION OF $C_1$ CARBON CONTENT IN TAR

Earl V. Harlow, Towson, Md., assignor to Koppers Company, Inc., a corporation of Delaware

Application April 16, 1954, Serial No. 423,676

6 Claims. (Cl. 196—147)

1. In a process of filtering tar to provide a tar filtrate substantially free of $C_1$ particles the step which comprises: flowing liquified tar at a linear velocity of from about 4 to about 16 feet per second across the surface of a filter screen to build and maintain a thin, tenacious membrane of $C_1$ particles thereon, the tar flowing across and not through the screen having an increased amount of $C_1$ particles and the tar which flows through the screen having a decreased amount of $C_1$ particles.

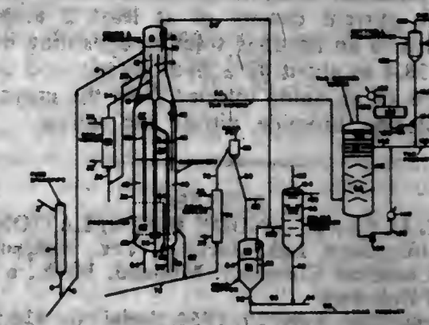
2,775,551



## COAL CARBONIZATION

Marvin F. Nathan, New York, N. Y., Walter E. Lobo, Westfield, N. J., and George T. Skaperdas, Fresh Meadows, N. Y., assignors to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

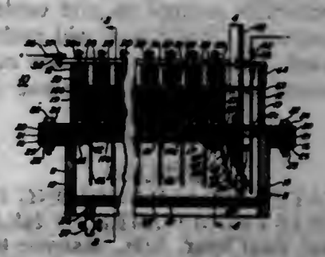
Application June 23, 1955, Serial No. 517,472

9 Claims. (Cl. 202—6)

1. A unitary process for the treatment of carbonaceous solids to remove therefrom volatile constituents which comprises heating and drying the solids in a finely subdivided state in a drying zone in a dense phase fluidized bed, further heating the dry solids in a preheating zone in a second dense phase bed, passing dry heated solids from the preheating zone downwardly as a confined stream through a subjacent carbonization zone to a pretreating zone wherein there is maintained at an elevated temperature above the temperature in the heating zone a third dense phase bed of finely subdivided pretreated solids, said pretreating zone being enclosed within the carbonization zone and openly communicating therewith through a grid, introducing oxygen into the pretreated solids bed and partially burning heated solids introduced thereto, maintaining within the carbonization zone a dense phase bed of finely subdivided char at a temperature above the temperature in the pretreating zone, passing pretreated solids and combustion gases through the grid directly into the enclosing carbonization zone beneath

the level of said dense phase bed of char, vaporizing from the pretreated solids volatile tar constituents whereby said carbonaceous solids are converted to char, introducing additional oxygen into the char solids bed to burn a portion of the devolatilized char and provide the heat required to elevate the pretreated solids to the carbonization temperature and vaporizing volatile components therefrom, recovering combustion gases and volatile tar components from a dilute phase above the dense char bed and removing product char from said bed.

---



2,775,552

## CONTINUOUS ELECTROLYTIC PROCESS FOR REDUCING URANIUM IN SOLUTION

Robert Q. Boyer, Berkeley, Calif., assignor to the United States of America as represented by the United States Atomic Energy Commission

Original application April 21, 1944, Serial No. 532,162. Divided and this application September 10, 1945, Serial No. 615,467

3 Claims. (Cl. 204—124)

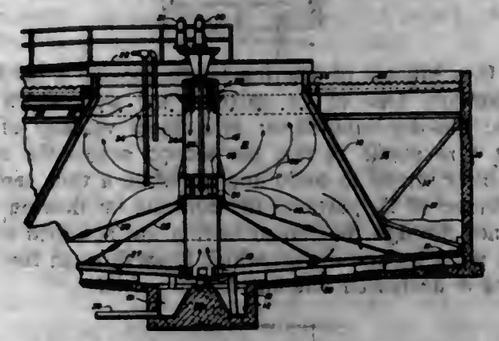
1. In a process for reclaiming uranium values from an oxidized hydrochloric acid solution of about 3 N concentration and containing $UO_2^{++}$ ions and ions selected from the group consisting of $Fe^{+++}$, $Cu^{++}$, $Ni^{++}$, and $Cr^{+++}$ ions, the steps comprising continuously passing said solution through the cathode compartment of an operating electrolytic cell having a rotating cathode which is provided with a thin, continuously-replaceable mercury coating and an anode compartment filled with a hydrochloric acid electrolyte of about 3 N concentration and separated from said cathode compartment by a porous barrier, continuously and simultaneously correlating the rate of flow of said solution through said cathode compartment of the operating cell with the electrolytic current density applied therethrough to promote the reduction of the $UO_2^{++}$ ions to $U^{++++}$ ions and the reduction of ions of said group to the metallic state and which are absorbed in said mercury cathode coating, and simultaneously and continuously replacing said mercury cathode coating by displacement during immersion of a portion of said rotating cathode in a relatively large volume of mercury.

2,775,553
**ELECTROLYTIC ETCHING PROCESS FOR ELECTROLYTIC CAPACITORS**
George J. Kahan, Williamstown, Mass., assignor to Sprague Electric Company, North Adams, Mass., a corporation of Massachusetts
No Drawing. Application December 31, 1952, Serial No. 329,150
2 Claims. (Cl. 204—141)

1. A process for increasing the effective surface of metallic tantalum comprising anodically treating it at an anodic current density of at least 2 amperes per square inch in an aqeuous solution consisting essentially of from 38.4 to about 48% hydrofluoric acid and up to about 20% of an anion selected from the group consisting of chloride, bromide, nitrate and sulfate.

2,775,554
**GALVANIC ANODE INSTALLATION**
Roy C. Jorgensen, Lake Jackson, Tex., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Application April 29, 1954, Serial No. 426,518
4 Claims. (Cl. 204—197)

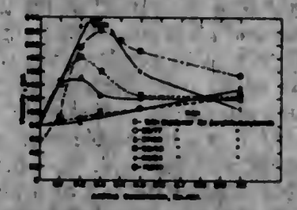
1. A cathodic protection system for protecting the interior surfaces of a tank from electrolytic corrosion, said system comprising, within a tank having a supporting member and an anchoring member, a pulley secured to said supporting member, a metallic cable having its end portions detachably secured to said anchoring member and its intermediate portion passing through said pulley, a plurality of galvanic anodes, said anodes being mechanically and electrically secured to said cable between one of said end portions thereof and said pulley, and means adjacent to each end of said cable for making positive electrical contact between said cable and said anchoring member.



2,775,555
**PRECIPITATING SCALE FORMING CONSTITUENTS FROM WATER BY HEAT**
Alick Clarkson, Paul Spur, Ariz., assignor to Vapor Heating Corporation, Chicago, Ill., a corporation of Delaware
Application February 25, 1952, Serial No. 273,234
9 Claims. (Cl. 210—15)

3. The process of treating water for removal of water hardening substances contained in solution therein, which comprises the step of heating the water under a substantial pressure and in a restricted zone of a larger and quiescent body of water to a temperature near the boiling point to effect rapid decomposing reaction on the water hardening substances, discharging the water from said heating zone into the upper portion of a second restricted zone within said larger body of water, introducing a catalyzer into the heating zone which consists in recirculating through the heating zone, with the water to be treated, previously treated water containing in suspension particles of reacted material, and simultaneously maintaining high turbulence in the water being heated to bring minute suspended particles of reacted material into forceable contact with each other so as to build larger and heavier particles which will more readily precipitate.

9. In a system for treating water for removal of scale forming constituents, the combination of a separating tank, a vertical conduit defining a heating zone disposed within said tank, a water discharge pipe connected to said tank and opening within the tank at a point well above the bottom, a nozzle for delivering steam into the lower end of said vertical conduit to heat water therein and to produce high turbulence and vibrations therein, a water supply pipe leading into said tank, a heat exchanger interposed in said water supply line, a filter device interposed in the water supply pipe intermediate the heat exchanger and the separating tank, a hot water line for conducting hot treated water to said heat exchanger to preheat said water delivered to said tank, a filter device interposed in said discharge pipe, a steam-supply line connected to said nozzle and including a valve, and means including a float-controlled mechanism responsive to the water level in said tank for controlling said valve and to regulate the supply of steam to the said nozzle in accordance with the volume of the flow of water to the tank and the temperature and pressure therein.



2,775,556
**APPARATUS AND METHOD FOR LIQUID TREATMENT AND CLARIFICATION**
Earl M. Kelly, Hillsborough, and Arthur M. Kivari, Los Angeles, Calif., assignors to Process Engineers Incorporated, San Francisco, Calif., a corporation of California
Application February 16, 1953, Serial No. 337,082
6 Claims. (Cl. 210—16)

1. In clarification apparatus including a tank for holding a pool of liquid to be clarified and in which solids settle to the bottom, and an annular baffle spaced from the wall of the tank and from the bottom and extending both above and below the level of the pool, the combination which comprises an annular manifold disposed in the tank adjacent the upper edge of the baffle for admitting liquid to be clarified to the periphery of the pool within the baffle at a plurality of points around the baffle, pumping means disposed in the tank inside the baffle for circulating the liquid up and down between an upper portion of the pool and an intermediate portion of the pool within the baffle and for circulating liquid and solids up and down between the intermediate portion of the pool and a lower portion of the pool, means for removing settled solids from the bottom, and radial effluent weirs disposed at the level of the pool in the tank outside the baffle for removing clarified effluent liquid from the pool.

2,775,557
**DRILLING MUDS CONTAINING ACRYLIC ACID-ACRYLAMIDE COPOLYMER SALTS**
Russell L. Morgan, Riverside, Conn., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine
Application December 8, 1954, Serial No. 473,820
3 Claims. (Cl. 252—8.5)

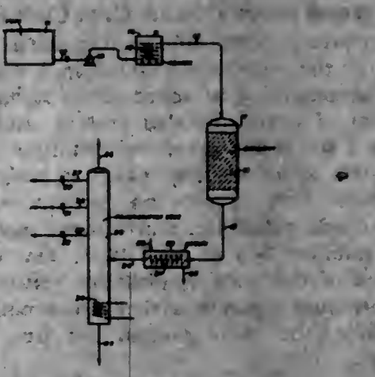
1. In a process for drilling a well wherein a mud seal of improved water-retaining properties is formed on the wall of said well by circulating therein an aqueous clay base drilling mud containing, as a wall-sealing agent, about 0.1 to 5 lbs. per barrel of a water-soluble salt of an acrylic acid-acrylamide polymer having a molecular weight of at least 10,000, the method of avoiding the formation of high viscosity in said mud which comprises adding said wall-sealing agent thereto as a polymer wherein the ratio of carboxylic acid salt groups to amide groups is between about 10:90 and 45:55.

2,775,558
**EXTREME PRESSURE LUBRICANT**
Morton Fainman, Chicago, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
No Drawing. Application August 31, 1954, Serial No. 453,436
6 Claims. (Cl. 252—33.6)

1. An extreme pressure lubricant consisting essentially of from about 75% to about 93% of a mineral lubricating oil, about 5% to about 10% of sulfur-containing lead tallate, from about 1% to about 10% of a chlorinated paraffin wax containing from about 40% to about 70% by weight of chlorine, and from about 1% to about 5% of 9,10-dichlorostearic acid.

2,775,559
**IMPROVED LUBRICANTS**
Chester M. Hinsel and Leo O. Edmonds, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Original application December 28, 1948, Serial No. 67,768, now Patent No. 2,671,004, dated March 9, 1954. Divided and this application August 1, 1951, Serial No. 240,267
7 Claims. (Cl. 252—47)

1. An improved lubricant comprising a major proportion of a mineral lubricating oil containing an alkylene polyamine partially N-substituted with at least one of RS— and RSS— in which R is a radical selected from the group consisting of alkyl, substituted alkyl, aryl, substituted aryl, aralkyl and substituted aralkyl, in an amount sufficient to impart antioxidant and anticorrosive characteristics to said lubricant, but less than 8 weight percent of said oil.



2,775,560
**CORROSION INHIBITING LUBRICATING COMPOSITIONS**
Howard M. Larton, Dow, and Lawrence C. Westcott, Edwardsville, Ill., assignors to Shell Development Company, New York, N. Y., a corporation of Delaware
No Drawing. Application June 21, 1954, Serial No. 438,350
4 Claims. (Cl. 252—48.6)

1. A vapor phase and liquid phase corrosion inhibiting lubricating composition comprising 0.015% $C_{18}$-alkenyl-succinic acid, 0.5% 2,6-ditertiarybutyl-4-methyl phenol, 0.02% sulfurized oleic acid, 0.05% n-nonanoic acid and the balance being a mineral lubricating oil.

2,775,561
**VISCOUS COMPOSITION AND METHOD OF MAKING THE SAME**
Stanley H. Freimuller, Madison, Wis., assignor to Research Products Corporation, Madison, Wis., a corporation of Wisconsin
No Drawing. Application July 2, 1952, Serial No. 296,956
17 Claims. (Cl. 252—308)

1. The method of preparing a thixotropic composition having the consistency of a plastic cream and including mineral oil, which comprises dissolving microcrystalline wax in said mineral oils the amount of microcrystalline wax being approximately 5% to 25% of the combined weight of the mineral oil and microcrystalline wax, and chilling said composition uniformly at a rate of at least 65 degrees C. per minute from a temperature at which said microcrystalline wax is soluble in said mineral oil to a temperature at which said microcrystalline wax is insoluble in said mineral oil.

2,775,562
**PREPARATION OF A SILICA-ALUMINA CRACKING CATALYST**
James A. Dinwiddie and Max A. Mossman, Baytown, Tex., assignors, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware
Application March 6, 1953, Serial No. 340,891
6 Claims. (Cl. 252—463)

1. A method for producing a heat stable catalyst suitable for converting hydrocarbons which comprises admixing an alcohol soluble and hydrolyzable silicon compound with aluminum alcoholate, hydrolyzing the admixture by contacting same with water vapor to form a precipitate of said silicon compound and boehmite, drying the precipitate and calcining the dried precipitate at a sufficiently high temperature to form a heat stable catalyst comprising silica and alumina.

2,775,563
**RESINOUS CONDENSATION PRODUCTS FROM METAL ALLOYS AND HYDROCARBON DIHALIDES**
Sol B. Wiener, Washington, D. C.
No Drawing. Application June 20, 1952, Serial No. 294,710
7 Claims. (Cl. 260—2)

1. A resinous material formed by reacting by heating a mixture of an alloy of an alkali metal and a heavy metal selected from the group consisting of copper, cadmium, zinc, lead, tin, thallium, gallium, indium, zirconium, tantalum, tungsten, molybdenum, uranium, iron, bismuth,

cobalt, chromium, nickel, with a polyhalogen hydrocarbon compound selected from the group consisting of monocarbocyclic dihalides and dihalides of aliphatic hydrocarbons having 1 to 4 carbon atoms, said heavy metal and dihalogen hydrocarbon compound being in substantially equal molar proportions.

---

**2,775,564**

**PROCESS FOR MANUFACTURE OF STRONGLY BASIC ANION EXCHANGERS**

Geert J. de Jong, Geleen, Netherlands, assignor to Stamicarbon N. V., Heerlen, Netherlands

No Drawing. Application October 26, 1953, Serial No. 388,439
Claims priority, application Netherlands November 8, 1952
2 Claims. (Cl. 260—2.1)

2. A process for the manufacture of a water insoluble resinous product having strongly basic anion exchanging properties, which comprises reacting a methyl tri (methoxyphenyl) phosphonium salt with formaldehyde in the presence of concentrated sulfuric acid to obtain a resin and subsequently washing the resulting resin with alkali.

---

**2,775,565**

**COATING COMPOSITION STABILIZED WITH A CYANOETHYLATED PROTEIN**

Leonard L. McKinney, John C. Cowan, and Cyril D. Evans, Peoria, Ill., assignors to the United States of America as represented by the Secretary of Agriculture

No Drawing. Application March 28, 1952, Serial No. 279,202
1 Claim. (Cl. 260—8)
(Granted under Title 35, U. S. Code (1952), sec. 266)

A coating composition comprising butadiene-styrene latex as the vehicle emulsified in a continuous aqueous system containing as an emulsion stabilizer, a stabilizing amount of cyanoethylated protein, said composition being in a stable and preserved condition in that its storage life—the period during which it maintains its original condition without gelation, without separation of the emulsifiable substance, and without spoilage of the emulsion stabilizer—is at least twice that of a composition formed of the same emulsifiable substance emulsified in a continuous aqueous system containing as an emulsion stabilizer, the same protein but free from cyanoethyl groups.

---

**2,775,566**

**BINDER FOR AGGLOMERATING FINELY DIVIDED MATERIALS**

Henry L. Crowley, South Orange, N. J., assignor, by mesne assignments, to Aerovox Corporation, New Bedford, Mass., a corporation of Massachusetts

No Drawing. Application February 6, 1953, Serial No. 335,595
2 Claims. (Cl. 260—19)

1. A binder for agglomerating finely divided metal oxides preparatory to heat-treatment at a temperature within the range of 800°–1500° C. containing as essential components stearic acid in saponified form, an alcohol-soluble, water-insoluble phenol-formaldehyde resin, a water-soluble, partially condensed urea-formaldehyde resin, a compatible plasticizer for the resins, the relative proportions of saponified stearic acid, resins and plasticizer, calculated by weight on the dry basis, being 10 parts, 4 to 8 parts and 10 to 20 parts, respectively, and about 10% of water on the dry weight of said components.

**2,775,567**

**METHOD OF PREPARING DYEABLE COPOLYMERS**

Costas H. Basdekis, Longmeadow, Mass., assignor to The Chemstrand Corporation, a corporation of Delaware

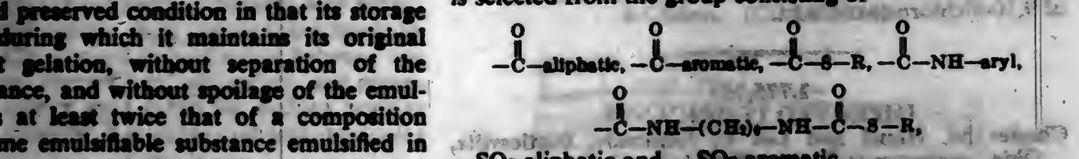
No Drawing. Application May 13, 1953, Serial No. 354,893
14 Claims. (Cl. 260—29.6)

1. A method of preparing a polymer of from 30 to 98 percent by weight of a compound of the group consisting of vinylpyridines and alkyl substituted vinylpyridines and from two to 70 percent of acrylonitrile, which comprises gradual addition of the monomers in the desired proportions to an aqueous medium in the presence of from 0.5 to 5.0 percent of a water soluble salt of an aldehyde condensed aromatic sulfonic acid, from 0.1 to 3.0 percent of a water-soluble alkali metal salt of a higher fatty acid, up to 0.4 percent of a member of the group consisting of alkali metal carbonates and bicarbonates, and from 0.1 to 3.0 percent of a peroxy catalyst, said percentages being based on the weight of the monomers to be charged.

---

**2,775,568**

**RUBBERY POLYMERS PLASTICIZED WITH THIO DERIVATIVES OF POLYCHLOROBENZENES**



Friedrich Lober, Otto Bayer, and Max Bögemann, Leverkusen-Bayerwerk, and Paul Schneider, Opladen, Germany

No Drawing. Original application December 27, 1950, Serial No. 207,068, now Patent No. 2,695,898, dated November 30, 1954. Divided and this application May 20, 1954, Serial No. 431,283
Claims priority, application Germany December 27, 1949
3 Claims. (Cl. 260—30.8)

1. A plasticized elastomer selected from the group consisting of natural rubber, rubbery conjugated diene polymers and their vulcanizates, containing as a plasticizer, a compound of the general formula

R—S—X

where R stands for a penta-substituted phenyl radical of the group consisting of $C_6Cl_5$- and $C_6Cl_4$·alk.-, alk. being an alkyl group containing from 1 to 8 C atoms, and X is selected from the group consisting of

---

**2,775,569**

**DISPERSION OF FLUOROCHLOROCARBON POLYMERS**

Charles D. Dinner, Jersey City, Wilbur O. Teeters, River Edge, and John M. Wrightson, North Bergen, N. J., assignors to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application December 30, 1949, Serial No. 136,168
17 Claims. (Cl. 260—32.8)

1. A dispersion which comprises finely-divided particles of the plastic homopolymer of trifluorochloroethylene and an added waxy polymer of trifluorochloroethylene as a plasticizer dispersed in a liquid dispersing medium comprising di-isobutly ketone and xylene.

---

**2,775,570**

**SOLUTIONS OF FORMALDEHYDE POLYMERS**

Archie E. Barksdell, Hockessin, Wilmington, and Robert N. MacDonald, Wilmington, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application August 30, 1952, Serial No. 307,364
5 Claims. (Cl. 260—33.4)

1. A composition of matter comprising a liquid solution of macromolecular polyoxymethylene in a solvent consisting essentially of an aromatic hydroxy compound, at a temperature above 35° C., said polyoxymethylene having an inherent viscosity of at least 0.6, measured at 60° C. as a 0.5% solution in p-chlorophenol containing 2% alpha-pinene, said solution being characterized in that said polyoxymethylene may be recovered from said solution in substantially the same undegraded polymeric form that it had before being dissolved.

---

**2,775,571**

**AMIDE-ALDEHYDE RESINS FROM AMIDES OF OXIDIZED PARAFFIN ACIDS**

John P. Buchanan, Yorba Linda, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Application July 27, 1953, Serial No. 370,629
9 Claims. (Cl. 260—39)

1. A moldable resin composition prepared by condensing a fluid amide with an aldehyde substance in the presence of a condensation catalyst and a filler, said fluid amide being a mixture of amides prepared by oxidizing paraffin wax with a gas containing free oxygen at a temperature between 100° C. and 140° C. to produce an oxidized wax having an acid number between about 200 and about 350 mg. KOH/g., separating from the oxidized wax a fraction insoluble in water and in petroleum naphtha, which fraction has a saponification number-acid number ratio between 1.4 and 2.2 to 1 and a total oxygen-carboxyl oxygen ratio between 1.2 and 1.8 to 1, and amidating said fraction.

---

**2,775,572**

**HIGH IMPACT STRENGTH PLASTIC COMPOSITION CONTAINING POLYVINYL ACETAL RESIN AND ETHYL ACRYLATE ELASTOMER**

Charles F. Fisk, Clifton, N. J., assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application August 28, 1952, Serial No. 306,946
6 Claims. (Cl. 260—45.5)

1. A hard, tough, rigid thermoplastic mixture characterized by an Izod notched impact strength of at least 4 foot-pounds per inch of notch and a flexural modulus in excess of 100,000 pounds per square inch comprising an intimate blend of about 5 to 20% by weight of an ethyl acrylate elastomer selected from the group consisting of polyethyl acrylate, a copolymer of 80–96% of ethyl acrylate with 4–20% of isobutylene, and a copolymer of 80–96% of ethyl acrylate with 4–20% of vinyl 2-chloroethyl ether and correspondingly about 95 to 80% of a polyvinyl acetal resin characterized by at least 75% replacement by aldehyde groups of the acetate ester groups in the polyvinyl acetate from which said resin is derived.

---

**2,775,573**

**DYEABLE POLYMER BLENDS, INCLUDING COPOLYMERS OF ACRYLONITRILE WITH ALKENYL HALOACETATES**

Alfred B. Craig and George E. Hass, Decatur, Ala.

No Drawing. Application March 2, 1953, Serial No. 339,912
8 Claims. (Cl. 260—45.5)

1. A dyeable fiber-spinning composition comprising a blend of (A) a polymer of at least 80 percent by weight of acrylonitrile and up to 20 percent of vinyl acetate and (B) a polymer of at least 30 percent by weight of an alkenyl haloacetate of the structure:

wherein X is a halogen atom selected from the group consisting of chlorine and bromine and R is a radical selected from the group consisting of vinyl, allyl, methallyl an disopropenyl, and up to 70 percent of acrylonitrile, the said blend in fiber form having been reacted in an acid dyebath with a compound of the structure:

wherein R and R' each represents a member selected from the group consisting of hydrogen and alkyl radicals having less than five carbon atoms, the polymers being blended in such proportions that from 2 to 20 percent of the total weight is the said alkenyl haloacetate.

---

**2,775,574**

**ACRYLONITRILE COPOLYMERS STABILIZED WITH CINNAMIC ACID AND ITS SALTS**

Robert J. Slocombe, Dayton, and George L. Wege, Englewood, Ohio, assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

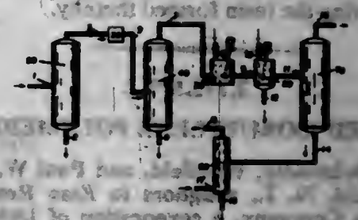
No Drawing. Application April 27, 1953, Serial No. 351,468
10 Claims. (Cl. 260—45.85)

1. A stable acrylonitrile polymer comprising solid a polymer of 20% to 100% of acrylonitrile and up to 80% of another monoolefinic monomer copolymerized therewith, said polymer containing intimately dispersed therein from 0.01% to 10% of a compound of the group consisting of:

Cinnamic acid
Cinnamic anhydride

esters of cinnamic acid and a monohydric, non-heterocyclic alcohol having from 2 to 12 carbon atoms in the alcohol radical;

Magnesium cinnamate
Calcium cinnamate
Aluminum cinnamate, and
Strontium cinnamate.



---

**2,775,575**

**PETROLEUM RESINS OF IMPROVED COLOR FROM 18°–85° C. STREAM**

Glen P. Hammer and Thomas G. Jones, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application May 20, 1953, Serial No. 356,153
2 Claims. (Cl. 260—82)

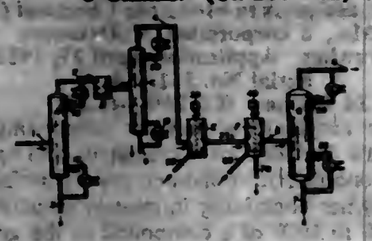
1. In a process for the preparation of improved petroleum resins the combination which comprises isolating a steam cracked hydrocarbon petroleum fraction boiling between about more than 18° C. to less than 85° C., heating the steam cracked fraction to a temperature sufficient to dimerize substantially all cyclodienes, stripping the resulting admixture to a temperature sufficient to separate an overhead product from the dimerized cyclodienes, recovering as the overhead product a stream boiling between about more than 18° C. to less than 85° C. and having the following composition:

| | Weight percent |
|---|---|
| Benzene | 13.5–15.75 |
| $C_5$–$C_6$ diolefins | 16.5–22.0 |
| $C_5$–$C_6$ olefins | 36.5–43.25 |
| $C_7$ diolefins and olefins | Less than 5 |

said composition being substantially free of cyclodienes,

and polymerizing the stream in the presence of a Friedel-Crafts catalyst at a temperature of about −18° C. to +66° C. and recovering the resin formed thereby.

---



2,775,576

## POLYMERS FROM STEAM CRACKED DISTILLATE STREAMS OF 18°–54° C. BOILING RANGE

Glen P. Hammer, Thomas G. Jones, Joseph A. McDaniel, Jr., and Mack C. Fuqua, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application May 28, 1953, Serial No. 358,152

3 Claims. (Cl. 260—82)

1. In a process for the preparation of improved petroleum resins the combination which comprises isolating a steam cracked hydrocarbon petroleum fraction boiling between about more than 18° C. to less than 54° C., heating the steam cracked fraction to a temperature sufficient to dimerize substantially all cyclodienes, stripping the resulting admixture to a temperature sufficient to separate an overhead product from the dimerized cyclodienes, recovering as the overhead product a stream boiling between about more than 18° C. to less than 54° C. and having the following composition:

| | Weight percent |
|---|---|
| Isoprene | 15 |
| Piperylene | 15 |
| Other acyclic diolefins | 4–5 |
| Normal $C_5$ olefins | 20–30 |
| Tertiary olefins | 30 |
| Paraffins | 5 |

said composition being substantially free of cyclodienes, and polymerizing the stream in the presence of a Friedel-Crafts catalyst at a temperature of about −4° C. to +38° C. and recovering the resin formed thereby.

---

2,775,577

## CONTROLLED ISOBUTYLENE POLYMERIZATION

Helmuth G. Schneider, Westfield, and Paul W. Brakeley, Jr., Plainfield, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application December 23, 1952, Serial No. 327,664

5 Claims. (Cl. 260—82)

1. A method for preparing isobutylene polymers having a molecular weight between 10,000 and 20,000 which comprises fractionating a light cracked petroleum fraction consisting of hydrocarbons having four carbon atoms in the molecule and containing isobutylene together with substantial amounts of butene-1 and butene-2, to remove sufficient butene-2 such that the ratio of isobutylene to n-olefins is not substantially less than 1:1 and the butene-2 content of the resulting product is not more than 20 volume percent of the total n-butene content and polymerizing the said treated petroleum fraction at a temperature below 0° C. in the presence of a metal halide catalyst chosen from the group consisting of boron fluoride and aluminum chloride.

2,775,578

## POLYMERIZATIONS INITIATED BY SATURATED CYCLIC TERPENE PEROXIDES

Gordon S. Fisher, Lake City, Fla., and Lee A. Goldblatt, New Orleans, La., assignors to the United States of America as represented by the Secretary of Agriculture

No Drawing. Application March 22, 1955, Serial No. 496,085

13 Claims. (Cl. 260—84.1)

(Granted under Title 35, U. S. Code (1952), sec. 266)

1. In a process of polymerizing polymerizable unsaturated organic compounds by mixing them with an organic peroxide and decomposing a peroxide to form free radicals, improvement which comprises employing as the organic peroxide a saturated cyclic terpene peroxide.

---

2,775,579

## LOW TEMPERATURE POLYMERIZATION PROCESS AND COMPOSITION

Michael Erchak, Jr., Morris Township, Morris County, and Robert J. Blanak, Morris Plains, N. J., assignors to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York

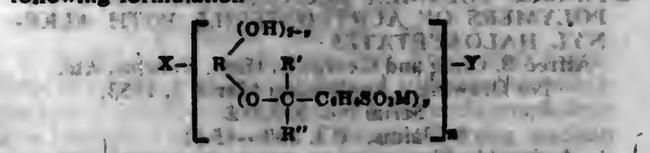
No Drawing. Application October 15, 1952, Serial No. 314,956

8 Claims. (Cl. 260—88.7)

1. Composition which polymerizes at temperatures maintained within the range between about 10° C. and about 40° C. comprising (1) at least one polymerizable monomer having a terminal methylene group doubly bonded to a carbon atom having at least one of its two remaining valences satisfied by an electronegative group other than an oxy group, with substantially all of the polymerizable monomer being mono-ene monomer; (2) a hypochlorite in amounts such that the molar C10 content thereof, i. e. the hypochlorite ion therein, is in the range between about 0.02 mol and about 2 mols per 100 mols of monomer introduced into the composition; (3) aqueous ammonia in amounts such that the total molar $NH_3$ content thereof, as such and in combined form as $NH_4^+$ ions and as $NH_4OH$ molecules, i. e. the stoichiometric molar quantity of ammonia in the aqueous ammonia solution, is in the range between about 0.3 mol and about 30 mols per 100 mols of monomer introduced into the composition; (4) a cupric salt in amounts such that the mol ratio of the cupric salt:stoichiometric molar quantity of ammonia as above defined under item (3) is in the range between about 1:400 and about 1:10.

---

2,775,580



## SULFOBENZYL LIGNINS

Virgil Scarth, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Application May 25, 1953, Serial No. 357,340

19 Claims. (Cl. 260—124)

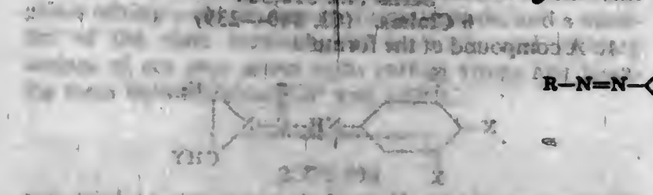
1. A new composition of matter characterized by the following formulation

in which R represents a lignin residue, R′ and R″ represent groups selected from among H and alkyl radicals having 1 to 3 carbon atoms per radical, the grouping

having a maximum of 4 carbon atoms, M represents an element or group selected from among H, $NH_4$, and a metal, y represents the average degree of substitution, n represents the number of units per lignin molecule, and X and Y represent end groups of a lignin molecule.

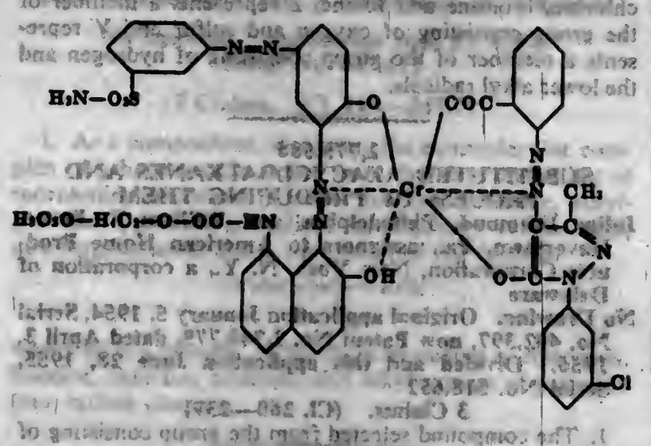
2,775,581

## METAL-CONTAINING AZO DYESTUFFS



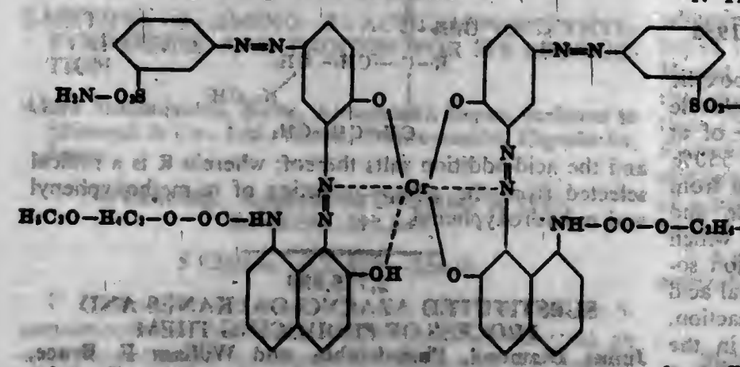
Reinhard Nohr and Charles Pottjeus, Basel, and Walter Wehrli, Riehen, Switzerland, assignors to Sandoz A. G., Basel, Switzerland, a Swiss firm

No Drawing. Application June 24, 1955, Serial No. 517,916

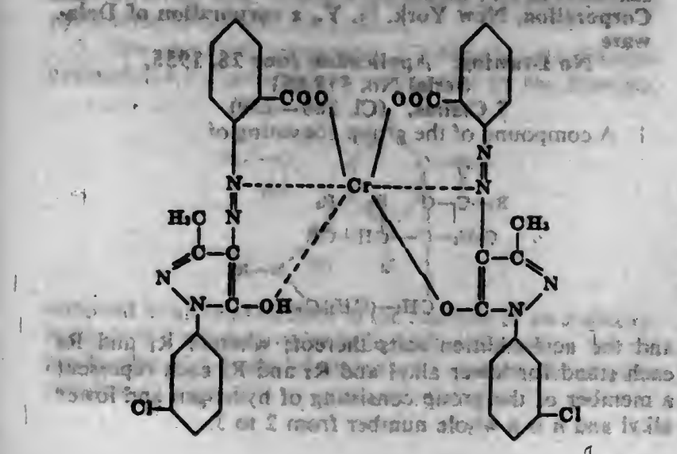


Claims priority, application Switzerland June 25, 1954

6 Claims. (Cl. 260—145)



2. The composition of matter consisting of the

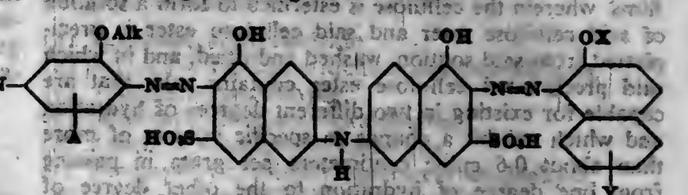


asymmetrical chromium-containing azo dyestuff corresponding to the formula

and the respective symmetrical chromium-containing azo dyestuffs corresponding to the formulae

and

2,775,582



## UNSYMMETRICAL TRISAZO DYESTUFF

Norman L. Anderson, Hasbrouck Heights, N. J., assignor to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York

No Drawing. Application April 29, 1952, Serial No. 285,670

19 Claims. (Cl. 260—173)

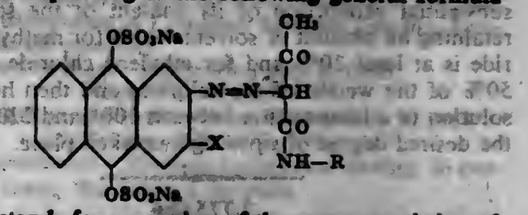
1. An unsymmetrical trisazo dyestuff which dyes cellulosic fibers blue shades the fastness properties of which are improved by aftertreatment of the dyed fiber with coppering agents, said dyestuff in the free acid form corresponding with the general formula:

wherein: R represents an ortho-hydroxy-carboxyaryl radical derived from a member of the group consisting of benzene, naphthalene, and the lower alkyl, lower alkoxy, and chlorinated derivatives thereof, Alk represents a lower alkyl radical, A represent a member of the group consisting of hydrogen, Alk and OAlk, X represents a member of the group consisting of hydrogen, lower alkyl radicals, lower hydroxyalkyl radicals and lower carboxy-alkyl radicals, and Y represents a sulfo group in one of the beta-positions remote from the —OX radical.

---

2,775,583

## LEUCO SULFURIC ACID ESTERS OF ANTHRAQUINONE-AZO-DYESTUFFS



Eduard Besler and Otto Brunnsdorf, Frankfurt am Main, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius und Bruning, Frankfurt am Main, Hochst, Germany

No Drawing. Application May 29, 1952, Serial No. 290,822

Claims priority, application Germany May 31, 1951

5 Claims. (Cl. 260—193)

1. The leuco sulfuric acid esters of anthraquinone-azo-

dyestuffs corresponding to the following general formula

wherein X stands for a member of the group consisting of hydrogen, chlorine and bromine, and R represents a radical selected from the group consisting of benzene, chlorobenzene, dichlorobenzene, methoxybenzene, methoxy-chlorobenzene, methylbenzene, methoxy-bromobenzene, dimethoxy-benzene, dimethoxy-chlorobenzene, methoxy-benzoylamino - chlorobenzene, methyl - dichlorobenzene, methyl-methoxy-bromobenzene and diethoxy-bromobenzene.

2,775,584

## PREPARATION OF ORGANIC ACID ESTERS OF CELLULOSE HAVING AN IMPROVED RESISTANCE TO DELUSTERING

Blanche B. White, Summit, Gregory M. Moeller, Basking Ridge, and Leonard J. Rosen, East Orange, N. J., assignors to Celanese Corporation of America, New York, N. Y., a corporation of Delaware

No Drawing. Application November 16, 1951, Serial No. 256,811
10 Claims. (Cl. 260—230)

1. In the process for manufacturing organic acid esters of cellulose suitable for the production of filaments and films, wherein the cellulose is esterified to form a solution of said cellulose ester and said cellulose ester is precipitated from said soution, washed and dried, and in which said precipitated cellulose ester contains salts that are capable for existing in two different degrees of hydration and which exhibit a change in specific volume of more than about 0.6 cubic centimeters per gram in passing from one degree of hydration to the other degree of hydration, the improvement which comprises carrying out the washing of said precipitated cellulose ester with a water solution of a salt, selected from the group consisting of soluble calcium and barium salts, that will react with said aforementioned salts by metathesis to produce salts which exhibit a change in specific volume of less than about 0.6 cubic centimenters per gram in passing from one degree of hydration to another degree of hydration, at least one of the salts produced having a lower solubility than the salts present in the organic acid esters of cellulose and in the wash water and then drying said cellulose ester directly after said washing, said improvement resulting in an increase in the resistance to delustering of said cellulose ester when in the form of a film or filament.

2,775,585

## RIPENING CELLULOSE ESTERS IN SOLUTION

Harold Bates and James Wotherspoon Fisher, Spondon, near Derby, and John Richard Smith, London, England, assignors to British Celanese Limited, a corporation of Great Britain

No Drawing. Application June 5, 1953, Serial No. 359,972
Claims priority, application Great Britain June 9, 1952
17 Claims. (Cl. 260—230)

1. A process for ripening cellulose esters of carboxylic acids containing 2 to 4 carbon atoms in the molecule made by esterifying cellulose with the anhydride of at least one such acid in the presence of more than 350% on the weight of the cellulose of a solvent selected from the group which consists of methylene chloride and ethylene chloride and of sulphuric acid as catalyst, which comprises adding water to the primary esterification solution in amount sufficient both to hydrolyse residual acid anhydride and to provide water for the ripening reaction, neutralising substantially all the sulphuric acid in the solution, removing from the solution by distillation a substantial proportion of its content of the solvent but retaining an amount of solvent which for methylene chloride is at least 30% and for ethylene chloride is at least 50% of the weight of the cellulose and then heating the solution to a temperature between 100° and 220° C. until the desired degree of ripening has taken place.

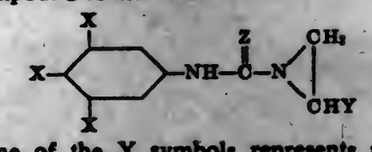
2,775,586

## PREPARATION OF STARCH SULFATE ESTERS

Eugene P. Paschall, Orland Park, Ill., assignor to Corn Products Refining Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application October 4, 1954, Serial No. 460,251
6 Claims. (Cl. 260—233.5)

1. A process for preparing starch sulfate esters in ungelatinized, granule form which comprises heating starch in granule form in semi-dry condition in contact with the reaction product of sodium nitrite and sodium bisulfite under non-gelatinizing conditions until the desired starch sulfate ester is formed, the initial pH of the mixture undergoing treatment being at least about 5.



2,775,587

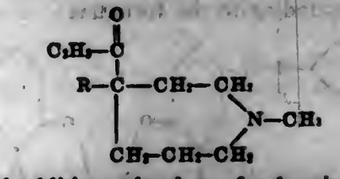
## HALOARYL AZRIDINECARBOXAMIDES

Bryant C. Fischbach, Walnut Creek, and Guy H. Harris, Concord, Calif., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application May 23, 1955, Serial No. 510,564
6 Claims. (Cl. 260—239)

1. A compound of the formula

wherein one of the X symbols represents at least one member of the group consisting of bromine, chlorine and iodine, and the remaining X symbols each represent a member of the group consisting of hydrogen, methyl, chlorine, bromine and iodine, Z represents a member of the group consisting of oxygen and sulfur and Y represents a member of the group consisting of hydrogen and the lower alkyl radicals.



2,775,588

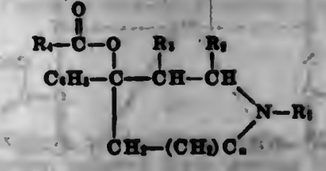
## SUBSTITUTED AZACYCLOALKANES AND PROCESS OF PRODUCING THEM

Julius Diamond, Philadelphia, and William F. Bruce, Havertown, Pa., assignors to American Home Products Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Original application January 5, 1954, Serial No. 402,397, now Patent No. 2,740,779, dated April 3, 1956. Divided and this application June 28, 1955, Serial No. 518,652
3 Claims. (Cl. 260—239)

1. The compound selected from the group consisting of an azacycloheptane having the formula

and the acid-addition salts thereof; wherein R is a radical selected from the group consisting of m-methoxyphenyl and m-hydroxyphenyl.



2,775,589

## SUBSTITUTED AZACYCLOALKANES AND PROCESS OF PRODUCING THEM

Julius Diamond, Philadelphia, and William F. Bruce, Havertown, Pa., assignors to American Home Products Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application June 28, 1955, Serial No. 518,651
7 Claims. (Cl. 260—239)

1. A compound of the group consisting of

and the acid-addition salts thereof; wherein $R_1$ and $R_4$ each stand for lower alkyl and $R_2$ and $R_3$ each represent a member of the group consisting of hydrogen and lower alkyl and $n$ is a whole number from 2 to 3.

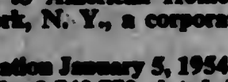
2,775,590

## PROCESS FOR PREPARATION OF CERTAIN OXAZINES AND PIPERIDINOLS

Claude J. Schmidle, Moorestown, N. J., assignor to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Application March 27, 1956, Serial No. 574,110
6 Claims. (Cl. 260—244)

1. A process for preparing 6-methyl-6-phenyltetrahydro-1,3-oxazines and 4-phenyl-4-piperidinols which comprises mixing α-chlorocumene, formaldehyde, and a member of the class consisting of ammonia and primary amines of not over about eight carbon atoms and reacting them between about 20° and 100° C.



2,775,591

## ALCOHOL-AMINE COMPLEXES

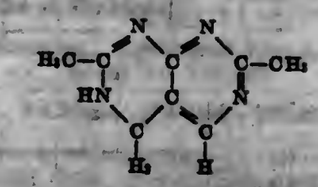
W. E. Craig, Philadelphia, Pa., and Harold F. Wilson, Moorestown, N. J., assignors to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Application June 17, 1954, Serial No. 437,571
7 Claims. (Cl. 260—247.7)

1. As a composition of matter, the equimolecular complex of a heterocyclic amine from the class consisting of morpholine, nicotine, picoline, lutidine, collidine, ethylpyridine, pyridine, quinoline, isoquinoline, benzoxazole, and benzothiazole and a compound of the formula

where R' is a member of the class consisting of hydrogen, fluorine, chlorine, bromine, and alkyl groups of not over four carbon atoms.

2,775,592



## 2-METHYL-4-AMINO-5-ACETAMINOMETHYLPYRIMIDINE AND PROCESS FOR ITS PRODUCTION

Akira Takamizawa, Kaizo, Amagasaki, Japan, assignor to Shionogi & Co., Ltd., Osaka, Doshe-machi, Higashi-ku, Japan

No Drawing. Application December 8, 1953, Serial No. 397,041
5 Claims. (Cl. 260—256.4)

1. Process for the production of 2-methyl-4-amino-5-acetaminomethylpyrimidine which comprises reacting an α-alkoxymethylene-β-alkoxypropionitrile with acetamidine and recovering said 2-methyl-4-amino-5-acetaminomethylpyrimidine as the reaction product.

5. The chemical compound 2,7-dimethyl-5,6-dihydropyrimidol(4,5-d)pyrimidine, represented by the formula:

obtained as an intermediate in the reaction of an α-alkoxymethylene-β-alkoxypropionitrile with acetamidine for the production of 2-methyl-4-amino-5-acetaminomethylpyrimidine.

2,775,593

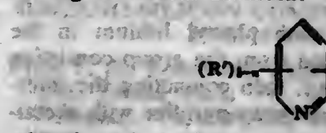
## THIOSEMICARBAZONES OF ALDEHYDES AND KETONES OF THE HETEROCYCLIC SERIES

Robert Behnisch and Fritz Mietzsch, Wuppertal-Elberfeld, and Hans Schmidt, Wuppertal-Vohwinkel, Germany, assignors, by mesne assignments, to Schenley Industries, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application November 17, 1949, Serial No. 128,022
In Germany October 1, 1948
Public Law 619, August 23, 1954,
Patent expires October 1, 1968
6 Claims. (Cl. 260—279)

1. A thiosemicarbazone of a carbonyl compound of the group consisting of

(a) Quinolinecarboxaldehyde,
(b) 6-(1,2,3,4-tetrahydro)quinolinecarboxaldehyde,
(c) 3-indolecarboxaldehyde,
(d) N-methyl-3-indolecarboxaldehyde,
(e) 2-methyl-3-indolecarboxaldehyde,
(f) 2-methyl-5-(2,3-dihydro)indolecarboxaldehyde,
(g) 1,3,3-trimethyl-$\Delta^{2,6}$-indolineacetaldehyde,
(h) 5-methoxy - 1,3,3 - trimethyl - $\Delta^{2,6}$ - indolineacetaldehyde,
(i) 3-thianaphthenecarboxaldehyde,
(j) 2-dimethylamino-5-pyridinecarboxaldehyde,
(k) 9-acridinecarboxaldehyde, and
(l) Isatin.



2,775,594

## STABILIZATION OF POLYMERIZABLE HETEROCYCLIC NITROGEN COMPOUNDS

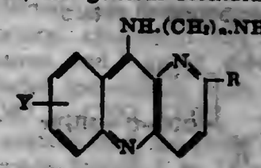
Mack F. Potts, Paul S. Hudson, and Warren L. Smith, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Application May 27, 1952, Serial No. 290,321
10 Claims. (Cl. 260—283)

1. A process for inhibiting the polymerization of a heterocyclic nitrogen compound represented by the following structural formula:

wherein $n$ is an integer selected from the group consisting of 1 and 2, R is selected from the group consisting of H and $CH_3$, and each R' is individually selected from the group consisting of H and alkyl radicals, not more than 12 carbon atoms being present in the total of said R' radicals, which comprises adding to said heterocyclic nitrogen compound a polymerization inhibiting amount of a sulfide selected from the group consisting of the sulfides of selenium and tellurium.

7. A composition comprising 2-vinylpyridine and a polymerization inhibiting amount of selenium monosulfide.



2,775,595

## SUBSTITUTED 1.10-DIAZA-ANTHRACENES

Alan August Goldberg, Shepton Mallet, England, assignor to Ward Blenkinsop & Company Limited, London, England, a British company

No Drawing. Application July 5, 1955, Serial No. 520,697
Claims priority, application Great Britain July 8, 1954
12 Claims. (Cl. 260—288)

1. A 9-substituted 1.10-diaza-anthracene having, in one tautomeric form, the general formula

in which R is an alkoxy group having one to six carbon atoms, Y is selected from the group consisting of hydro-

gen and halogen atoms, R' is an hydroxy-alkyl group having at least two but less than seven carbon atoms and at least one but less than three hydroxyl groups and *n* is an integer having a minimum value of two and a maximum value of six, and acid salts thereof.

---

2,775,596

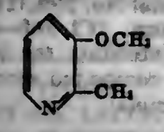
## PRODUCTION OF SUBSTITUTED PYRIDINES

John E. Mahan, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Application October 20, 1952, Serial No. 315,837
15 Claims. (Cl. 260—290)

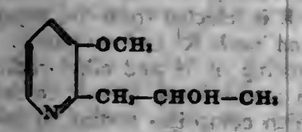
1. In a process for producing pyridine derivatives by the interaction of carbonyl compound with ammonia, the improvement which comprises effecting the reaction in the presence of a compound selected from the group consisting of antimony fluoride, copper fluoride, bismuth fluoride, zinc fluoride, iron fluoride, and barium fluoride.

---



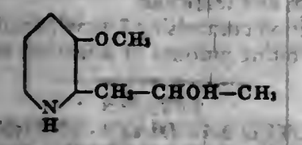
2,775,597

## METHOD FOR PREPARING QUINAZOLONE INTERMEDIATES

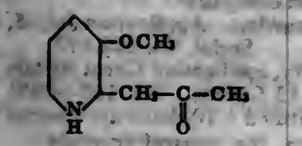


Bernard R. Baker, Nanuet, N. Y., and Francis J. McEvoy, Nutley, N. J., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

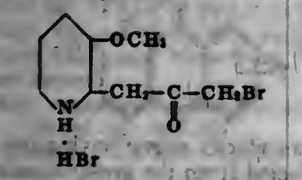
No Drawing. Application February 12, 1954, Serial No. 410,034
13 Claims. (Cl. 260—294.3)



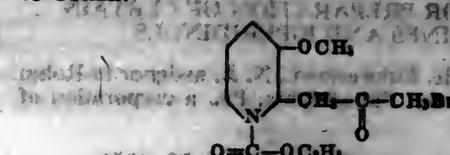
1. A method which comprises the steps of treating 2-methyl-3-pyridol with sodium methoxide and trimethylphenylammonium chloride at a temperature of from about 120° C. to about 180° C. in the presence of a non-acidic organic solvent to obtain:



contacting said compound with phenyl lithium in the presence of a member selected from the group consisting of ethyl ether and butyl ether, then contacting the intermediate 2-lithium methyl-3-methoxy-pyridine with acetaldehyde to obtain:



reducing said compound with hydrogen in the presence of platinum oxide catalyst to obtain:



oxidizing said compound under strong oxidizing conditions to obtain:

brominating said compound to obtain:

and contacting said product with ethyl chlorocarbonate to obtain:

---

2,775,598

## PROCESS OF PREPARING PYRIDOXAL ISONICOTINOYLHYDRAZONE AND INTERMEDIATE USED THEREIN

Sydney Archer and Morris E. Auerbach, Albany, N. Y., assignors to Sterling Drug Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application April 14, 1955, Serial No. 501,625
2 Claims. (Cl. 260—295)

1. A process for the preparation of pyridoxal isonicotinoylhydrazone which comprises heating an aqueous acidic solution of pyridoxine with manganese dioxide, treating the resulting solution containing pyridoxal and manganous ion with isonicotinoylhydrazine to form manganous bis-(pyridoxal isonicotinoylhydrazone), collecting the precipitated manganous bis-(pyridoxal isonicotinoylhydrazone) salt, and heating an aqueous alkaline suspension of the manganous salt with an aqueous alkaline solution of ethylenediamine-N,N,N',N-tetraactice acid to liberate the pyridoxal isonicotinoylhydrazone.

---

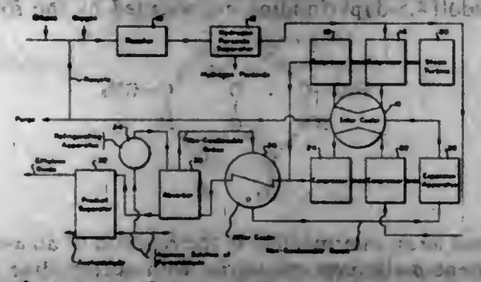
2,775,599

## PROCESS FOR THE PRODUCTION OF N-VINYLPYRROLIDONE-2

Bruno Puetzer and Leon Katz, Cincinnati, Ohio, and Lester Horwitz, Binghamton, N. Y., assignors to Schenley Industries, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application April 10, 1952, Serial No. 281,658
4 Claims. (Cl. 260—326.5)

1. Process for the production of N-vinylpyrrolidone-2 which comprises heating in the liquid phase, at a temperature not substantially in excess of the boiling point of benzene and at ordinary atmospheric pressure, a solution in a substantially inert organic solvent of an N-(β-haloethyl)-pyrrolidone-2 and a basic reagent selected from the group consisting of alkali-metal amides, potassium hydroxide and lower alkoxides of the alkali-metals, separating the solvent from the reaction mixture, and recovering N-vinylpyrrolidone-2 by distillation at a subatmospheric pressure.



---

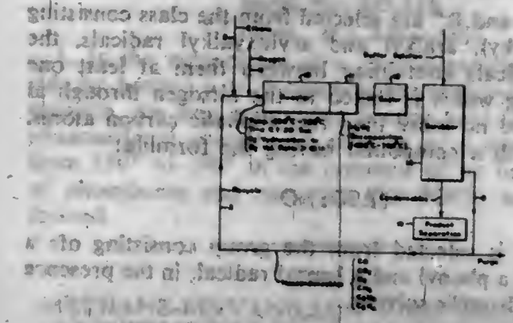
2,775,600

## SEPARATION OF ETHYLENE OXIDE FROM A GASEOUS MIXTURE CONTAINING SAME

Frank Maslan, Brookline, Mass., assignor to National Research Corporation, Cambridge, Mass., a corporation of Massachusetts

Application June 1, 1954, Serial No. 433,644
5 Claims. (Cl. 260—348)

1. In the process for separating ethylene oxide, formaldehyde and acetaldehyde from an effluent gaseous mixture freed of hydrogen peroxide and obtained from an oxidation of ethane and recycle gases rich in ethylene in a low-temperature, low-pressure, noncatalytic reaction, the improvement which comprises compressing said effluent gaseous mixture to a pressure on the order of about 100 p. s. i., absorbing a mixture comprising acetaldehyde, formaldehyde and ethylene oxide therefrom with a liquid-absorbing medium selected from the group consisting of water and aqueous solutions of formaldehyde maintained at a temperature below about 20° C., and decompressing the remainder of the effluent gaseous mixture to recover the energy content therefrom.



---

2,775,601

## NON-CATALYTIC VAPOR PHASE OXIDATION OF ETHANE

James H. Gardner and Nat C. Robertson, Cambridge, and Erwin F. Schoenbrunn, Needham Heights, Mass., assignors to National Research Corporation, Cambridge, Mass., a corporation of Massachusetts

Application November 17, 1952, Serial No. 320,954
4 Claims. (Cl. 260—348.5)

1. A process for the production of ethylene oxide from ethane which comprises the steps of feeding a mixture of ethane and large quantities of recycle gas into a catalyst-free reaction zone heated to a temperature between 400° C. and 700° C., feeding with said mixture a quantity of oxygen such that said mixture contains less oxygen than ethane, said mixture having a volume ratio of $C_2$ hydrocarbons to oxygen of above 10, maintaining said gaseous mixture at a pressure slightly in excess of atmospheric pressure, said gaseous mixture being passed through said heated reaction zone for a period of time from about a fraction of a second to twenty seconds, said time being sufficient to effect consumption of only 35% to 75% of the oxygen fed to the reactor, removing hydrogen peroxide from the exit gas, separating the oxygenated hydrocarbons from the exit gas, and recycling unoxygenated hydrocarbons and unconsumed oxygen to the reactor.

---

2,775,602

## THIOSTEROID PRODUCTION

John C. Babcock and Arnold C. Ott, Kalamazoo, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application June 5, 1953, Serial No. 359,965
6 Claims. (Cl. 260—397.3)

1. The process which comprises reacting a $\Delta^4$-3-keto steroid, selected from $\Delta^4$-3,20-diketopregnenes and $\Delta^4$-3,17-diketoandrostenes, with benzyl mercaptan in an organic solvent and in the presence of a boron trifluoride reaction catalyst to selectively convert the 3-keto group to a 3-thio group.

---

2,775,603

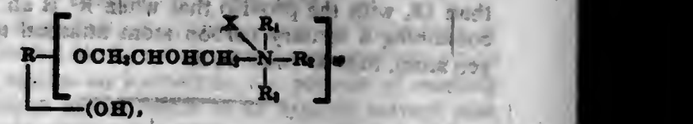
## CYCLIZATION PROCESS

John C. Sheehan, Arlington, Mass.

No Drawing. Application October 2, 1953, Serial No. 383,914
5 Claims. (Cl. 260—397.4)

1. In the acyloin condensation of a seco-steroid diester to form a steroid ring, the improvement comprising carrying out said cyclization with sodium in a homogeneous medium.

---



2,775,604

## QUATERNARY AMMONIUM HALIDES

John David Zech, Wilmington, Del., assignor to Atlas Powder Company, Wilmington, Del., a corporation of Delaware

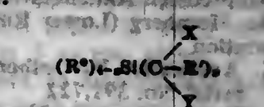
No Drawing. Application February 9, 1953, Serial No. 336,695
14 Claims. (Cl. 260—404.5)

1. A chemical compound of the formula:

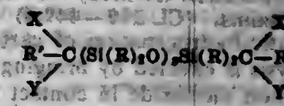
wherein:

R=the hydroxyl free residue of a hexitol
$w$=1 to 6
$z$=6—$w$
$R_1$=an alkyl radical with 6 to 25 carbon atoms
$R_2$ and $R_3$ are lower alkyl radicals
X=a halide

---



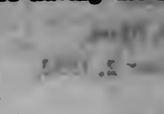
2,775,605



## ORGANO-SILICON COMPOUNDS AND METHODS FOR MAKING THEM

Peter L. De Benneville, Philadelphia, and Marvin J. Hurwitz, Elkins Park, Pa., assignors to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Application June 1, 1955, Serial No. 512,571
15 Claims. (Cl. 260—448.2)



1. A composition of matter comprising a compound selected from the group consisting of those having Formulas I and II:

I 

II 

where $x$ is an integer having a value of 1 to 2, $y$ is an integral or mixed number having a value or an average value of about 1 to 9, R° is selected from the group consisting of vinyl, allyl, and alkyl groups having 1 to 18 carbon atoms, R is an alkyl group having 1 to 3 carbon atoms, R' is selected from the group consisting of hydrogen, phenyl, benzyl, cyclohexyl and alkyl groups of 1 to 18 carbon atoms, and X and Y are electron-withdrawing groups selected individually from the group consisting of —$COOR^2$, —CHO, $COR^2$, —CN, and —$NO_2$, wherein $R^2$ is selected from the group consisting of alkyl and alkenyl groups having 1 to 18 carbon atoms with the proviso that X and Y cannot both be —$COOR^2$.

11. The method which comprises reacting a compound having the formula

with a compound selected from the group consisting of

$(R^\circ)_{4-x}SiCl_x$

$Cl(Si(R)_2O)_ySi(R)_2Cl$

$(R^\circ)_{4-x}Si(NR^3R^4)_x$

$R^3R^4N(Si(R)_2O)_ySi(R)_2NR^3R^4$

where $x$, $y$, $R^\circ$, R, R', X, and Y are defined in claim 1, and $R^3$ and $R^4$ together may be the morpholino residue $=(CH_2CH_2)_2O$, the piperidino residue $-(CH_2)_5-$, or the pyrrolidino residue $-(CH_2)_4-$, or separately; $R^3$ may be cyclohexyl, phenyl, aralkyl, especially benzyl, or an alkyl group having 1 to 18 carbon atoms, $R^4$ may be hydrogen, cyclohexyl, aralkyl, especially benzyl, or an alkyl group having 1 to 18 carbon atoms, the total of carbon atoms in $R^3$ and $R^4$ together being no greater than 18, with the proviso that when $R^3$ is an alkyl group containing a tertiary carbon atom attached to the nitrogen atom, then $R^4$ must be H.

## REACTION OF BENZENE AND DICHLOROSILANE TRICHLOROSILANE MIX

George H. Wagner, Clarence, and Paul W. Shafer, Niagara Falls, N. Y., assignors to Union Carbide and Carbon Corporation, a corporation of New York

No Drawing. Application March 22, 1954, Serial No. 417,922

10 Claims. (Cl. 260—448.2)

1. The method for production of phenyldichlorosilane which comprises subjecting a reaction mixture of benzene, trichlorosilane and dichlorosilane to elevated temperatures and pressures, said elevated temperatures being greater than 150° C. and said elevated pressures being at least sufficient to maintain a liquid phase, and said reaction mixture containing a mole ratio of trichlorosilane to dichlorosilane of at least 0.1 of a mole of trichlorosilane to 1 mole of dichlorosilane.

---

2,775,607

## REACTIVATION OF CATALYSTS

Herbert Kölbel and Paul Ackermann, Moers, Germany, assignors to Rheinpreussen Aktiengesellschaft für Bergbau und Chemie, Homberg (Lower Rhine), Germany, a German corporation

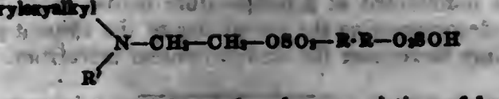
No Drawing. Application November 12, 1953, Serial No. 391,722

Claims priority, application Germany November 17, 1952

3 Claims. (Cl. 260—449.6)

1. In the catalytic hydrogenation of carbon monoxide wherein the catalysis is effected by bringing a mixture of hydrogen and carbon monoxide in contact with a finely-divided solid catalyst suspended in a liquid reaction medium in a reaction zone, the reaction taking place in the presence of said suspended catalyst and wherein the activity of said catalyst in suspension declines slowly and then reaches a point of incipient catalyst activity decrease defined by a sudden fall of catalyst activity, the improvement making it possible to employ the catalyst after activity declines, which comprises removing part of said catalyst suspension from the reaction zone, dividing the catalyst of the removed suspension into a portion rich in carbon and a portion poor in carbon, suspending the latter portion in an inert liquid to thereby form a reactivated catalyst suspension, and thereafter passing this reactivated suspension to the aforesaid reaction zone.

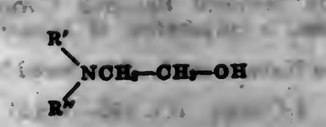
2,775,608



## SULFONIC ACID ESTERS OF 2-DIALKYLAMINE ETHANOLS

James M. Sprague, Drexel Hill, and Edward L. Engelhardt, Collingdale, Pa., assignors to Merck & Co., Inc., a corporation of New Jersey

No Drawing. Application February 8, 1956, Serial No. 563,164



6 Claims. (Cl. 260—456)

1. Compounds having the general formula

wherein R' is selected from the class consisting of lower alkyl, aralkyl and aryloxyalkyl radicals and R is selected from the class consisting of lower alkyl, phenyl, lower alkyl substituted phenyl, and benzyl radicals.

6. The process for obtaining sulfonic acid esters of 2-dialkylamino-ethanols in which a compound having the formula:

in which R' and R'' are selected from the class consisting of lower alkyl, aralkyl and aryloxyalkyl radicals, the selected radicals containing between them at least one benzene ring which is linked to the nitrogen through at least one and no more than two aliphatic carbon atoms, is mixed with a compound having the formula:

$(RSO_3)_2O$

in which R is selected from the group consisting of: a lower alkyl, a phenyl and a benzyl radical; in the presence of a non-hydroxylic solvent.

2,775,609

## PREPARATION OF CYANO ORGANICSULFONYL CHLORIDES

Frederick Comte, Kirkwood, Mo., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application July 8, 1954, Serial No. 442,211

5 Claims. (Cl. 260—465)

1. In the preparation of a cyano organicsulfonyl chloride by heating a trichlorophosphazosulfonyl organic acyl chloride, the step comprising heating said trichlorophosphazosulfonyl organic acyl chloride at a temperature of from 150° to 190° C. in the presence of an aromatic sulfonamide as a reaction moderator and removing the $POCl_3$ as rapidly as formed.

---

2,775,610

## PREPARATION OF CYANO ORGANICSULFONYL CHLORIDES

Frederick Comte, Kirkwood, Mo., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application July 8, 1954, Serial No. 442,212

4 Claims. (Cl. 260—465)

1. In the preparation of a cyano organicsulfonyl chloride by heating a trichlorophosphazosulfonyl organic acyl chloride, the steps comprising heating a mixture containing initially said trichlorophosphazosulfonyl organic acyl chloride and at least one part by weight of the desired cyano organicsulfonyl chloride as a reaction moderator per 100 parts by weight of said trichlorophosphazosulfonyl organic acyl chloride at a temperature of from 150° to 190° C. and removing the $POCl_3$ as formed.

2,775,611

## PREPARATION OF CYANO ORGANICSULFONYL CHLORIDES

Frederick Comte, Kirkwood, Mo., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application July 8, 1954, Serial No. 442,213

6 Claims. (Cl. 260—465)

1. In the preparation of a cyanoorganicsulfonyl chloride by heating a trichlorophosphazosulfonyl organic acyl chloride, the step comprising heating said trichlorophosphazosulfonyl organic acyl chloride at a temperature of from 150° to 190° C. in the presence of a catalytic amount of water of from about 0.1% to about 2% by weight and removing the $POCl_3$ as rapidly as formed.

---

2,775,612

## PREPARATION OF CYANO ORGANICSULFONYL CHLORIDES

Frederick Comte, Kirkwood, Mo., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application July 8, 1954, Serial No. 442,214

7 Claims. (Cl. 260—465)

1. In the preparation of a cyanoorganicsulfonyl chloride by heating a trichlorophosphazosulfonyl organicacyl chloride, the step comprising heating said trichlorophosphazosulfonyl organicacyl chloride at a temperature of from 150° to 190° in the presence of an inorganic acid of phosphorus and removing the $POCl_3$ as rapidly as formed.

---

2,775,613

## METHANE-BIS(VANILLIN) AND DERIVATIVES AND PROCESSES FOR PREPARING THE SAME

John D. Garber, Cranford, N. J., assignor to Merck & Co., Inc., Rahway, N. J., a corporation of New Jersey

No Drawing. Application March 15, 1954, Serial No. 416,430

5 Claims. (Cl. 260—479)

1. A member from the group consisting of bis(2-hydroxy-3-methoxy-5-formyl phenyl) methane and bis (2-acyloxy-3-methoxy-5-formyl phenyl) methane, wherein the acyl substituent is a lower fatty acid radical.

---

2,775,614

## PRODUCTION OF ESTERS OF γ-CHLOROBUTYRIC ACID

Friedrich Hoelscher, Otterstadt, Germany, assignor to Badische Anilin- & Soda-Fabrik Aktiengesellschaft, Ludwigshafen (Rhine), Germany

No Drawing. Application June 13, 1952, Serial No. 293,452

Claims priority, application Germany July 13, 1951

3 Claims. (Cl. 260—487)

1. An improved process for the manufacture of esters of γ-chlorobutyric acid which comprises passing dry hydrogen chloride into a boiling mixture of about equivalent amounts of γ-butyrolactone and hydroxy compounds in the presence of a diluent which forms an azeotropic mixture with water whereby the water formed during the reaction is continuously removed azeotropically, said hydroxy compounds being selected from the group consisting of aliphatic, cycloaliphatic and araliphatic mono to tetrahydroxy compounds containing from 3 to 8 carbon atoms in the molecule and devoid of reactive groups other than said hydroxyl groups.

2,775,615

## POLYHALOGENATED POLYCARBOXYLATES

Tracy M. Patrick, Jr., Melrose, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application January 13, 1954, Serial No. 403,905

5 Claims. (Cl. 260—488)

1. A halogenated ester selected from the class consisting of 4-acetoxymethyl-2,6,6,6-tetrachlorohexyl acetate and 4-acetoxymethyl-6,6,6-trichlorohexyl acetate.

---

2,775,616

## PREPARATION OF METHIONINE FROM α-AMINO-γ-METHYLTHIOBUTYRONITRILE

David Oliver Holland, Dorking, England, assignor to Beecham Research Laboratories Limited, Betchworth, England, a company of Great Britain

No Drawing. Application December 15, 1952, Serial No. 326,170

Claims priority, application Great Britain December 21, 1951

7 Claims. (Cl. 260—534)

1. In the manufacture of methionine by hydrolysis of crude methionine nitrile which contains by-products which yield tarry matter on hydrolysis, the process of reacting upon a solution of the nitrile in an organic solvent with a mineral acid selected from the group consisting of phosphoric acid and sulphuric acid so as to precipitate the corresponding salt and then removing and hydrolysing the salt, the solvent being selected from the group consisting of lower alkyl alcohols, lower alkyl mono ethers of a polymethylene glycol, and acetone such that the nitrile salt is substantially insoluble and the by-products substantially soluble therein.

---

2,775,617

## PREPARATION OF TETRA-ALKYL QUATERNARY AMMONIUM HALIDES

Sydney H. Shapiro, Chicago, and Miles R. McCorkle, Oswego, Ill., assignors to Armour and Company, Chicago, Ill., a corporation of Illinois

No Drawing. Application November 13, 1951, Serial No. 256,149

5 Claims. (Cl. 260—567.6)

1. In a process of preparing a quaternary ammonium compound, the step comprising reacting one mole of an alkyl secondary amine in which the alkyl groups contain from 12 to 22 carbon atoms with more than one mole of an alkyl halide in which the alkyl group contains from 1 to 5 carbon atoms, in the presence of a sufficient amount of sodium bicarbonate to neutralize the hydrohalic acid produced by the reaction as it is formed and to maintain the reactants at a basic pH without promoting hydrolysis of the alkyl halide.

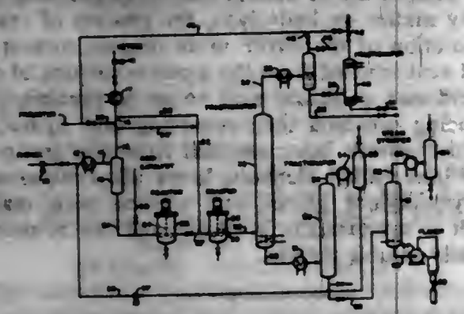
---

2,775,618

## CHLORINATED ACYL PEROXIDES AND METHOD FOR THEIR MANUFACTURE

Albert L. Dittman, Jersey City, N. J., and John M. Wrightson, Whittier, Calif., assignors to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Original application May 11, 1951, Serial No. 225,850, now Patent No. 2,705,706, dated April 5, 1955. Divided and this application April 11, 1952, Serial No. 281,866



3 Claims. (Cl. 260—610)

1. Trifluorodichloropropionyl peroxide, in which all fluorine substituents appear at the terminal carbon atoms.

2,775,619
**PREPARATION OF PARAFORMALDEHYDE**
Alexander Golat, Yonkers, N. Y.
No Drawing. Application September 25, 1953, Serial No. 382,450
9 Claims. (Cl. 260—615)

1. The process of producing paraformaldehyde comprising heating to a temperature within the approximate range 90–100° C. an aqueous solution containing hydrated formaldehyde and formaldehyde polymers, maintaining said solution at said temperature for a period of about one half to one hour, removing water from the resulting depolymerized solution by evaporation at reduced pressure at such a rate that the still bottoms reach a temperature in the range 75–85° C. before the still bottoms exhibit more than a slight turbidity and cooling the still bottoms to produce solid paraformaldehyde.

2,775,620
**PRODUCTION OF BIS(HYDROXYARYL) SUBSTITUTED COMPOUNDS**
George T. Williamson, Oakland, Calif., assignor to Shell Development Company, New York, N. Y., a corporation of Delaware
Application July 12, 1954, Serial No. 442,770
11 Claims. (Cl. 260—619)

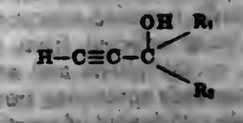
10. In a process for the production of bis(hydroxyaryl) alkanes wherein a phenol having at least one replaceable hydrogen atom attached directly to a carbon atom in the phenolic ring is reacted with an aliphatic ketone in the presence of an acid catalyst consisting essentially of a strong mineral acid at a temperature in the range of from about 20 to about 110° C., the steps which comprise charging said phenol and said aliphatic ketone in continuous stream in a mole ratio of phenol to said aliphatic ketone of at least 5:1 and in the presence of said acid catalyst through a plurality of reaction zones arranged in series flow and maintained at a temperature in said temperature range, introducing in constant stream a mixture comprising said acid catalyst and all of said phenol but only from about 10 to about 90% by weight of said aliphatic ketone into the first of said plurality of reaction zones, introducing the remainder of said aliphatic ketone in continuous stream into at least one reaction zone subsequent to said first reaction zone in said plurality of reaction zones, and maintaining a temperature gradient increasing progressively in the direction of flow of the reactants through said plurality of zones.

2,775,621
**HYDROGENATION OF FORMALDEHYDE CONDENSATION PRODUCTS**
Alexander F. MacLean and Adin L. Stautzenberger, Corpus Christi, Tex., assignors to Celanese Corporation of America, New York, N. Y., a corporation of Delaware
No Drawing. Application June 20, 1952, Serial No. 294,705
3 Claims. (Cl. 260—635)

1. A process for the hydrogenation of an aqueous mixture of carbohydrates produced by the condensation of aqueous formaldehyde in the presence of a multivalent metal compound which is a catalyst for said condensation, comprising the steps of removing said multivalent metal as an insoluble compound from said carbohydrate mixture, bringing the pH of said mixture to between 3 and 5, and then directly, without further treatment, distilling said mixture, containing at most 5% of formaldehyde, at a pH between 3 and 5 to remove formaldehyde therefrom to bring the formaldehyde content thereof to not more than 0.5%, removing most of the acidic constituents of the mixture, and hydrogenating the aqueous carbohydrate mixture containing 10 to 20% of said carbohydrate resulting from the preceding steps at a pressure of 500 to 2000 pounds per square inch gauge in the presence of a catalyst for the hydrogenation.

2,775,622
**2,2-DIMETHYLOL-1,5-DIHYDROXYPENTANE AND DERIVATIVES THEREOF**
John E. Snow, Hasbrouck Heights, N. J., assignor to Heyden Chemical Corporation, New York, N. Y., a corporation of Delaware
No Drawing. Application March 27, 1951, Serial No. 217,885
5 Claims. (Cl. 260—635)

1. 2,2-dimethylol-1,5-dihydroxypentane.



2. A process for the preparation of 2,2-dimethylol-1,5-dihydroxypentane which comprises reacting an aqueous solution of formaldehyde and 3-hydroxyvaleraldehyde in the presence of an alkaline condensing agent and then recovering the desired product from the reaction mixture.

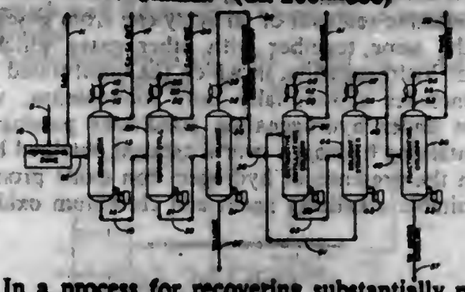
2,775,623
**ISOLATION OF ETHYLENE GLYCOL FROM A MIXTURE ALSO CONTAINING PROPYLENE GLYCOL**
John Barr Bell, Jr., Locust, N. J., assignor to Jefferson Chemical Company, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application October 20, 1953, Serial No. 387,300
7 Claims. (Cl. 260—637)

1. The process of isolating ethylene glycol from a mixture of it with propylene glycol-1,2, which comprises, heating the mixture in the presence of an acid dehydration catalyst capable of catalyzing the dehydration of propylene glycol-1,2 at a temperature not exceeding about 160° C. but sufficient to drive off from the reaction mixture the water, propionaldehyde and 2,6-dimethyl-1,4-dioxane formed during the course of the reaction, discontinuing the heating when substantially all of the propylene glycol-1,2 has been decomposed, and removing ethylene glycol from the resultant reaction mixture.

2,775,624
**STABILIZED TETRACHLOROETHYLENE**
Maxwell J. Shooters, Painesville, Ohio, and Norman L. Beckers, Houston, Tex., assignors to Diamond Alkali Company, Cleveland, Ohio, a corporation of Delaware
No Drawing. Application September 25, 1953, Serial No. 382,484
6 Claims. (Cl. 260—652.5)

1. A composition of matter consisting essentially of tetrachloroethylene and a stabilizing amount of a compound of the structure:

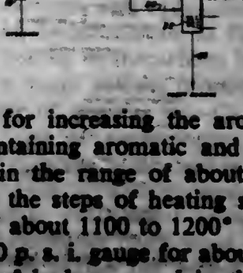
wherein $R_1$ and $R_3$ are selected from the group consisting of hydrogen and lower alkyl radicals.



2,775,625
**INHIBITING POLYMERIZATION OF MONOMERIC VINYLIDENE CHLORIDE**
John H. Reilly and Marion R. Rector, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Application June 17, 1953, Serial No. 362,386
4 Claims. (Cl. 260—652.5)

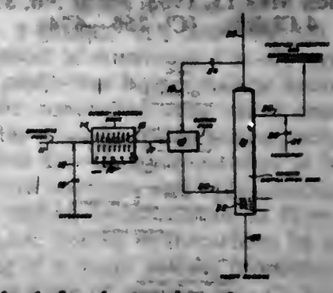
1. A composition of matter consisting essentially of monomeric vinylidene chloride and from 0.006 to 0.1 percent, based on the weight of said monomer, of a monoazo dye which is the diazotization product of a member of the class consisting of aniline, orthotoluidine, and xylidene, coupled with beta-naphthol.

2,775,626
**PRODUCTION OF 1-ETHYNYL-2,6,6-TRIMETHYL-CYCLOHEX-1-ENE**
Kurt H. Schaaf and Roland Kapp, Newark, N. J., assignors to Nopco Chemical Company, Harrison, N. J., a corporation of New Jersey
No Drawing. Application November 4, 1953, Serial No. 390,244
9 Claims. (Cl. 260—666)



1. A process comprising heating a hydrocarbon solvent solution of 1-ethynyl-2,6,6-trimethylcyclohexan-1-ol at the reflux temperature of the solvent in the presence of cupric sulfate, the hydrocarbon solvent being selected from the group consisting of aromatic and aliphatic hydrocarbon solvents having a boiling point between about 120° C. and about 250° C.

2,775,627
**EXTRACTIVE DISTILLATION PROCESS FOR RECOVERING AROMATICS**
Harrison M. Lavender, Jr., San Anselmo, Calif., assignor to California Research Corporation, San Francisco, Calif., a corporation of Delaware
Application December 17, 1954, Serial No. 475,889
7 Claims. (Cl. 260—668)



1. In a process for recovering substantially pure benzene from a catalytic reformate containing benzene, toluene and nonaromatic components, the steps comprising freeing the reformate of normally gaseous and other lighter nonaromatic constituents; passing the remaining reformate product so obtained to a re-run column from which a benzene concentrate containing substantially all the benzene content of said reformate, along with nonaromatic components and an appreciable amount of toluene, is taken overhead, and from which a fraction comprised in major portion of toluene is withdrawn as bottoms; passing said concentrate to an extractive distillation column, and there contacting the concentrate with a selective solvent at elevated temperatures whereby a substantial portion of the nonaromatic components are separated as an overhead product, while withdrawing a bottoms product containing substantially all of the benzene and toluene present in the concentrate, along with any remaining nonaromatic components and solvent; passing said bottoms product to a solvent stripping column maintained at a temperature adapted to distill overhead the nonsolvent portions of the feed to the column while withdrawing as bottoms, and recycling to the extractive distillation column, a solvent fraction which is low in nonsolvent components; passing the overhead from the solvent stripping column to a fractionating column maintained under such conditions as to distill the benzene overhead as a substantially pure benzene stream, while withdrawing as bottoms a fraction containing toluene and any remaining nonaromatic components, as present in the benzene concentrate.

2,775,628
**ISOMERIZATION OF XYLENES**
Daniel E. Nicholson and Robert H. Perry, Jr., Baytown, Tex., assignors, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware
Application June 10, 1954, Serial No. 435,788
2 Claims. (Cl. 260—668)

1. A method of producing paraxylene wherein cracking and disproportionation reactions are substantially minimized which comprises contacting an aromatic hydrocarbon fraction containing $C_8$ to $C_{10}$ aromatics and at least one isomer of paraxylene and substantially less than the equilibrium concentration of paraxylene with a catalyst consisting of silica-alumina having a surface area in the range between about 50 and about 80 $M^2/g.$ in the presence of hydrogen in a molar ratio of hydrogen to hydrocarbon in a range between about 3:1 and about 5:1 at a temperature in the range from about 900° to 1000° F. and at a pressure in the range between 200 to about 400 p. s. i. g. and at a liquid space velocity in the range from about 1 to about 3 v./x./hr. to form a product containing paraxylene in an amount substantially greater that the concentration of paraxylene in said hydrocarbon fraction and approaching equilibrium concentration and substantially free of hydrocarbons having a lesser number of carbon atoms than said isomer, and recovering said paraxylene from the product.

2,775,629
**PRODUCTION OF AROMATICS AND DEHYDROGENATED HYDROCARBONS**
James A. Anderson, Jr., Baytown, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware
Application December 11, 1953, Serial No. 397,732
6 Claims. (Cl. 260—668)

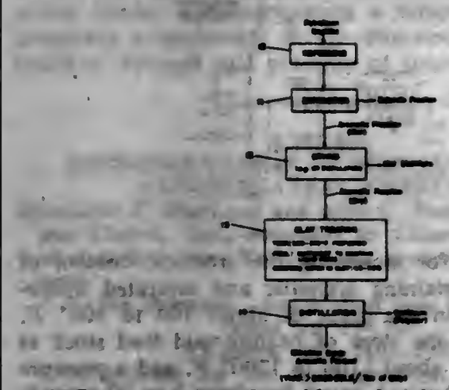
1. A method for increasing the aromatic content of a feed stock containing aromatic and saturated hydrocarbons boiling in the range of about 100 to 900° F. which comprises the steps of heating said feed stock at a temperature of about 1100 to 1200° F. and a pressure of about 0 to 300 p. s. i. gauge for about 1 to 50 seconds in the presence of hydrogen and in the substantial ab-

sence of any catalytic material to form a product containing an appreciated amount of aromatic hydrocarbons, cooling said product to a temperature of not more than about 200° F. within about 30 seconds, distilling said product to remove hydrocarbons boiling above and below the boiling range of said feed stock and recovering a distilled product containing said appreciated amount of aromatic hydrocarbons.

---

2,775,630
SEPARATING α-METHYLSTYRENES FROM ISOPROPYLBENZENES USING AMINES
Claude J. Schmidle, Mooretown, N. J., assignor to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware
No Drawing. Application February 11, 1953, Serial No. 336,452
5 Claims. (Cl. 260—669)

1. A process for removing an α-methylstyrene from a mixture containing an α-methylstyrene and an isopropylbenzene which comprises treating said mixture with formaldehyde and a basic nitrogen compound having on a nitrogen atom at least one hydrogen available for reaction from the class consisting of ammonia and lower primary alkylamines in the presence of hydrochloric acid as catalyst, reacting said α-methylstyrene, formaldehyde, and said basic nitrogen compound in the presence of said catalyst at a temperature between 50° and 150° C., whereby an acid salt of a nitrogen base is formed, separating said salt, and recovering the said hydrocarbon.



---

2,775,631
PRODUCTION OF AROMATICS FROM OLEFINS AND CARBON DIOXIDE
Norman C. Carter, Old Ocean, Tex., and John S. Crocmans, Louisville, Ky., assignors to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application January 14, 1953, Serial No. 331,328
9 Claims. (Cl. 260—673)

1. The conversion of a straight chain olefin selected from the group consisting of a pentene and a hexene into an aromatic hydrocarbon which comprises contacting said olefin and carbon dioxide in a ratio of carbon dioxide to hydrocarbon of at least 0.5 as the sole effective reactants with a molybdenum oxide catalyst at a temperature in the range 750–1100° F. for a time sufficient to convert an appreciable proportion of the olefin into an aromatic hydrocarbon.

---

2,775,632
TREATMENT OF AROMATIC HYDROCARBONS
Earl M. Honeycutt, Claymont, Del., and James R. Calkins, Swarthmore, Pa., assignors to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Application May 13, 1953, Serial No. 354,742
4 Claims. (Cl. 260—674)

1. In a process of making nitration grade aromatic hydrocarbon which comprises reforming a petroleum naphtha, extracting the reformate with a water soluble solvent to yield an aromatic rich hydrocarbon fraction containing a minor amount of said solvent, and water washing said aromatic rich fraction to remove said solvent, the steps which comprise removing water from the water washed aromatic fraction to yield an aromatic stock having a water content less than 200 p. p. m., treating said stock in liquid phase at a temperature between 275° F. and its critical temperature with adsorptive clay having a combined water content between 4.5% and 7.5% by weight, and recovering from the treated material nitration grade aromatic product in a yield exceeding 2000 barrels per ton of clay.

---

2,775,633
SEPARATION OF TERTIARY OLEFINS
Merrell R. Fenske and Jennings H. Jones, State College, Pa., assignors to Esso Research and Engineering Company, a corporation of Delaware
No Drawing. Application December 10, 1953, Serial No. 397,471
20 Claims. (Cl. 260—677)

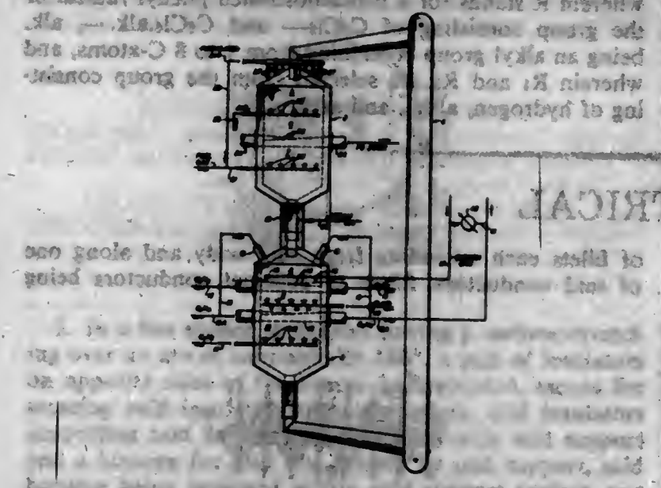
1. A process for removing olefins of the class consisting of aliphatic and cycloaliphatic mono-olefins and non-conjugated diolefins from a mixture of hydrocarbons which comprises mixing the hydrocarbon mixture with an excess of a perfluoro organic acid to convert the olefins into esters of the perfluoroacid, and separating unreacted hydrocarbons from the reaction mixture.

---

2,775,634
REMOVAL OF ACETYLENE FROM OLEFINS BY SELECTIVE HYDROGENATION
Gene Nowlin, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application June 22, 1953, Serial No. 363,400
17 Claims. (Cl. 260—677)

1. A selective removal of an acetylene from gases containing the same together with other gases which are capable of hydrogenation, in which the unsaturated component includes substantially only monoolefins, which comprises under hydrogenation conditions passing said gases containing hydrogen over a catalyst obtained by reducing in the presence of hydrogen iron oxide promoted with a suitable alkalizing agent and chromium oxide.

---



2,775,635
METHOD AND APPARATUS FOR HEATING FLUIDS
Louis C. Bearer, McGregor, Tex., assignor to Phillips Petroleum Company, a corporation of Delaware
Application November 12, 1952, Serial No. 319,990
14 Claims. (Cl. 260—679)

1. A process for conducting a two-stage reaction of a fluid which comprises moving a mass of heated refractory, particulate solids through a reaction zone; countercurrently contacting a fluid reactant with part of said mass in a lower portion of said zone to effect a first-stage reaction; disengaging first-stage reaction product from said mass in an intermediate portion of said zone; non-countercurrently contacting another part of said mass with said first-stage reaction product introduced into an upper portion of said zone above the level of solids therein so as to effect a second-stage reaction; and withdrawing a second-stage reaction product from said zone downstream with respect to solids flow from the locus of entry of said first-stage reaction product into said zone, said second-stage reaction being conducted at a higher temperature and a shorter reaction time than said first-stage reaction.

8. In a pebble heater apparatus, the improvement comprising, in combination, a vertically disposed heating

chamber; a top closure member and a bottom closure member therefor; pebble inlet means positioned in said upper closure member and in open communication with said chamber; pebble outlet means positioned in said lower closure member and in open communication with said chamber; gas outlet means positioned in said upper closure member; first fluid introduction means positioned

in the lower end of said chamber; second fluid introduction means positioned in an upper intermediate portion of said chamber; gas disengaging means positioned in a lower intermediate portion of said chamber between said first and second fluid introduction means; and conduit means connecting said gas outlet means with said first fluid introduction means.

---

2,775,636
ALKYLATION PROCESS
Walter H. Rapp, Mountainside, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Application June 29, 1951, Serial No. 234,413
5 Claims. (Cl. 260—683.4)

1. A once-through method of reacting isoparaffinic hydrocarbons with olefinic hydrocarbons in the presence of liquid acid catalyst material for the reaction, to form branched chain saturated hydrocarbons boiling within the gasoline range, and substantially free from polymerization products, in which said reactant materials are contacted in a confined reaction zone, comprising maintaining an emulsified body of said materials and product in said zone with an intermediate upper level therein, continuously vaporizing and withdrawing a portion of unreacted isoparaffinic hydrocarbons from said zone above the liquid level therein, continuously withdrawing a portion of the emulsified materials from said zone, separating said materials into a heavier component comprising said acid catalyst, and a lighter component comprising said reactant materials and the reaction product substantially free of catalyst material, fractionating said lighter component to recover therefrom a product component and a normal component consisting of unreacted isoparaffinic hydrocarbons, recycling a stream of said recovered isoparaffinic hydrocarbons to said reaction zone, continuously recycling a stream of said separated heavier component comprising said acid catalyst to said reaction zone, continuously condensing the vaporized isoparaffinic material withdrawn from said reaction zone and recycling the condensed isoparaffinic material to said reaction zone, the streams of said isoparaffinic material and of said acid-containing heavier component being introduced into said reaction zone as a plurality of opposed, paired jets in impinging contact one with another within the body of materials in said zone, at least a portion of said jetted streams comprising a mixture of said acid catalyst and said isoparaffinic hydrocarbon material, and continuously jetting said olefinic hydrocarbon into said emulsified body directly between said opposed jet streams at a plane substantially coincident with that established by impingement of said opposed jets.

---

2,775,637
PURIFICATION OF OLEFIN-CONTAINING HYDROCARBON STREAMS
William C. Lanning and Robert J. Hogan, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application June 23, 1953, Serial No. 363,678
17 Claims. (Cl. 260—683.15)

1. A process for the selective removal of carbon monoxide from an olefin-containing hydrocarbon stream without substantial reduction in the olefin content of said stream which comprises passing said stream at a temperature of at least about 300° F. into contact with an alkalized iron oxide-chromium oxide purification agent which has been reduced in hydrogen.

17. A process for the polymerization of an ethylene-containing stream of hydrocarbons also containing carbon monoxide which comprises passing said stream at a temperature in the approximate range 300–680° F., a pressure in the approximate range 100–1000 p. s. i. g., and a space velocity in the approximate range 500–2000 volumes of gas per volume of treating agent per hour into contact with an alkalized iron oxide-chromium oxide treating agent which has been reduced in hydrogen, recovering a stream of hydrocarbons of a reduced carbon monoxide content and then subjecting the said recovered stream of hydrocarbons under polymerization conditions to the action of a nickel oxide-silica-alumina polymerization catalyst.

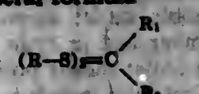
2,775,638
CATALYTIC POLYMERIZATION OF OLEFINS
Thomas H. Milliken, Jr., Moylan, George Alexander Mills, Swarthmore, and Alex G. Oblad, Springfield, Pa., assignors to Houdry Process Corporation, Wilmington, Del., a corporation of Delaware
No Drawing. Application August 25, 1952, Serial No. 306,282
3 Claims. (Cl. 260—683.15)

1. The method of converting $C_3$—$C_5$ hydrocarbons to substantially olefin-free higher boiling hydrocarbons in a single catalytic conversion zone which consists in dehydrogenating the $C_3$—$C_5$ hydrocarbons, polymerizing the dehydrogenated $C_3$—$C_5$ hydrocarbons to higher boiling unsaturated hydrocarbons, and hydrogenating the unsaturated higher boiling hydrocarbons to form substantially olefin-free higher boiling hydrocarbons by passing a mixture consisting of a major volume proportion of hydrogen and a lesser volume of gaseous $C_3$—$C_5$ hydrocarbons at a pressure of at least 10 atmospheres at a space rate greater than 1 at a temperature within the range from 400° to 1150° F. over a catalyst consisting of a minor quantity of a group VIII metal as a hydrogenation-dehydrogenation promoting component deposited on an aluminaceous carrier having the property of promoting acid-catalyzed reactions.



2,775,639

**RUBBERY DIENE POLYMERS PLASTICIZED WITH CHLORINE-SUBSTITUTED MERCAPTALS**

Friedrich Lober, Otto Bayer, and Max Bögemann, Leverkusen-Bayerwerk, and Paul Schneider, Opladen, Germany

No Drawing. Original application December 27, 1950, Serial No. 207,068, now Patent No. 2,695,898, dated November 30, 1954. Divided and this application May 20, 1954, Serial No. 431,284
Claims priority, application Germany December 27, 1949
3 Claims. (Cl. 260—761)

1. A plasticized elastomer selected from the group consisting of natural rubber, rubbery conjugated diene polymers and their vulcanizates containing, as a plasticizer, a compound of the general formula

wherein R stands for a pentasubstituted phenyl radical of the group consisting of $C_6Cl_5$— and $C_6Cl_4$alk.—, alk. being an alkyl group containing from 1 to 8 C-atoms, and wherein $R_1$ and $R_2$ are selected from the group consisting of hydrogen, alkyl, and aryl.

2,775,640

**METHOD AND MEANS FOR INSULATING HIGH VOLTAGE ELECTRODES**

Asa B. Steeves, Metuchen, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware

Application October 1, 1952, Serial No. 312,458
5 Claims. (Cl. 174—15)

1. In an apparatus for subjecting fluid materials to the effect of high potential electric currents, including a container vessel for said fluid materials, a service entrance means for passing an electrical conductor element through a wall of said vessel, comprising an entrance port in said vessel wall, a substantially tubular, rigid conduit means of an impermeable material mounted in said port in fluid-tight relation to said vessel wall and extending outwardly beyond said vessel wall, a hollow tubular bushing of a rigid, porous dielectric material secured in fluid-tight coaxial relation to said conduit means, and dependent therefrom to extend into said vessel, beyond said wall, an electrode element disposed substantially coaxially within said conduit means and said bushing forming a substantially annular conduit passageway around said electrode element within said conduit means and bushing, means for sealing said electrode element with reference to said conduit means at one end of said electrode element and means for sealing said electrode with reference to said bushing at the other end of said electrode element, said electrode element extending outwardly through said sealing means at each of the outer and inner ends thereof, means for introducing a fluid dielectric material into said conduit means, and said annular conduit passageway within said conduit means and bushing, under a differential pressure to discharge said fluid material outwardly from said passageway into the vessel through the pores of said bushing material.

2,775,641

**ELECTRON TUBE STEM**

David L. Swartz, Newport, R. I., assignor to Radio Corporation of America, a corporation of Delaware

Application July 11, 1955, Serial No. 521,256
6 Claims. (Cl. 174—50.61)

1. An electron tube stem comprising a body, a plurality of conductors extending therethrough, and a plurality of fillets each extending from said body and along one of said conductors, fillets of adjacent conductors being

disposed on opposite sides only of a median plane of said body.

2,775,642

**HALF CIRCULAR BUS BRACKET**

William M. Scott, Jr., Bryn Mawr, Pa., assignor to I-T-E Circuit Breaker Company, Philadelphia, Pa., a corporation of Pennsylvania

Original application May 9, 1950, Serial No. 160,899. Divided and this application December 31, 1952, Serial No. 328,884
7 Claims. (Cl. 174—99)

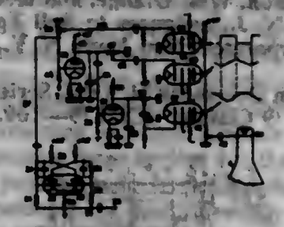
1. In a sectionalized bus system to be secured to a structural member, a prefabricated section comprising a first bus housing member, a second bus housing member, said first and second housing members when joined forming a cylindrical closure for a bus, said prefabricated section further including a pair of substantially 180° cast iron supports, each of said cast iron supports comprising a pair of legs arranged to extend to and be secured to the structural member and a cradle section for removably receiving one of said housing members, two pairs of diametrically opposite insulators engaging and supporting the bus at opposite sides thereof, said cast iron support for each pair of insulators extending from a point slightly beyond the longitudinal axis of one insulator around to and slightly beyond the longitudinal axis of the second insulator, adjustable members each mounted in said supports and extending through one of said housing members to said insulators for securing said insulators to said supports and providing axial adjustment of said insulators, and additional adjustable members for adjustably securing said legs to said structural members to permit angular positioning of said supports with reference to said structural members.

2,775,643

**HALF CIRCULAR BUS BRACKET**

William M. Scott, Jr., Bryn Mawr, Pa., assignor to I-T-E Circuit Breaker Company, Philadelphia, Pa., a corporation of Pennsylvania

Application August 16, 1950, Serial No. 179,687
2 Claims. (Cl. 174—99)



1. In a bus system, a support having a surface extending over an arc of substantially 180°, a pair of insulators on opposite sides of the bus to be supported, means for securing said insulators to said support, said insulators supporting said bus in spaced relation with said support and a housing for said bus carried by said support, said housing being mounted within said support surface and comprising two semi-cylindrical members; longitudinal flanges on each side of one of said semi-cylindrical members; a ledge on the upper portion of the support on each side; each longitudinal flange of said one semi-cylindrical member being positioned by said ledge.

2,775,644

**PICTURE ANALYSIS AND RECORDING DEVICES**

Paul Mandel, Paris, France, assignor to Societe Nouvelle de l'Outillage R. B. V. et de la Radio-Industrie (R. B. V.-R. I.), Paris, France, a joint-stock company

Application October 8, 1951, Serial No. 250,236
Claims priority, application France October 14, 1950
9 Claims. (Cl. 178—7.2)

5. In a flying-spot picture-translating system wherein the beam of a cathode ray tube is driven according to a television interlaced raster under the control of frame synchronizing pulses, and an image of the flying spot of said tube is caused to scan a kinematographic film through two cooperative optical paths alternately unmasked at the frame frequency of the interlaced raster with resultant production of a cyclically varying flicker modulation component independent of any signal modulation component in the picture-bearing wave, means for deriving from the frame synchronizing pulses of said raster an alternating voltage of rectangular wave-form of one-half the frequency of said frame synchronizing pulses, means for deriving from said rectangular wave-form voltage a symmetrical saw-tooth voltage of the same frequency, means for adjusting the amplitude of said symmetrical saw-tooth wave-form voltage and anti-flicker means for introducing said adjusted electrical saw-tooth wave-form voltage into the system as an additional modulation component opposing the said flicker modulation component for flicker-reducing purposes.

2,775,645

**APPARATUS FOR TAPPING TELEPHONE CONVERSATIONS FOR THE PURPOSE OF RECORDING**

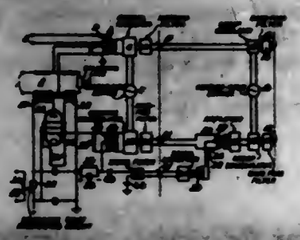
Johannes Jacobus Joseph Fahlenkamp, Hilversum, Netherlands

Application September 26, 1950, Serial No. 186,710
Claims priority, application Netherlands October 6, 1949
1 Claim. (Cl. 179—1)

An apparatus for picking up signals from a telephone voice coil eccentrically located in a telephone apparatus, comprising, in combination, a box having an axis of symmetry and two end faces extending transverse to said axis and adapted to fit to the base of the telephone apparatus; a pick-up coil arranged in said box and having an axis extending parallel to and eccentric with respect to said axis of symmetry of said box whereby said pick-up coil can be placed in a plurality of positions eccentric with respect to said axis of symmetry in the region of the eccentric telephone voice call by turning said box about said axis of symmetry thereof and by placing any of said end faces on top so as to couple said pick-up coil to the telephone voice coil; and means for attaching said pick-up coil to said box in said plurality of positions eccentric with respect to said axis of symmetry of said box.

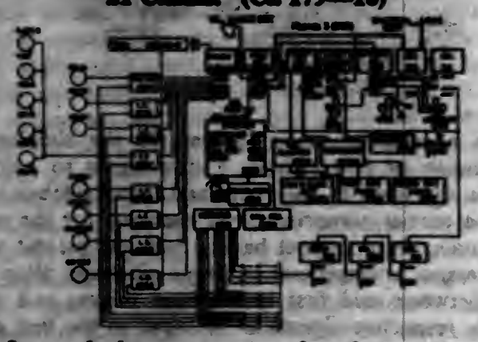
2,775,646

**SINGLE-SIDEBAND APPARATUS**



Johan Adriaan Greefkes, Hilversum, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application November 23, 1951, Serial No. 257,680
Claims priority, application Netherlands November 30, 1950
6 Claims. (Cl. 179—15)

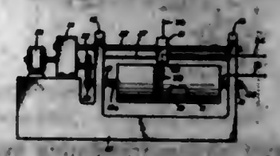


1. In a communication system for the simultaneous transmission of two signals, a transmitter to emit said signal in the form of the upper and lower sidebands of a common carrier comprising two channels for the respective signals, each channel having first and second mixers in successive arrangement, a single sideband filter interposed between said first and second mixers and means to apply respective signals as an input to the first mixer, a first local oscillator connected in common to the first mixer of both channels to combine with the signals applied thereto to produce a wave in the output thereof having two sidebands only one of which is fed by the associated filter as an input to the second mixer, and means to apply respective local oscillations to the second mixers of both channels differing in frequency to an extent equal to twice the frequency of the first local oscillator, said last-named means including a second local oscillator and an auxiliary mixer to combine the frequencies of said first and second local oscillators.

2,775,647
SINGLE SIDEBAND CARRIER-WAVE TELEPHONE SYSTEM
Johannes Enkel, Hilversum, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application September 24, 1951, Serial No. 248,646
Claims priority, application Netherlands September 26, 1950
6 Claims. (Cl. 179—15)

4. A single sideband multi-channel carrier wave telephone system for the simultaneous transmission of a plurality of calls, comprising means for producing a plurality of sideband-modulated carrier waves in channels arranged in a multiplicity of groups wherein frequency intervals between the carrier waves of the channels are substantially equal to twice the bandwidth of the sideband transmitted for each call and means by which signalling is effected for each channel comprising means for producing a plurality of signalling carrier waves associated respectively with each channel and being outside the transmitted sideband of the respective channel, and receiving terminal apparatus including means by which the signalling frequencies, belonging to the channels of one group, are jointly separated from that group before mutually separating the channels of that group, said last-named means comprising receiver means for receiving said one group of channels, first separating means for separating the modulated carrier waves of said one group, second separating means for separating the signaling frequencies of said one group, and coupling means connecting said receiver means jointly to said first and second separating means.

2,775,648
AUTOMATIC TOLL TICKETING TELEPHONE SYSTEM
Harry N. Newstedt, Chicago, Ill., assignor to Automatic Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware
Application March 28, 1951, Serial No. 217,923
21 Claims. (Cl. 179—18)

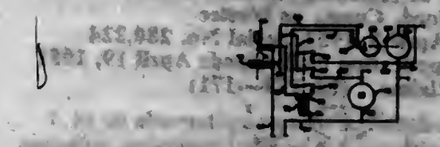


21. In a telephone system, a first finder-selector link, a second finder-selector link, a first group of lines divided into a plurality of subgroups, each subgroup of lines in said first group accessible to said first link, a second group of lines divided into a plurality of subgroups, each subgroup of lines in said second group accessible to said second link, each one of said subgroups of lines in said first group and in said second group corresponding respectively to a different class of service, a register sender, a pair of conductors individual to each of said links, means controlled incident to a call on any one of said lines for operating the associated link to find the calling line and to connect said register sender to said marking conductors and to mark said pair of conductors in accordance with the particular class of service of the subgroup of lines including said calling line, and means in said register sender controlled over said pair of conductors in accordance with the marking thereon for registering the particular class of service of the calling line in any subgroup of lines in said first and second groups of lines.

2,775,649
TELEPHONE SUBSCRIBER SETS
Lyndall Crosthwaite Pocock and Anthony Crisp Beadle, London, England, assignors to International Standard Electric Corporation, New York, N. Y.
Application April 14, 1952, Serial No. 282,132
Claims priority, application Great Britain April 18, 1951
11 Claims. (Cl. 179—81)

1. A telephone substation circuit comprising a source of unidirectional line current, a transmitter and a receiver, a line coupled to said current source, coupling means for coupling said transmitter and said receiver to said line, a shunt circuit for controlling the unidirectional current passing through said transmitter and the pulsating speech currents passing through said receiver, said shunt circuit comprising non-linear resistance bridge means having a first pair of diagonal points in shunt with said transmitter, said shunt circuit including inductive means in shunt with said receiver, means coupling said inductive means with the opposite diagonal points of said bridge means for altering the impedance of said inductive means in accordance with the value of the voltage across said first diagonal points.

2,775,650
FERROELECTRIC RECORDING AND REPRODUCTION OF SPEECH
Warren P. Mason, West Orange, and Robert N. Thurston, Whippany, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application December 31, 1954, Serial No. 479,208
9 Claims. (Cl. 179—100.1)



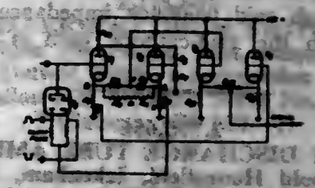
1. In combination with a system for recording and reproducing continuous wave signals, a record comprising a layer consisting of ferroelectric crystalline material not more than a few microns thick superposed on a substrate comprising a metal selected from the pair consisting of platinum and palladium, said record having a remanent polarization pattern along a preselected path on said layer which pattern corresponds to preselected continuous wave signals.

2,775,651
TELEPHONE ANSWERING AND RECORDING DEVICES
Harry W. Cain, Meriden, Conn., assignor to Telephone Answering and Recording Corporation, New York, N. Y., a corporation of Delaware
Application April 29, 1953, Serial No. 351,894
14 Claims. (Cl. 179—100.1)

1. In a telephone answering machine, in combination, supporting means, a turn-table rotatably mounted on said supporting means and adapted to hold a recording disc, recording means movably mounted on said supporting means, means on said supporting means to feed said recording means transversely of said disc in recording engagement therewith, means secured to said supporting means to drive said turn-table and said feeding means, means on said supporting means to disengage said recording means from said disc and from said feeding means, means including a switch on said supporting

means for conditioning said machine to perform an automatic answering and message recording function, means including a second switch on said supporting means for conditioning said machine to perform a play-back function, inter-locking means operable by each of said switches for releasing the other, and means to operatively connect said second switch with said disengaging means whereby operation of said second switch may actuate said disengaging means.

2,775,652
HEARING AID CASING
Ralf Stolz, Weston, Mass.
Application July 20, 1953, Serial No. 368,944
4 Claims. (Cl. 179—107)

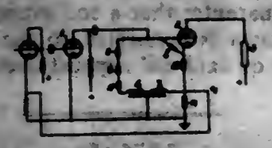


1. In a device of the character described, the combination comprising a casing, a portion of said casing being pivotally displaceable from and complementary to the remaining portion of said casing whereby said portions of said casing provide means for clipping said casing to apparel, means operatively associated with said casing for yieldably holding said pivotally displaceable portion in non-displaced position, the displaceable portion and the remaining portion together providing a smooth and continuous front surface for the casing when the displaceable portion is in its nondisplaced position, a microphone mounted in said pivotally displaceable portion of said casing, an amplifier mounted in said remaining portion of said casing below the displaceable portion, and means operatively connecting said microphone to said amplifier.

2,775,653
MOVING COIL DIAPHRAGMS FOR ELECTRO-DYNAMIC LISTENING APPARATUS
Günther Wurdel, Berlin-Steglitz, Germany, assignor to Holmberg & Co., Kommanditgesellschaft, Berlin, Germany
Application November 6, 1951, Serial No. 255,695
Claims priority, application Germany November 16, 1950
6 Claims. (Cl. 179—115)

1. In a sound reproducing apparatus, in combination, a diaphragm having an annular channel-shaped projection, including two annular concentric parallel side walls extending substantially normal to the plane of said diaphragm, and a bottom wall, said channel-shaped projection having a U-shaped cross section so that said side walls and said bottom wall define an annular channel; a coil support having an annular end portion projecting into said channel and engaging the inner face of said bottom wall, said annular end portion having coaxial annular outer and inner surfaces extending parallel to said side walls within said annular channel and engaging said side walls to hold said coil support in a position normal to the plane of said diaphragm and so as to reinforce said channel-shaped projection, said channel carrying said coil support and positioning the same accurately with respect to the diaphragm, and said channel acting as a gauge to guarantee that a coil support of proper size and wall thickness is connected to the diaphragm; and a coil arranged on said coil support outside of said channel.

2,775,654
CIRCUIT FOR ADJUSTING AMPLITUDE DISTORTION
Donald Wolpheus and Lodlaisky Lax, Cambridge, England, assignors to Eye Limited, Cambridge, England, a British company
Application December 11, 1950, Serial No. 200,134
Claims priority, application Great Britain December 16, 1949
3 Claims. (Cl. 179—171)

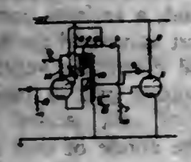


1. An amplifier comprising a first electronic valve having an anode, a cathode and a control grid, a high tension positive supply line, means for feeding the input signal to the control grid of said electronic valve, means for maintaining said control grid at a predetermined voltage, a resistor connected between the cathode of first valve and ground, a resistor connected between the anode of the said first valve and the high tension positive supply line a second electronic valve having an anode, a cathode and a control grid, a resistor connected between the cathode of said second valve and ground, means connecting the anode of said second valve to the high tension positive supply line, a resistor chain connected between the anode of said first valve and ground, means connecting the control grid of said second valve to an intermediate point on said resistor chain, an impedance network connected between the cathodes of said two valves, one portion of said impedance network producing a non-linear amplitude characteristic and the other portion of said impedance network producing a linear amplitude characteristic, means for feeding the signals from intermediate points on said two portions respectively to the control grids of two cathode follower valves, a potentiometer connected across the cathodes of said cathode follower valves, and a variable tapping on said potentiometer from which the output signal is taken.

2,775,655
AMPLIFIER CIRCUIT
Jan Lourens Bordewijk, Delft, Joseph Frederik Lenaz, Hilversum, and Jan te Winkel, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application July 22, 1952, Serial No. 300,172
Claims priority, application Netherlands August 21, 1951
4 Claims. (Cl. 179—171)

1. A wide band amplifier arrangement comprising first and second amplifier stages in coupled relationship,

each of said stages having an electron discharge device having a cathode, a control grid and an anode, a signal-conductive connection between the anode of said first stage and the control grid of said second stage, the cathode circuit of said second stage including a negative feedback impedance, means for applying a negative feedback voltage developed across said negative feedback impedance to said first amplifier stage, a first impedance, a first inductance connected serially with said first impedance between the anode of the device of said first stage and ground, and a second inductance included in said cathode circuit, said second inductance being tightly coupled to said first inductance and so related to the cathode circuit as to introduce therein at a point between the last-mentioned cathode and the feedback impedance an induced compensating current component in opposition to any current in the frequency region to be amplified which flows from the electron discharge of the first stage through the capacitive grid-cathode path of the second stage device, the relative values of said tightly coupled inductances and of said first impedance being such that any flow through said feedback impedance of the said current through the grid-cathode path is substantially eliminated.

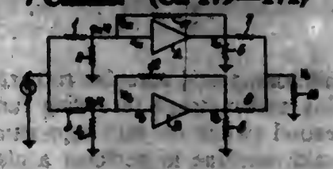


2,775,656

**ELECTRON DISCHARGE TUBE AMPLIFIERS**

Geoffrey Newbold Hounsfield, Ickenham, England, assignor to Electric & Musical Industries Limited, Hayes, England, a company of Great Britain

Application September 17, 1951, Serial No. 246,994
Claims priority, application Great Britain September 27, 1950
2 Claims. (Cl. 179—171)



1. An electron discharge tube amplifier comprising a first amplifier tube having at least a cathode, a control electrode and an output electrode, a transformer having a first winding with one end connected to a point of substantially low fixed potential, a connection between the cathode of said first tube and a first intermediate point on said first winding, means for applying signals between said control electrode and said low fixed potential point, a high tension source of potential which is positive with respect to said low fixed potential point, a load impedance connecting the output electrode of said tube to said source, a second winding coupled to said transformer and having a point thereon connected to said output electrode to apply positive feedback to said cathode thereby to increase the cathode impedance of said tube, a second amplifier tube having at least a cathode, control electrode, and an output electrode, means coupling the output electrode of said first tube to the control electrode of said second tube to feed signals thereto, an impedance connecting the output electrode of said second tube to said high tension source of potential which is positive with respect to the potential of said low fixed potential point, a connection from the cathode of said second tube to a point of substantially low fixed potential, a negative feedback connection coupling the output electrode of said second tube to a second intermediate point on said first winding, and means for deriving output signals from the output electrode of said second tube.

2,775,657

**DUAL CHANNEL AMPLIFYING CIRCUIT**

Johannes Jacobus Zaalberg Van Zelst, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application April 3, 1952, Serial No. 280,224
Claims priority, application Netherlands April 19, 1951
7 Claims. (Cl. 179—171)

1. An amplifying circuit comprising a main amplifier A and a spare amplifier B, each having an input circuit, an output and a negative feedback circuit, a signal source, means connecting the two input circuits to said signal source, a load impedance, and means connecting the two output circuits to said load impedance, characterized in that for the negative feedback coefficients of the negative feedback circuits the following conditions are substantially fulfilled:

$$a_a = \frac{q_a}{N_a} - \frac{1}{\mu_{ab}}$$

$$a_b = K\frac{q_a}{N_a}$$

$$b_a = \frac{q_b}{N_b}$$

$$b_b = \frac{q_b}{N_b} - \frac{1}{\mu_{ab}}$$

in which K represents a constant having a value which differs from 1 by an amount to at least 30% of 1, and in which the negative feedback coefficients $a_a$, $a_b$, $b_a$ and $b_b$ are defined in accordance with

$$V_{ta} = a_a E_a + a_b E_b$$

$$V_{tb} = b_a E_a + b_b E_b$$

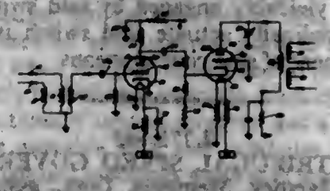
in which $V_{ta}$ and $V_{tb}$ indicate the negative feedback voltages supplied to the input circuits of the amplifiers A and B respectively, $E_a$ and $E_b$ respectively represent the voltages produced across the load impedance when the spare amplifier B or the main amplifier A respectively is made temporarily inoperative by switching off the heating current and temporarily adding a resistor to compensate for its internal resistance being varied thereby, $q_a$ and $q_b$ represent the fractions in which the signal voltage is supplied to the input circuits of the amplifiers A and B respectively, $\mu_{ab}$ and $\mu_{ba}$ represent the mean amplification factors of the amplifiers A and B respectively, measured as a relation between the voltages $E_a$ or $E_b$ respectively and the input voltage of the amplifier concerned, and $N_a$ represents the amplification of the circuit, whereby in normal operation of the amplifying circuit both of the amplifiers A and B are operative with the main amplifier A providing a relatively greater part and the spare amplifier B providing a relatively smaller part of the output voltage at said load impedance, and whereby in the event of failure of the main amplifier A, the spare amplifier B will automatically provide the entire amount of output voltage at said load impedance with an amplitude substantially equal to the amplitude of the output voltage obtained in normal operation of the amplifying circuit.

2,775,658

**NEGATIVE RESISTANCE AMPLIFIERS**

Warren P. Mason, West Orange, and William Shockley, Madison, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application August 1, 1952, Serial No. 302,278
4 Claims. (Cl. 179—171)



1. In an alternating current signal circuit, a two terminal negative resistance, means for coupling said negative resistance in linear amplifying relationship with said alternating current signal circuit, and a directional transducer interposed in said signal circuit, said transducer including a gyrator and a reciprocal signal transmission path connected to said signal circuit in such bridging relationship with said gyrator as to increase the amplitude of signals transmitted through said signal circuit in one direction and substantially cancel signals transmitted in the other direction, the reciprocal component of the transfer impedance of said transducer being substantially equal to the gyrator component of the transfer impedance.

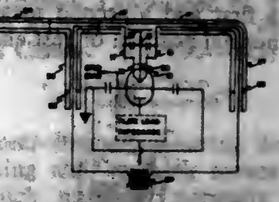
2,775,659

**CASCODE CIRCUITS**

Edwin Keith Nelson, Pico, Calif., assignor to Standard Coil Products Co. Inc., Los Angeles, Calif., a corporation of Illinois

Application February 20, 1951, Serial No. 211,959
12 Claims. (Cl. 179—171)

1. In a television receiver circuit having an upper and a lower frequency band, a first triode having a grounded cathode and a second triode having a grounded grid and a network automatically tunable to the frequency spectrum in said upper and lower frequency bands, said network consisting effectively of an inductance in said upper frequency band connected between the plate of said first triode and the cathode of said second triode, said inductance having a value designed to parallel resonate with the plate interelectrode capacitance of the first triode at the high frequency portion of said upper frequency band and to series resonate with the cathode interelectrode capacitance of said second triode at the low frequency portion of said band.



8. A wide-band high frequency amplifier comprising first and second triodes each having an anode, a cathode and a control grid, means connecting the second triode as a cathode-input grounded-grid stage with its cathode having a predetermined capacitance to ground, means connecting the first triode as a grid-input anode-output grounded-cathode driving stage, a signal coupling circuit including an inductor connected between said triodes, means connecting said inductor in series between the anode of said grounded-cathode triode and the cathode of said grounded-grid triode, said inductor being proportioned to provide inductance that resonates with said predetermined capacitance at a frequency near the high frequency portion of said wide band thereby forming a series resonant low impedance circuit comprising the output load impedance for the first triode.

2,775,660

**FILAMENT LEAD-IN AND IMPEDANCE MATCHING STRUCTURE FOR A GROUNDED GRID AMPLIFIER**

Harry E. Smith, Verona, and Allen B. Taylor, Belleville, N. J., assignors to Standard Electronics Corporation, Newark, N. J., a corporation of Delaware

Application December 2, 1953, Serial No. 395,796
3 Claims. (Cl. 179—171)

3. Input structure for a grounded grid amplifier tube comprising an input coaxial transmission line, matching stubs for said line and said tube, a section of transmission line interconnecting said matching stubs, said matching stubs and said section having hollow inner conductors, a cathode and filament connector for said tube hinged to and concentric with the inner conductor of said section, and filament current supply leads located in the inner conductor of said section and at least one of said matching stubs.

2,775,661

**REVERSING DRUM SWITCH**

Joseph J. Gribble, Shorewood, Wis., assignor to Square D Company, Detroit, Mich., a corporation of Michigan

Application July 15, 1953, Serial No. 368,090
7 Claims. (Cl. 200—1)

1. In a reversing drum switch, a plurality of pairs of stationary contacts, a switching drum disposed between said stationary contacts and carrying movable contacts cooperating therewith, said stationary contacts being spaced substantially 180° apart about the drum and said movable contacts being arranged in pairs with the contacts in each pair spaced substantially 180°, an indexing plate mounted to be rotatable with said drum, indexing "off" notches on said plate 180° apart and indexing forward and reverse notches on opposite sides of one only of said "off" notches, spring loaded means engaging said notches to index plate and drum positions, an operating handle for said drum and means reversing the drum and handle engagement by substantially 180° to provide for momentary or indexed forward and reverse positions of the drum for the same positions of the handle.

2,775,662

**ELECTRICAL KEY**

Henry C. Harrison, Port Washington, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

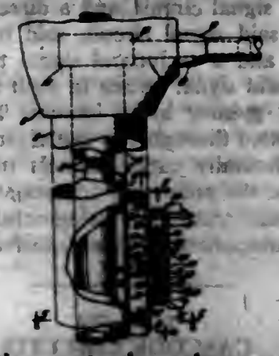
Application November 4, 1952, Serial No. 318,718
3 Claims. (Cl. 200—1)

1. A communication operator's key having a substantially rectangular frame and a center post integral therewith, uniplanar parallel opposed longitudinal slide ways formed in said frame and said post, a cam, said cam slidable in said ways, means for biasing said cam to a normal position in said ways, a plurality of longitudinal

cam tracks spaced one from another laterally formed in said cam, an individual pair of elongated substantially straight wire contact springs for each of said tracks, said springs disposed parallel to said slide ways, each of said springs secured at one end to said frame and having a free end, an electrical contact on each free end, said contacts of each pair adapted to make and break, a cam follower on one spring of each pair engageable with its respective track, a handle secured to said frame, said handle having a first and a second means for arresting its motion in a normal position of rest and in an operated

position, respectively, a projection on said handle, a link secured at one end to said cam and having a free formed end disposed in the path of said projection as said key is actuated between its rest and operated positions, to slide said cam in said ways from said normal to an operated position, each of said followers responsive to the motion of its respective track to control its respective contact pairs as said slide is actuated, and means in said tracks for opening and closing said contacts according to any desired predetermined sequence of openings and closings as said handle is actuated.

---



2,775,663
ELECTRIC LIGHT SOCKET WITH A REPLACEABLE SWITCH
John P. Rousseau, New York, N. Y.
Application May 27, 1953, Serial No. 357,759
1 Claim. (Cl. 200—51.17)

An electric light socket with a replaceable switch, comprising a first casing shell, a second casing shell, fastening means for detachably fastening the two casing shells together to form a complete casing, a first cartridge removably disposed in the first casing shell, a second cartridge removably disposed in the second casing shell, said cartridges being held within said casing shells when the casing shells are fastened together to form the complete casing, a pair of conductors projecting into the first casing shell, a pair of leaf spring contact members mounted on the first cartridge, means connecting said conductors to said leaf spring contact members and securing both the conductors and the leaf spring contact members to the first cartridge, a pair of fixed contact members secured to the second cartridge in registration with the leaf spring contact members on the first cartridge for engagement therewith, a bulb socket secured to said second cartridge, an additional contact member secured to said second cartridge within said socket for engagement with a bulb mounted therein, and conductors, including a switch, mounted within said second cartridge and connecting the socket and additional contact member on said second cartridge to the first mentioned pair of contact members on said second cartridge, said leaf spring contact members being adapted to exert a force upon the fixed contact members of the second cartridge in order to urge said second cartridge away from the first cartridge, and thereby to resiliently support the two cartridges in their respective casing shells to prevent displacement thereof.

---

2,775,664
NEUTRAL SAFETY AND BACK-UP LIGHT SWITCH
Clovis W. Lincoln and Robert M. Gold, Saginaw, Mich., and Henry D. Spieberman, North Hollywood, Calif., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application October 30, 1952, Serial No. 317,671
10 Claims. (Cl. 200—61.54)

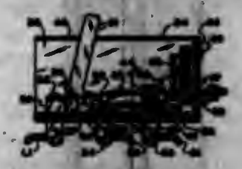
1. In combination, a steering column, rotatable transmission control means disposed adjacent said column, a longitudinally slidable switch secured on said column, said switch having spaced apart circuit closing positions and being normally urged to one of said circuit closing positions, and stepped flange means on said control means continuously yieldably engaged by said switch and effective to longitudinally actuate said switch in response to rotary movement of said control means.

---

2,775,665
CENTRIFUGAL SPEED GOVERNOR
William H. Harstick, Memphis, Tenn., assignor to International Harvester Company, a corporation of New Jersey
Application April 11, 1955, Serial No. 500,625
6 Claims. (Cl. 200—80)

6. A speed governor having a casing, said casing being adapted to be connected to the drive shaft of a power unit for rotation therewith, a governor chamber within said casing, an actuating member disposed for reciprocation within said chamber, means engaging said actuating member for urging the same in a first direction, said actuating means having a contact element adapted to engage a speed control means during movement of said member in a second direction, oppositely disposed first walls on said actuating member, said walls diverging outwardly in the first direction, oppositely disposed second walls on said casing, said second walls diverging outwardly in the second direction, a plurality of first spherical members adjacent said first walls, a plurality of second spherical members adjacent said second walls, said first spherical members being in engagement with said second spherical members, said spherical members being movable laterally outwardly on said walls in response to centrifugal force thereby urging said actuating member to move in the second direction.

---



2,775,666
ELECTRICAL RELAYS
Branko Lazich, Wilkinsburg, Pa., assignor to Westinghouse Air Brake Company, a corporation of Pennsylvania
Application April 19, 1951, Serial No. 221,773
10 Claims. (Cl. 200—104)

1. A relay comprising a shell of magnetic material closed at one end, an axially disposed core of magnetic material extending inwardly from the closed end of said shell, an armature of magnetic material pivotally supported adjacent the inward end of said core to rotate on an axis which coincides with the axis of said shell and said core, stationary pole pieces extending inwardly from the inner surface of said shell, an operating coil mounted on said core, said armature and said pole pieces being disposed and arranged so that said armature is rotated through a predetermined arc by attraction to said pole pieces when said operating coil is energized, a header disc for closing the open end of said shell and including terminal posts extending through said header disc, a plurality of contacts mounted on said terminal posts to be located inside said shell when the disc is attached to said shell, each of said contacts including a movable contact member and at least one stationary contact member, and a contact operating member movable with said armature for operating said movable contact members when said armature rotates through said predetermined arc.

---

2,775,667
CONTROL APPARATUS
Frederick A. Greenawalt, Columbus, Ohio, assignor to Ranco Incorporated, Columbus, Ohio, a corporation of Ohio
Application July 21, 1953, Serial No. 369,427
4 Claims. (Cl. 200—116)

1. A control apparatus comprising in combination, an electrical switch member movable in opposite directions between limits, means to yieldingly urge said member in said opposite directions, electrical contact means actuated by said member when the latter is moved to its limits of movement, latch means engaged by said member during said movements in opposite directions to interrupt movement of said member from either of said limits to the other by the first mentioned means, means to actuate said latch to disengage and release said member for movement by the first mentioned means, a second switch member disposed between the first mentioned switch member and one of said contact means whereby said second switch member cooperates with the first mentioned member and the last mentioned contact means to establish an electrical circuit through said second mentioned switch member, and means to adjust the position of said second switch member relative to the first mentioned member.

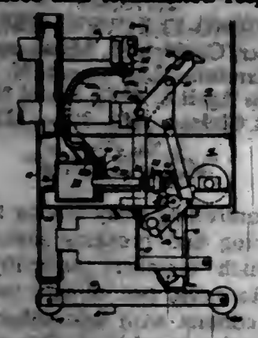
---

2,775,668
THERMO-ELECTRIC RELAYS
Henry Dornsteer, Cambridge, Mass., and William S. H. Hamilton, Larchmont, N. Y.
Application April 8, 1953, Serial No. 347,544
2 Claims. (Cl. 200—122)

1. A circuit controlling relay having thermally responsive circuit making and breaking means including two thermostatic switch members normally in contact, a heater therefor to cause one of said switch members to flex and break contact with said other switch member within a predetermined period of time, said switch members, responsive to varying ambient temperature being conjointly movable in the same direction to different relative positions without breaking contact, and a third thermostatic member mounted to flex at a predetermined higher ambient temperature in the direction opposite to the flexing movement of one of said switch members, said third member being mounted to engage and restrain the flexing movement of said switch member so as to prevent the recontacting of said switch members after contact has been broken by the action of said heater.

---

2,775,669
THERMALLY OPERATED CIRCUIT MAKER
Richard C. Sloan, Newton, N. C.
Application May 6, 1954, Serial No. 428,971
7 Claims. (Cl. 200—142)

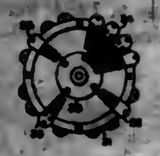


1. A circuit controlling element comprising a base member having a pair of uprising supports, a pair of members pivoted to each other intermediate their ends, and having their distal ends engaging said pair of supports, a shaft slidably mounted in said base member and having one end thereof adapted to engage a medial portion of the two members pivotally connected to each other, a compression spring mounted on said shaft, said shaft being settable manually to a position to where one end thereof will engage the two members pivoted to each other, the other end of the shaft having a downturned portion, a toggle switch mechanism mounted on the base member and having a lever projecting upwardly in the path of the downturned portion on the shaft, the two members pivoted intermediate their ends having a fusable material on each adapted to hold the two members in alined position against the pressure of said compression spring and said material meltable at a predetermined temperature to allow the compression spring to pivot the two members out of alinement with each other and to allow the downturned portion of said shaft to move the toggle switch lever mechanism from one position to the other.

---

2,775,670
COMBINED AIR PUFFER AIR BUFFER FOR CIRCUIT BREAKERS
William C. Geiger, Jr., Philadelphia, Pa., assignor to I-T-E Circuit Breaker Company, Philadelphia, Pa.
Application September 4, 1953, Serial No. 378,613
8 Claims. (Cl. 200—148)

1. A combined air puffer air buffer device for a multipole circuit breaker comprising a cylinder and a piston;



said cylinder being rigidly mounted on said circuit breaker; said piston operatively connected to the opening mechanism of said circuit breaker; a plurality of orifices in said cylinder along a circumference which is intermediate the ends thereof; tube means connected to each of said orifices and terminated respectively at each

pole of said circuit breaker; said piston moved toward said orifice during the initial opening operation to provide an air puffing operation; said piston moved away from said orifice during the final opening operation of said circuit breaker to provide an air buffer action; said piston being moved in only first direction during both the initial and final opening operation of said circuit breaker.

---

2,775,671
ELECTRO-MECHANICAL RELAYS
Jean Albert Dreyfus, Geneva, Switzerland
Original application November 10, 1948, Serial No. 59,361. Divided and this application September 19, 1952, Serial No. 310,513
6 Claims. (Cl. 200—166)

1. A suspension element for a movable member, said element comprising a flexible elastic blade having a fixed end and another end adapted to be connected to said movable member, said blade extending when at rest in one plane which is substantially perpendicular to the direction of movement of said movable member and having rectangular portions extending in said plane and separated by elongated slots formed in the blade, the width of the blade being greater than its thickness and smaller than its length, said rectangular portions forming $2n$ half loops joining $2n+1$ straight sections, wherein $n=1,2,3,4\ldots$

---

2,775,672
COAXIAL CABLE TEMPERATURE SIGNAL STRENGTH CONTROL
Edward J. Tomcavage and John Wakomavich, Mahanoy City, Pa.
Application April 16, 1954, Serial No. 423,792
4 Claims. (Cl. 201—48)

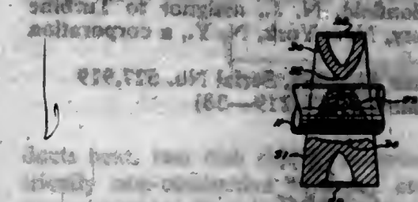
1. A temperature-responsive signal level control device for use in a high frequency transmission system to control the signal input level of an amplifier of said system comprising a main housing, a bellows mounted in said main housing, a temperature sensing element connected to said bellows and arranged to expand and contract said bellows in accordance with changes in ambient temperature, a sub-housing mounted on said main housing, respective coaxial cable connectors mounted on the walls of said sub-housing for receiving terminal portions of the transmission system, a potentiometer mounted in said sub-housing and having a rotary control shaft extending into said main housing through a wall thereof, means electrically connecting respective terminals of said potentiometer to said coaxial cable connectors, whereby one terminal of the potentiometer may be connected to a section of the transmission system and another terminal of the potentiometer may be connected to the input terminal of an amplifier, a level pivoted in said main housing and operatively connected to said bellows, and link means connecting the intermediate portion of said lever to said control shaft.

---

2,775,673
RESISTOR
Frank G. Johnson, Columbus, Nebr.
Application May 26, 1954, Serial No. 432,350
3 Claims. (Cl. 201—63)

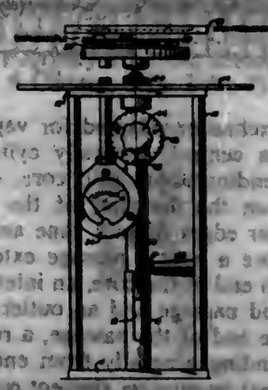
1. A resistor comprising a body of insulative ceramic material having tortuous grooves on top and bottom thereof, said grooves being substantially V-shaped in cross-section, a layer of conductive material overlying said grooves, and a layer of conductive material on one side of said body joining said grooves on the top and bottom of said body.

---



2,775,674
WALL SWITCH EXTENSION
William A. Meder, San Lorenzo, Calif.
Application March 25, 1955, Serial No. 496,701
4 Claims. (Cl. 200—172)

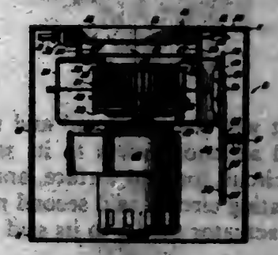
1. A manually engageable extension for a wall switch provided with a toggle extending outwardly from a wall plate having a mounting screw disposed above and below said toggle, comprising: a flat longitudinally extending member, said member having longitudinally extending slot means for pivotally attaching said member to one of said wall plate screws while permitting vertical movement of the member relative thereto, and means extending outwardly from the plane of said member adapted to engage upper and lower portions of said toggle for actuating the latter upon vertical reciprocation of said member while permitting free transverse movement of said member about said pivotal attachment relative to said toggle.



2,775,675
METHOD FOR WELDING STEEL TUBING
Norbert E. Fenz, Cleveland, Ohio, assignor to Republic Steel Corporation, Cleveland, Ohio, a corporation of New Jersey
Application August 5, 1953, Serial No. 372,502
2 Claims. (Cl. 219—8.5)

1. The method of producing welded pipe from a cylindrical metal blank having longitudinal opposed edges which comprises the steps of moving the blank endwise, progressively bringing successive, axially short portions of said edges into electrically conductive engagement, inducing a flow of high frequency current throughout the entire circumference of said blank, concentrating the flow of induced current in a narrow path successively through each of the axially short engaging portions of said blank and thereby producing sufficiently high densities therein to heat the edges of said portions to welding temperature, spreading the flow of induced current in a wider path through other parts of the circumference of the blank and thereby producing lower current densities and lower temperatures therein, and applying welding pressure to the blank to weld together progressively the successively heated edges of said axially short portions of the blank.

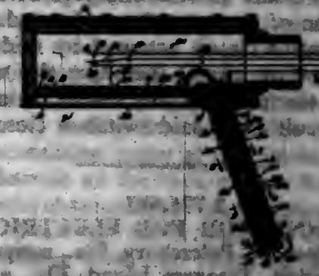
---



2,775,676
HIGH FREQUENCY APPARATUS FOR SEALING GLASS TO METAL
Doyle S. Greenberg, Quakertown, and Samuel Kuhn, Allentown, Pa., assignors to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application October 24, 1952, Serial No. 316,602
4 Claims. (Cl. 219—10.53)

2. An apparatus for sealing glass parts to metal parts comprising a support having spaced members to jointly support a metal part, a support for a glass part, means actuable to move the supports to locate and support the parts in sealing positions in engagement with each other, means to heat the metal part to thereby heat adjacent portions of the glass part, a temperature indicating unit, and a thermocouple connected to the unit and constituting one of the spaced members of the support for the metal part whereby the weight of the metal part on the thermocouple will assure thermal contact of the metal part and the thermocouple to cause the unit to indicate the temperature of the metal part.

---



2,775,677
LABEL ACTIVATOR
Elmer O. Schaefer, Chicago, Ill., assignor to Great Lakes Stamp & Mfg. Co., Inc., Chicago, Ill., a corporation of Illinois
Application March 1, 1955, Serial No. 491,473
13 Claims. (Cl. 219—19)

3. A device suitable for use in activating thermo-activated adhesive coatings on relatively thin flexible backings, said device including a grid to receive a backing and activate the coating thereon, said grid having a plurality of relatively flat members, said members spaced to allow the passage of air therebetween, heating means associated with each member of said grid, inducing means for inducing the passage of air between the members of said grid, said inducing means including a fan mounted in a housing, said housing having an air exhaust to one side thereof, closing means associated with said exhaust to control the amount of air induced between the members of said grid, and restraining means intermediate said grid and said inducing means to restrain the movement of the backing between said members.

---

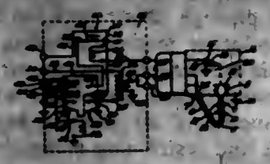
2,775,678
ICE DETECTING PROBE
Charles H. Fleischer, Chicago, Ill., assignor to Cook Electric Company, Chicago, Ill., a corporation of Illinois
Application December 13, 1954, Serial No. 474,841
6 Claims. (Cl. 219—19)

1. An ice detecting probe having trailing and leading edges adapted to be projected into an air stream comprising a housing sleeve provided with openings exposed to said leading and trailing edges thereof, a core snugly fitting in said housing sleeve, said core having longitudinal passages therein in communication with said openings and a continuous groove cut lengthwise in its peripheral surface, and an electric heating coil in said groove.

---

2,775,679
ICE DETECTION SYSTEM
Charles H. Fleischer, Chicago, Ill., assignor to Cook Electric Company, Chicago, Ill., a corporation of Illinois
Application September 27, 1954, Serial No. 458,440
11 Claims. (Cl. 219—20)

1. Apparatus for detecting the formation of ice on a moving vehicle including an ice forming surface adapted to be carried by said vehicle, an actuator having two positions, the first position being when said actuator is subjected to a predetermined wind pressure, the second position being when ice forms on said surface and when said actuator is not subjected to said predetermined wind pres-



sure, an electric switch adapted to be actuated by said actuator, an arming circuit to energize said switch when said actuator is in its said first position, said arming circuit including a relay adapted to lock said arming circuit

closed so that it will remain closed and the switch energized when said actuator moves to its said second position, a heating circuit for said surface, and a second relay to close said heating circuit, said second relay being actuated when said actuator moves to its said second position.

---

2,775,629
**ICE DETECTION SYSTEM**
Charles H. Fischaber, Chicago, Ill., assignor to Cook Electric Company, Chicago, Ill., a corporation of Illinois
Application January 8, 1953, Serial No. 330,316
15 Claims. (Cl. 219—20)

1. Apparatus for detecting the formation of ice or the like comprising a chamber having a flexible portion, a lead wall and a trailing wall, said walls having perforated areas, said lead wall having a greater perforated area than said trailing wall, a switch adapted to be held in open position by said flexible portion when the latter is held in an expanded position by pressure in said chamber, said flexible portion being moved to contracted position to close said switch upon a drop in pressure in said chamber, the pressure in said chamber being decreased by the formation of ice upon the perforated area of said lead wall, a control circuit actuated by said switch, and an electrical heating circuit including the walls of said chamber, said electrical heating circuit being closed by said control circuit when said switch is closed.

---

2,775,681
**CORD CONNECTOR FOR ELECTRIC IRONS**
Merrill M. Kistner, St. Petersburg, Fla., assignor to Steam Iron Corporation, Treasure Island, Fla., a corporation of Florida
Application April 3, 1953, Serial No. 346,590
3 Claims. (Cl. 219—25)

1. A reversible cord connector for an electric iron comprising a handle having a main recess in its rear leg and an additional recess at each side of the main recess, the recesses opening outwardly at the rear face of the rear leg of the handle, and a connector comprising a body portion and portions at each side of the body portion, the connector being removably received in the recess with the body portion in the main recess and the side portions in the additional recesses, centrally disposed means for retaining the connector in the recesses, co-acting means in the main recess and on the connector to complete an electric circuit, and a cord connected to the means on the connector and extending from one of the side portions of the connector, the connector being reversible in the recess to position the cord on either side of the leg.

---

2,775,682
**ELECTRIC FLUID HEATER**
Lee P. Hynes, Haddonfield, N. J., assignor to Turbine Equipment Company, New York, N. Y., a corporation of New Jersey
Application August 12, 1955, Serial No. 527,919
10 Claims. (Cl. 219—38)

1. In an electric heater, a heater tube of circular cross section, an electric heater therein, a flow tube of rectangular cross section surrounding a single heater tube in spaced relation thereto, partition walls extending out from the heater tube at circumferentially spaced positions and engaging the flow tube in opposite corners of the cross section thereof, and dividing the space between the heater tube and the flow tube into a plurality of heating passages, and a cross connection between the passages at an end of the tubes.

---

2,775,683
**HEAT EXCHANGERS FOR VAPORIZING LIQUID REFRIGERANT**
Herman W. Klein, Hollywood, Ill., assignor to Dole Refrigerating Company, Chicago, Ill., a corporation of Illinois
Application July 16, 1954, Serial No. 443,759
4 Claims. (Cl. 219—39)

1. In a heat exchanger adapted for vaporizing a volatile refrigerant, a central, generally cylindrical core, a helical vane extending about said core, of a pitch substantially less than the diameter of the helix, a jacket engaging the outer edges of said vane and forming with said vane and core a helical passage extending substantially from end to end of the core, an inlet duct extending to one end of said passage and an outlet duct extending from the opposite end of the passage, a resistance heater in said core extending generally from end to end of the passage, and a heat responsive element conductively connected to said resistance heater and positioned and adapted to make and break an electric circuit for said heater in response to predetermined changes in temperature of fluid flowing through said passage.

---

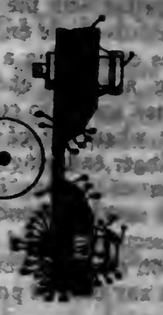
2,775,684
**COOKING UTENSIL**
Henry A. Berliner, Washington, D. C.
Application January 19, 1955, Serial No. 482,713
2 Claims. (Cl. 219—44)

1. A cooking utensil comprising vertically spaced bottom walls, a side wall attached to the peripheries of the bottom walls to define an enclosed chamber therebetween and extending above the upper bottom wall to provide a side for the utensil, the lower bottom wall having at its central part a hollow downwardly extending part defined by side walls and a bottom and the interior of which is open to the enclosed chamber between the bottom walls, a liquid substantially filling said downwardly extending part and said enclosed chamber which when passing electric current generates and conducts heat, two dish shaped receptacles formed of electrically non-conductive material arranged in vertically spaced relation in said downwardly extending part with their open sides facing each other, means supporting said receptacles in spaced relation to each other, a disk of electrically conductive material supported in each of said spaced receptacles, electric contact plugs mounted on the side wall of the utensil, and leads connecting said disks to said contact plugs.

---

2,775,685
**CONCEALED WELD STUD**
Dale A. Webster, Elyria, Ohio, assignor to Gregory Industries, Inc., Detroit, Mich., a corporation of Michigan
Application November 20, 1953, Serial No. 393,475
4 Claims. (Cl. 219—99)

1. A concealed weld stud comprising, a body having a circumferential wall and a pin terminating beyond the wall in a weld end, said wall and said pin being spaced apart to provide a ferrule receiving recess about said pin, and a ferrule about said weld end and in said recess.



---

2,775,686
**INTERNALLY ILLUMINATED KNOB**
Bertram B. Bullis, Los Angeles, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Application February 17, 1954, Serial No. 410,811
6 Claims. (Cl. 240—2)

1. An internally illuminated knob comprising a light transmitting knob cover and a light transmitting knob base, a plurality of lights arranged within the said knob, a holding bracket of an electrical conductive material affixed to the knob base with attaching means for the said lights, a base contact bracket connected to the knob base having a multiplicity of extensions, said extensions being bent midway their length with the ends of said extensions having a bent portion to contact a portion of the base of the said lights, a transparent insulating material positioned between the said holding bracket and the base contact bracket, a mounting tube attached to the said base, and said mounting tube having attaching means for securing the said knob cover to the said knob base.

2,775,687
**PANEL LIGHTING**
John E. Cushman, Endicott, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application January 28, 1953, Serial No. 334,111
1 Claim. (Cl. 240—2.1)

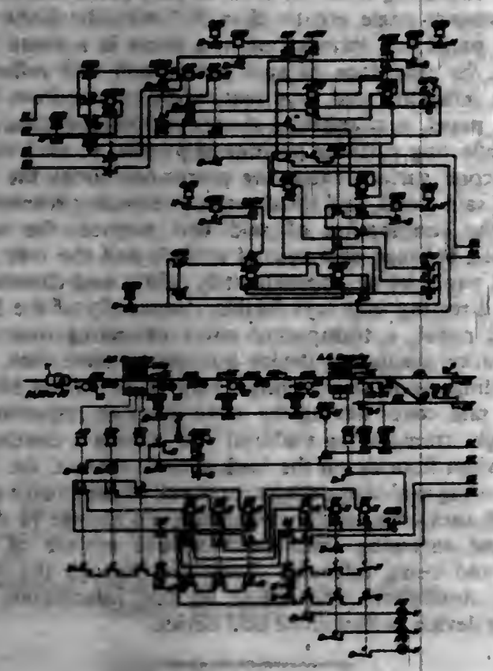
A lighting panel having substantially parallel front and rear faces and being constructed of light transmitting material, said panel including a window area positioned therein through which an information displaying device may be viewed, a plurality of light sources mounted within said panel and distributed uniformly around said window area, said sources providing light rays for illuminating said device, said rays traveling from said sources through said material toward said window area, a first reflecting surface extending from the front of said panel rearwardly at a constant angle greater than 90° with the front face of said panel and terminating at a point in a plane containing the rear face of said panel, said first reflecting surface reflecting said rays rearwardly of the front face of said panel, a channeling means including second and third reflecting surfaces positioned parallel to each other, said second surface extending rearwardly from the rear face of said panel, said third surface extending rearwardly from the termination of said first surface, the angle described between said second surface and the rear face of said panel being approximately 150°, said channeling means directing said rays further rearwardly of the front of said panel, a transparent cover extending over said information displaying device but spaced therefrom, said channeling means terminating on the front surface of said cover, said cover having the same index of refraction as said light transmitting material and having a coating of magnesium fluoride on the back surface thereof, the light rays leaving said channeling means and passing rearwardly through said cover with substantially no change in direction and emerging from the rearward surface of said cover and being refracted therefrom through the intervening atmosphere and falling on said information displaying device to illuminate said device.

---

2,775,688
**FLASHLIGHT**
Harry Golden, New York, N. Y.
Application April 16, 1954, Serial No. 423,679
2 Claims. (Cl. 240—10.66)

1. A flashlight comprising an elongated tubular casing, a bulb socket mounted within said casing substantially midway of the length thereof, said socket extending transversely of said casing and being insulated therefrom, said socket comprising a shell forming one contact and a central contact secured to the inner end thereof insulated from said shell, a lug connected to said central contact and disposed in spaced relationship to said shell axially of said casing, a removable cap for one end of

said casing, a compression spring in said cap whereby a battery may be disposed in said casing with the negative pole in contact with said lug and the positive pole in contact with said spring, a removable cap for the opposite end of said casing, a compression spring in said last named cap, means for insulating said last named spring from said last named cap whereby a battery may be disposed in said casing with the positive pole engaging said shell and the negative pole engaging said last named spring, switch means comprising a slidable metallic strip engaging said casing, a curved end on said strip for engaging said last named spring to complete the circuit and breaking the circuit when out of engagement with said last named spring, finger engaging means for moving said strip, an aperture in said casing in alignment with said socket, a bulb cover and lens removably disposed in said aperture, a bracket secured to said casing and spring clips rotatably mounted on said bracket for detachably securing said flashlight in any desired position on a support.



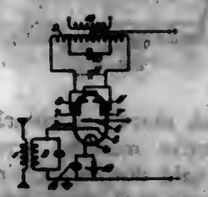
---

2,775,689

## COMBINED MANUAL AND AUTOMATIC ROUTE CONTROL SYSTEM FOR RAILROADS

Frank T. Pascoe, Scott Township, Allegheny County, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

Application July 27, 1951, Serial No. 238,799
15 Claims. (Cl. 246—2)



1. In an automatic route control system for railroads, a train describer system for supplying indications of the routes for approaching trains in the order of their approach, a manually controllable interlocking control system for establishing routes for said trains corresponding to the route indications supplied by said train describer system, a change-over relay which is released when said interlocking control sytem is conditioned for manual operation and which when energized conditions said interlocking control system to automatically establish traffic routes in accordance with the indications supplied by said train describer system, manually operable means for energizing said change-over relay, and track circuit controlled means for maintaining said change-over relay energized only so long as route indications for the approaching trains continue to be supplied by said train describer system.

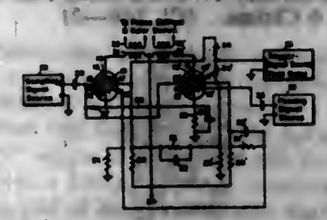
2,775,690

## CIRCUIT FOR FREQUENCY TRANSFORMATION OF HIGH-FREQUENCY OSCILLATIONS

Johan Ludewijk Hendrik Jonker and Gerhard Diemer, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application February 26, 1952, Serial No. 273,435
Claims priority, application Netherlands March 5, 1951
10 Claims. (Cl. 250—20)

10. Apparatus for mixing a high-frequency wave with a local oscillation to produce a beat voltage having a frequency other than that of said local oscillation, said apparatus comprising an electron discharge tube including a cathode to generate an electron beam having a normal axis, a control electrode for modulating the intensity of the beam, and first and second pairs of deflection and anode electrodes disposed symmetrically about the normal axis, electrodes of each pair being disposed on opposite sides of said normal axis, circuit means connecting the electrodes of said first and second pairs disposed on one side of said beam axis to the electrodes of said second and first pairs respectively disposed on the other side of said axis, a first resonant circuit tuned to the frequency of said local oscillation and coupled to said circuit means to produce the local oscillation in said tube and having a mid-point, said first resonant circuit including a second resonant circuit symmetrically arranged about said mid-point and tuned to the frequency of said beat voltage, and means to apply said high-frequency wave between said cathode and said control electrode whereby said high-frequency wave is mixed in said tube with said local oscillation to produce said beat voltage across said second circuit.



---

2,775,691

## TRIGGERED GATING SYSTEM

John L. Rennick, Elmwood Park, Ill., assignor to Zenith Radio Corporation, a corporation of Illinois

Application September 19, 1951, Serial No. 247,316
4 Claims. (Cl. 250—27)

1. A triggered gating circuit for a color television system which has a given field-scanning frequency and which utilizes a signal subjected to periodic phase changes in translating color information comprising: a pair of electron-discharge devices of the pentagrid type individually including a cathode, first and second signal electrodes, a collector electrode between said signal electrodes, and an anode; means for establishing the collector electrode of each of said devices at a positive potential with respect to the cathode thereof; a network cross coupling the collector electrode of each said device to the first signal electrode of the other device to provide a trigger circuit having two stable operating conditions in each of which one of said devices is gated and rendered conductive while the other is substantially non-conductive; means for applying said signal between the cathode and the second signal electrode of each of said devices to be translated therethrough dur-

ing operating intervals when such device is gated to be conductive; a balanced output circuit coupled between the anodes of said devices; means coupled to said balanced output circuit for deriving an output signal of a predetermined phase during operating intervals when one of said devices is conductive and for deriving an output signal in phase opposition to said first-mentioned output signal during operating intervals when the other of said devices is conductive; and means for applying actuating pulses, having a repetition frequency corresponding to said field-scanning frequency, to said trigger circuit to gate said devices in alternation and at said field-scanning frequency.

2,775,692

## MEASURING DEVICE

Zigmund W. Wlodinsky, Baton Rouge, La.

Application September 27, 1946, Serial No. 699,650
3 Claims. (Cl. 250—27)
(Granted under Title 35, U. S. Code (1952), sec. 266)

3. An apparatus for measuring peak amplitude of an alternating electrical wave comprising, a coaxial assembly having perforated portions of inner and outer conductors thereof, insulating spacers supporting the inner conductor within the outer conductor, enclosing means attached to said outer conductor surrounding the perforated portions thereof for providing, with said insulating spacers, an evacuable area enclosing said perforated portions, a source of electrons within said evacuable area, an electron collector plate external to said outer conductor but within said enclosing means, means maintaining said electron source at a negative potential with respect to the closest of said conductors, and means applying an electron decelerating potential to said collector plate of sufficient magnitude to prevent electron flow from said electron source to said plate.

## PULSE AMPLITUDE SELECTOR

Ted W. Berwin, Encino, Calif., assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa

Application February 25, 1953, Serial No. 338,792
9 Claims. (Cl. 250—27)

2. A diversity selector for determining which one of a plurality of incoming signals has the largest amplitude comprising, a one-shot multi-vibrator receiving a triggering pulse each time a determination is to be made, a multivibrator tube, a cathode resistor and condenser connected in parallel and between the cathode of said multi-vibrator tube and ground, a plurality of trigger circuits comprising a pair of electron tubes, one of said electron tubes in each of said trigger circuits coupled to the cathode of the multivibrator tube, a plurality of output terminals connected, respectively, to the plates of the other tubes of said trigger circuits and one of said output terminals receiving an output to indicate which of the input signals has the largest amplitude.

## ELECTRICAL CIRCUIT ARRANGEMENTS FOR EFFECTING INTEGRATION AND APPLICATIONS THEREOF

Alan Dower Blumlein, deceased, late of Ealing, London, England, by Doreen Walker, legal representative, Lanherne Looeydjack, Penzance, England, assignor to Electric and Musical Industries Limited, a British company

Original application May 8, 1945, Serial No. 592,641, now Patent No. 2,692,334, dated October 19, 1954. Divided and this application June 4, 1953, Serial No. 365,931
3 Claims. (Cl. 250—27)

1. A circuit arrangement for integrating a voltage which comprises a source of voltage, an amplifier comprising an odd number of stages and including a thermionic valve having anode-cathode impedance, an integrating circuit including a first impedance unit and a second impedance unit of a different kind of impedance, said source of voltage, said anode-cathode impedance and said two impedance units all being connected in series with each other, said amplifier having an input circuit and an output circuit, said first impedance unit being connected to apply voltage from said source of voltage through the first impedance unit to said input circuit, said second impedance unit being connected from said output circuit to said input circuit whereby it provides a negative feedback path between said output circuit and said input circuit, a further source of voltage, a further impedance like said first impedance connected to apply voltage from said further source through said further impedance to said input circuit and constituting with said second impedance unit a further integrating circuit whereby a voltage representing the sum of the time integrals of the voltages of said source and said further source, respectively, is developed in said output circuit.

2,775,695

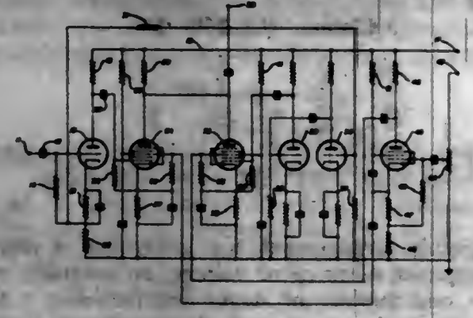
## VARIABLE FREQUENCY PULSE GENERATOR

Charles L. Shadbolt, Santa Monica, Calif., assignor, by mesne assignments, to Hughes Aircraft Company, a corporation of Delaware

Application September 30, 1953, Serial No. 383,187
6 Claims. (Cl. 250—27)

1. An apparatus for generating pulses synchronized by a variable frequency sine wave input signal, said apparatus comprising class C amplification means responsive to said input signal for amplifying corresponding positive portions thereof to produce a series of sine wave pulses; a rectifier, responsive to said sine wave pulses, coupled from the output of said class C amplification means to a point of substantially fixed potential, said rectifier being poled to conduct on the leading edge of said sine wave pulses whereby an output voltage is developed

across said rectifier that commences to increase at the exact instant the instantaneous value of said sine wave pulses commences to decrease in magnitude and rises sharply thereafter at the trailing edges of said sine wave pulses; and means responsive to said output voltage for generating an output pulse at the instant said output voltage rises to a predetermined magnitude.



---

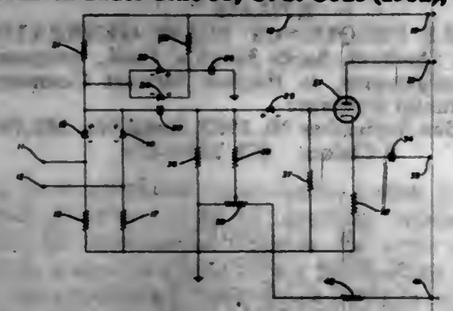
2,775,696

**MILLIVOLT GATING CIRCUIT**

Robert E. Thomas, Walnut Creek, Calif., assignor to the United States of America as represented by the United States Atomic Energy Commission

Application July 14, 1953, Serial No. 367,964
7 Claims. (Cl. 250—27)

1. An improved gating circuit comprising a pair of like gating tubes having a common plate resistor and each having control and screen electrodes, means impressing signals to be gated upon the control electrode of the first of said gating tubes, means impressing positive gating signals on the screen grid of said first tube and simultaneously impressing negative gating signals on the screen grid of said second tube, and means impressing upon the control electrode of the second of gating tubes a signal proportional to the anode potential thereof whereby voltage variation across the common plate resistor is minimized.



---

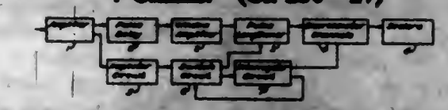
2,775,697

**CRYSTAL DIODE COINCIDENCE CIRCUIT**

Richard Madey, Berkeley, Calif., assignor to the United States of America as represented by the United States Atomic Energy Commission

Application August 27, 1953, Serial No. 382,499
3 Claims. (Cl. 250—27)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. An improved coincidence circuit comprising a plurality of parallel-connected crystal diodes adapted for connection across a power supply whereby current flows therethrough in the direction of maximum conductivity thereof and each having a resistor serially connected thereto on the low voltage side thereof, a plurality of input terminals connected one to each of said crystals on the low voltage side thereof, an output tube having a control electrode and being joined to an output terminal for applying signals thereto, a coupling crystal diode connected to the control electrode of said output tube and capacitively coupled to said parallel-connected crystal diodes on the opposite sides thereof from said resistors with the direction of maximum conductivity toward said control electrode, and a circuit including said coupling crystal diode adapted for connection across a power supply for establishing a circulating current flow through said crystal diode oppositely of the direction of maximum conductivity thereof and including means for controlling the steady state amplitude of said circulating current for establishing the discriminating level of the coincidence circuit whereby only coincident input signals produce an output signal at said output terminal.



---

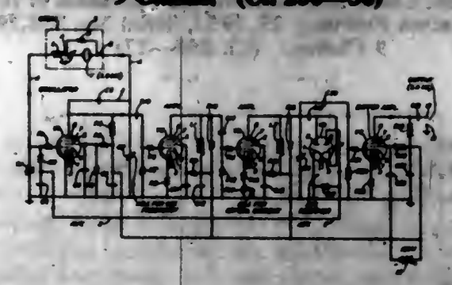
2,775,698

**MULTICHANNEL PULSE ANALYZER**

Perm R. Bell and George G. Kelley, Oak Ridge, Tenn., and Clinton G. Gee, Glenview, Ill., assignors to the United States of America as represented by the United States Atomic Energy Commission

Application April 10, 1953, Serial No. 347,986
7 Claims. (Cl. 250—27)

1. A multi-channel analyzer for determining pulse amplitude distribution comprising a linear amplifier for providing a signal pulse with amplitude proportional to the amplitude of each corresponding input pulse and a control pulse corresponding to each input pulse, means for delaying said signal pulse, an amplitude-selective amplifier for selecting delayed pulses within a selected voltage amplitude range, a pulse lengthener coupled to said amplifier for sustaining the crest of incident pulses, a plurality of parallel-connected discriminators coupled to said pulse lengthener and biased to operate at different potentials, means for counting output pulses from each of said discriminators, circuit means for delaying each control pulse for a selected time interval, means for rejecting said delayed control pulse upon receipt of a second control pulse within said interval, means for enabling said lengthener responsive to passage of said delayed control pulse, and means for enabling said discriminators simultaneously responsive to passage of said pulse.



---

2,775,699

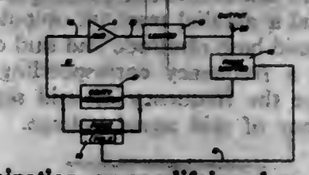
**CRYSTAL OSCILLATOR APPARATUS**

Edwin P. Felch, Chatham, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application August 3, 1954, Serial No. 447,581
9 Claims. (Cl. 250—36)

1. Crystal oscillator apparatus comprising a source of gain having input and output circuits comprising shunt reactors, a feedback circuit coupling said output circuit with said input circuit and comprising a series reactor connected in series with a frequency-controlling crystal network, said crystal network comprising a series-resonant type overtone mode frequency piezoelectric crystal body, said series reactor and said shunt reactors being tuned to resonate substantially at said desired overtone mode operating frequency of said crystal body, said crystal network being substantially resistive and non-reactive at said

operating frequency, and means comprising a resistor connected directly across in parallel circuit relation with said crystal network and having a resistance value sufficiently small for suppressing spurious oscillations at the undesired fundamental mode frequency and frequencies of said crystal body lower in frequency than said operating frequency and simultaneously sufficiently large with respect to the series-resonant resistance of said crystal network at said operating frequency for permitting desired oscillations substantially at said desired operating overtone mode frequency thereof.



---

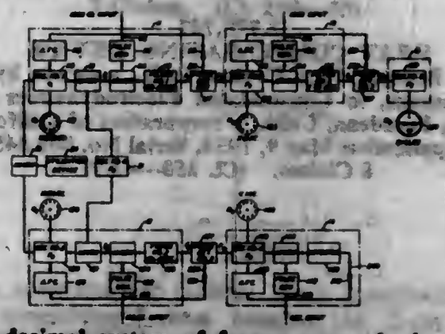
2,775,700

**FREQUENCY STABILIZED OSCILLATOR**

Douglas H. Ring, Red Bank, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application October 1, 1953, Serial No. 383,619
5 Claims. (Cl. 250—36)

4. In combination, an amplifying element having input and output terminals, means forming a regenerative feedback path between said output and input terminals including a variable phase shifter and a resonator element serially coupled to each other and to said amplifying element for high frequency wave energy flow for forming with said amplifying element a closed oscillatory loop, phase comparing means having two input terminals and an output terminal, the two input terminals being coupled for high frequency wave energy flow to opposite sides of the resonator element for deriving a measure of the phase shift of the oscillatory wave in its travel through said resonator element, and means coupled to the output terminal of said phase comparing means for utilizing said measure to adjust the variable phase shifter for varying the frequency of the oscillatory wave.



---

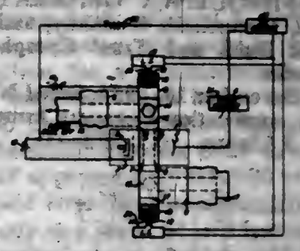
2,775,701

**FREQUENCY CONTROLLED OSCILLATION SYSTEM**

John O. Israel, West Orange, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application March 19, 1954, Serial No. 417,449
4 Claims. (Cl. 250—36)

1. A decimal system of frequency synthesis comprising first generating means providing an array of frequency components uniformly spaced in frequency, second generating means providing an array of frequency components uniformly spaced in frequency at intervals each one-tenth the frequency interval provided by said first generating means, third generating means providing an array of frequency components uniformly spaced in frequency at intervals each one-hundredth the frequency interval provided by said first generating means, a first auxiliary oscillator, automatic frequency control means connected to and actuated jointly by said first and third generating means to control the frequency of the auxiliary oscillator, a second auxiliary oscillator, automatic frequency control means connected to and actuated by said second generating means to control the frequency of said second auxiliary oscillator, and mixing means connected to both said auxiliary oscillators to derive therefrom an output wave controlled as to frequency by all three said generating means.



---

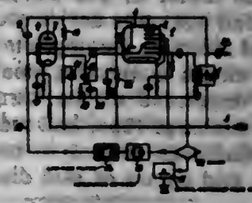
2,775,702

**REFLEX KLYSTRON OSCILLATOR**

George L. Allerton, Allentown, Pa., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York

Application July 3, 1952, Serial No. 297,077
4 Claims. (Cl. 250—36)

1. A reflex klystron oscillator having an external tuning cavity and means for cyclically varying the frequency of the oscillator comprising a plunger in the cavity, a source of low frequency electrical power, an electromechanical vibratory device connected to the source for vibrating the plunger at the frequency of the source, circuit connections between the cathode and repeller electrodes of the klystron, means for applying a fixed potential between the cathode and repeller and electrical connections from the source to the repeller-cathode circuit to vary the repeller voltage over a predetermined range at the frequency of the source so that at any instant the potential of the repeller and the tuning of the cavity both correspond to substantially the same oscillation frequency of the klystron.



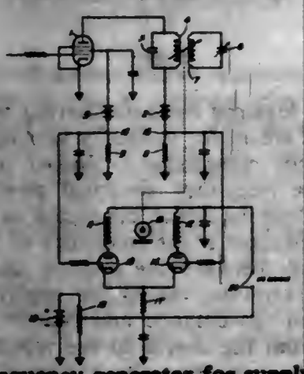
---

2,775,703

**CIRCUIT-ARRANGEMENT COMPRISING A FREQUENCY-STABILIZED OSCILLATOR**

Louis Raymond Bourgonjon, Hilversum, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application May 18, 1953, Serial No. 355,778
Claims priority, application Netherlands May 17, 1952
3 Claims. (Cl. 250—36)

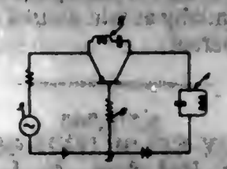


1. A system for stabilizing a first voltage produced by a controllable oscillator with respect to a second voltage produced by a reference oscillator comprising a phase discriminator for comparing said first voltage with said second voltage and producing therefrom a control voltage depending on the frequency difference therebetween, a voltage-responsive frequency control device including a reactance tube having an anode, a control grid and a screen grid coupled to said controllable oscillator, means for applying said control voltage to said reactance tube to vary the frequency of said controllable

oscillator in a direction effecting synchronization with said second voltage, and a search voltage generator producing a low-frequency search voltage for varying the frequency of said controllable oscillator in the absence of synchronization, said generator including said reactance tube and a feedback circuit coupled to said tube and comprising a four-terminal network having input terminals and output terminals, a series impedance including a first resistor and a first capacitor serially connected thereto and a parallel impedance including a second resistor and a second capacitor shunted thereby, a high frequency choke coupling said anode to one of said input terminals, a short-circuiting capacitor for said first voltage connected between said input terminals, and an auxiliary amplifying tube having an anode and a control grid, said control grid being connected to one of said output terminals.

---

2,775,704
**HIGH-FREQUENCY GENERATORS**
Günter Martens, Darmstadt, Germany, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application December 18, 1952, Serial No. 326,656
Claims priority, application Germany January 18, 1952
3 Claims. (Cl. 250—36)



1. A high frequency generator for supplying high frequency oscillations to a variable load comprising an amplifying stage having an input circuit and an electron discharge tube having an anode and a grid, means for applying high frequency oscillations to said input circuit, an anode circuit connected to said anode, an oscillatory output circuit connected in said anode circuit, a load circuit coupled to said output circuit, a grid circuit connected to said grid, and control means responsive to the voltage in both said anode and grid circuits to vary the coupling between said output circuit and said load circuit to maintain maximum output energy in said output circuit for all load values, said control means comprising an electric motor connected to vary said coupling, a first discharge device coupled to said motor for rotating said motor in one direction to tighten said coupling, a second discharge device coupled to said motor for rotating said motor in the opposite direction to loosen said coupling, means connecting one of said discharge devices to be responsive to the current in said anode circuit of said discharge tube, and means connecting the other of said discharge devices to be responsive to the current in said grid circuit of said discharge tube.

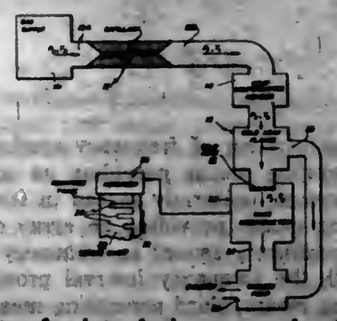
---

2,775,705
**TRANSISTOR MIXING CIRCUIT**
Adrianus Johannes Wilhelmus Maria Van Overbeek, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application June 24, 1953, Serial No. 363,889
9 Claims. (Cl. 250—36)

1. A mixing circuit comprising a transistor having a base electrode, a collector electrode and an emission electrode and having a base current-base voltage characteristic curve exhibiting two points of curvature of which one is at a relatively maximum value of base current and the other is at a relatively minimum value of base current, said base electrode having a biasing potential having a value located at a point substantially midway between said two points of curvature of said curve, a resonant circuit connected to an electrode of said transistor, means interposed between said base electrode and said emission electrode for providing a signal voltage, an impedance

connected to said base electrode providing for self-oscillation of said transistor at the resonant frequency of said resonant circuit, said impedance having a value at the frequency of said self-oscillation at which the instantaneous value of said self-oscillation exceeds said two points of curvature, and a parallel resonant output circuit interposed between said base electrode and said collector electrode tuned to a frequency corresponding to a mixed product of twice the frequency of said self oscillations and the frequency of said signal voltage.

---

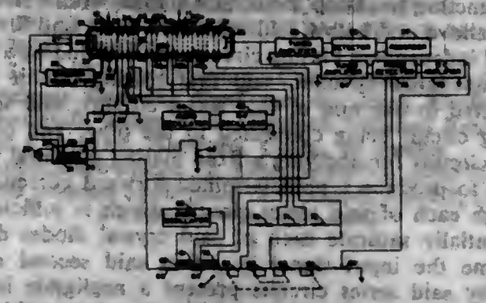


2,775,706
**COLLECTOR ASSEMBLY**
William C. Wiley, Detroit, Mich., assignor to Bendix Aviation Corporation, Detroit, Mich., a corporation of Delaware
Application July 9, 1951, Serial No. 235,744
8 Claims. (Cl. 250—41.9)

1. A mass spectrometer, including, means for emitting ions in pulses in a particular direction, means for subjecting the ions to a magnetic field providing lines of flux in a direction substantially perpendicular to the direction of ion emission so as to produce a rotation of the ions, means for collecting the ions upon their rotation through a substantially constant angular distance different from an integral number of revolutions, the collecting means being disposed in substantially the same direction as the magnetic field and at an angle to the emitting means to receive the ions after their angular rotation and means for measuring the times of flight of the ions to determine their masses.

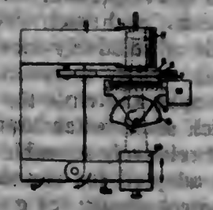
---

2,775,707
**HEAT COMPENSATING DEVICE**
John R. Benoff, West Covina, Calif., assignor, by mesne assignments, to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California
Application May 9, 1955, Serial No. 506,845
8 Claims. (Cl. 250—41.9)



1. Apparatus for introducing a sample of gas from a gas supply into an enclosure which is being constantly evacuated by a vacuum pump comprising capillary means connected to the gas supply with the gas expanding through the capillary means and thereby lowering its temperature and pressure, and heat compensating means connected between the capillary means and the evacuated enclosure and having at least one surface with which the gas makes turbulent contact for regaining the heat necessary to bring its temperature substantially back up to that of the gas supply before it enters the evacuated enclosure.

---



2,775,708
**MASS SPECTROMETER**
James R. Parsons and Dale A. Fitzgel, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
Application January 18, 1955, Serial No. 482,699
14 Claims. (Cl. 250—41.9)

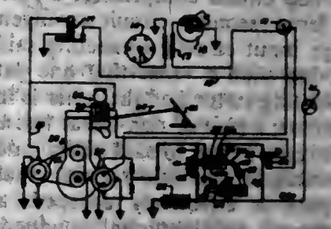
1. A mass spectrometer comprising an ion source, an ion collector electrode spaced from said ion source, an ion permeable electrode, means applying a first potential to said ion permeable electrode to accelerate ions in a direction away from said source, means to direct said ions which have a predetermined mass to said collector electrode, means to vary the acceleration of said ions at a first frequency, second ion detecting means connected to said collector electrode, said second detecting means being responsive solely to the impingement of ions on said collector electrode at said first frequency, and means responsive to said second detecting means to vary the magnitude of said first potential until the output signal of said second detecting means is a minimum.

---

2,775,709
**X-RAY DIAGNOSTIC APPARATUS**
Kurt Weigel and Hansheinrich Verse, Hamburg-Fuhlsbuttel, Germany, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application October 23, 1952, Serial No. 316,372
Claims priority, application Germany November 28, 1951
7 Claims. (Cl. 250—65)

1. An apparatus for medical X-ray examination of a patient comprising a base member, an X-ray source mounted on said base member for producing an X-ray beam having a central axis, an image collector mounted on said base member in a position intercepting said X-ray beam, a support for said patient between the X-ray source and the image collector, intermediate support members secured to said patient support and rotatably mounted on said base member, means for moving the intermediate support members and thereby said patient support in two directions at right angles to one another in a plane at right angles to said X-ray beam, and means for rotating said intermediate support members around the central axis of the X-ray beam.

---

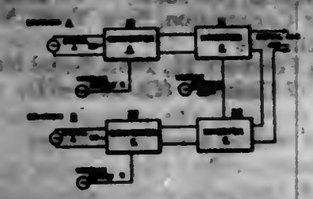


2,775,710
**METHOD OF RADIOLOGICAL SURVEYING**
Clifford G. Ledeman, Scarsdale, N. Y., assignor to Texaco Development Corporation, New York, N. Y., a corporation of Delaware
Application February 21, 1952, Serial No. 272,855
7 Claims. (Cl. 250—71)

1. In geophysical exploration by radioactivity detection, the improvement which comprises disposing at least one thermoluminescent body adjacent a portion of earth to be investigated, exposing said body to radiation emitted from said portion for a predetermined length of time whereby said radiation causes latent luminescence to be formed in said thermoluminescent body, thereafter subjecting said thermoluminescent body to radiation having wave lengths of approximately 0.00006 to 0.04 cm. thereby releasing said latent luminescence from said thermoluminescent body as a result of said last-mentioned radiation, and quantitatively measuring said latent luminescence so released.

---

2,775,711
**THROTTLE ACTUATED STARTER SWITCH DEVICE**
Fred A. Kemmer, St. Louis, Mo., assignor, by mesne assignments, to ACF Industries, Incorporated, New York, N. Y., a corporation of New Jersey
Application June 19, 1952, Serial No. 294,517
15 Claims. (Cl. 290—38)



1. A starting system for internal combustion engines comprising a starting motor, a starting pinion and gear, a solenoid, a source of electrical energy, and a starting circuit including said source and said solenoid, a relay and a manual, lost-motion switch having movable and stationary contact members, an actuator for applying manual pressure directly to said movable contact member to close said switch but capable of limited movement in the switch opening direction after the switch is closed without shifting said movable contact member, and means for yieldingly maintaining said contact members in engagement.

---

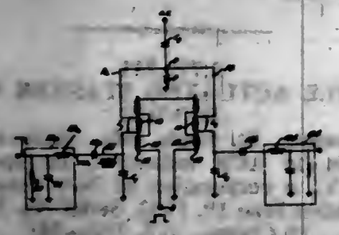
2,775,712
**PHASE COMPARISON SYSTEM**
Alan M. MacCallum, Plainfield, and Cortes M. Perkins, Rutherford, N. J., and Alfred Rosenzt, Bronx, N. Y.
Original application June 28, 1948, Serial No. 35,606. Divided and this application July 26, 1951, Serial No. 238,984
4 Claims. (Cl. 307—73)

2. A signal chain for a control system, comprising a plurality of converters adapted to receive alternating current signals of different frequencies and each converter

being energized by an alternating current source of the same frequency as the associated signal, each of said converters producing a D. C. voltage at its output having a polarity determined by the relative phase of the alternating current source and signal, an inverter connected to each of said converters and energized by a common alternating current source and controlled by the D. C. voltage

from the associated converter, said inverters providing alternating current voltages of the same frequency as the associated energizing current source and the phase of said signals relative to the phase of said associated source being determined by the polarity of the D. C. voltages, and means for adding said alternating current voltages from said inverters algebraically.

---



2,775,713

**FERRO-RESONANT FLIP-FLOP CIRCUIT**

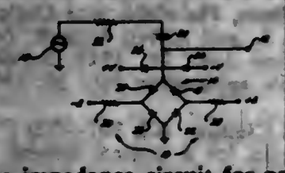
Carl L. Ibbom, Hawthorne, Calif., assignor to The National Cash Register Company, a corporation of Maryland

Application March 22, 1954, Serial No. 417,625

13 Claims. (Cl. 307—88)

12. A flip-flop circuit comprising: a pair of paths each including a ferro-resonant circuit arrangement; an alternating voltage input circuit connecting said paths in parallel and having such a value that one path is in a high current conducting status and the other is in a low current conducting status; a pair of non-linear resistors connecting a source of trigger pulses to said paths, said trigger pulses biasing the voltage across said resistors such that the high conducting path is effectively damped; and an output circuit including a unidirectional conducting means and an inductor connected to each said path, said inductors operable during the triggering action to momentarily maintain a D. C. current flow in said output circuits dependent upon the initial conducting status of said paths, whereby upon termination of said trigger pulse the path that previously had a low current conducting status swings to a high conducting status.

---



2,775,714

**VARIABLE IMPEDANCE OUTPUT CIRCUIT**

Daniel L. Curtis, Venice, Calif., assignor, by mesne assignments, to Hughes Aircraft Company, a corporation of Delaware

Application November 26, 1952, Serial No. 322,765

2 Claims. (Cl. 307—88.5)

1. A variable impedance circuit for producing an output signal which is clamped within a first given range above and below a predetermined reference level in response to an applied variable amplitude alternating current signal which varies about said reference level, and which prohibits production of an output signal during the time said input signal is within a second given range above and below said reference level, said second range being smaller than said first range, said variable impedance circuit comprising: a first series circuit including two crystal diodes having a first common junction; a second series circuit including two crystal diodes having a second common junction, said series circuits being connected in parallel; a source of variable amplitude alternating-current signals; a resistor and capacitor connected in series between said signal source and said first common junction for applying said alternating-current signal to said first and second series circuits, said second common junction being connected to a point of fixed potential; first and second clamping means connected to said first common junction to clamp the output signals within said first range above and below said reference level; and first and second independent biasing circuits, each including a resistive impedance element, said first biasing circuit being connected to one end of said series circuits, said second biasing circuit being connected to the other end of said series circuits for applying a fixed biasing potential thereacross to produce a predetermined forward current flow through each of said series circuits which is sufficient to substantially saturate each of said crystal diodes during the time the input signal is within said second range, whereby said series circuits present a negligible impedance to said input signal during the time it is within said second range above and below said reference level and no output signal is produced thereby and whereby said series circuits present a high impedance to said input signal during the time it is without said second range and an output signal is produced thereby.

2,775,715

**CONTROL SYSTEM FOR PLURALITY OF SPACED ELECTRICAL SWITCHES**

Daniel Vern Tuttle, Kirkland, Ill., assignor, by mesne assignments, to Tuttle & Kift, Inc., Chicago, Ill., a corporation of Illinois

Application January 4, 1954, Serial No. 402,634

6 Claims. (Cl. 307—96)

6. In a control system for a plurality of spaced electrical heating units, in combination:

A. A plurality of switch units adapted to be mounted in spaced relation and respectively to control the circuits to said heating units, each such switch unit comprising: (*a*) a first pair of relatively movable first and second make-and-break contact members adapted for connection in and to open and close the circuit of the heating unit with which such switch unit is associated; (*b*) a second pair of relatively movable make-and-break contact members adapted for connection in and to open and close a control circuit; (*c*) a rotatable cam effective upon rotation thereof to cyclically move the first contact member of said first pair toward and away from the second contact member of such pair whereby the time duration, if any, of the time span of each such cycle of movement during which such contact members are closed depends upon the physical location of such second contact member in the path of movement of the first contact member; (*d*) manually adjustable means effective upon actuation simultaneously to vary the location of the second contact member of said first pair and to maintain closed said second pair of contacts when said second contact member is so positioned as to be engaged by said first contact member as the latter is moved cyclically by said cam, and (*e*) means for adjustably varying the relation between the relative positions of said manually adjustable means and said manually adjustable means and said second contact members;

B. A flexible drive shaft interconnecting the cams of the several switch units;

C. An electrical motor for driving said flexible shaft; and

D. An electrical circuit for energizing said motor, such circuit including therein the said second pair of contact members of the several switch units whereby said motor will remain energized so long as any such second pair of contact members is closed.

2,775,715

**SYNCHRONOUS MOTOR COMPRISING AN ARMATURE HAVING PERMANENT MAGNETIC POLES**

Jeanne Jean Philippe Valeton, Frits Rudolf Hazeli and Franciscus Hendrikus Josef van der Poel, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application March 22, 1955, Serial No. 495,972

Claims priority, application Netherlands April 7, 1954

4 Claims. (Cl. 310—156)

1. A synchronous motor comprising an armature having a first portion provided with a number of permanent magnetic poles and a second portion provided with an equal number of salient poles, said salient poles having a cage winding and coinciding with said magnetic poles.

---

2,775,717

**SEQUENTIALLY FEEDING BRUSH HOLDER FOR COMMUTATOR TYPE ELECTRICAL MACHINES**

Nikolaus Laing, Stuttgart, Germany

Application March 7, 1955, Serial No. 492,700

Claims priority, application Germany March 8, 1954

12 Claims. (Cl. 310—246)

1. A brush holder of the class described, comprising: means for supporting a first elongated brush for initial active engagement with a commutator together with at least one elongated reserve brush for subsequent engagement with said commutator after said first brush has been consumed to a predetermined residual length; resilient feeding means for each brush independently urging each of said brushes longitudinally toward active engagement with said commutator; and sequentially operative tripping means actuated by said resilient feeding means for the one of said brushes which is in active service when said active brush has been consumed to a predetermined residual length, said tripping means holding each reserve brush in an inactive position effectively out of engagement with said commutator until said actuation thereof and releasing a single reserve brush for active service sequentially in response to each such actuation.

---

2,775,718

**ELECTRONIC SPEED LIGHT**

William Dubilier, New Rochelle, N. Y.

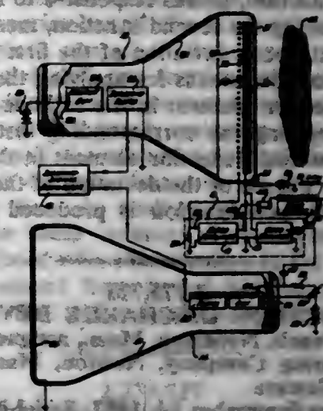
Application March 4, 1954, Serial No. 414,200

4 Claims. (Cl. 313—113)

1. An electronic flash tube comprising a gas-filled envelope, a pair of electrodes at opposite ends of said envelope defining a luminous discharge path, said envelope having an outwardly vaulted portion adjacent to said discharge path, a metallic light reflecting coating upon the outside of said vaulted portion, to confine light produced by the discharge to a predetermined spreading angle, a

pair of connecting terminals exterior of said tube adjacent to one of said electrodes, and means to connect one of said terminals to the adjacent electrode and to connect the other terminal to said other electrode through said coating.

---

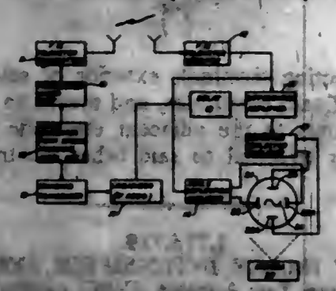


2,775,719

**X-RAY IMAGE INTENSIFIER SYSTEM**

Siegfried Hansen, Los Angeles, Calif., assignor, by mesne assignments, to Hughes Aircraft Company, a corporation of Delaware

Application June 30, 1953, Serial No. 366,161



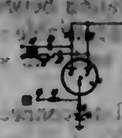
5 Claims. (Cl. 315—11)

1. The method of producing a continuous visual presentation of a periodic X-ray image with the aid of a photoconductive layer having first and second surfaces with capacitance therebetween, said first surface being in contact with a transparent conductive coating and said second surface possessing secondary electron emission characteristics, said method including the steps of projecting the periodic X-ray image towards said first surface of said photoconductive layer, converting the X-ray image into a light image in a plane contiguous to said first surface to release electrical charge from each elemental area of said first surface in proportion to the light intensity thereon, directing the electrical charges to corresponding elemental areas of said second surface to produce a charge replica of the X-ray image, producing an electron beam of elemental cross sectional area, scanning said second surface with said electron beam to liberate more secondary electrons from each scanned elemental area than beam electrons incident thereon, collecting the secondary electrons from said second surface at a first quiescent potential to produce a first electrical signal representative of said charge replica and to discharge said second surface to substantially said first potential, amplifying alternating components of said first electrical signal to produce a second electrical signal, impressing said second electrical signal on said transparent conductive coating to shift the potential of the elemental area of said second surface being scanned by said electron beam substantially to said first potential by means of said capacitance whereby said charge replica is not affected, said second electrical sig-

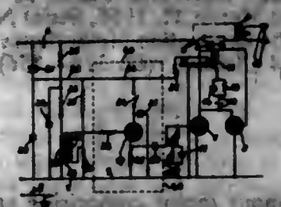
sal being a reproduction of the scanned areas of said charge replica capable of being converted into a visual presentation of the X-ray image.

2,775,720
DEVIATION PLOTTER
Robert M. Stanmeyer and Henry E. Burke, Pasadena, Calif., assignors, by mesne assignments, to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California
Application October 1, 1953, Serial No. 383,643
5 Claims. (Cl. 315—24)

1. Apparatus for automatically determining the deviation of a first function from a second function comprising the combination of a cathode ray tube, a signal generator, means responsive to the signal generator for creating the first function, means responsive to the signal generator for creating the second function, means for obtaining the instantaneous deviation of the first function from the second function, means for applying the first function to a first deflection element in the cathode ray tube, and means for applying the corresponding instantaneous deviation to a second deflection element in the cathode ray tube whereby a trace of the deviation of the first function from the reference function is produced in the screen of the tube.



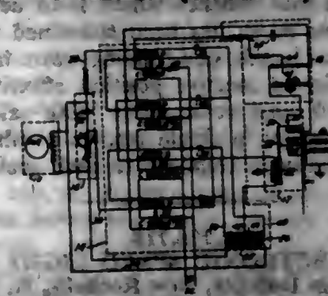
2,775,721
ELECTRON DISCHARGE DEVICES
Edward C. Dench, Needham, Mass., assignor to Raytheon Manufacturing Company, Newton, Mass., a corporation of Delaware
Application September 14, 1953, Serial No. 379,770
8 Claims. (Cl. 315—39.3)



1. An electron discharge device comprising a cathode, an anode structure comprising a supporting member, vanes attached to but insulated from said supporting member, each pair of vanes together with that portion of said supporting member lying therebetween comprising a frequency responsive element, conductors joining adjacent vanes and means for inserting radio frequency energy at a range of frequencies not including the resonant frequency of the frequency responsive elements near one end of said structure, and means for extracting radio frequency energy from said structure.

2,775,722
ELECTRIC DISCHARGE TUBES
Arnold Hugh William Beck, Thomas Melvin Jackson, and John Lyddiatt, London, England, assignors to International Standard Electric Corporation, New York, N. Y.
Application April 8, 1953, Serial No. 347,496
Claims priority, application Great Britain April 10, 1952
12 Claims. (Cl. 315—169)

1. A switching circuit for switching a signal source to a load comprising an electric discharge tube having a cold cathode and two anodes cooperating therewith, means for establishing a transmission path across the gap between the two anodes by establishing discharges between the said cathode and the respective anodes, and means coupling said transmission path in series between said source and load.



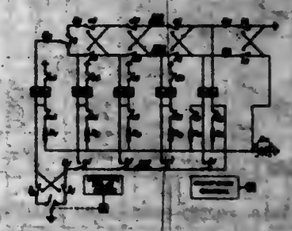
2,775,723
ELECTRIC CIRCUIT ARRANGEMENT FOR SUPPLYING A LOAD WITH ALTERNATING CURRENT
Gerald Offley Crowther, New Malden, England, and Leon Henry Lidal, Glasgow, Scotland, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application August 19, 1953, Serial No. 375,186
Claims priority, application Great Britain August 20, 1952
7 Claims. (Cl. 315—251)

1. An electric circuit arrangement for supplying a load with half cycle intervals or a part thereof of an alternating current supply, at each time of operation of the circuit arrangement, comprising a first electric discharge tube whose effective impedance is in series with the load, a second electric discharge path, said second discharge path being adapted to be rendered selectively conductive and nonconductive, means coupled to said alternating current supply and to said discharge path for selectively switching said discharge path from one of said conduction conditions to the other of said conduction conditions, means further coupled to said discharge path for maintaining the conduction condition initiated by said switching means, and means coupled to said discharge path and responsive to the change in the conduction thereof for initiating conduction in said first electric discharge tube whereby said first discharge tube is rendered conductive for one half cycle only upon the change in conduction in said discharge path.

2,775,724
ELECTRICAL SPEED CONTROL SYSTEM
William H. Clark, Jr., Rockford, N. J., assignor to Curtiss-Wright Corporation, a corporation of Delaware
Application July 5, 1952, Serial No. 297,283
2 Claims. (Cl. 317—5)

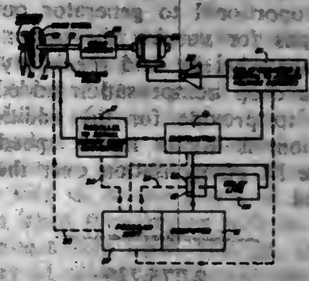
1. A discriminating feedback magnetic amplifier circuit system producing polarized D. C. signals, comprising four saturable reactors each having four windings

therein designated A, B, C and D, said A windings being serially connected, two with leads in one sense and two with leads in the other sense, an A. C. signal generator having two outputs of the same frequency, network means to change the phase relation of said outputs relative to each other with change in speed of said generator from a desired speed, one of said generator outputs being connected to said A windings, said B windings being interconnected, adjustable means to energize said B windings jointly with D. C. energy to bias said reactors, said C windings being interconnected, a transformer having a primary energized by the other output of said signal generator and having a center-tapped secondary, a load inductance connected at one end to said center tap and at its other end to one end of each said D winding, the other ends of two of said D windings being connected to one end of said secondary, the other ends of the other two of said D windings being connected to the other end of said secondary, each said D winding having a rectifier in circuit therewith, the rectifiers of two commonly connected D windings passing energy oppositely, switch means actuated by said load inductance according to the direction of current flow therethrough, a feedback power source, and connections from said power source through said switch means and through said C windings, the direction of current flow in said C windings being such as to unsaturate said reactors.



2,775,725
ELECTRIC RELAY DEVICES
Norman Sydney Ellis, South Shields, England, assignor to A. Reyrolle & Company Limited, Durham, England, a company of Great Britain
Application May 22, 1953, Serial No. 356,790
Claims priority, application Great Britain May 27, 1952
27 Claims. (Cl. 317—36)

1. A directional and impedance relay device responsive to the conditions in a main A. C. electric circuit and comprising a polarized D. C. relay element, a rectifier comparator circuit for applying differentially to such element two rectified A. C. inputs, means for deriving from the main circuit an operating current proportional to a current of the main circuit, a restraining current proportional to a voltage of the main circuit and a polarising current dependent on a voltage of the main circuit and approximately in phase with the restraining current, means whereby one of the said A. C. inputs comprises the vectorial difference between the operating current and the sum of the restraining and polarising currents, and means whereby the other A. C. input comprises the vectorial difference between the restraining current and the sum of the operating and polarising currents.

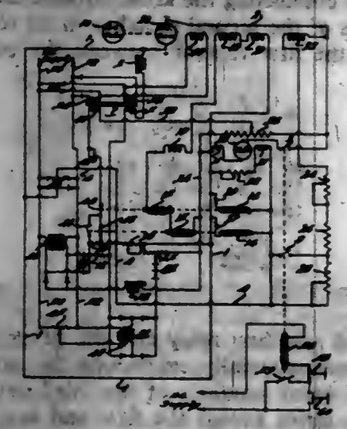


2,775,726
APPARATUS FOR REGISTERING PULSES
Jan Louis de Kroes and Alphonsus Hoetmer, Hilversum, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application November 1, 1951, Serial No. 254,242
Claims priority, application Netherlands November 6, 1950
1 Claim. (Cl. 317—149)

Apparatus for registering pulses comprising a voltage source having two terminals, a pulsing member responsive to incoming sequential pulses and including a connecting element and first and second contacts alternately engaged by said element in response to an applied pulse, said element being connected to one terminal of said source, a series of at least three relays each provided with a winding and first, second and third switches actuated thereby, each switch having a connecting arm and make and break contacts engaged thereby, means serially connecting the arms through the associated break contacts in the first switches of all relays in said series except the last thereof between one end of the winding of said last relay and the first contact of said pulsing member, the second contact of said pulsing member being connected to one end of the winding of the first relay in said series, means serially connecting the arms through the associated break contacts of the second switches in all relays in said series except the first thereof between the other end of

the winding of said first relay and the other terminal of said source, means serially connecting the arms through the associated break contacts of the third switches in all relays in said series except the first and second thereof between the make contact of the second switch in said second relay and said one terminal of said source, the winding of each of said relays except said first relay being connected between the break contact in the corresponding second switch and the make contact of the first switch associated with the preceding relay in the series, means cross-coupling the make contacts of the second and third switches to the break contacts of the second and third switches associated with all the relays in the series except the first and second thereof, and holding circuit means in conjunction with each relay in said series.

2,775,727
DIGITAL TO ANALOGUE CONVERTER WITH DIGITAL FEEDBACK CONTROL
John J. J. Kernahan, Livingston, and John C. Lozier, Short Hills, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application December 8, 1954, Serial No. 473,829
8 Claims. (Cl. 318—28)



3. A digital to analog converter including a digital servo loop comprising a rotatable output shaft, a digital computer yielding solutions representing the desired angular position of said output shaft at a predetermined rate, a code wheel secured to said output shaft, means for reading said code wheel and converting the indicated position of said code wheel into digital form compatible with the output from said computer at a sampling rate which is substantially higher than said predetermined rate, means for subtracting said two digital indications and determining the error between the desired and actual positions of said code wheel in digital terms, a motor coupled to said output shaft, and means for energizing said motor with a restoring current determined by the magnitude

and sign of said error, the energization versus error characteristic of said last-mentioned means being relatively steep for small differences and decreasing to a more gradual linear slope.

---

2,775,728
ADJUSTABLE VOLTAGE DRIVE CONTROLLER
Dorn L. Pettit, Wauwatosa, Wis., assignor to Square D Company, Detroit, Mich., a corporation of Michigan
Application February 28, 1955, Serial No. 490,887
16 Claims. (Cl. 318—143)

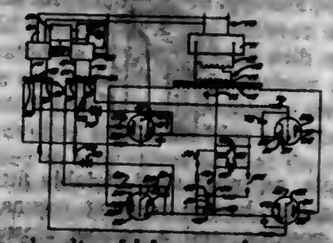
11. In a magnetic amplifier exciter control system for a direct current generator supplying a direct current motor, a main generator field winding, a magnetic amplifier having output and control windings, means supplying said main field winding from the output windings of said magnetic amplifier, means supplying a reference voltage, means supplying a voltage proportional to the generator voltage, means comparing said latter voltage to said reference voltage to supply a signal voltage energizing the control winding of the magnetic amplifier to vary the generator excitation to control the motor speed, a second control winding for the magnetic amplifier, means energizing said second control winding with a second signal voltage proportional to the current in the motor-generator circuit to partially compensate for the IR voltage drop therein, means for adding a voltage proportional to the second signal voltage to said reference voltage whereby to increase said first signal voltage to increase the IR voltage drop compensation, said means for comparing said reference voltage and the voltage proportional to generator output including regulatory means for varying the motor speed as desired, and means whereby said regulatory means varies the IR voltage drop compensation added to said first signal voltage to provide for the addition of greater IR compensation at higher motor speeds, whereby a tapering of the IR compensation over the motor speed range is effected.

---

2,775,729
REVERSING CONTROL DEVICE FOR ELECTRIC MOTORS
Guy A. Curtis, Cleveland Heights, Ohio
Application May 4, 1954, Serial No. 427,462
16 Claims. (Cl. 318—267)

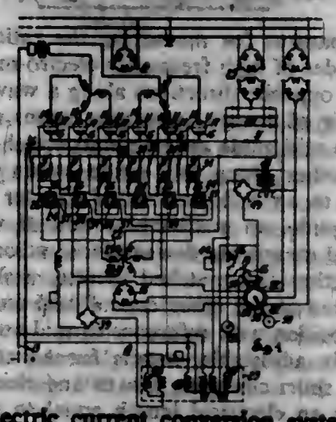
1. A selective device for the purposes described comprising a pair of members movable in a direction relatively toward, and in a direction relatively away from, each other, respectively, a rocking beam, said beam having latching means at opposite sides of its rocking axis operable when the beam is depressed at one end to latch one of the members against movement in a predetermined direction and release the other of the members, and operable when the beam is depressed at the other end to latch said other of the members against movement in an opposite direction and to release said one of the members, a settable means settable relative to the rocking beam by whichever member is unlatched, and operable, when so set, to rock the beam into releasing position relative to the then latched member and into latching position relative to the then unlatched member, all upon movement of the members through at least a portion of their cycle and said settable means being settable and, by the member which was released by the preceding rocking movement of the beam to rock the beam to releasing relation to the member latched by the said preceding rocking movement of the beam and into latching relation to the member released by said preceding rocking movement of the beam all upon the next succeeding movement of the members through at least a portion of their cycle, means to move said members in a preselected one of said relative directions, and resilient return means urging said members in the other of said relative directions.

---



2,775,730
BATTERY CAPACITOR POWER CARTRIDGE
Stanley D. Ehrsberger, Elsewhere, and John G. Gunderman, Denver, Colo., assignors, by mesne assignments, to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application October 2, 1952, Serial No. 312,772
5 Claims. (Cl. 320—1)

1. In an electrical power cartridge of the class described, a sub-assembly and a casing of insulating material for detachably receiving and mounting said sub-assembly, said casing comprising a cylindrical portion open at both ends and a passage extending through the entire length of said cylinder, said sub-assembly comprising a supporting member, a battery terminal contact member of conducting material mounted on the supporting member in an insulated manner, combined electrical conductor means and battery holding means secured to the supporting member, said conductor means having yieldable means positioned on one side of the supporting member to engage the remote terminal end of a battery when the other terminal end engages the contact member and thereby yieldably hold the battery on the contact member, a condenser having an outer shell and positioned on the opposite side of the supporting member with its end terminal adjacent the supporting member, means for electrically connecting the end terminal of the condenser to the conductor means and for holding the condenser to the sub-assembly, and a second conductor means connected to the battery terminal contact and extending alongside of the condenser, said casing holding the last named second conductor means in contact therewith when said sub-assembly is inserted in said casing.

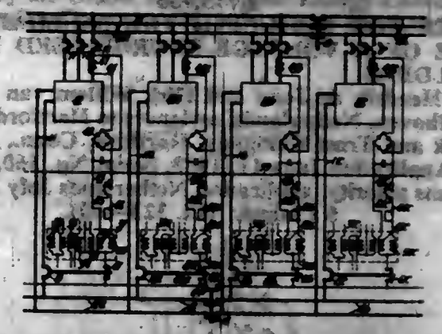


2,775,731
CAPACITOR CHARGING SYSTEM
Robert F. Schaik, Chicago, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application October 14, 1954, Serial No. 462,261
7 Claims. (Cl. 320—1)

1. A welding circuit, which comprises a power supply having a predetermined voltage output, a capacitive load circuit, variable impedance means connected between the power supply and the load circuit, and means automatically operable for varying the impedance means downwardly as the load circuit approaches a charged condition.

---

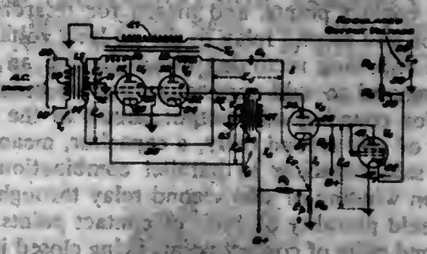
2,775,732
SYSTEM FOR MAINTAINING THE REGULATING MEANS OF AN ELECTRIC CONVERTER OPERATIVE OVER A WIDE RANGE
Harold Winegrad, Milwaukee, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.
Application October 22, 1953, Serial No. 387,767
8 Claims. (Cl. 321—19)



1. An electric current conversion system having a plurality of electric valves provided with control members for controlling the energy transmitted between an alternating current supply circuit and a direct current load circuit, regulating means including magnetic amplifier means comprising a magnetic amplifier for regulating over a relatively small voltage range the output voltage of said system, said magnetic amplifier means including winding means responsive to a condition of said load circuit; reference means including an element of said winding means for setting the output voltage of said system at a preselected value; control means for varying said output voltage over a relatively large voltage range; and linking means responsive to operation of said reference means to simultaneously operate said control means to maintain said regulating means operative over said large voltage range.

---

2,775,733
SYSTEM FOR OBTAINING A PREDETERMINED DIVISION OF LOAD BETWEEN A PLURALITY OF PARALLELED CONVERTERS
Harold Winegrad, Milwaukee, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.
Application December 21, 1953, Serial No. 399,206
12 Claims. (Cl. 321—37)



1. An electric current conversion system having a supply circuit, a load circuit, a plurality of electric valve conversion units connected in parallel between said circuits for transmitting energy therebetween, regulating means for each said unit for controlling the current transmitted to said load circuit by said unit, control means for each said regulating means comprising a feedback element, a reference element, and means for supplying to said feedback element a current proportional to the current transmitted to said load circuit by said unit; means for connecting said reference elements of all said control means

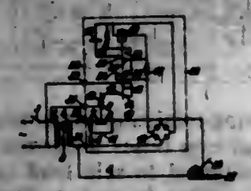
in parallel comprising totalizing buses, and means for supplying to said totalizing buses a current proportional to the total current supplied to said load circuit by all said units to cause the current in each said reference element to be proportional to a predetermined percentage of said total current, each said regulating means being operable to control the current transmitted by its unit in response to the currents in said feedback element and said reference element of said each said regulator means.

---

2,775,734
FILAMENT REGULATOR CIRCUIT
Edward A. Andrade, Cedar Rapids, Iowa, assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa
Application April 10, 1953, Serial No. 348,004
3 Claims. (Cl. 323—45)

1. Means for regulating an output voltage comprising, an output terminal, an output transformer with its secondary connected between ground and the output terminal, a pair of primaries of said output transformer, a pair of thyratron control tubes with cathodes connected to ground, the primaries of said output transformer connected on one side of to the plates of said thyratrons respectively, an input transformer with its primary connected to an alternating input voltage, the center tap of the secondary of said input transformer connected to ground, one end of the secondary of said input transformer connected to the other side of one of the primaries of said output transformer, the other end of the secondary of the input transformer connected to the other side of the second primary of the output transformer, a control transformer with the midpoint of its secondary connected to ground and opposite ends thereof connected to control grids of the first and second thyratron tubes, a phase shift circuit comprising a condenser and triode tube operating as a variable resistor connected in series between one end of the secondary of the input transformer and ground, the primary of the control transformer connected in the plate circuit of said triode tube, a B plus voltage connected to said control primary, a resistor connected in

series with said B plus voltage, a pentode connected as a diode connected between said resistor and ground, the plate of said pentode connected diode tube connected to the control grid of said triode tube, a potentiometer connected to the output terminal, and an output from said potentiometer supplied to the filament of said pentode connected diode tube to operate it in a saturated state.



---

2,775,735

**DEVICE FOR REDUCING THE NO-LOAD VOLTAGE OF A VOLTAGE SOURCE USED IN ARC-WELDING**

Frans Hendrik de Jong and Dirk Willem van Rheenen, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application June 11, 1953, Serial No. 360,884
Claims priority, application Netherlands July 8, 1952
5 Claims. (Cl. 323—60)

5. A welding circuit comprising a pair of welding conductors coupled to a voltage source, an impedance comprising a potentiometer connected in parallel with said voltage source for providing a reduced voltage to said conductors, said potentiometer having two ends and a tapping point, one end of said potentiometer being connected to one of said conductors, a first relay having an excitation winding and a pair of contact points, means for connecting the other end of said potentiometer to the other of said conductors through said pair of contact points, means for connecting said tapping point to said other conductor, a second relay having an excitation winding and a plurality of pairs of contact points, means for connecting the excitation winding of said first relay to said voltage source through a first pair of said plurality of pairs of contact points, and means for retarding the response of said second relay to the no-load voltage of said circuit comprising rectifying means having an input circuit connected to said conductors and an output circuit, means for coupling said output circuit to the excitation winding of said second relay, a capacitor, means for connecting said capacitor in parallel combination with the excitation winding of said second relay through a second pair of said plurality of pairs of contact points, said first and second pairs of contact points being closed in the non-energized condition of said second relay, a first resistor included in said output circuit coupling means in series connection with said parallel combination means for short-circuiting said first resistor through a third pair of said plurality of pairs of contact points, a second resistor and means for discharging said capacitor across said second resistor through a fourth pair of said plurality of pairs of contact points, said third and fourth pairs of contact points being closed in the energized condition of said second relay, said welding circuit operating at a predetermined arc voltage and said second relay being energizable at a reduced no-load voltage of said welding circuit and being non-energizable at said arc voltage.

---

2,775,736

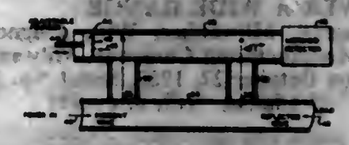
**VALVE LOCATING DEVICE**

Othmar W. Pies, Cincinnati, Ohio, William H. Middendorf, Covington, Ky., and Carl F. Evert, Jr., Cincinnati, Ohio; said Pies assignor to Aqua Survey & Instrument Company, Cincinnati, Ohio, a partnership

Application October 18, 1954, Serial No. 463,015
2 Claims. (Cl. 324—45)

1. In a valve box locating device, an outer casing having an aperture, a window member comprising a frame arranged within said aperture, a magnetic needle having trunnioned mountings between a pair of spaced plates and comprising damping means positioned between said spaced plates and arranged around the arc of movement

of said needle, an inner shell slidably fitting within said outer casing and having resilient means retaining said window in position, and a bottom closure member retaining said inner shell and said magnetic needle in position within said outer casing.



---

2,775,737

**STANDING WAVE MEASURING SYSTEM**

Edward M. Purcell, Cambridge, Mass., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

Application May 3, 1946, Serial No. 667,072
7 Claims. (Cl. 324—58)

1. An apparatus for measuring the ratio of the relative magnitudes of high frequency electro-magnetic waves travelling in opposite directions along a wave guide, comprising a pair of energy extracting means adapted to be connected to said guide at two points which are separated from each other along said guide by an electrical distance equal to an odd number of quarter wave lengths within the guide, an auxiliary section of wave guide, a detecting and measuring device placed at one end of said auxiliary section and matched thereto, a short circuiting means inserted at the other end of said auxiliary section having its position with reference to said auxiliary section longitudinally adjustable, means for adjusting the position of said short circuiting means and electrical connections having an electrical length equal to one-half wave length of the energy being propagated therein between each of said energy extracting means and to respective points on said auxiliary section separated by the same electrical distance as the said two points first named.

---

2,775,738

**MODULATOR**

Kurt Schlesinger, Maywood, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois

Application August 30, 1951, Serial No. 244,335
5 Claims. (Cl. 332—43)

1. A modulator system for modulating a carrier wave having a frequency of the order of 3.5 megacycles or more by a modulating signal which varies in frequency up to a frequency of the order of 1.5 megacycles, said

system including in combination, first and second modulating sections each including a triode valve having a cathode, an anode and a control grid, means for applying said carrier wave to said sections including a pair of bifilar windings connected between said cathodes of said valves and a reference potential for applying said carrier wave thereto with equal amplitude and in opposite phase, means for applying said modulating signal between said control grids and said cathodes of said sections with substantially equal amplitude and opposite phase, resistor means connecting said control grids of said sections to said reference potential for providing a bias therefor and for balancing the signals applied to said valves so that the components thereof in said anodes of said valves are equal and opposite, and means connecting said anodes of said valves for combining the modulation products of said two sections in additive relation, said last named means including a trap for eliminating the second harmonic of the carrier wave.

---

2,775,739

**DEVICE FOR AMPLITUDE MODULATION OF ULTRA SHORT WAVES**

Kornelis Swier Knol and Gerrit de Vries, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application March 15, 1952, Serial No. 276,858
Claims priority, application Netherlands April 6, 1951
4 Claims. (Cl. 332—57)

1. Apparatus for amplitude modulating ultra-short wave energy comprising a hollow wave-guide for conveying said energy, at least one elongated gaseous discharge tube disposed in said guide in the path of said energy, and means coupled to said tube to vary the ionization thereof in accordance with a modulating signal, said tube occupying substantially less than the total cross-section area of said waveguide and being disposed with respect to said guide at an angle at which the ionized gas atmosphere therein is primarily located in a plane lying at an angle not exceeding 30° with respect to the axis of the guide.

---

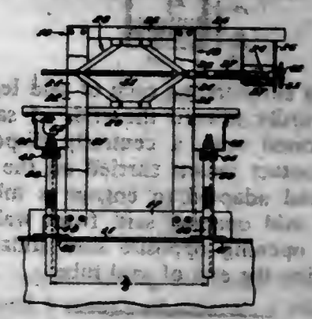
2,775,740

**DIRECTIONAL COUPLING SYSTEMS**

Bernard M. Oliver, Morristown, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application November 2, 1950, Serial No. 193,610
12 Claims. (Cl. 333—10)

3. A directional coupling arrangement comprising a first two wire transmission line, a source of a signal wave at one end of said line, a characteristic impedance termination at the other end of said line, a second two wire line having a portion disposed in electromagnetic field coupling relation with respect to a portion of said first line, a load for utilizing the signal wave at one end of said second line, a characteristic impedance termination at the other end of said second line, and capacitive means having a dielectric constant greater than unity distributed along the coupled portions and inserted across pairs of wires formed by single wires from each of said two transmission lines for reversing the electric coupling between the two lines.



---

2,775,741

**PHASE SHIFTING DEVICE**

Paul I. Corbell, Palo Alto, Calif., assignor, by mesne assignments, to the United States of America as represented by the United States Atomic Energy Commission

Application December 10, 1952, Serial No. 325,155
5 Claims. (Cl. 333—31)

1. Means for adjusting the phase of energy traveling down a wave guide comprising, a pair of openings formed in a wide side of said wave guide, a pair of probes extending through said openings and separated longitudinally of said wave guide by substantially one-quarter wave length, and said probes comprising generally hollow cylindrical tubes with their lower ends closed, closure means mounted in the other ends of said tubes, a pair of openings formed in each of said closure means, and a separate pair of smaller tubes extending through the openings of each of said closure means with one of said smaller tubes of each pair extending further into its respective probe than the other.

---

2,775,742

**ELECTROMAGNET COIL ASSEMBLY**

Edward A. Bogue, South Bend, Ind., and Charles W. Musser, Niles, Mich., assignors to ETC, Inc., Niles, Mich., a corporation of Illinois

Application March 6, 1952, Serial No. 275,896
4 Claims. (Cl. 336—83)

2. An electromagnet coil assembly comprising a spool made of insulating material, a coil wound on the spool, input and output terminals connected to the coil, a housing of magnetizable metal containing the spool and coil, said housing having end walls and an open top, slotted magnetic tubes snugly fitting within the spool and extending through the end walls of the housing, and thermoplastic insulating material filling the space between the coil, the spool and the housing, said terminals extending outwardly from the said insulating material through the open top of the housing.

---

2,775,743

**LAMP HOLDER**

Edwin G. Goddard, Lombard, Ill.

Application October 7, 1953, Serial No. 384,692
5 Claims. (Cl. 339—52)

1. A lamp holder comprising a base, a cover cooperating with said base to form an enclosure, said cover pro-

viding the front wall of said enclosure and said base providing the back wall thereof, and a structurally independent tube supporting device mounted within said enclosure, said tube supporting device including a U-shaped bracket having two legs and a connecting portion, means securing said connecting portion to said base, a plate of insulating material slidably mounted on the legs of said

bracket, a spring surrounding each of said legs for urging said plate forwardly toward the ends of said legs, said plate being formed with a centrally disposed circular opening, and contact means carried on the rear surface of said plate and adapted to engage a tube prong inserted through said opening said front wall being provided with an opening opposite said slidably mounted plate for receiving the end of said tube.

---

2,775,744

**ELECTRICAL PLUG CONNECTOR**

Fred G. Hoeneman, Livingston, N. J.

Application January 11, 1954, Serial No. 403,216

2 Claims. (Cl. 339—74)

1. A plug connector for an electrical cord comprising a chambered casing, a pair of laterally spaced contact blades pivotally mounted intermediate their ends within said casing at points adjacent to the outer free end of the latter, said contact blades each having an internal arm and an external arm outwardly projecting from said casing, compression springs mounted within said casing to exert yieldably in swinging thrust against said internal arms of the contact blades whereby to divergently spread the external arms of said contact blades, means to couple respective electrical cord wires to the ends of the respective internal arms of said contact blades, a control member of substantially circular cross section slidably disposed within the casing for longitudinal movements intermediate and in engagement with the internal arms of the contact blades to and inwardly from an outwardly moved, horizontally aligned position between the pivotal points of said contact blades, whereby, in the latter position, diametrically opposite curved peripheral surfaces of said control member are opposed to the pivotal points of respective contact blades in non-obstructing relation to spring induced rocking movement of said contact blades about their pivotal points, but, when inwardly moved away from said pivotal points, to rock said blades against spring tension to parallelism, said control member having finger engageable means, externally projecting from the casing, by which the same can be manipulated.

---

2,775,745

**BREAKAWAY ELECTRICAL CONNECTOR**

Frederic N. Eaton, Pasadena, Calif., assignor to the United States of America as represented by the Secretary of the Navy

Application June 22, 1955, Serial No. 517,405

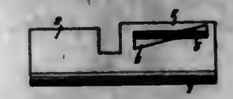
5 Claims. (Cl. 339—91)

(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A breakaway electrical connector comprising separable male and female parts, detent means carried by one of said parts and selectively movable to a retracted position wherein said parts are freely separable and to an extended position in engagement in a recess in the other of said parts whereby said parts will be secured against separation, means movably carried by said one part for normally retaining said detent means in the extended position and including a member engageable with the other part upon assembly of the parts, movement of the parts into assembled condition causing movement of the second mentioned means in a manner to release said detent means for free movement of the latter to the retracted position until said recess is approximately aligned with said detent means, a portion of said second mentioned means being operative upon alignment of the recess and detent means to return to its normal position whereby to cause movement of said detent means

to the extended position and locking of said parts against separation, said portion of the second mentioned means comprising cam means engageable with said detent means, a shaft movably supported on said one part, said member being moved from a first position to a second position during said movement of the parts into assembled condition, latch means pivotally supported on said shaft and in an extended position engaging said cam means for causing movement of said cam means to its detent releasing position upon movement of said member from its first position to its second position, means for pivoting said latch means to a retracted position for causing disengagement of said latch means with the cam means upon said member reaching its second position, and spring means for biasing said cam means to its normal position.

---



2,775,746

**ELECTRICAL SOCKET CONNECTORS**

Sidney Geoffrey Young, London, England

Application January 19, 1954, Serial No. 405,015

3 Claims. (Cl. 339—256)

1. An electric socket connector of the type adapted to receive and grip resiliently a pin inserted therein, such connector comprising two limbs resiliently connected together, each of said limbs being in the shape of a generally flat strip and each being provided with a tongue formed out of the material of the strip so as to leave a hole therein, each of said tongues extending towards the other of said limbs and in spaced, generally parallel relationship to each other to form a socket therebetween, the median plane of said socket being substantially at right angles to the respective planes of the two said limbs

2,775,747

**REINFORCED DEAD-END SPLICE CONNECTOR**

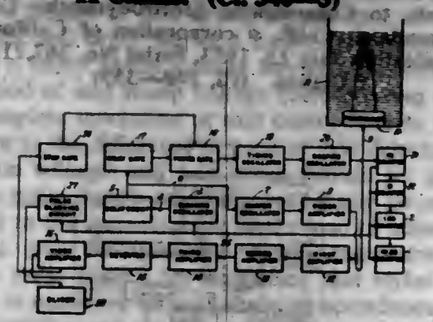
Walter Reinsher, New York, N. Y., and Henry Peter Degen, Wilton, Conn., assignors to Burndy Engineering Co., Inc., a corporation of New York

Application September 27, 1954, Serial No. 458,405

2 Claims. (Cl. 339—277)

1. In combination, a soft metal clevis having a pair of legs for anchoring a cable to an anchoring pin, and a reinforcing core comprising a U-shaped member made of metal having a high tensile strength positioned inside the body of the soft metal clevis, said clevis and reinforcing core provided with an aperture extending entirely therethrough for passing the cable end therethrough, and separate securing means larger than the diameter of the aperture in the core for external attachment to any selected cable, whereby a longitudinally applied force to the cable will position the securing means on the reinforcing core and hold the cable to the clevis.

---



2,775,748

**APPARATUS FOR MEASURING LIQUID LEVELS**

Robert L. Rod, New York, N. Y., and William D. Becher, Paterson, N. J., assignors to Regus Electric Manufacturing Co., Paterson, N. J., a corporation of New Jersey

Application March 17, 1953, Serial No. 342,954

11 Claims. (Cl. 340—3)

1. Apparatus for measuring the level of a body of liquid comprising a supersonic frequency transducer located within said body of liquid, transmitting means for impressing a pulse of electrical oscillations of said supersonic frequency on said transducer, a receiver connected to said transducer including means for receiving a pulse of electrical oscillations from said transducer, and means for measuring a variable elapsed time interval between the transmitted and received pulses including a non-predetermined electronic counter means for counting the variable number of cycles of a timing wave which occur during said variable time interval.

---

2,775,749

**MASS-LOADED RING VIBRATOR**

Harry Summers, Waterford, Conn.

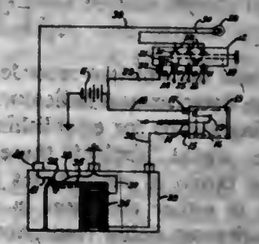
Application April 1, 1953, Serial No. 346,293

13 Claims. (Cl. 340—9)

(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A mass-loaded ring vibrator, said vibrator comprising a ring of transducing material adapted for reversibly converting energy which is quantitatively characterized by flux density into energy of mechanical vibration, and a small number of separate narrow radial protuberances detachably fastened to said ring.

---



2,775,750

**MOTOR VEHICLE LIGHT CIRCUIT WARNING DEVICE**

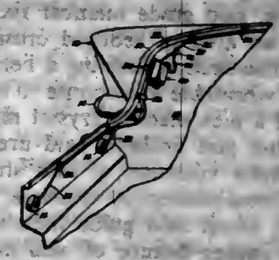
Owen M. Criswell, Valparaiso, Ind.

Application September 6, 1955, Serial No. 532,621

1 Claim. (Cl. 340—52)

In a motor vehicle having an ignition circuit, a vehicle light circuit, and a source of current, a relay having normally closed contacts, said contacts being opened responsive to the energization of said relay, a warning lamp, means connecting said relay in parallel with said ignition circuit, an ignition switch, circuit means connecting said ignition circuit to said source of current through said ignition switch, a vehicle light control switch, circuit means connecting said vehicle light circuit to said source of current through said light control switch, a further switch, means mechanically coupling said further switch to said light control switch and being formed and arranged to close said further switch simultaneously with said light control switch, and circuit means connecting said warning lamp to said source of current through said contacts and said further switch, whereby said warning lamp will be energized when the ignition switch is opened and the light control switch is closed.

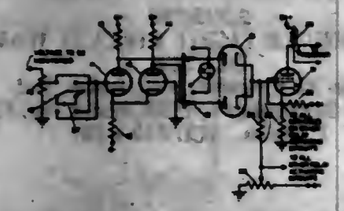
---



2,775,751

**MOBILE ELECTRICAL ALARM**

Harry B. Gordon, Highland Park, and Aaron Gordon, Chicago, Ill., and Edward C. Abdelnour, New York, N. Y.



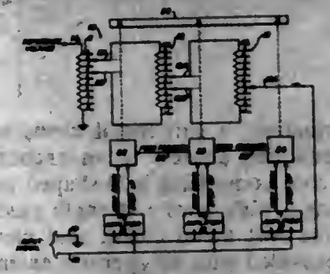
Application July 7, 1955, Serial No. 520,529

2 Claims. (Cl. 340—70)

1. An automatic alarm device adapted to be detachably secured to a metal body edge portion of a mobile vehicle of the type having an electrical power system, comprising a self-contained electrical signal unit operative when energized to emit an audible alarm, said signal unit having an electrical circuit providing a lead adapted to be connected in parallel with the vehicle electrical power system, and bracket means rigidly secured to said signal unit and providing an outwardly extending mechanical support therefor, said bracket being formed of spring metal and having a double reverse bend at its outer end to define a resiliently deformable gripping recess of exposed form for spring tension attachment to the vehicle body, said bracket serving to electrically ground said signal unit circuit.

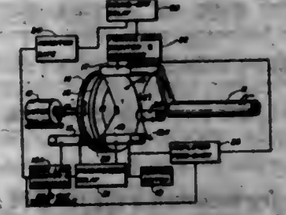
2,775,752
**ELECTRONIC INTERMITTENT RECORDER**
Max J. Hobermann, Fairlawn, N. J.
Application August 10, 1954, Serial No. 448,975
2 Claims. (Cl. 340—223)

1. An electronic intermittent recorder comprising more than one change detector and indicator, each said change detector including means for establishing a balanced condition for the signal applied thereto, regardless of polarity, over a range of magnitudes and being responsive to change in either direction in the signal applied thereto; said indicators being responsive to the action of their associated change detectors when the signal applied to said change detector departs from its normal value by more than a fixed preestablished percentage such that said indicators shall not be responsive to any action of the change detectors after the first such action wherein the signal applied to one of said change detectors departed from its normal value by more than a fixed preestablished percentage.



2,775,753
**WEB MOTION SENSER**
Charles J. Kennedy, Haddonfield, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application October 20, 1954, Serial No. 463,541
The terminal fifteen years of the term of the patent to be granted has been disclaimed
3 Claims. (Cl. 340—259)

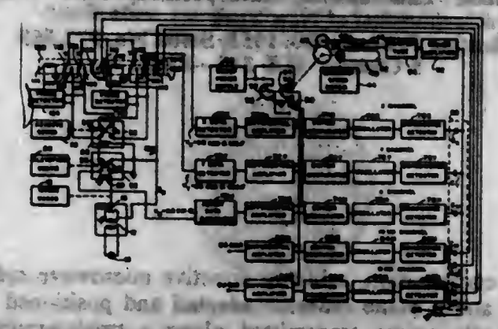
1. In a web driving system, a web motion contacting device comprising a web guide member positioned to slidingly engage a surface of a web member, said web member having a direction of travel parallel to said surface and bending about said guide member at an angle of substantially 90°, said guide member being at the apex of said angle, said guide member including a hollow stud having an area of reduced cross-section, said area of reduced cross-section defining a bend-point about which said stud is vibratable in response to motion of said web member, and a piezoelectric crystal mounted in the hollow of said stud and bridging said area of reduced cross-section whereby vibration of said stud about said area of reduced cross-section in response to motion of said web member about said guide member in said direction of travel causes flexure of said crystal to generate electrical signals corresponding to said web member travel induced vibrations.



2,775,754
**ANALOGUE-DIGITAL CONVERTER**
Robert L. Sink, Altadena, Calif., assignor, by mesne assignments, to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California
Application August 10, 1951, Serial No. 241,320
9 Claims. (Cl. 340—347)

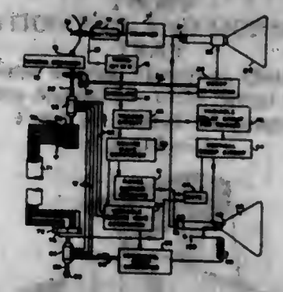
1. An analogue-digital converter comprising a decade potentiometer including a separate section for each digital order, a voltage source connected across the potentiometer, a separate reversible stepping switch connected to each section of the potentiometer to determine the setting of the respective section, a separate pair of relays connected respectively to control the upscale and downscale movement of each stepping switch, a separate phase sensitive amplifier connected to energize each of said pair of relays, the several amplifiers progressively differing in sensitivity by a factor of about 10, means for comparing an input voltage signal with the output of the potentiometer and for feeding the algebraic sum of said signals to the several amplifiers, feed forward connections between succeeding stepping switches from the low-

est to the highest order to drive such succeeding switches in appropriate direction when the potentiometer section controlled by the preceding switch is driven off scale and as long as said section remains off scale, means for indicating the settings of the several potentiometer sections, and switch means connected to be actuated responsive to movement of the highest order stepping switch off scale in the lowest position to reverse the polarity of the voltage source.

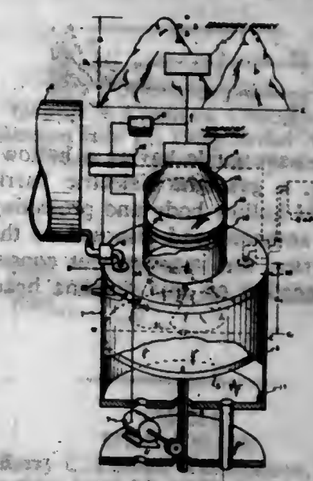


2,775,756
**ANGULAR POSITION TRANSDUCER**
Robert L. Sink, Altadena, Calif., assignor, by mesne assignments, to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California
Application July 13, 1953, Serial No. 367,711
7 Claims. (Cl. 340—359)

1. In a device for measuring rotation of a first member with respect to an angular reference position, the combination which comprises a second member rotatable on the same axis as the first member and independently thereof, means for rotating the second member, a ring of recording medium disposed on the second member and rotatable therewith around its axis, an indexing ring having a plurality of spaced index signals disposed on the second member and rotatable therewith around its axis, a recording head disposed at a fixed position adjacent the ring of recording medium for impressing a first signal on the ring of recording medium, a pick-up head disposed adjacent the ring of recording medium and rotatable with the first member, automatic feed-back means for causing the recording head to make a second signal on the ring of recording medium when the first signal rotates past the pick-up head, automatic means for counting and recording the number of signals impressed on the ring of recording medium, erasing means for removing the signals from the ring of recording material after the signals have been rotated past the pick-up head and before the signal positions have rotated back to the recording head, and automatic means for counting the index signals passing a fixed point adjacent the indexing ring beginning when a signal is impressed on the ring of recording medium by the recording head and ending when a later signal is picked up by the pick-up head.



2,775,756
**FACSIMILE RECORDER COMPUTER**
Sylvanus B. Bency, Eatontown, N. J., and Paul M. Levy, New York, and Rocco L. Serio, Massapequa, N. Y., assignors to the United States of America as represented by the Secretary of the Army
Application March 3, 1955, Serial No. 492,058
7 Claims. (Cl. 343—11)
(Granted under Title 35, U. S. Code (1952), sec. 266)

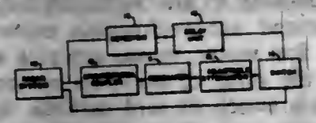


1. A system for continuously plotting the range and height coordinates of a target projectile in flight with respect to time from a prescribed reference position comprising means for generating discrete, coordinate data voltages having instantaneous magnitudes proportional respectively to the instantaneous height position of said projectile and to two prescribed coordinates of the instantaneous azimuth position of said projectile with respect to said reference position, means for detecting each of said coordinate data voltages, a recording drum adapted to be rotatably driven at a prescribed rate of speed, a stylus synchronously driven with said drum and adapted to move axially of said drum, means operatively associated with said drum and said stylus for periodically generating a linear sweep voltage having a prescribed slope, the period of said sweep voltage corresponding in time to one complete revolution of said drum, discrete means responsive to the difference of each of said detected coordinate data voltages and said sweep voltage for generating discrete pulse signals when a point on said sweep voltage is equal to the instantaneous magnitude of respective coordinate data voltages, and means responsive to said discrete pulse signals for energizing said stylus whereby a mark is produced on said drum in accordance with the height position and the two prescribed coordinates of the azimuth position of said target projectile.

2,775,757
**AUXILIARY INDICATOR FOR RADIO-ECHO DETECTION SYSTEM**
Louis D. Ellsworth, Arlington, and Chalmers W. Sherwin, Belmont, Mass., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Application November 19, 1943, Serial No. 510,993
8 Claims. (Cl. 343—11)

1. A radio echo detection system, comprising a means for producing a concentrated electromagnetic beam emission, means for scanning said beam emission in a field in space in a predetermined manner, a cathode ray tube, means producing in one direction a repeated linear sweep of the electron beam thereof, a first self-synchronous motor, means rotating the rotor of said motor in synchronism with the scanning movement of said beam emission, means producing an alternating current of constant amplitude, a second self-synchronous motor electrically coupled to said first motor, means applying said alternating current to the rotor of said first motor, means for moving the beam sweep of said cathode ray tube in a direction quadrature to said one direction, said last mentioned means rendered responsive to the amplitude of the output of the rotor of said second motor, means receiving energy reflected from remote objects upon which said beam emission impinges, and means applying said received energy to said cathode ray tube to indicate reception thereof.

2,775,758
**PHOTO-GLYPH RECORDING**
Otto John Munz, Annapolis, Md.
Application May 25, 1951, Serial No. 228,180
18 Claims. (Cl. 343—17)



2. The process of reproducing objects to produce three dimensional reproductions comprising the steps of scanning a predetermined first sector of the object extending along the vertical direction from base surface of the object, converting the scanning of said sector into a light image which can be projected to expose a light sensitive colloid emulsion, casting a light sensitive emulsion layer in a container which is movable in a vertical direction corresponding to the vertical direction of the scanning operation, exposing said emulsion layer in said container to the light from said light image corresponding to said predetermined scanned sector, developing, fixing and hardening said exposed emulsion to produce an image in said layer corresponding to the sector of the object which is scanned, and repeating said operations by scanning along successive sectors along said vertical direction, each scanning followed by converting into a light image, casting an additional emulsion layer on the last hardened image emulsion, developing, fixing and hardening to build up successive sectored image layers in the container which are in registration with each other to produce a three dimensional reproduction within all of the layers disposed along the vertical axis of the container.

2,775,759
**TEST EQUIPMENT FOR A HIGH-FREQUENCY TRANSMITTER AND RECEIVER**
Jasper J. Okrent, Port Washington, N. Y., assignor to Hazeltine Research, Inc., Chicago, Ill., a corporation of Illinois
Application March 28, 1955, Serial No. 497,286
5 Claims. (Cl. 343—17.7)

1. Test equipment for a transmitter and receiver of repetitive bursts of high-frequency energy comprising:

resonant means activated by said transmitted bursts for developing oscillations over extended periods; and circuit means coupled to said resonant means and operatively

synchronized with the transmitter for gating said oscillations to develop delayed bursts for application to the receiver.

---

2,775,760
MICRO WAVE ANTENNA FEED
Lowell R. Brown, Royal Oak, and Winton J. Kelly, Birmingham, Mich., assignors to Davis Tool & Engineering Company, Detroit, Mich., a corporation of Michigan
Application July 28, 1952, Serial No. 301,274
4 Claims. (Cl. 343—781)

2. In a micro-wave guide having a hollow electrically conductive body, a gas-tight dielectric barrier disposed in the end of said hollow body and projecting therefrom and a dielectric antenna head disposed on the projecting end of said barrier, the improvement consisting of the provision of a portion on said antenna head projecting backwardly along the outside of said hollow electrically conductive body in the region of the high voltage gradient existent at the metallic terminus of the hollow body.

---

2,775,761
MICROWAVE ANTENNA SYSTEM
William C. Jakes, Jr., Red Bank, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application February 20, 1952, Serial No. 272,565
5 Claims. (Cl. 343—834)

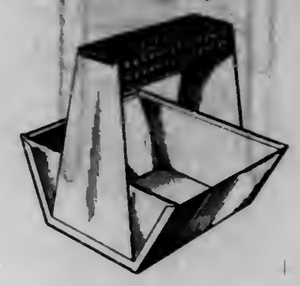
5. In combination, a highly directive microwave radio antenna and a plane reflector adapted and positioned to reflect radio waves transmitted along a predetermined path from and into said antenna, the distance $d$ between said antenna and the midpoint of said reflector being several times the largest dimension of said antenna and of said reflector, the ratio of the product of the wavelength of the wave energy being transmitted by said combination and said distance $d$ to the projected area toward said reflector being greater than 0.1 and the square root of the ratio of the area of the antenna aperture to the projected area of the reflector being no greater than 1.6, whereby either increased gain or extremely broad ranges of tolerable operating parameters may be obtained.

# DESIGNS

DECEMBER 25, 1956

179,435
ROTARY VANE AIRCRAFT
Stefan Apostolescu, New York, N. Y.
Application January 9, 1956, Serial No. 39,653
Term of patent 14 years
(Cl. D71—1)

179,436
DOOR LOCK MEDALLION PLATE OR SIMILAR ARTICLE
Richard H. Arbib, New York, N. Y., and Robert T. Curcuru, Birmingham, Mich., assignors to Signa-Craft, Inc., New York, N. Y., a corporation of New York
Application April 27, 1956, Serial No. 41,235
Term of patent 14 years
(Cl. D50—6)



179,437
EXPANSIBLE CHAIN FOR A BRACELET OR SIMILAR ARTICLE
Karl C. Augenstein, Cranston, R. I., assignor to Speidel Corporation, Providence, R. I., a corporation of Rhode Island
Application August 20, 1956, Serial No. 42,661
Term of patent 14 years
(Cl. D45—4)

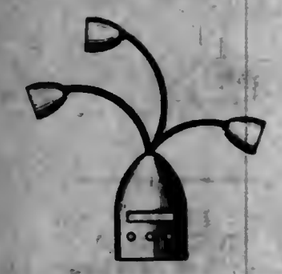
179,438
EXPANSIBLE CHAIN FOR A BRACELET OR SIMILAR ARTICLE
Karl C. Augenstein, Cranston, R. I., assignor to Speidel Corporation, Providence, R. I., a corporation of Rhode Island
Application August 20, 1956, Serial No. 42,662
Term of patent 14 years
(Cl. D45—6)

179,439
COMBINATION PAIL AND MOP SQUEEZING TRAY
Joseph Roland Bisson, Montreal, Quebec, Canada
Application August 20, 1954, Serial No. 31,939
Term of patent 14 years
(Cl. D9—1)

179,440
COMBINED LIPSTICK HOLDER AND VANITY CASE OR SIMILAR ARTICLE
Frederick M. Breen, Westchester, N. Y., assignor to Coty, Inc., New York, N. Y., a corporation of Delaware
Application February 10, 1956, Serial No. 40,114
Term of patent 14 years
(Cl. D86—10)

179,441
TOOTHBRUSH
George S. Clemens, Chicago, Ill.
Application July 11, 1956, Serial No. 42,218
Term of patent 14 years
(Cl. D9—2)

179,442
SIDE CHAIR
Berry C. Collins, Tallahassee, Fla.
Application April 29, 1955, Serial No. 35,737
Term of patent 14 years
(Cl. D15—1)



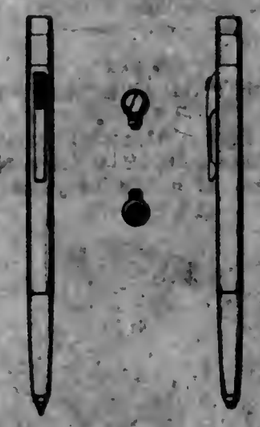
179,443
AIRCRAFT FLIGHT INSTRUMENT
Edward R. Dayton, Huntington Station, and Charles J. Bogan, Amityville, N. Y., assignors to Sperry Rand Corporation, Great Neck, N. Y., a corporation of Delaware
Application October 28, 1955, Serial No. 38,611
Term of patent 14 years
(Cl. D52—6)

179,444
AIRCRAFT NAVIGATION INSTRUMENT
Edward R. Dayton, Huntington Station, Grant W. Schleich, Huntington, and Eugene F. Ready, Merrick, N. Y., assignors to Sperry Rand Corporation, Great Neck, N. Y., a corporation of Delaware
Application October 28, 1955, Serial No. 38,612
Term of patent 14 years
(Cl. D52—6)

179,445
RADIO CABINET WITH MULTIPLE ADJUSTABLE SPEAKERS
Donald K. Eaton, Los Angeles, Calif.
Application May 15, 1956, Serial No. 41,492
Term of patent 14 years
(Cl. D56—4)

179,446
FRUIT DISH
Orville C. Hansen, Cedars, Okla.
Application August 10, 1956, Serial No. 42,577
Term of patent 14 years
(Cl. D36—2)

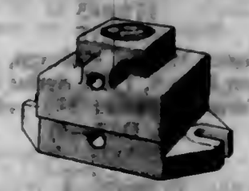
179,447
CANDY DISH
Orville C. Hansen, Cedars, Okla.
Application August 10, 1956, Serial No. 42,578
Term of patent 14 years
(Cl. D36—2)



179,448
BOAT
Dean E. Hanson, Spring Lake Park, Minn.
Application February 1, 1955, Serial No. 34,318
Term of patent 3½ years
(Cl. D71—1)

179,449
BALL POINT PEN
Robert J. Harper, Scarsdale, and Robert H. Ensign, Bronxville, N. Y., assignors to Scripto, Inc., a corporation of Georgia
Application October 14, 1955, Serial No. 38,369
Term of patent 14 years
(Cl. D74—17)

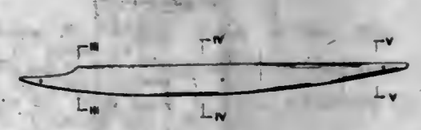
179,450
BALL-POINT PENCIL
Robert J. Harper, Scarsdale, and Robert H. Ensign, Bronxville, N. Y., assignors to Scripto, Inc., a corporation of Georgia
Application August 6, 1956, Serial No. 42,529
Term of patent 14 years
(Cl. D74—24)



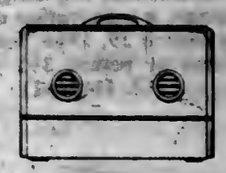
179,451
COMBINED SHOWER STALL LIGHT AND CURTAIN RAIL
Frederic O. Hindle, Milford, Conn., assignor of one-half to Eben B. Woolley, Milford, Conn.
Application April 9, 1956, Serial No. 40,981
Term of patent 14 years
(Cl. D21—1)

179,452
MOBILE HOME
Francis E. Holt, Indianapolis, Ind., assignor, by mesne assignments, to Venture Corporation, Elwood, Ind., a corporation of Indiana
Application April 4, 1955, Serial No. 35,337
Term of patent 14 years
(Cl. D14—3)

179,453
COLLET CHUCK OR THE LIKE
James M. Kemper, Wilmington, Ohio
Application April 10, 1956, Serial No. 40,999
Term of patent 14 years
(Cl. D54—14)

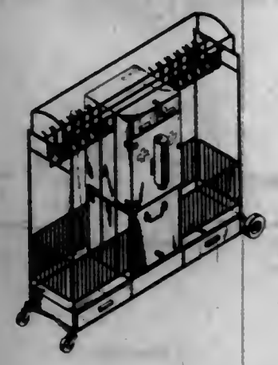


179,454
COMBINED DESK AND SEAT
Theodore C. Knobloch, Detroit, Mich.
Application April 11, 1956, Serial No. 41,022
Term of patent 14 years
(Cl. D33—14)



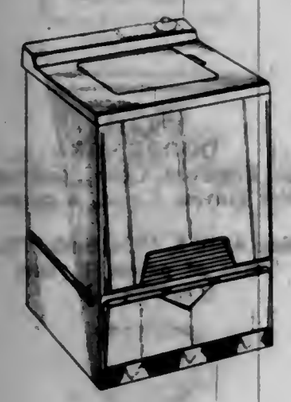
179,455
FISH LURE
Finn H. Magnus, Essex Fells, N. J.
Application October 21, 1955, Serial No. 38,509
Term of patent 3½ years
(Cl. D31—4)

179,456
TOP EDGE PROTECTOR FOR AUTOMOBILE DOORS
Benjamin C. McKee, Memphis, Tenn.
Application June 13, 1955, Serial No. 36,483
Term of patent 3½ years
(Cl. D14—6)

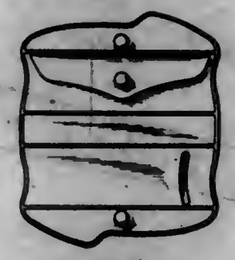


179,457
AIR CONDITIONING CABINET
Herman A. Mugler, Huntington, N. Y.
Application March 30, 1956, Serial No. 40,849
Term of patent 14 years
(Cl. D62—4)

179,458
DOORKNOB
Richard J. Ohno, Branford, Conn., assignor to Sargent & Company, New Haven, Conn., a corporation of Connecticut
Application April 8, 1954, Serial No. 29,922
Term of patent 7 years
(Cl. D50—3)



179,459
**ATHLETIC EQUIPMENT CARRIER RACK**
Melvin W. Potts, Roff, Okla.
Application March 12, 1956, Serial No. 40,539
Term of patent 14 years
(Cl. D14—3)



179,460
**DRINK DISPENSER CASING**
Donald S. Reynolds and Robert J. Thorn, Chicago, Ill.
Application November 25, 1955, Serial No. 39,051
Term of patent 14 years
(Cl. D52—3)

179,461
**LAUNDRY MACHINE**
Ray C. Sandin, Northbrook, Ill., assignor to General Electric Company, a corporation of New York
Application March 29, 1956, Serial No. 40,823
Term of patent 3½ years
(Cl. D49—1)

179,462
**SPECTACLE CASE**
Raymond F. E. Stegeman, Greece, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York
Application March 29, 1955, Serial No. 35,268
Term of patent 3½ years
(Cl. D57—1)

179,463
**CUP**
Albert R. Taggart, Arlington Heights, Ill., assignor to P. R. Mallory Plastics, Inc., Chicago, Ill., a corporation of Illinois
Application September 27, 1955, Serial No. 38,131
Term of patent 14 years
(Cl. D44—9)

179,464
**CAMP TRAILER**
Ivan C. Tiholiz, Northridge, Calif.
Application July 11, 1955, Serial No. 36,913
Term of patent 14 years
(Cl. D14—3)

179,465
**CHEST**
Forest Wilson, Chicago, Ill.
Application June 9, 1955, Serial No. 36,436
Term of patent 3½ years
(Cl. D33—6)

179,466
**DRESSER**
Forest Wilson, Chicago, Ill.
Application June 9, 1955, Serial No. 36,442
Term of patent 3½ years
(Cl. D33—6)

# LIST OF REISSUE PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 25TH DAY OF DECEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Beatty, George B.: *See*—
Hunt, Arthur E. Re. 24,259.
Burliuk, David, and E. Rambusch, to Rambusch Decorating Co. Recessed lighting equipment. Re. 24,258, 12–25–56, Cl. 240—78.
Firma B. Thies Spezialmaschinenfabrik: *See*—
Thies, Alfred F. B. Re. 24,260.
General Motors Corp.: *See*—
Turlay, Joseph D. Re. 24,262.
Grady, Maurice W.: *See*—
Hunt, Arthur E. Re. 24,259.
Hunt, Arthur E., to A. E. Hunt, G. B. Beatty, and M. W. Grady. Coupling system for interchangeably connecting the wiring systems of trucks and trailers. Re. 24,259, 12–25–56, Cl. 307—10.
Martin, Stanley A. Animal feed and method for making the same. Re. 24,261, 12–25–56, Cl. 99—6.
Rambusch Decorating Co.: *See*—
Burliuk, David, and Rambusch. Re. 24,258.
Rambusch, Edward: *See*—
Burliuk, David, and Rambusch. Re. 24,258.
Thies, Alfred F. B., to Firma B. Thies Spezialmaschinenfabrik. Process for drying textiles. Re. 24,260, 12–25–56, Cl. 24—15.
Turlay, Joseph D., to General Motors Corp. Engine manufacturing process. Re. 24,262, 12–25–56, Cl. 29—428.

# LIST OF PLANT PATENTEES

Armstrong Nurseries, Inc.: *See*—
Swim, Herbert C. 1,542.
Swim, Herbert C., to Armstrong Nurseries, Inc. Rose plant. 1,542, 12–25–56, Cl. 47—61.

# LIST OF DESIGN PATENTEES

Apostolescu, Stefan. Rotary vane aircraft. 179,435, 12–25–56, Cl. D71—1.
Arbib, Richard H., and R. T. Curcuru, to Signa-Craft, Inc. Door lock medallion plate or similar article. 179,436, 12–25–56, Cl. D50—6.
Augenstein, Karl C., to Speidel Corp. Expansible chain for a bracelet or similar article. 179,437, 12–25–56, Cl. D45—4.
Augenstein, Karl C., to Speidel Corp. Expansible chain for a bracelet or similar article. 179,438, 12–25–56, Cl. D45—8.
Bausch & Lomb Optical Co.: *See*—
Stegeman, Raymond F. E. 179,462.
Bisson, Joseph R. Combination pail and mop squeezing tray. 179,439, 12–25–56, Cl. D9—1.
Bogan, Charles J.: *See*—
Dayton, Edward R., and Bogan. 179,443.
Breen, Frederick M., to Coty, Inc. Combined lipstick holder and vanity case or similar article. 179,440, 12–25–56, Cl. D86—10.
Clemens, George S. Toothbrush. 179,441, 12–25–56, Cl. D9—2.
Collins, Berry C. Side chairs. 179,442, 12–25–56, Cl. D15—1.
Coty, Inc.: *See*—
Breen, Frederick M. 179,440.
Curcuru, Robert T.: *See*—
Arbib, Richard H., and Curcuru. 179,436.
Dayton, Edward R., and C. J. Bogan, to Sperry Rand Corp. Aircraft flight instrument. 179,443, 12–25–56, Cl. D52—6.
Dayton, Edward R., G. W. Schleich, and E. F. Reedy, to Sperry Rand Corp. Aircraft navigation instrument. 179,444, 12–25–56, Cl. D52—6.
Eaton, Donald K. Radio cabinet with multiple adjustable speakers. 179,445, 12–25–56, Cl. D56—4.
Ensign, Robert H.: *See*—
Harper, Robert J., and Ensign. 179,449.
Harper, Robert J., and Ensign. 179,450.
General Electric Co.: *See*—
Sandin, Ray C. 179,461.
Hamon, Orville C. Fruit dish. 179,446, 12–25–56, Cl. D36—2.
Hamon, Orville C. Candy dish. 179,447, 12–25–56, Cl. D36—2.
Hanson, Dean E. Boat. 179,448, 12–25–56, Cl. D71—1.
Harper, Robert J., and R. H. Ensign, to Scripto, Inc. Ballpoint pen. 179,449, 12–25–56, Cl. D74—17.
Harper, Robert J., and R. H. Ensign, to Scripto, Inc. Ballpoint pencil. 179,450, 12–25–56, Cl. D74—24.
Hindle, Frederic O., ¼ to E. B. Woolley. Combined shower stall light and curtain rail. 179,451, 12–25–56, Cl. D21—1.
Holt, Francis E., to Ventoura Corp. Mobile home. 179,452, 12–25–56, Cl. D14—3.
Kemper, James M. Collet chuck or the like. 179,453, 12–25–56, Cl. D54—14.
Knobloch, Theodore C. Combined desk and seat. 179,454, 12–25–56, Cl. D33—14.
Magnus, Finn H. Fish lure. 179,455, 12–25–56, Cl. D31—4.
Mallory, P. R., Plastics, Inc.: *See*—
Taggart, Albert R. 179,463.
McKee, Benjamin C. Top edge protector for automobile doors. 179,456, 12–25–56, Cl. D14—6.
Mugler, Herman A. Air conditioning cabinet. 179,457, 12–25–56, Cl. D62—4.
Ohno, Richard J., to Sargent & Co. Doorknob. 179,458, 12–25–56, Cl. D30—3.
Potts, Melvin W. Athletic equipment carrier rack. 179,459, 12–25–56, Cl. D14—3.
Reedy, Eugene F.: *See*—
Dayton, Edward R., Schleich, and Reedy. 179,444.
Reynolds, Donald S., and R. J. Thorn. Drink dispenser casing. 179,460, 12–25–56, Cl. D52—3.
Sandin, Ray C., to General Electric Co. Laundry machine. 179,461, 12–25–56, Cl. D49—1.
Sargent & Co.: *See*—
Ohno, Richard J. 179,458.
Schleich, Grant W.: *See*—
Dayton, Edward R., Schleich, and Reedy. 179,444.
Scripto, Inc.: *See*—
Harper, Robert J., and Ensign. 179,450.
Signa-Craft, Inc.: *See*—
Arbib, Richard H., and Curcuru. 179,436.
Speidel Corp.: *See*—
Augenstein, Karl C. 179,437.
Augenstein, Karl C. 179,438.
Sperry Rand Corp.: *See*—
Dayton, Edward R., and Bogan. 179,443.
Dayton, Edward R., Schleich, and Reedy. 179,444.
Stegeman, Raymond F. E., to Bausch & Lomb Optical Co. Spectacle case. 179,462, 12–25–56, Cl. D57—1.
Taggart, Albert R., to P. R. Mallory Plastics, Inc. Cup. 179,463, 12–25–56, Cl. D44—9.
Thorn, Robert J.: *See*—
Reynolds, Donald S., and Thorn. 179,460.
Tiholiz, Ivan C. Camp trailer. 179,464, 12–25–56, Cl. D14—3.
Ventoura Corp.: *See*—
Holt, Francis E. 179,452.
Wilson, Forest. Chest. 179,465, 12–25–56, Cl. D33—6.
Wilson, Forest. Dresser. 179,466, 12–25–56, Cl. D33—6.
Woolley, Eben B.: *See*—
Hindle, Frederic O. 179,451.

# LIST OF PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 25TH DAY OF DECEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

ACF Industries, Inc.: *See*—
Kemmer, Fred A. 2,775,435.
Kemmer, Fred A. 2,775,711.
Zub, Albert W. 2,775,436.

Aarnio, Reino, to Fiat Metal Mfg. Co. Shower shield for bathtub. 2,774,978, 12–25–56, Cl. 4—149.

Abbott Laboratories: *See*—
Morrisey, Edward J., Jr., and Richards. 2,775,240.

Abdelnour, Edward C.: *See*—
Gordon, Harry B. and A., and Abdelnour. 2,775,751.

Abel, Frederick, and F. R. McNeill, to The Huffman Mfg. Co. Power mower with cord securing clip. 2,775,087, 12–25–56, Cl. 56—25.4.

Abendroth, Guss F., W. T. Ilfrey, and G. H. Tausch, to Esso Research and Engineering Co. Method for controlling sand in wells. 2,775,303, 12–25–56, Cl. 166—15.

Abs, Alfred J.: *See*—
Suter, Oswald, and Abs. 2,775,043.

Ackermann, Paul: *See*—
Kölbel, Herbert, and Ackermann. 2,775,607.

Acoustic Research, Inc.: *See*—
Villchur, Edgar M. 2,775,309.

Aerovox Corp.: *See*—
Crowley, Henry L. 2,775,566.

Agriculture, United States of America, as represented by the Secretary of: *See*—
Fischer, Gordon S., and Goldblatt. 2,775,578.
McKinney, Leonard L., Cowan, and Evans. 2,775,565.

Ahrens, Hermann H. F., to Daimler-Benz Aktiengesellschaft. Aerating device for vehicles, particularly omnibusses. 2,775,185, 12–25–56 Cl. 98—9.

Aktiebolaget Bofors: *See*—
Tillander, Folke G., and Åslund. 2,775,164.

Aktiebolaget & Karlstads Mekaniska Werkstad: *See*—
Söderlund, Ulf G. 2,775,169.

Albright, John R., to Geo. D. Roper Corp. Lubrication means for rotary pumps. 2,775,209, 12–25–56, Cl. 103—126.

Alexander, Harold M.: *See*—
McCown, William E., and Alexander. 2,775,071.

Alexeff, Alexander V., and R. L. Godshalk, to The Babcock & Wilcox Co. Closure means for chamber wall opening. 2,775,216, 12–25–56, Cl. 110—179.

Alford Cartons: *See*—
Vines, Oscar L. 2,775,390.
Vines, Oscar L. 2,775,391.

Allegheny Ludlum Steel Corp.: *See*—
Ganlof, Albert C. 2,775,301.

Aller, Willis F., to The Sheffield Corp. Pneumatic gauging device. 2,775,117, 12–25–56, Cl. 73—37.8.

Allerton, George L., to Western Electric Co., Inc. Reflex klystron oscillator. 2,775,702, 12–25–56, Cl. 250—36.

Allied Chemical & Dye Corp.: *See*—
Anderson, Norman L. 2,775,582.

Allied Chemical & Dye Corp.: *See*—
Erchak, Michael, Jr., and Blasek. 2,775,579.

Allis-Chalmers Mfg. Co.: *See*—
Buhr, August G. 2,775,177.
Winograd, Harold. 2,775,732.
Winograd, Harold. 2,775,733.

Altgelt, Herman E., to Deere & Co. Overload trip device for plows. 2,775,183. 12–25–56, Cl. 97—47.89.

Alumatic Corp. of America: *See*—
Zitomer, Abe. 2,774,997.

Alvarez, Manuel M., 50% to J. E. Gonzales. Adjustable drawing table construction. 2,775,497. 12–25–56, Cl. 311—39.

American Bosch Arma Corp.: *See*—
Bischoff, Waldemar O., and Fancher. 2,775,233.
High, Carl F. 2,775,203.

American Cyanamid Co.: *See*—
Baker, Bernard R., and McEvoy. 2,775,597.
Morgan, Russell L. 2,775,557.
Stirn, Frank E., and Taylor. 2,774,988.
Stirn, Frank E., and Taylor. 2,775,080.
Stirn, Frank E., and Taylor. 2,775,081.
Stirn, Frank E., and Taylor. 2,775,083.
Stirn, Frank E., and Taylor. 2,775,084.
Stirn, Frank E., and Taylor. 2,775,257.
Stirn, Frank E., and Taylor. 2,775,267.
Stirn, Frank E., and Taylor. 2,775,447.

American Home Products Corp.: *See*—
Diamond, Julius, and Bruce. 2,775,588.
Diamond, Julius, and Bruce. 2,775,589.

American Infra Red Radiant Co., Inc.: *See*—
Schwank, Günther. 2,775,294.

American Machine & Foundry Co.: *See*—
Kottmann, Arthur A. 2,775,085.
Waite, Fred L. 2,775 352.

American Machine and Metals, Inc.: *See*—
Kadlec, Ladislav. 2,775,045.

American Molded Products Co., The: *See*—
Tellen, Chester J. 2,775,411.

American Optical Co.: *See*—
Dillon, Oscar W. 2,775,074.

American Radiator & Standard Sanitary Corp.: *See*—
Phillips, Gerard D., Jr. 2,775,135.

American Smelting and Refining Co.: *See*—
Lebedeff, Yurri E., Stone, and von Stein. 2,775,509.

American Steel Foundries: *See*—
Bachman, Fred E. 2,775,322.

American Sugar Refining Co., The: *See*—
Wimmer, Ernest L., and Lakata. 2,775,540.

American Viscose Corp.: *See*—
Pedlow, John W. 2,775,505.

Anastasia, Angelo. Safety belt for vehicles. 2,775,288, 12–25–56, Cl. 155—189.

Anderson, A. C., Inc.: *See*—
Lessmann, Herbert F. 2,775,356.

Anderson, Axel E. Bark-removing machine having self-lifting blunt-edge tools. 2,775,274, 12–25–56, Cl. 144—208.

Anderson, Earl K., to Filper Corp. Peach pitter. 2,775,278, 12–25–56, Cl. 146—28.

Anderson, James A., Jr., to Esso Research and Engineering Co. Production of aromatics and dehydrogenated hydrocarbons. 2,775,629, 12–25–56, Cl. 260—668.

Anderson, Norman L., to Allied Chemical & Dye Corp. Unsymmetrical triaso dyestuff. 2,775,582, 12–25–56, Cl. 260—173.

Anderson, Walter A. Jack actuated device for removing tires from vehicle attached wheels. 2,775,289, 12–25–56, Cl. 157—1.1.

Andrade, Edward A., to Collins Radio Co. Filament regulator circuit. 2,775,734, 12–25–56, Cl. 323—45.

Apteker, Rubin to Sears, Roebuck and Co. Self-retaining pump type shoe. 2,775,049, 12–25–56, Cl. 36—55.

Aqua Survey & Instrument Co.: *See*—
Pics, Othmar W., Middendorf, and Evert. 2,775,736.

Archer, Sydney, and M. E. Auerbach, to Sterling Drug Inc. Process of preparing pyridoxal isonicotinoyl-hydrazone and intermediate used therein. 2,775,596, 12–25–56, Cl. 260—295.

Ardern, David B., and R. M. Shirk, to Houdry Process Corp. Hydrocarbon lift system for the conversion of hydrocarbons and the separation of fines. 2,775,547, 12–25–56, Cl. 196—52.

Armantrout, Kenneth M., to Borg-Warner Corp. Power steering mechanism. 2,775,133, 12–25–56, Cl. 74—388.

Armco Steel Corp.: *See*—
Bloom, Fredrick K., and Clarke. 2,775,519.
Bloom, Fredrick K., and Clarke. 2,775,520.

Armour and Co.: *See*—
Shapiro, Sydney H., and McCorkle. 2,775,617.

Army, United States of America as represented by the Secretary of the: *See*—
Bracy, Sylvanus B., Levy, and Sarlo. 2,775,756.
Lochhead, John L. 2,775,165.
Magram, Sidney J. 2,775,515.
Musser, C Walton, and Dietsch. 2,775,052.

Ashley, Carlyle M., to Carrier Corp. Ice cube makers. 2,775,096, 12–25–56, Cl. 62—4.

Ashton, Albert A., to Emsco Mfg. Co. Drawworks having selective transmission and control. 2,775,429, 12–25–56, Cl. 255—19.

Åslund, Ivan: *See*—
Tillander, Folke G., and Åslund. 2,775,164.

Atlas Powder Co.: *See*—
Zech, John D. 2,775,604.

Audio Devices, Inc.: *See*—
Speed, William C., and Dwyer. 2,775,450.

Auerbach, Morris E.: *See*—
Archer, Sydney, and Auerbach. 2,775,596.

Austin, Leslie W., and J. C. Hicks, to Kaiser Aluminum & Chemical Corp. Composite refractory material. 2,775,525, 12–25–56, Cl. 106—59.

Austin, Leslie W., and J. C. Hicks, to Kaiser Aluminum & Chemical Corp. Refractory material. 2,775,526, 12–25–56, Cl. 106—59.

Austin, Leslie W., and J. C. Hicks, to Kaiser Aluminum & Chemical Corp. Refractory material. 2,775,527, 12–25–56, Cl. 106—60.

Automatic Canteen Co. of America: *See*—
Swingler, William F. 2,775,465.

Automatic Electric Laboratories, Inc.: *See*—
Newstedt, Harry N. 2,775,648.

Avco Mfg. Corp.: *See*—
Norberg, Oscar R. 2,775 430.

Avery-Hardoll Ltd.: *See*—
Fraser, John. 2,775,258.

Babcock, John C., and A. C. Ott, to The Upjohn Co. Thiosteroid production. 2,775,602, 12–25–56, Cl. 260—397.3.

Babcock & Wilcox Co., The: *See*—
Alexeff, Alexander V., and Godshalk. 2,775,216.

Bach, Harold H., and C. L. Towle. Method and apparatus for processing ballast. 2,775,438. 12–25–56, Cl. 262—2.

Bachman, Fred E., to American Steel Foundries. Brake rotor. 2,775,322, 12–25–56, Cl. 188—218.

Badische Anilin- & Soda-Fabrik Aktiengesellschaft: *See*—
Hoelscher, Friedrich. 2,775,614.

Baker, Bernard R., and F. J. McEvoy, to American Cyanamid Co. Method for preparing quinazolone intermediates. 2,775,597, 12–25–56, Cl. 260—294.3.

Baker, Donald L., to Carrier Corp. Window locking assembly. 2,775,001. 12–25–56, Cl. 20—52.

Baker, Hugh L.: *See*—
Brown, Oscar E., and Baker. 2,775,469.

Baker, James E. Metering valve for a carburetor. 2,775,437, 12–25–56, Cl. 261—62.

Baker, Leonard, W. Holma, and L. C. Williams, to Miehle Printing Press & Mfg. Co. Machine for and method of folding sheets. 2,775,448, 12–25–56, Cl. 270—95.

Balint, Julius J., G. A. Bannasch, and D. H. Bratton, to General Motors Corp. Operating apparatus for a vehicle window. 2,775,479, 12–25–56, Cl. 296—44.

Banker, Oscar H., to New Products Corp. Torsional vibration absorber. 2,775,105, 12–25–56, Cl. 64—27.

Bannasch, Gilbert A.: *See*—
Balint, Julius J., Bannasch, and Bratton. 2,775,479.

Bardwell, Howard F., and P. L. May, to International Harvester Co. Wire twisting mechanism for bay balers. 2,775,190, 12–25–56, Cl. 100—4.

Barkdoll, Archie E., and R. N. MacDonald, to E. I. du Pont de Nemours and Co. Solutions of formaldehyde polymers. 2,775,570, 12–25–56, Cl. 260—33.4.

Barker, Raymond C. Fishhook guard. 2,775,060, 12–25–56, Cl. 43—57.5.

Barrett, Lawrence D., Jr., and J. E. Dennis, to Westinghouse Electric Corp. Blade structure. 2,775,426, 12–25–56, Cl. 253—77.

Basdekis, Costas H., to The Chemstrand Corp. Method of preparing dyeable copolymers. 2,775,567, 12–25–56, Cl. 260—29.6.

Bates, Harold, C. W. Sammons, and J. W. Fisher, to British Celanese Ltd. Manufacture and use of cellulose esters. 2,775,529, 12–25–56, Cl. 106—165.

Bates, Harold, J. W. Fisher, and J. R. Smith, to British Celanese Ltd. Ripening cellulose esters in solution. 2,775,585, 12–25–56, Cl. 260—230.

Batten, Webster R., and D. Hadden, to Geo. D. Roper Corp. Dual pump drive with overrunning clutches. 2,775,204, 12–25–56, Cl. 103—11.

Baumunk, Harry. Carpenter's square. 2,775,037, 12–25–56, Cl. 33—120.

Baxter, Joseph, Jr., to The Black-Clawson Co. Paper machinery. 2,775,168, 12–25–56, Cl. 92—23.

Bayer, Otto: *See*—
Lober, Friedrich, Bayer, Bögemann, and Schneider. 2,775,568.
Lober, Friedrich, Bayer, Bögemann, and Schneider. 2,775,639.

Beadle, Anthony C.: *See*—
Pocsek, Lyndall C., and Beadle. 2,775,649.

Bear Mfg. Co.: *See*—
MacMillan, Charles W. 2,775,042.

Bearer, Louis C., to Phillips Petroleum Co. Method and apparatus for heating fluids. 2,775,635, 12–25–56, Cl. 260—679.

Beaver Cable Dolly Corp.: *See*—
De Arment, John M. 2,775,357.

Becher, William D.: *See*—
Rod, Robert L., and Becher. 2,775,748.

Beck, Arnold H. W. T. M. Jackson, and J. Lytollis, to International Standard Electric Corp. Electric discharge tubes. 2,775,722, 12–25–56, Cl. 315—169.

Beck, William A.: *See*—
Kollman, Jack, and Beck. 2,775,383.

Beckers, Norman L.: *See*—
Sheeters, Maxwell J., and Beckers. 2,775,624.

Bedford, William A., Jr., to United-Carr Fastener Corp. Panel fastening device. 2,775,010. 12–25–56, Cl. 24—73.

Beebout, Forest O. Angle indicator. 2,775,044, 12–25–56, Cl. 33—221.

Beecham Research Laboratories Ltd.: *See*—
Holland, David O. 2,775,616.

Behnisch, Robert, F. Mietzsch, and H. Schmidt, to Schenley Industries Inc. Thiosemicarbasones of aldehydes and ketones of the heterocyclic series. 2,775,593, 12–25–56, Cl. 260—279.

Behr, Siegfried. Lady's hair ornament. 2,775,245, 12–25–56, Cl. 132—44.

Behrens, Herbert C., to Diebold, Inc. Combination locks. 2,775,113, 12–25–56, Cl. 70—133.

Bell, Charles R., to Bendix Aviation Corp. Beam change preconditioner automatic pilots. 2,775,420, 12–25–56, Cl. 244—77.

Bell, John B., Jr., to Jefferson Chemical Co., Inc. Isolation of ethylene glycol from a mixture also containing propylene glycol. 2,775,623. 12–25–56, Cl. 260—637.

Bell, Persa R., G. G. Kelley, and C. G. Ross, to the United States of America as represented by the United States Atomic Energy Commission. Multichannel pulse analyzer. 2,775,698, 12–25–56, Cl. 250—27.

Bell Telephone Laboratories, Inc.: *See*—
Elliott, Stanley J., Thomas, and Werley. 2,775,407.
Felch, Edwin P. 2,775 699.
Fine, Morris E. 2,775,536.
Harrison, Henry C. 2,775,662.
Israel, John O. 2,775,701.
Jakes, William C., Jr. 2,775,761.
Kernahan, John J. J., and Lesler. 2,775,727.
Mason, Warren P., and Shockley. 2,775,658.
Mason, Warren P., and Thurston. 2,775,650.
Oliver, Bernard M. 2,775,740.
Rine, Douglas H. 2,775,700.

Bellini, Eugene, to Vanity Fair Mills, Inc. Knitting machine needle device with operating means and method. 2,775,106, 12–25–56, Cl. 66—86.

Bemis, Thomas F. Disposable cardboard pan, end forms and inserts. 2,775,019, 12–25–56, Cl. 25—131.5.

Benapfl, John R., to Consolidated Electrodynamics Corp. Heat compensating device. 2,775,707, 12–25–56, Cl. 250—41.9.

Bendix Aviation Corp.: *See*—
Bell, Charles R. 2,775,420.
Bevins, James E., and Hyde. 2,775,442.
Dorn, Maxwell, and Rosenbaum. 2,775,220.
Wiley, William C. 2,775,706.

Benedikz, Thor. Eyeglass cleaning compact. 2,775,344, 12–25–56, Cl. 206—38.

Bennett, Alfred: *See*—
MacCallum, Alan M., Perkins, and Bennett. 2,775,712.

Bennett, Arthur D., and D. Silverman, to Stanolind Oil and Gas Co. Fluid entry detection in wells. 2,775,120, 12–25–56, Cl. 73—155.

Bennett, Arthur D., and D. Silverman, to Stanolind Oil and Gas Co. Fluid input and diameter measurements in wells. 2,775,121, 12–25–56, Cl. 73—155.

Bennett, Arthur S., and D. B. Williams. Method of making composite metal bodies. 2,775,029, 12–25–56, Cl. 29—474.3.

Beresin, Morris. Artificial teeth and method of assembling same. 2,775,035, 12–25–56, Cl. 32—8.

Berestnef, Alexis A., to Carrier Corp. Absorption refrigeration systems. 2,775,097, 12–25–56, Cl. 62—6.

Berggren, Detlof E., to Hartford National Bank and Trust Co., as trustee. Tilting X-ray medical examination table. 2,775,496, 12–25–56, Cl. 311—6.

Bergstein, Frank D.: *See*—
Nerenberg, Robert W. 2,775,388.

Bergstein Packaging Trust, The: *See*—
Nerenberg, Robert W. 2,775,388.

Bergstein, Robert M.: *See*—
Nerenberg, Robert W. 2,775,388.

Bergstrom, Harold A., to Continental Can Co., Inc. Drum for liquids and semi-liquids. 2,775,384. 12–25–56, Cl. 220—5.5.

Bergstrom, Harold A., to Continental Can Co., Inc. Composite can with quick-opening lap seam. 2,775,395, 12–25–56, Cl. 220—51.

Berkeley Industries: *See*—
Gordon, Murray A. 2,775,279.

Berliner, Henry A. Cooking utensil. 2,775,694. 12–25–56, Cl. 219—44.

Berman, Hymie D. Visual display device. 2,775,048. 12–25–56, Cl. 35—35.

Berthoud & Cie: *See*—
Schütz, Kurt. 2,775,482.

Berwin, Ted W., to Collins Radio Co. Pulse amplitude selector. 2,775,693. 12–25–56, Cl. 250—27.

Besler, Eduard, and O. Braunsdorf, to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius und Bruning. Leuco sulfuric acid esters of anthraquinone-azo-dyestuffs. 2,775,583, 12–25–56, Cl. 260—193.

Beuter, Christiaan P. J., to Hersberg Mullne Automatic Products Ltd. Container manufacture. 2,775,287. 12–25–56, Cl. 229—15.

Bethlehem Steel Co.: *See*—
Campbell, George J., and Coccia. 2,775,441.
Mancke, Edgar B. 2,775,517.
Poole, William D. 2,775,535.

Better, Bernard R., and J. W. Lobde, Jr., to Scully-Jones and Co. Torque drivers. 2,775,326, 12–25–56, Cl. 192—56.

Beuchat, Roland, and S. Junod. Belt buckle. 2,775,011, 12–25–56, Cl. 24—178.

Bevins, James E., and R. W. Hyde, to Bendix Aviation Corp. Speed regulating means. 2,775,442, 12–25–56, Cl. 264—10.

Bianco, Henry J., to The Burch Co. Window with removable sash guides. 2,775,008, 12–25–56, Cl. 20—52.2.

Biasell La Verne R. Simulated automobile body toy. 2,775,462, 12–25–56, Cl. 280—1.1.

Bierlein, Carl A.: *See*—
Bixler, George W., and Bierlein. 2,775,470.

Biller, Hans. Toy aeroplane roundabout. 2,775,458. 12–25–56, Cl. 272—31.

Bird & Son, Inc.: *See*—
Sallie, Stanley H., and Zitke. 2,775,582.

Bischoff, Waldemar O., and K. I. Fancher, to American Bosch Arma Corp. Fuel injection pump. 2,775,233. 12–25–56, Cl. 123—140.

Bitonte, Joseph L.: *See*—
Montgomery, Earle T., Welch, and Bitonte. 2,775,531.

Bixler, George W., and C. A. Bierlein, to General Motors Corp. Exhaust stack vibration isolator. 2,775,470. 12–25–56, Cl. 285—96.

Black-Clawson Co., The: *See*—
Baxter, Joseph, Jr. 2,775,168.

Blasek, Robert J.: *See*—
Erchak, Michael, Jr., and Blasek. 2,775,579.

Bloch, Monroe P.: *See*—
Harris, Frederic R. 2,775,095.

Bloom, Fredrick K., and W. C. Clarke, Jr., to Armco Steel Corp. Cold-span articles. 2,775,519, 12–25–56, Cl. 75—125.

Bloom, Fredrick K., and W. C. Clarke, Jr., to Armco Steel Corp. Cold-stamped articles. 2,775,520, 12–25–56, Cl. 75—125.

Blum, Harold T., to The Briar Hill Stone Co. Saw blade for cutting stone. 2,775,236, 12–25–56, Cl. 125—18.

Blumlein, Alan D., deceased, by D. Walker, legal representative, to Electric and Musical Industries Ltd. Electrical circuit arrangements for effecting integration and applications thereof. 2,775,694. 12–25–56, Cl. 250—27.

Boadway, Thaddeus J. Industrial filter. 2,775,349, 12–25–56, Cl. 210—150.

Bögemann, Max: *See*—
Lober, Friedrich, Bayer, Bögemann, and Schneider. 2,775,568.
Lober, Friedrich, Bayer, Bögemann, and Schneider. 2,775,639.

Bogue, Edward A., and C. W. Musser, to Etc, Inc. Electromagnet coil assembly. 2,775,742, 12–25–56, Cl. 336—83.

Bogue Electric Mfg. Co.: *See*—
Rod, Robert L., and Becher. 2,775,748.

Bonell, William H., and B. E. Ludwig, to Lockheed Aircraft Corp. Method of testing pressure vessels. 2,775,116, 12–25–56, Cl. 73—37.

Bordewijk, Jan L., J. F. Lansu, and J. te Winkel, to Hartford National Bank and Trust Co., as trustee. Amplifier circuit. 2,775,655, 12–25–56, Cl. 179—171.

Borg-Warner Corp.: *See*—
Armantrout, Kenneth M. 2,775,133.
English, Herdis G. 2,775,323.
Ingersoll, James H., White, Kovalick, Hegyi, Ruisard, and Levitt. 2,775,073.
Kelbel, Donald W. 2,775,144.
Orr, Palmer, and Kelbel. 2,775,132.

Boskamp, Arthur. Stabilized hexylresorcinol therapeutic agent containing castor oil. 2,775,838, 12–25–56, Cl. 167—55.

Bourgonjon, Louis R., to Hartford National Bank and Trust Co., trustee. Circuit-arrangement comprising a frequency-stabilized oscillator. 2,775,703, 12–25–56, Cl. 250—36.

Bourgraf, George J. Burial casket. 2,775,021, 12–25–56, Cl. 27—6.

Boyer, Robert Q., to the United States of America as represented by the United States Atomic Energy Commission. Continuous electrolytic process for reducing uranium in solution. 2,775,552, 12–25–56, Cl. 204—154.

Boyes, John T. Conditioning apparatus for woven fabric and the like. 2,775,020, 12–25–56, Cl. 26—68.

Bracy, Sylvanus B., P. M. Levy, and R. L. Sarlo, to the United States of America as represented by the Secretary of the Army. Facsimile recorder computer. 2,775,756, 12–25–56, Cl. 343—11.

Brakeley, Paul W., Jr.: *See*—
Schneider, Helmuth G., and Brakeley. 2,775,577.

Braswell, James B., and F. L. Clement. Dumping mechanism for semitrailers. 2,775,480, 12–25–56, Cl. 298—19.

Bratton, David H.: *See*—
Ballnt, Julius J., Baunasch, and Bratton. 2,775,479.

Braunsdorf, Otto: *See*—
Besler, Eduard, and Braunsdorf. 2,775,583.

Breeback, Rudolph H., to Crown Cork & Seal Co., Inc. Filling machines. 2,775,269, 12–25–56, Cl. 141—99.

Bremer, Frederick J., to The Mosler Safe Co. Manipulation-resistant combination lock. 2,775,115, 12–25–56, Cl. 70—133.

Brenstke, Harold R.: *See*—
Brenstke, Walter L. and H. R. 2,775,142.

Brenstke, Walter L. and H. R. Differential. 2,775,142, 12–25–56, Cl. 74—711.

Brewer, Ellis B. Angle tube bracket and hanger assembly. 2,775,473, 12–25–56, Cl. 287—54.

Briar Hill Stone Co., The: *See*—
Blum, Harold T. 2,775,236.

Briesmeister, Arthur C.: *See*—
Robinson, Eugene S., Briesmeister, and McInteer. 2,775,399.

British Celanese Ltd.: *See*—
Bates, Harold, Fisher, and Smith. 2,775,585.

Rockoff, Joseph. 2,775,264.

De Arment, John E., to Beaver Cable Dolly Corp. Cable reel dolly and lifting apparatus. 2,775,357, 12–25–56, Cl. 214—390.

De Benneville, Peter L., and M. J. Hurwitz, to Rohm & Haas Co. Organo-silicon compounds and methods for making them. 2,775,605, 12–25–56, Cl. 260—448.2.

Decker, Maurice S., Jr.: *See*—
Clark, Donald J., and Decker. 2,775,238.

Deere & Co.: *See*—
Altgelt, Herman H. 2,775,183.
Silver, Walter H. 2,775,182.

Deere Mfg. Co.: *See*—
Du Shane, Wallace H. 2,775,175.
Du Shane, Wallace H. 2,775,180.
Swenson, Victor E. 2,775,134.

Defabaugh, Charles E.: *See*—
Gagle, Duane W., and Defabaugh. 2,775,530.

De Jong, Frans H., and D. W. Van Rheenen, to Hartford National Bank and Trust Co., as trustee. Device for reducing the no-load voltage of a voltage source used in arc-welding. 2,775,735, 12–25–56, Cl. 323—60.

De Jong, Geert J., to Stamicarbon N. V. Process for manufacture of strongly basic anion exchangers. 2,775,564, 12–25–56, Cl. 260—2.1.

De Kroes, Jan L., and A. Heetman, to Hartford National Bank and Trust Co., as trustee. Apparatus for registering pulses. 2,775,726, 12–25–56, Cl. 317—140.

De Long, Chancey E.: *See*—
McCurdy, John L., and De Long. 2,774,991.

Dench, Edward C., to Raytheon Mfg. Co. Electron discharge devices. 2,775,721, 12–25–56, Cl. 315—39.3.

Denney, John E.: *See*—
Crammond, Peter, and Denney. 2,774,989.

Dennis, John R.: *See*—
Barrett, Lawrence D., Jr., and Dennis. 2,775,426.

De Sedouy, Philippe L.: *See*—
Geffroy, Robert, and de Sedouy. 2,775,511.

D'Eustachio, Dominic, to Pittsburgh Corning Corp. Method of producing cellulated articles. 2,775,524, 12–25–56, Cl. 106—40.

De Vries, Gerrit: *See*—
Knol, Kornelis S., and de Vries. 2,775,739.

De Vries, Gerrit. Dispenser apparatus. 2,775,368, 12–25–56, Cl. 222—51.

Diamond Alkali Co.: *See*—
Skeeters, Maxwell J., and Beckers. 2,775,624.

Diamond, Julius, and W. F. Bruce, to American Home Products Corp. Substituted azacycloalkanes and process of producing them. 2,775,588, 12–25–56, Cl. 260—239.

Diamond, Julius, and W. F. Bruce, to American Home Products Corp. Substituted azacycloalkanes and process of producing them. 2,775,589, 12–25–56, Cl. 260—239.

Dickens, Robert F.: *See*—
Gearhart, Roy E. 2,775,327.

Diebold, Inc.: *See*—
Behrens, Herbert C. 2,775,113.

Bell, John B., Jr. 2,775,623.

Jeremiah, Earl, to United Can and Glass Co. Can unscrambler. 2,775,334, 12–25–56, Cl. 198—30.

Jessup, Wilbur F., to The Cincinnati Milling Machine Co. Booster for template controlled truing mechanism. 2,775,235, 12–25–56, Cl. 125—11.

Johnson, Frank G. Resistor. 2,775,673, 12–25–56, Cl. 201—63.

Johnson, Gerald E.: *See*—
Johnson, Richard L. and G. E. 2,775,351.

Johnson & Johnson: *See*—
Schwartz, Morris A., and Fisher. 2,775,410.

Johnson, Richard L. and G. E. Gun rack for automobile seats. 2,775,351, 12–25–56, Cl. 211—64.

Johnson, Samuel G., Jr., to International Harvester Co. Mold assembly device. 2,775,007, 12–25–56, Cl. 22—37.

Johnson, Thomas H., and A. J. Mueller to Harris-Seybold Co. Plate clamp. 2,775,198, 12–25–56, Cl. 101—416.1.

Jones, Hugh A. Filters. 2,775,350, 12–25–56, Cl. 210—157.

Jones, Jennings H.: *See*—
Fenske, Merrell R., and Jones. 2,775,633.

Jones, Thomas G.: *See*—
Hamner, Glen P., and Jones. 2,775,575.
Hamner, Glen P., Jones, McDaniel, and Fuqua. 2,775,576.

Jonker, Johan L. H., and G. Diemer, to Hartford National Bank and Trust Co., as trustee. Circuit for frequency transformation of high-frequency oscillations. 2,775,690, 12–25–56, Cl. 250—20.

Jordan, Jack P., to Crown Cork & Seal Co., Inc. Protective cover for dispensing containers. 2,775,372, 12–25–56, Cl. 222—182.

Jorgensen, Roy C., to The Dow Chemical Co. Galvanic anode installation. 2,775,554, 12–25–56, Cl. 204—197.

Junod, Samuel: *See*—
Beuchat, Roland, and Junod. 2,775,011.

Kabelitz, Hans, to Gebrüder Sucker G. m. b. H. Methods and apparatus for the processing of textile materials. 2,775,046, 12–25–56, Cl. 34—23.

Kadlec, Ladislav, to American Machine and Metals, Inc. Liquid filled magnetic compass. 2,775,045, 12–25–56, Cl. 33—223.

Kahan, George J., to Sprague Electric Co. Electrolytic etching process for electrolytic capacitors. 2,775,553, 12–25–56, Cl. 204—141.

Kaiser Aluminum & Chemical Corp.: *See*—
Austin, Leslie W., and Hicks. 2,775,525.
Austin, Leslie W., and Hicks. 2,775,526.
Austin, Leslie W., and Hicks. 2,775,527.

Kapp, Roland: *See*—
Schaaf, Kurt H., and Kapp. 2,775,626.

Kapusnyk, Frank. Boat having multiple floats. 2,775,218, 12–25–56, Cl. 114—61.

Karcher, Harry C., to General Motors Corp. Engine extension shaft. 2,775,104, 12–25–56, Cl. 64—4.

Karl, Alfred. Process for dehydrating of tar. 2,775,541, 12–25–56, Cl. 196—5.

Kasdan, Nathan, to Majestic Metal Specialties, Inc. Ladies' handbag. 2,775,280, 12–25–56, Cl. 150—28.

Kasdan, Nathan. Metal bound box or basket. 2,775,361, 12–25–56, Cl. 220—4.

Katz, Leon: *See*—
Puetzer, Bruno, Katz, and Horwitz. 2,775,560.

Kayat, Elias, to Continental Can Co., Inc. Handle attachment for paper cups. 2,775,382, 12–25–56, Cl. 229—1.5.

Kelbel, Donald W.: *See*—
Orr, Palmer, and Kelbel. 2,775,132.

Kelbel, Donald W., to Borg-Warner Corp. Transmission. 2,775,144, 12–25–56, Cl. 74—769.

Kelley, George G.: *See*—
Bell, Peter R., Kelley, and Goss. 2,775,696.

Kellogg, M. W., Co., The: *See*—
Dipner, Charles D., Teeters, and Wrightson. 2,775,569.
Dittman, Albert L., and Wrightson. 2,775,616.
Nathan, Marvin F., Lobo, and Skaperdas. 2,775,551.

Kelly, Earl M., and A. M. Rivari, to Process Engineers Inc. Apparatus and method for liquid treatment and clarification. 2,775,556, 12–25–56, Cl. 210—16.

Kelly, Winton J.: *See*—
Brown, Lowell R., and Kelly. 2,775,760.

Kennedy, Charles J., to Radio Corp. of America. Web motion sensor. 2,775,753, 12–25–56, Cl. 340—259.

Kennedy, Charles T. Vehicle wheel. 2,775,282, 12–25–56, Cl. 152—158.

Kennedy, Gertrude E., and J. Hawkins, to R. E. Cunningham. Bobby pin holder. 2,775,243, 12–25–56, Cl. 132—1.

Kernahan, John J. J., and J. C. Lozier, to Bell Telephone Laboratories, Inc. Digital to analogue converter with digital feedback control. 2,775,727, 12–25–56, Cl. 318—20.

Kesling, Harold D. Apparatus for and method of forming teeth positioning appliances. 2,775,036, 12-25-56, Cl. 32—14.

Kiekert, Friedrich W. Sliding doors. 2,774,998, 12-25-56, Cl. 20—24.

Kimberlin, Charles N., Jr., and R. W. Kreps, to Esso Research and Engineering Co. Conversion of hydrocarbons in the presence of inert solids. 2,775,546, 12-25-56, Cl. 196—50.

King, Edward P., 30% to C. Daniel, 30% to R. W. Peterson, and 10% to Elgin Milk Products Co., Inc. Anti-foam filler means. 2,775,486, 12-25-56, Cl. 299—144.

Kirby, Thomas G., to Ford Motor Co. Dynamometry. 2,775,119, 12-25-56, Cl. 72—134.

Kirkpatrick, Willard H., to Visco Products Co. Process and device for inhibiting corrosion in wells. 2,775,302, 12-25-56, Cl. 166—1.

Kistner, Merrill M., to Steam Iron Corp. Cord connector for electric irons. 2,775,681, 12-25-56, Cl. 219—25.

Kitto, William H.: *See*—
McMaster, Archie J., and Kitto. 2,775,075.

Kivari, Arthur M.: *See*—
Kelly, Earl M., and Kivari. 2,775,556.

Kleinknecht, George M., to Woodco Corp. Locking mechanism for awning type windows. 2,775,000, 12-25-56, Cl. 20—42.

Kleinsway, Inc.: *See*—
Freund, Benjamin E. 2,775,417.

Kleist, Herman W., to Dole Refrigerating Co. Heat exchangers for vaporizing liquid refrigerant. 2,775,683, 12-25-56, Cl. 219—39.

Knebel, Herman C., to S. H. Pomeroy Co., Inc. Metallic window sash. 2,775,235, 12-25-56, Cl. 189—76.

Knight, John J.: *See*—
Loss, Edward G. 2,775,140.

Knol, Kornelis S., and G. de Vries, to Hartford National Bank and Trust Co., as trustee. Device for amplitude modulation of ultra short waves. 2,775,739, 12-25-56, Cl. 332—57.

Knoll, Paul H., and S. J. Koslowski. Signal for fishing rods. 2,775,053, 12-25-56, Cl. 43—17.

Koble, Robert A., and F. T. Sherk, to Phillips Petroleum Co. Hydrocarbon separation. 2,775,103, 12-25-56, Cl. 62—123.

Köthel, Herbert, and P. Ackermann, to Rheinpreussen Aktiengesellschaft für Bergbau und Chamie. Reactivation of catalysts. 2,775,607, 12-25-56, Cl. 260—449.6.

Koligaard, Reyner, to Houdry Process Corp. Hydrocarbon conversion system. 2,775,548, 12-25-56, Cl. 196—52.

Kollman, Jack, and W. A. Beck, to Ekco-Alcoa Containers, Inc. Food packaging assembly. 2,775,283, 12-25-56, Cl. 229—3.5.

Kummer, Fred A., to ACF Industries, Inc. Carburetor accelerating pump with gas vent. 2,775,435, 12-25-56, Cl. 261—34.

Kommer, Fred A., to ACF Industries, Inc. Throttle actuated starter switch device. 2,775,711, 12-25-56, Cl. 290—38.

Kool Vent Metal Awning Corp. of America: *See*—
Tate, William F. 2,775,324.

Koppers Co., Inc.: *See*—

Tuck, James A. 2,775,296.

Krassowski, Peter. Baseboard heater. 2,775,431, 12-25-56, Cl. 257—133.

Kraus, Ludwig, and J. Gaambo, to Daimler-Benz Aktiengesellschaft. Wheel suspension for motor vehicles. 2,775,467, 12-25-56, Cl. 280—124.

Krause, Frank R., to The McKay Machine Co. Apparatus for tapering the ends of spring leaves and the like. 2,775,152, 12-25-56, Cl. 80—40.

Krebs, Robert W.: *See*—
Kimberlin, Charles N., Jr., and Krebs. 2,775,546.

Kruck, Eugene. Dog bed. 2,775,222, 12-25-56, Cl. 119—1.

Kuba, Samuel: *See*—
Granberry, Doyle S., and Kuba. 2,775,676.

Kundert, Alex. Detachable link strap of synthetic plastic material. 2,775,066, 12-25-56, Cl. 59—80.

Kurvers, Robert J., and G. F. Scheller, to Lockheed Aircraft Corp. Retractable caster with brake. 2,775,813, 12-25-56, Cl. 188—2.

Kylie, Herman. Tiltable front drawer panel. 2,775,501, 12-25-56, Cl. 312—320.

Laheda, Alfred, to Gesellschaft fuer Linde's Eismaschinen Aktiengesellschaft. Double action pumps. 2,775,211, 12-25-56, Cl. 103—175.

Lahr, Harold R., to United Air Lines, Inc. Navigational computers. 2,775,404, 12-25-56, Cl. 235—61.

Lanning, Harry J., to the United States of America as represented by the Secretary of the Navy. Shaft positioning device. 2,775,127, 12-25-56, Cl. 74—10.29.

Laing, Nikolaus. Sequentially feeding brush holder for commutator type electrical machines. 2,775,717, 12-25-56, Cl. 310—246.

Lakata, George D.: *See*—
Wimmer, Ernest L., and Lakata. 2,775,540.

Lanning, William C., and E. J. Hogan, to Phillips Petroleum Co. Purification of olefin-containing hydrocarbon streams. 2,775,637, 12-25-56, Cl. 260—683.15.

Lansu, Joseph F.: *See*—
Bordewijk, Jan J., Lansu, and te Winkel. 2,775,655.

Larkin, Sam. Lifting apparatus for upright bowling pins. 2,775,464, 12-25-56, Cl. 273—42.

Lavender, Harrison M., Jr., to California Research Corp. Extractive distillation process for recovering aromatics. 2,775,627, 12-25-56, Cl. 260—668.

Lawrence, Leonard: *See*—
Goliobin, William. 2,775,014.

Lax, Ladislav: *See*—
Weighton, Donald, and Lax. 2,775,654.

Lazich, Branko, to Westinghouse Air Brake Co. Electrical relays. 2,775,666, 12-25-56, Cl. 200—104.

Leaphart, Noah C., Sr. Coupling pin for separable parts having spring urged pivotal locking plate thereon. 2,775,154, 12-25-56, Cl. 85—3.

Leathers, Ward, W. E. Mazur, and J. G. Weaver, said Leathers assor. to International Business Machines Corp. Traverse gear box. 2,775,139, 12-25-56, Cl. 74—426.

Lebedeff, Yurii E., J. M. Stone, and P. W. von Stein, to American Smelting and Refining Co. Selenium dioxide volatilization process. 2,775,509, 12-25-56, Cl. 23—139.

Lee, Cora A.: *See*—
Lee, George E. 2,775,114.

Lee, George E., deceased; C. A. Lee, administratrix of said G. E. Lee. Combination lock. 2,775,114, 12-25-56, Cl. 70—133.

Leff, Benjamin. Three dimensional polvimetor. 2,775,040, 12-25-56, Cl. 33—174.

Legge, Elmer E., and E. J. Stephens, to Emhart Mfg. Co. Useing machine load measuring system. 2,775,118, 12-25-56, Cl. 73—88.5.

Lehde, John W., Jr.: *See*—
Better, Bernard E., and Lehde. 2,775,326.

Leithäuser, Heinz, W. Linder, and E. Sattler, to Koppers Co., Inc. Apparatus for the production of hydrocarbons. 2,775,512, 12-25-56, Cl. 23—288.

Leitner, Irving A.: *See*—
Leitner, Lionel J. and I. A. 2,775,355.

Yokel, Edward C., to Twin Disc Clutch Co. Slip operating clutch and cooling means therefor. 2,775,328, 12-25-56, Cl. 192—57.

Yost, Albert G., ⅜ to L. G. Sokol and J. P. Janovic. Means for softening musical instrument reeds. 2,775,272, 12-25-56, Cl. 144—196.

Youd, James T., to Hawaiian Pineapple Co., Ltd. Press. 2,775,191, 12-25-56, Cl. 100—145.

Young, Sidney G. Electrical socket connectors. 2,775,746, 12-25-56, Cl. 339—256.

Young, Walter N., to International Resistance Co. Automatic batch furnace apparatus. 2,775,449, 12-25-56, Cl. 263—7.

Young, William K., deceased: The Third National Bank of Rockford, executor. Device for changing circular motion to rectilinear motion. 2,775,128, 12-25-56, Cl. 74—49.

Zaha, Karl M., to International Harvester Co. Spring mounted tool shank. 2,775,181, 12-25-56, Cl. 97—47.54.

Zalcman, Haskiel. Method of removing hair and wool from animal hides and skins. 2,775,504, 12-25-56, Cl. 8—94.16.

Zalega, Edwin A. Shower curtain rod attachment. 2,774,974, 12-25-56, Cl. 4—154.

Zandmer, Solis M. Apparatus for providing ducts between borehole wall and casing. 2,775,304, 12-25-56, Cl. 166—100.

Zech, John D., to Atlas Powder Co. Quaternary ammonium halides. 2,775,694, 12-25-56, Cl. 260—404.5.

Zenith Radio Corp.: *See*—
Rennick, John K. 2,775,691.

Ziller, Lester G., to Comfort Equipment Co. Valved manifold for field spraying equipment. 2,775,261, 12-25-56, Cl. 137—625.

Zinke, Willard L., to the United States of America as represented by the Secretary of the Navy. Cantilever spring. 2,775,443, 12-25-56, Cl. 267—1.

Zinkil, Roy H.: *See*—
Nelson, Axel E., Schmidt, and Zinkil. 2,774,972.

Zithe, Ernest J.: *See*—
Sallis, Stanley H., and Zithe. 2,775,532.

Zitzmer, Abe, to Aluminette Corp. of America. Sash and sash frames. 2,774,997, 12-25-56, Cl. 20—12.

Zuh, Albert W., to ACF Industries, Inc. Accelerating pump inlet check valve closer. 2,775,136, 12-25-56, Cl. 261—34.

Zukowski, Edward A.: *See*—
Ehrlich, Walter A., and Zukowski. 2,775,461.

# CLASSIFICATION OF PATENTS

## ISSUED DECEMBER 25, 1956

NOTE.—First number=class, second number=subclass, third number=patent number

C., to whom all subscriptions should be made payable and all communications addressed; subscription price, $10.50 per annum, foreign mailing $2.00 additional; single copies, 20 cents each.

# MARKS PUBLISHED FOR OPPOSITION

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Notice of opposition under section 13 may be filed within thirty days of this publication. See Rules 20.1 to 20.5.

As provided by section 31 of said act, a fee of twenty-five dollars must accompany each notice of opposition.

## CLASS 1

### RAW OR PARTLY PREPARED MATERIALS

SN 674,638. Toyad Corporation, Latrobe, Pa. Filed Oct. 11, 1954.

Chemfoam

For Foamed Plastic Materials in the Form of Sheets, Slabs, and the Like.
First use Mar. 1, 1954.

SN 763. Druid Hill Park Seed Corporation, Baltimore, Md. Filed Jan. 16, 1956.

HALL MALL

For Grass Seeds.
First use December 1955.

## CLASS 2

### RECEPTACLES

SN 692,405. F. J. Kress Box Company, Pittsburgh, Pa. Filed Aug. 3, 1955.

Masterpak

For Paperboard Cartons.
First use July 18, 1955.
Subj. to Intf. with SN 9,183.

SN 2,069. Atlas Plywood Corporation, Boston, Mass. Filed Feb. 6, 1956.

Atlas Plywood
FROM FOREST TO FINISHED PRODUCT

The word "Plywood" is hereby disclaimed apart from its use as shown in the drawing. Owner of Reg. Nos. 208,762 and 209,986.
For Plywood Shipping Cases.
First use August 1953.

SN 8,608. American Box Board Company, Grand Rapids, Mich. Filed May 21, 1956.

E-Z MATIC

For Merchandise Holding Boxes and Receptacles Made of Paperboard.
First use on or about Apr. 10, 1956.

SN 11,244. Fulton Bag & Cotton Mills, Atlanta, Ga. Filed June 29, 1956.

Ful-Pic

For Cotton Pickers' Bags.
First use June 5, 1956.

SN 11,383. Mallinckrodt Chemical Works, St. Louis, Mo. Filed July 2, 1956.

UTIL-AR-PAK

Owner of Reg. No. 594,056.
For Corrugated Shipping Cartons.
First use May 15, 1956.

SN 13,085. Southwestern Industrial Electronics Company, Houston, Tex. Filed July 30, 1956.

SIE

For Storage Boxes.
First use on or before Feb. 15, 1945.

## CLASS 3

### BAGGAGE, ANIMAL EQUIPMENTS, PORTFOLIOS, AND POCKETBOOKS

SN 4,647. Henry L. Kotkins, Seattle, Wash. Filed Mar. 15, 1956.

TOTE EM

Owner of Reg. No. 578,736.
For Luggage.
First use February 1953.

SN 5,581. Bankers Trust Company, New York, N. Y. Filed Apr. 2, 1956.

BANKIT

For Portfolio for Business and Banking Correspondence.
First use Oct. 5, 1955.

## CLASS 6

### CHEMICALS AND CHEMICAL COMPOSITIONS

SN 695,205. Avon-Strand, Inc., Chicago, Ill. Filed Sept. 23, 1955.

EXTERMO

For Insecticide Cones.
First use June 1, 1955.
Subj. to Intf. with SN 696,741.

SN 696,451. Mid-Western Spray Chemical Co., Inc., Mission, Kans. Filed Oct. 14, 1955.

WEEVLDOOM

For Liquid Insecticide for Application to Grain in Storage.
First use Oct. 24, 1950.

SN 696,741. Rochester Germicide Company, Inc., Rochester, N. Y. Filed Oct. 19, 1955.

EXTERMO

For Insecticides.
First use in January 1895.
Subj. to Intf. with SN 695,205.

SN 698,339. Bryton Chemical Company, Marcus Hook, Pa. Filed Nov. 16, 1955.

HYBASE

For Sulfonates.
First use Jan. 7, 1954.

SN 6,652. Standard Ultramarine & Color Co., Huntington, W. Va. Filed Apr. 18, 1956.

BERMUDA

For Dyes—Namely, Phthalocyanine Blues.
First use Apr. 7, 1955.

SN 7,008. Hofford Varnish Co., Inc., Carlstadt, N. J. Filed S. R. Apr. 24, 1956; amended to P. R. June 21, 1956.

AQUA-TONE

For Liquid Leather Finishing Composition.
First use January 1955.
Subj. to Intf. with SN 7,530.

SN 7,530. Paule Chemical Corp., Charlestown, Mass. Filed May 2, 1956.

AQUA-TONE

For Shoe Sprays—Namely, Spraying Fluids for Providing Shoes With Water Repellent Finishes.
First use January 1956.
Subj. to Intf. with SN 7,008.

SN 10,435. S. C. Johnson & Son, Inc., Racine, Wis. Filed June 18, 1956.

GLADE

For Household Deodorant.
First use Mar. 18, 1956.

## CLASS 7

### CORDAGE

SN 9,479. Mount Vernon Mills, Inc., Baltimore, Md. Filed June 1, 1956.

MOUNT VERNON MILLS INC.

For Cordage, Particularly Twines and Ropes.
First use May 2, 1956.

SN 11,034. Plymouth Cordage Company, Plymouth, Mass. Filed June 26, 1956.

ORANGE TOP

For Baler Twine.
First use May 16, 1956.

## CLASS 8

### SMOKERS' ARTICLES, NOT INCLUDING TOBACCO PRODUCTS

SN 680,802. Alfred Robbins Organization, Inc., New York, N. Y. Filed Jan. 31, 1955.

EXECUTIVE LINE

The words "Executive Line" are disclaimed apart from the mark as shown.
For Pocket and Table Lighters for Cigarettes and Cigars, Ash Trays, and Cigarette Boxes.
First use July 1, 1947.

SN 10,282. Johnny Ashtray, Kansas City, Kans. Filed June 15, 1956.

Johnny Ashtray

The term "Ashtray" is disclaimed apart from the goods.
For Ash Trays.
First use June 9, 1956.

## CLASS 10

### FERTILIZERS

SN 1,286. "Seifa" Società per il Commercio di Fertilizzanti Azotati—S. p. A., Milan, Italy. Filed Jan. 23, 1956.

Priority claimed under Sec. 44(d) on Italian application filed Nov. 3, 1955; Reg. No. 128,546, dated July 9, 1956.
For Chemical Fertilizers for Agricultural Purposes.

## CLASS 12

### CONSTRUCTION MATERIALS

SN 700,732. Johns-Manville Corporation, New York, N. Y. Filed Dec. 28, 1955.

**LOK-PALLET**

Owner of Reg. No. 617,056.
For Unit Stacks of Shingles.
First use Mar. 7, 1955.

## CLASS 13

### HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES

SN 696,006. Waldoroth Label Corporation, Boston, Mass. Filed Oct. 6, 1955.

**JIFFY**

For Label Fastener of the Spiral Screw Button Type.
First use November 1954.

SN 8,697. Regal Ware, Inc., Kewaskum, Wis. Filed May 21, 1956.

**SEAL-O-MATIC**

For Cooking Vessels.
First use Jan. 1, 1956.

SN 10,703. The Pipeline Development Company, Cleveland, Ohio. Filed June 21, 1956.

**PLIDCOWEAR**

For Tubular Fluid Conduction Pipes and Members.
First use Dec. 29, 1954.

SN 12,608. Flexigrip, Inc., New York, N. Y. Filed July 23, 1956.

**FLEXTITE**

For Zippers and Slide Fasteners.
First use Oct. 30, 1952.

SN 12,729. Knud W. Larsen, d. b. a. Gary Lawn-Mist Sprinkler Co., Gary, Ind. Filed July 24, 1956.

**LAWN MIST**

For Underground Lawn Sprinkling Systems.
First use May 14, 1956.

SN 12,747. Ronson Corporation, Newark, N. J. Filed July 24, 1956.

**RHUCOR**

For Manually Operated Valves, Power Operated Valves, Actuating Cylinders, and Components Thereof, Primarily as Used in Control Systems Applied to Aircraft, Missiles, and Engines.
First use May 16, 1956, on manually operated valves for airplane braking systems.

SN 12,914. Stillwater Clay Products Co., Cleveland, Ohio. Filed July 26, 1956.

**LOCK-A-BAR**

For Pipe Supports for Pipes Within a Conduit System.
First use May 16, 1956.

SN 12,918. Western Wire Products Company, St. Louis, Mo. Filed July 26, 1956.

**SAFE-T-EDGE**

For Perforated Hanger Bars.
First use July 12, 1956.

## CLASS 14

### METALS AND METAL CASTINGS AND FORGINGS

SN 12,090. The International Nickel Company, Inc., New York, N. Y. Filed July 13, 1956.

**INCORAY**

Owner of Reg. Nos. 128,408, 335,374, and others.
For Radiation Alloys and Particularly Cobalt-Containing Radiation Alloys.
First use Jan. 16, 1956.
Subj. to Intf. with SN 2,602.

SN 13,561. American Alloys Corporation, Kansas City, Mo. Filed Aug. 8, 1956.

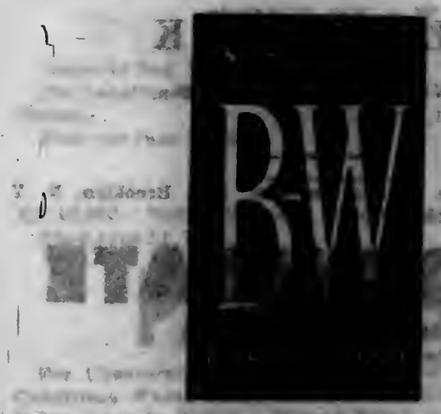
**AZA**

For Ingots of Casting Metal Composed Principally of Aluminum.
First use Oct. 1, 1954.

SN 13,668. Hermes Plastics Inc., New York, N. Y. Filed Aug. 9, 1956.

**GRAVALUM**

For Laminated Aluminum and Phenolic Plastic Engraving Stock.
First use June 21, 1956.



SN 13,968. The Colorado Fuel and Iron Corporation, Denver, Colo. Filed Aug. 15, 1956.

**CLAY-LOY**

For Steel Plate.
First use Nov. 22, 1955.

SN 14,217. Borg-Warner Corporation, Chicago, Ill. Filed Aug. 20, 1956.

Owner of Reg. Nos. 513,546, 607,848, and others.
For Ingots, Plate and Sheet Steel.
First use Jan. 4, 1956.

SN 14,423. Vanadium-Alloys Steel Company, Latrobe, Pa. Filed Aug. 22, 1956. Sec. 2(f).

**Warplis**

For Tool Steel Drill Rods and Ground Flats.
First use in April 1938 on tool steel drill rods.

SN 14,671. Kennametal Inc., Latrobe, Pa. Filed Aug. 27, 1956.

**KENFACE**

For Crushed Cemented Hard Metal Carbide.
First use on or about May 31, 1956.

SN 17,119. Precision Steel Warehouse, Inc., Chicago, Ill. Filed Oct. 8, 1956.

Owner of Reg. Nos. 421,089, 610,565, and others.
For Cold Rolled Annealed Spring Steel, Cold Rolled Annealed High Carbon Flat Wire, Hard Rolled High Carbon Spring Steel Strip, Blue Tempered Spring Steel, Black Oiled Tempered Scaleless Spring Steel, Spring Steel Feeler Gauge Stock, Tool Steel Sheets, Spring Steel Music Wire, Stainless Steel Strip, Cold Rolled Strip Steel, Cold Rolled Steel Sheets, Shim Steel, Tin Coated Steel in Coils and Cut Lengths, Low Carbon Cold Rolled Steel Flat Wire, Beryllium Copper Stripe in Coils and Cut Lengths, Brass Stripe in Coils and Cut Lengths, Nickel Silver Stripe in Coils and Cut Lengths, Phosphor Bronze Stripe in Coils and Cut Lengths, Steel Arbor Spacers and Shims, Brass Shim Stock, Steel Shim Stock, Ground Flat Stock, Thickness Gauge Stock and Drill Rods.
First use Sept. 6, 1955.

## CLASS 15

### OILS AND GREASES

SN 652,323. Continental Oil Company, Ponca City, Okla. Filed Aug. 26, 1953. Sec. 2(f).

**OIL-PLATES YOUR ENGINE**

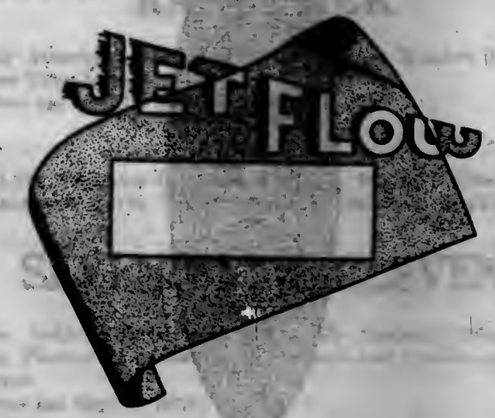
Owner of Reg. No. 348,368.
For Lubricating Oils for Internal Combustion Engines.
First use Jan. 29, 1938.

SN 15,317. Shell Oil Company, New York, N. Y. Filed Sept. 7, 1956.

**PELLA**

For Lubricating Oil.
First use Dec. 1, 1929.

## CLASS 16



### PROTECTIVE AND DECORATIVE COATINGS

SN 694,439. Temco, Inc., Nashville, Tenn. Filed Sept. 9, 1955.

**CERAMIC-CLAD**

For Protective and Decorative Finish Applied to Heat Exchangers, Such as Air Furnaces.
First use Aug. 24, 1955.

SN 4,421. Sam Bauman, Jr., d. b. a. Sam Bauman & Son, Memphis, Tenn. Filed Mar. 13, 1956.

For Paint, Lacquer, and Varnish.
First use on or about Feb. 1, 1955.

SN 7,219. Silibond Products, Inc., Arlington, Mass. Filed Apr. 26, 1956.

**SILASHEEN**

For Durable Finish Coat Applied to Interior and Exterior Dry Masonry, Stucco, or Brick Surfaces, Which Is Adhesive to Masonry, Has Preservative and Decorative Properties, and Is Highly Resistant to Discoloration Under Severe Weather Conditions.
First use Apr. 10, 1953.

SN 8,413. Hogan Laboratories, Inc., New York, N. Y. Filed May 16, 1956.

**FAXKOTE**

For Preservative for Facsimile Prints.
First use Mar. 19, 1956.

SN 8,476. Franklin Research Company, Philadelphia, Pa. Filed May 17, 1956.

## AWARD

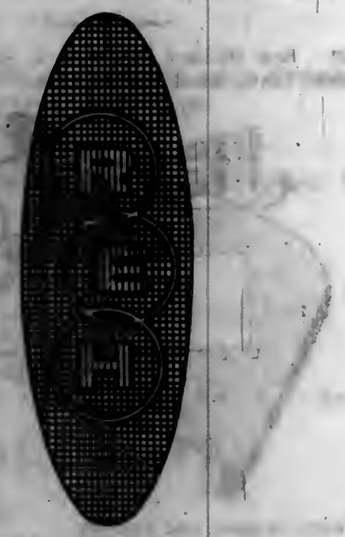
For Floor Finish.
First use July 11, 1955.

SN 9,473. Lacquer Corporation of America, Brooklyn, N. Y. Filed June 1, 1956.

## RHINO-TEX

For Paints and Enamels.
First use Apr. 1, 1956.

### CLASS 18



### MEDICINES AND PHARMACEUTICAL PREPARATIONS

SN 693,892. Ames Company, Inc., Elkhart, Ind. Filed Aug. 30, 1955.

## CONET

For Wax-Like Composition Used as the Base or Carrier for the Active Ingredient in a Suppository and Which Also Lubricates and Soothes the Bodily Tissues With Which the Suppository Comes in Contact.

SN 695,837. Pascal Co., Inc., Seattle, Wash. Filed Oct. 4, 1955.

The drawing is lined for red and black.
For Epinephrine Solution for Topical Use as a Dental Hemostat and Retraction of Tissue and Other Similar Uses in Connection With Dental Operation.
First use on or about Apr. 8, 1955.

SN 697,099. Lakeside Laboratories, Inc., Milwaukee, Wis. Filed Oct. 25, 1955.

## METAHYDRIN

For Injectable Medication Intended for the Treatment of Edema.
First use Mar. 1, 1955.

SN 697,287. Gray Pharmaceutical Co., Inc., Newton, Mass. Filed Oct. 28, 1955.

## GLUTAVENE

For Therapeutic Glutamic Acid Preparation.
First use Aug. 31, 1955.

SN 697,288. Gray Pharmaceutical Co., Inc., Newton, Mass. Filed Oct. 28, 1955.

## GLUTAVENE K

For Therapeutic Glutamic Acid Preparation.
First use Aug. 31, 1955.

SN 697,481. The Iso-Sol Company, Inc., Brooklyn, N. Y. Filed Nov. 1, 1955.

## PROCHELATE

For Ophthalmic Medicines.
First use on or about Oct. 19, 1955.

SN 1,938. Capillaris Manufacturing Co., Glen Ridge, N. J. Filed Feb. 2, 1956.

For Medicated Remedy for Scalp and Skin Disorders, for Blackheads, Pimples, Sunburn, Chapped Skin and Face Eruptions, Eczema, and Salt Rheum.
First use in 1882.

SN 1,989. Schering Corporation, Bloomfield, N. J. Filed Feb. 2, 1956.

## METIBIOTIC

For Medicinal Preparation for the Treatment of Mastitis, for Veterinary Use.
First use Dec. 8, 1955.

SN 3,128. Thompson-Hayward Chemical Company, Kansas City, Mo. Filed Feb. 21, 1956. Sec. 2(f).

## FEEDOIL

Owner of Reg. No. 423,978.
For Livestock and Poultry Feed Supplements Containing Vitamins.
First use April 1941.

SN 8,495. Merck & Co., Inc., Rahway, N. J. Filed May 17, 1956.

## HYDELTRACIN

Owner of Reg. No. 632,567.
For Medicinal Preparation Containing Hormonal Compound and Antibiotic.
First use May 7, 1956.

SN 8,575. Walter Ratner, d. b. a. Rulo Products, Chicago, Ill. Filed May 18, 1956.

## RULO

For Dietary Supplement in Concentrated Tablet Form.
First use Mar. 9, 1949.

SN 10,174. Luyties Pharmacal Company, St. Louis, Mo. Filed June 13, 1956. Sec. 2(f).

## YELLOLAX

Owner of Reg. No. 330,844.
For Laxative Medicines, Principally in the Form of Laxative Tablets.
First use June 1, 1931.

SN 10,250. Natick Chemical Industries, Inc., Natick, Mass. Filed June 14, 1956.

## PANAGEN

For Unsaturated Fatty Acid Complexes for Treatment of Conditions Where There Exists a Deficiency of Unsaturated Fatty Acids in Either a Human Being or an Animal.
First use May 29, 1956.

SN 10,259. John Edward Ronicker, d. b. a. J. E. Ronicker Co., West Milton, Ohio. Filed June 14, 1956.

For Antibiotic, Arsanilic Acid and Vitamin Mixture for Stimulating Growth of Swine.
First use May 5, 1956.

SN 10,546. Merck & Co., Inc., Rahway, N. J. Filed June 19, 1956.

## LERITINE

For Compound Having Analgesic, Sedative, Hypnotic, and Antispasmodic Properties.
First use June 11, 1956.

SN 10,550. Philip T. Paul, d. b. a. Salem Pharmaceuticals, Naugatuck, Conn. Filed June 19, 1956.

## Keranil

For Dermatological Ointment.
First use Nov. 17, 1952.

SN 10,742. American Cyanamid Company, New York, N. Y. Filed June 22, 1956.

## TEMPOSIL

Owner of Reg. No. 578,464.
For Anti-Alcoholism Preparation.
First use Apr. 23, 1956.

SN 10,936. Sterling Drug Inc., New York, N. Y. Filed June 25, 1956.

## NITERSATE

For Vasodilator, Particularly of the Coronary Blood Vessels.
First use May 29, 1956.

SN 11,399. Parke, Davis & Company, Detroit, Mich. Filed July 2, 1956.

## CELONTIN

For Anticonvulsant Preparation.
First use Jan. 27, 1956.

### CLASS 19

### VEHICLES

SN 691,305. Albert J. Leeward, d. b. a. Leeward Aeronautical Service, Fort Wayne, Ind. Filed July 14, 1955.

## Executivcair

For Aircraft.
First use Oct. 1, 1954.

SN 692,878. Studebaker-Packard Corporation, Detroit, Mich. Filed Aug. 11, 1955.

For Passenger Automobiles.
First use May 15, 1955.

SN 2,177. Ohio Valley Merchandising Company, Morganfield, Ky. Filed Feb. 6, 1956.

## RAIN CHEK

For Attachment for an Automobile Vent Window To Drain Water Therefrom.
First use Jan. 11, 1956.

SN 3,825. Andrew C. Chappie, d. b. a. The A. C. Chappie Replacement Parts, Canton, Ohio. Filed Mar. 5, 1956.

## SEVEN COME ELEVEN

For Vehicle Parts, New and Used—Namely, Chassis and Parts Thereof and Combination Wheels and Brakes and Parts Thereof.
First use Sept. 8, 1955.

SN 11,527. Auto Specialties Manufacturing Co., St. Joseph, Mich. Filed July 5, 1956.

## AUSCO

For Vehicle Brakes.
First use on or about Mar. 7, 1956.

### CLASS 20

### LINOLEUM AND OILED CLOTH

SN 8,639. Duracote Corporation, Ravenna, Ohio. Filed May 21, 1956.

## DURA-TRIM

For Plastic Films and Coated Fabrics for Wall Coverings.
First use July 12, 1949.

## CLASS 21

## ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES

SN 678,494. Westric Battery Company, Denver, Colo. Filed Dec. 16, 1954.

Spark-a-lyte

Owner of Reg. Nos. 151,634 and 337,714.
For Storage Batteries.
First use Nov. 22, 1954; and about Jan. 1, 1920, as to "Westric."

SN 690,875. General Electric Company, Schenectady, N. Y. Filed July 7, 1955.

MUSITHERM

For Electric Clock-Thermal Control Combinations.
First use Mar. 18, 1955.

SN 699,619. Chatham Electronics, Division of Gera Corporation, Livingston, N. J. Filed Dec. 8, 1955.

CHATHAM ELECTRONICS

No claim is made to the words "Chatham Electronics" apart from the mark as presented.
For Vacuum Tubes, Gas Filled Discharge Devices, and Test Sets Using Discharge Devices.
First use on or before Nov. 1, 1955, on cartons containing vacuum tubes and gaseous discharge devices.

SN 6,045. Ray-O-Vac Company, Madison, Wis. Filed Apr. 9, 1956.

Owner of Reg. No. 557,977.
For Dry Cells and Dry Batteries.
First use Feb. 1, 1956.

SN 7,144. Acro Welder Mfg. Co., Milwaukee, Wis. Filed Apr. 26, 1956. Sec. 2(f).

ACROMATIC

Owner of Reg. No. 549,447.
For Electric Resistance Welders and Brazers.
First use Sept. 29, 1945.

SN 9,294. The Pyle-National Company, Chicago, Ill. Filed May 29, 1956.

PYLE ☆ LINE

Owner of Reg. No. 554,290.
For Electrical Connectors.
First use Apr. 5, 1956.

SN 9,648. Kwikset Locks, Inc., Anaheim, Calif. Filed June 5, 1956.

K P M P

For Electronic Toroids.
First use Apr. 26, 1955.

SN 10,464. Northeast Tool and Die Works, Inc., Kansas City, Mo. Filed June 18, 1956.

"FINE LINE"

For Vehicle Directional Signal Lights.
First use Jan. 1, 1953.

SN 10,620. The Pyle-National Company, Chicago, Ill. Filed June 20, 1956.

PYLE-STAR-LINE

Owner of Reg. No. 554,290.
For Electrical Connectors.
First use Apr. 5, 1956.

SN 10,950. Volkers & Schaffer Manufacturing Corp., Schenectady, N. Y. Filed June 25, 1956.

HUSHED

For Transistor Amplifiers.
First use July 1, 1955.

SN 11,031. Perfection Mica Company, Chicago, Ill. Filed June 26, 1956.

INSULMENT

For Powdered Mica Product for Shielding Electrical and Electronic Devices From Electric and Magnetic Fields.
First use June 1, 1956.

SN 11,511. Ward Leonard Electric Co., Mount Vernon, N. Y. Filed July 3, 1956.

MINISTRIP

For Electrical Resistors.
First use June 12, 1956.

SN 11,556. Electrend Products Corp., St. Joseph, Mich. Filed July 5, 1956.

RAY-VEC

For Electric Heaters.
First use Dec. 22, 1955.

## CLASS 22

## GAMES, TOYS, AND SPORTING GOODS

SN 1,387. Travel Products, Lancaster, Pa. Filed Jan. 24, 1956.

TURNPIKE

For Game.
First use Dec. 2, 1955.

## CLASS 23

## CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF

SN 681,343. Clark Equipment Company, Buchanan, Mich. Filed Feb. 9, 1955. Sec. 2(f).

CLARK EQUIPMENT

Owner of Reg. Nos. 165,644, 505,904, and others.
For Power Operated Industrial Lift Trucks, Towing Tractors, Tractor Shovels, Straddle Carriers, and Power Shovels and Cranes.
First use May 19, 1954.

SN 681,652. Walstechnik G. m. b. H., Pforzheim, Germany. Filed Feb. 14, 1955.

Owner of German Reg. No. 646,944, dated Oct. 28, 1953.
For Worm Cutter Milling Machines; Cutting Tools—Namely, Broaches; Milling Tools, Hobbing Tools, Worm Hobs With Symmetrical Hobbing Profile, Thread Hobs, Forming Hobs, Inserted Tooth Milling Cutters, Worm Hobs With Asymmetrical Hobbing Profile.

SN 1,265. Thomas A. Patty, Miami, Fla. Filed Jan. 23, 1956.

MOVIEMATIC

For Coin-Operated Motion Picture Book Vending Machines and Accessories.
First use Sept. 1, 1952.

SN 1,759. Barber-Greene Company, Aurora, Ill. Filed Jan. 31, 1956.

BATCH O MATIC

For Batch Plants for Producing Bituminous Mixes.
First use March 1955.

SN 1,799. Luther Corporation, Rockford, Ill., to Magnaflux Corporation, Chicago, Ill. Filed Jan. 31, 1956.

INDIAN

For Power Driven Chain Saws.
First use Aug. 24, 1955.

SN 4,437. Humberto A. Garcia, d. b. a. The New Yorker Sewing Machine Company, New York, N. Y. Filed Mar. 13, 1956. Sec. 2(f).

THE NEW YORKER SEWING MACHINE CO. NEW YORKER

Owner of Reg. No. 571,431.
For Domestic and Industrial Sewing Machines.
First use Sept. 21, 1950.

SN 6,287. Remington Arms Company, Inc., Bridgeport, Conn. Filed Apr. 12, 1956.

MIGHTY MITE

For Powder-Actuated Stud Drivers and Parts Thereof.
First use Feb. 29, 1956.

SN 6,307. Vulcan Foundry Company, d. b. a. R-Mor Products and as R-Mor Products Co., Oakland, Calif. Filed Apr. 12, 1956.

RM OR ED GE

For Sheep's Foot Tamper Caps.
First use July 6, 1955.

SN 11,204. Unity Sewing Supply, Inc., New York, N. Y. Filed June 28, 1956.

SWIFTY

For Sewing Machine Attachments—Namely, Adjustable Hook Gauges, Hemmers, Binders, and Feet.
First use May 7, 1956.

SN 11,237. The Duro Co., Dayton, Ohio. Filed June 29, 1956.

DURO

Owner of Reg. Nos. 402,994, 508,123, and others.
For Electrically Driven Deep Well, Shallow Well and Submergible Pumps, Sump Pumps, Fire Pumps, Cellar Drainers, and Water Systems, Comprising in Combination, a Pump, an Electric Driving Motor, a Tank, Connecting Piping, and Control Valves.
First use July 1915.

SN 11,437. Vaughan's Seed Company, Chicago, Ill. Filed July 2, 1956.

LAWNOVATER

For Lawn and Garden Cultivators.
First use on or about June 25, 1956.

SN 11,475. Eclipse Counterbore Company, Ferndale, Mich. Filed July 3, 1956.

**ECLIPSE**

Owner of Reg. Nos. 119,518 and 386,323.

For Machine Tools for Cutting in Metal—Namely, Counterbores, Pilots, Hollow Mills, Reamers, Taps, Spot Facers, Countersinks, Center Cutting Tools, Cutters, Form Cutters, End Mills, Drills, Boring Bars, Interchangeable Drives, Core Drills, Tool Holders, and Multi-Diameter Cutters.

First use Feb. 1, 1914, on counterbores.

SN 11,476. Eclipse Counterbore Company, Ferndale, Mich. Filed July 3, 1956.

Eclipse

Owner of Reg. Nos. 119,518 and 386,323.

For Machine Tools for Cutting in Metal—Namely, Counterbores, Pilots, Hollow Mills, Reamers, Taps, Spot Facers, Countersinks, Center Cutting Tools, Cutters, Form Cutters, End Mills, Drills, Boring Bars, Interchangeable Drives, Core Drills, Tool Holders, and Multi-Diameter Cutters.

First use Apr. 9, 1921.

SN 11,477. Eclipse Counterbore Company, Ferndale, Mich. Filed July 3, 1956.

Eclipse

Owner of Reg. Nos. 119,518 and 386,323.

For Machine Tools for Cutting in Metal—Namely, Counterbores, Pilots, Hollow Mills, Reamers, Taps, Spot Facers, Countersinks, Center Cutting Tools, Cutters, Form Cutters, End Mills, Drills, Boring Bars, Interchangeable Drives, Core Drills, Tool Holders, and Multi-Diameter Cutters.

First use Mar. 1, 1933.

SN 11,576. Hahn, Inc., Evansville, Ind. Filed July 5, 1956.

**POW-R-BOY**

For Multiple-Purpose Garden Implement and Lawn Mowing, Snow Throwing, Garden Tilling, and Power Scooping Attachments Therefor.

First use Jan. 24, 1956.

SN 11,631. Stowe-Woodward, Inc., Newton Upper Falls, Mass. Filed July 5, 1956.

**PRESTOW**

For Rubber Covered Rolls for Machinery.

First use June 12, 1956.

SN 11,723. Triangle Package Machinery Company, Chicago, Ill. Filed July 6, 1956.

**FLEXI-MATIC**

For Carton Forming, Filling, and Sealing Machines.

First use on or about June 21, 1956.

SN 11,749. The DoAll Company, Des Plaines, Ill. Filed July 9, 1956.

Demon

The words "High-Speed Steel" are disclaimed apart from the mark as shown. Owner of Reg. No. 587,052.

For Band Saw Blades in Both Cut-Length and in Bulk Length and Hack Saw Blades.

First use on or about Mar. 2, 1953.

SN 11,789. P & G Manufacturing Co., New York, N. Y. Filed July 9, 1956.

**KARV-LOK**

For Carving Board and Holder.

First use Oct. 17, 1955.

SN 11,804. Aktiebolaget Volvo, Goteborg, Sweden. Filed July 11, 1956.

**VOLVO**

The term "Volvo" translated into English means "I am rolling." Owner of Swedish Reg. No. 78,133, dated Apr. 29, 1955.

For Farm Tractors and Agricultural Tractors.

SN 11,895. Aktiebolaget Volvo, Goteborg, Sweden. Filed July 11, 1956.

VOLVO

"Volvo" means in Latin "I am rolling." Owner of Swedish Reg. No. 76,138, dated June 11, 1954.

For Farm Tractors and Agricultural Tractors.

SN 12,192. The Heyer Corporation, Chicago, Ill. Filed July 16, 1956.

**CONQUEROR**

For Duplicators.

First use Mar. 16, 1953.

SN 12,237. South Bend Tackle Company, Inc., South Bend, Ind. Filed July 16, 1956.

**SHOT-MASTER**

For Device for Applying Weights to Fishing Lines.

First use June 29, 1956.

SN 12,358. Funk Aircraft Company, Coffeyville, Kans. Filed July 18, 1956.

reversomatic

For Hydraulic Controlled Reversing Clutch and Torque Converter.

First use Mar. 17, 1956.

SN 12,450. Nihon Spindle Seiso Kabushiki-Kaisha, Amagasaki, Hyogo, Japan. Filed July 19, 1956.

**PNEUMANIEZ**

For Pneumatic Clearers for Textile Machineries.

First use Oct. 15, 1954.

SN 12,466. Edwin P. Sundholm, Albert City, Iowa. Filed July 19, 1956.

**LOAD-A-MATIC**

For Grease Guns.

First use Jan. 31, 1956.

SN 12,529. Penfield Saw Works, Inc., Thomaston, Conn. Filed July 20, 1956.

**RHINO-RAIL**

For Guide Bars for Chain Saws.

First use June 12, 1956.

SN 12,644. Lehigh Inc., Easton, Pa. Filed July 23, 1956.

LEHIGH

For Vending Machines.

First use Feb. 13, 1956.

SN 12,722. Holub Industries, Inc., Sycamore, Ill. Filed July 24, 1956.

**REAM-RITE**

For Hand Operable Reamer for Electrical Conduit and Other Pipes and Tubes.

First use Jan. 26, 1956.

SN 12,759. Carl F. Whitaker, d. b. a. Prenco Mfg. Co., Boston, Mass. Filed July 24, 1956.

**JIFFY WHEEL**

No claim is made to the word "Wheel" apart from the mark as shown.

For Wheels Used for Grinding, Buffing, Burnishing, Polishing, Scouring, and Sanding.

First use Feb. 7, 1956.

SN 12,888. The International Silver Company, Meriden, Conn. Filed July 26, 1956.

**WESTMINSTER**

For Stainless Steel Flatware—Knives, Forks, and Spoons.

First use Jan. 12, 1955.

SN 12,988. Stowe-Woodward, Inc., Newton Upper Falls, Mass. Filed July 27, 1956.

**BLACK DIAMOND**

For Rubber Covered Rolls for Machinery.

First use July 7, 1956.

SN 13,159. Michigan Tool Company, Detroit, Mich. Filed July 31, 1956. Sec. 2(f).

**MICHIGAN**

For Gear Cutting Machines, Gear Finishing Machines, Gear Shaping Machines, Gear Grinding Machines, Checking Machines, Machines for Cutting Toothed and Shaped Elements, Machines for Finishing Toothed and Shaped Elements, Machines for Forming Toothed Elements, Cleaning Machines, Chip Separators, Classifying Devices, Automatic Handling Devices, Loaders, Cutting Tools, Hobs, Shaving Tools, Worms, Gears, Burnishers, Laps, and Racks.

First use 1915 on cutting tools.

SN 13,160. Michigan Tool Company, Detroit, Mich. Filed July 31, 1956.

**DONE-DRIVE**

For Double Enveloping Worms and Gears, Gear Sets, Speed Reducers, Hobs, Cutters, Machines for Cutting Double Enveloping Worms and Gears, Machines for Finishing Double Enveloping Worms and Gears, and Checking Machines.

First use 1932 on double enveloping worms and gears.

SN 13,163. Michigan Tool Company, Detroit, Mich. Filed July 31, 1956.

SHEAR SPEED

For Gear Shapers, Machines for Cutting Toothed and Shaped Elements, Cutting Tools and Shaping Tools.

First use 1945 on gear shapers.

SN 13,164. Michigan Tool Company, Detroit, Mich. Filed July 31, 1956.

**ROTO-FLO**

For Machines for Forming Gears and Toothed Elements, Tools for Forming Gears and Toothed Elements.

First use June 1954 on forming toothed elements.

SN 13,284. Gebr. Heller Maschinenfabrik GmbH, Nurtingen, Wurttemberg, Germany. Filed Aug. 2, 1956.

H

For Machine Tools and Controls and Parts Therefor—Namely, Horizontal, Special, and Vertical Single and Multi-Way Boring Machines; Centering and Ending Machines; Gang, Pillar, and Radial Type Drilling Machines; Horizontal, Single and Double Spindle Planer, Thread, and Vertical Milling Machines; Small, Heavy-Duty and Special Foundry and Vertical Mitre Circular Saws; Rail Sawing and Drilling Machines;

Saw Blade and Tool Grinding Machines; and Hydraulic Controls and Drives for Same, Including, Control and Feed Units, Motors and Pumps.
First use 1931.

---

SN 13,341. The Bar-Plate Manufacturing Company, Orange, Conn. Filed Aug. 3, 1956.

Bar-Plate

For Boxmakers' Cutting and Creasing Jackets and Plates for Use in Printing Presses and Cutting and Creasing Presses; Equipment for Making Printing Plates From Photographs; Page Fountain Dividers for Printing Presses; Printing Roll Dampener Cleaners; and Diemakers' Steel Rule Layout Machines and Steel Rule Storage Cabinets and Racks.
First use on or about Jan. 26, 1948.

---

SN 13,421. Clinton Machine Company, Clinton, Mich. Filed Aug. 6, 1956.

LE JET

For Chain Saws and Parts Thereof.
First use at least as early as March 1956.

---

SN 13,441. General Slicing Machine Company, Inc., Walden, N. Y. Filed Aug. 6, 1956.

GENERAL

Owner of Reg. Nos. 317,416, 604,422, and others.
For Food Slicing Machines.
First use Feb. 5, 1956.

---

SN 13,451. International Harvester Company, Chicago, Ill. Filed Aug. 6, 1956.

DOF-FLEX

For Flexible Cotton Doffers for Cotton Pickers.
First use July 13, 1956.

---

SN 13,456. Link Manufacturing Company, Inc., Fargo, N. Dak. Filed Aug. 6, 1956.

"AERO"

For Grain and Seed Cleaner, Grader, and Treater.
First use during the summer of 1951.

SN 13,469. Donald L. Moore, d. b. a. Hydrozion Company, Kansas City, Mo., to Hydrozion Engineering Co., Inc., Kansas City, Mo. Filed Aug. 6, 1956.

HYDROZION

For Fluid Circulating Rotary Earth Boring Units.
First use July 3, 1956.

---

SN 13,518. Atlas-Sandt Corporation, New York, N. Y. Filed Aug. 7, 1956.

SANDT

For Die Presses, Embossing Machines, Molding Machines, and Machines Used in the Shoe Industry.
First use June 6, 1956.

---

SN 13 659. Ford Motor Company, Dearborn, Mich. Filed Aug. 9, 1956.

AUTOCYCLE

For Machine Tools.
First use June 26, 1956.

---

SN 13,688. Salpac Company, Collingswood, N. J. Filed Aug. 9, 1956.

NU-KUT

For Detachable Blade Barber Shears, Detachable Blades for Barber Shears, and Barber Shears Adapted To Receive Detachable Blades.
First use July 23, 1956.

---

SN 13,723. C & H Air Conditioning Fan Company, Inc., Atlanta, Ga. Filed Aug. 10, 1956.

MYTEESWEEP

For Lawn Sweepers.
First use on or about Feb. 1, 1956.

---

SN 13,891. W. F. Webster Cement Co., Cambridge, Mass. Filed Aug. 13, 1956.

WEBTEX

For Construction Implements; Caulking Guns and Cartridges Therefor; and Scaffolding.
First use July 1952.

---

SN 13,912. Fielding & Platt Limited, Gloucester, England. Filed Aug. 14, 1956.

HYPACTOR

Owner of British Reg. No. 711,874, dated Oct. 30, 1952.
For Hydraulic Machines and Parts Thereof.

---

SN 13,995. New Rochelle Manufacturing Co., New Rochelle, N. Y. Filed Aug. 15, 1956.

For Piston Pumps.
First use Mar. 11, 1955.

SN 14,028. Wilmot Engineering Company, Haselton, Pa. Filed Aug. 15, 1956.

HYDROTATOR

For Agitating, Thickening, Separating, Classifying and/or Flotation Apparatus and Parts Therefor, for the Recovery, Thickening or Classification of Solids From Solutions Containing Materials in Suspension, Such as Coal, Ore, Minerals, or Organic Materials.
First use June 1926.

---

SN 14,135. De Walt, Inc., Lancaster, Pa. Filed Aug. 17, 1956.

POWER SHOP

For Woodworking Saws.
First use Feb. 10, 1953.

---

SN 14,263. National Research Corporation, Cambridge, Mass. Filed Aug. 20, 1956.

NRC

Owner of Reg. Nos. 594,193 and 621,237.
For Vacuum Coating Apparatus and the Like.
First use in or about October 1955.

---

SN 14,290. Stoelting Brothers Co., Kiel, Wis. Filed Aug. 20, 1956.

Flavorite

For Pasteurizer.
First use Apr. 16, 1946.

---

SN 14,291. Stoelting Brothers Co., Kiel, Wis. Filed Aug. 20, 1956.

SANITATOR

For Forking and Stirring Agitator.
First use July 7, 1947.

---

SN 14,292. Stoelting Brothers Co., Kiel, Wis. Filed Aug. 20, 1956.

SIMPLICITY

For Cheese Press.
First use Oct. 12, 1953.

---

SN 14,324. Chicago Bridge & Iron Company, Chicago, Ill. Filed Aug. 21, 1956. Sec. 2(f).

CONKEY

For Evaporators, Crystallisers and Parts Thereof Such as Condensers and Separators.
First use in the fall of 1944 on evaporators.

SN 14,431. Beebe Bros., Seattle, Wash. Filed Aug. 23, 1956.

For Winches.
First use Aug. 15, 1956.

---

SN 14,482. Schnellpressenfabrik Koenig & Bauer Aktiengesellschaft, Wuersburg, Germany. Filed Aug. 23, 1956.

For Printing Presses and Graphic and Stereotyping Machinery.
First use prior to 1937; in commerce Sept. 9, 1955.

---

SN 14,484. Schnellpressenfabrik Koenig & Bauer Aktiengesellschaft, Wuersburg, Germany. Filed Aug. 23, 1956.

PAX

For Printing Presses, More Particularly, Sheet-Fed Letterpress Rotaries.
First use prior to 1932; in commerce July 14, 1956.

---

SN 14,485. Schnellpressenfabrik Koenig & Bauer Aktiengesellschaft, Wuersburg, Germany. Filed Aug. 23, 1956.

REX

For Printing Presses, More Particularly, Sheetfed Flatbed Letterpresses.
First use prior to 1932; in commerce Mar. 30, 1956.

---

SN 14,486. Schnellpressenfabrik Koenig & Bauer Aktiengesellschaft, Wuersburg, Germany. Filed Aug. 23, 1956.

GIGANT

For Hydraulic Matrix Moulding Presses for the Graphic Industry, More Particularly for Moulding Flongs, Lead, and Synthetic Material Matrices.
First use prior to 1932; in commerce June 8, 1956.

---

SN 14,487. Schnellpressenfabrik Koenig & Bauer Aktiengesellschaft, Wuersburg, Germany. Filed Aug. 23, 1956.

KOEBAU

For Printing Presses and Graphic and Stereotyping Machines.
First use in or before 1935; in commerce prior to 1938.

SN 14,469. Schnellpressenfabrik Koenig & Bauer Aktiengesellschaft, Wuerzburg, Germany. Filed Aug. 23, 1956.

## REMBRANDT

For Sheet-Fed Rotogravure Presses.
First use on or before 1938; in commerce Sept. 9, 1955.

SN 14,683. Modern Corporation, Detroit, Mich. Filed Aug. 27, 1956.

## MODCO

For Marking Metal Cutting Tools and Metal Production Parts.
First use July 1, 1946.

SN 14,742. R. Hoe & Co., Inc., New York, N. Y. Filed Aug. 28, 1956.

## KWIK-KUT

For Carbide Tipped Tools—Namely, Machine Tool Router Bits, Shaper Knives, Bevel-Edge Trimmers, Trim Saws, Wing Cutters, Slotting Cutters, and Spur Drills.
First use May 28, 1945.

SN 14,782. Ten-Tex Corporation, Chattanooga, Tenn. Filed Aug. 28, 1956.

## TEN-TEX

For Tufting Machinery, Both Portable and Fixed, Pressure Dyeing Machines, Railroad Tie Incisor Machines, Railroad Tie Doweller Machines, Railroad Tie Handling Machines Including Machinery for Loading and Unloading Railroad Ties Into and Out of Railroad Cars, and Railroad Tie Conveying and Hoisting Machines.
First use at least as early as 1942.

SN 14,899. Millers Falls Company, Greenfield, Mass. Filed Aug. 30, 1956. Sec. 2(f) as to "Millers Falls Tools since 1868."

No registration rights are being claimed for the word "Tools" separate and apart from the mark shown or separate and apart from the words "Millers Falls." The drawing is lined for red. Owner of Reg. Nos. 156,709, 621,176, and others.
For Awls, Bevels, Bits, Bit Extensions, Braces, Chisels, Countersinks, Drills, Drill Points, Glass Cutters, Hammers, Mitre Boxes, Nail Sets, Planes, Pliers, Punches, Putty Knives, Saws, Saw Frames, Saw Blades, Scrapers, Screw Drivers, Tack Claws, Utility Knives and Knife Blades, Vises, and Wrenches.
First use June 21, 1956; and 1922 or prior thereto as to "Millers Fall Tools Since 1868" and its immediate background design on awls.

SN 15,121. The Garlock Packing Company, Palmyra, N. Y. Filed Sept. 5, 1956. Sec. 2(f).

## GARLOCK

Owner of Reg. No. 23,430.
For Packing Hooks, Gasket Cutters; Wipers; Scrapers, Vibration Dampeners, Roller Covers, Liners, Facings, and Dust Shields, All Made of Rubber and Intended Primarily for Use With Machinery.
First use in 1936 on wipers.

SN 16,341. The Garlock Packing Company, Palmyra, N. Y. Filed Sept. 25, 1956. Sec. 2(f) as to "Garlock."

Owner of Reg. No. 37,332.
For Packing Hooks, Gasket Cutters; Wipers; Scrapers, Vibration Dampeners, Roller Covers, Liners, Facings, and Dust Shields, All Made of Rubber and Intended Primarily for Use With Machinery.
First use 1936.

SN 17,237. Borg-Warner Corporation, Chicago, Ill. Filed Oct. 11, 1956.

## MECHANIC-KUT

Owner of Reg. Nos. 251,466 and 524,215.
For Saws and Knives of All Kinds and Parts Thereof for Replacement and Repair.
First use during March 1948 on saws.

SN 17,653. Modern Carpet Sweeper Co., Inc., Great Neck, N. Y. Filed Oct. 17, 1956.

## MODERNAIRE

For Mechanical Carpet Sweepers.
First use prior to July 1940.

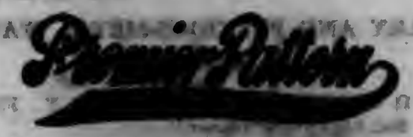
### CLASS 26

### MEASURING AND SCIENTIFIC APPLIANCES

SN 4,166. A-B-Coaters, Detroit, Mich. Filed Mar. 9, 1956.

## PRECOTE

For Sensitised Blueprint Papers and Ammonia Papers.
First use Sept. 12, 1955.



SN 5,147. Allen Electric and Equipment Company, Kalamazoo, Mich. Filed Mar. 26, 1956.

## ALLEN UNI-STAND

Owner of Reg. Nos. 509,647 and 543,224.
For Stand or Platform for Supporting Apparatus for Testing the Electrical and Vacuum Characteristics of an Internal Combustion Engine.
First use Mar. 5, 1956.

SN 5,452. Premier Pattern Company, Inc., Cincinnati, Ohio. Filed Mar. 29, 1956.

No claim is made to the exclusive right to the use of the word "Pattern" separate and apart from the mark as shown.
For Paper and Sheet Metal Shoe Patterns for Tip, Vamp, Upper, Outer Sole, Inner Sole, Tongues, and Sock Linings.
First use March 1915.

SN 6,104. Da-Lite Screen Company, Inc., Chicago, Ill. Filed Apr. 10, 1956.

## MOTOR-ROLL

For Motion Picture Screens.
First use Mar. 30, 1956.

SN 6,678. Acton Laboratories, Inc., Acton, Mass. Filed Apr. 19, 1956.

For Measurement Instruments—Namely, Phase Meters, Impedance Meters, Phase Standards, Vacuum Tube Voltmeters, Recorders, and Potentiometer Test Equipment.
First use Jan. 24, 1956.

SN 8,689. Pentagon Pattern and Engineering Company, Chicago, Ill. Filed May 21, 1956.

For Patterns for Foundry Use.
First use Feb. 1, 1956.

SN 9,140. General Controls Co., Glendale, Calif. Filed May 28, 1956.

## ROASTENDER

For Probe or Stem Thermostats, Oven Thermostats, and Roast Thermometers.
First use Apr. 18, 1956.

SN 9,670. Robertson Photo-Mechanix, Inc., Chicago, Ill. Filed June 5, 1956.

## TWINKLE

For Cameras.
First use May 9, 1956.

SN 9,802. The Liquidometer Corporation, Long Island City, N. Y. Filed June 7, 1956. Sec. 2(f).

## LIQUIDOMETER

For Gauging Apparatus for Liquids and Parts Thereof.
First use June 24, 1926.

SN 9,877. Macklanburg-Duncan Company, Oklahoma City, Okla. Filed June 8, 1956.

For Levels.
First use April 1956.

SN 9,909. Waters Manufacturing, Inc., South Sudbury, Mass. Filed June 8, 1956.

## ANGLYZER

For Machine for Indicating Angular Rotation.
First use May 10, 1956.

SN 9,973. General Aniline & Film Corporation, New York, N. Y. Filed June 11, 1956.

## VERSIPAN

For Light-Sensitive Photographic Materials—Namely, Film and Paper.
First use May 16, 1956.

SN 10,042. Tura, Inc., Great Neck, N. Y. Filed June 11, 1956.

## TURA

For Spectacles.
First use December 1946.

SN 10,167. Illinois Tool Works, Chicago, Ill. Filed June 13, 1956.

## SPIROID

Owner of Reg. No. 609,064.
For Metal Working Machines—Namely, Machines for Lapping and Testing Reduction Gearing Incorporating a Tapered Worm and a Face Worm Gear.
First use Apr. 24, 1956.

SN 10,342. Peerless Photo Products, Inc., Shoreham, N. Y. Filed June 15, 1956. Sec. 2(f).

## TRU-GRAF

Owner of Reg. No. 541,229.
For Sensitised Photographic Scientific Recording Papers.
First use July 1948.

SN 10,246. Robertshaw-Fulton Controls Company, Greensburg, Pa. Filed June 15, 1956.

**FULTROL**

For Thermostatic Regulators.
First use Oct. 31, 1955.

SN 10,506. B-I-F Industries, Inc., Providence, R. I. Filed June 19, 1956.

**PNEUMASTER**

For Pneumatically-Operated Controllers for Flow, Liquid Level, Pressure, and Temperature, and Panels and Parts Thereof.
First use in February 1956.

SN 10,834. Atlas Supply Company, Newark, N. J. Filed June 25, 1956.

**ATLAS**

Owner of Reg. No. 506,651 and others.
For Wheel Balancers.
First use Sept. 22, 1954.

SN 11,232. Curtiss-Wright Corporation, Caldwell, N. J. Filed June 29, 1956.

**ECHOSCOPE**

For Apparatus for Determining the Dimensions and Internal Structure of Solid Bodies by Means of Ultrasonic Vibrations.
First use on or about May 10, 1955.

## CLASS 27

## HOROLOGICAL INSTRUMENTS

SN 9,733. Muller-Schlenker, Schwenningen am Neckar, Germany. Filed June 6, 1956.

**EMES**

Owner of German Reg. No. 510,538, dated May 2, 1939.
For Standing Clocks, Wall Clocks, Alarm Clocks, Table Clocks, Pocket Watches, Wrist Watches, Lapel Watches, Auto Clocks, and Mechanically and Electrically Driven Clockworks.

SN 10,933. Societe Anonyme Mido, Bienne, Switzerland. Filed June 25, 1956.

**TRIORITMO**

Owner of Swiss Reg. No. 101,596, dated Feb. 20, 1942.
For Watches, Movements for Watches and Clocks, Watch Casings, and Dials.

SN 11,682. Robert L. Hunter, d. b. a. The Nautical Clock Co., Norfolk, Va. Filed July 6, 1956.

**SEVEN SEAS**

Owner of Reg. No. 370,233.
For Watches, Clocks, Chronometers, and Dials Therefor.
First use Dec. 24, 1938.

## CLASS 28

## JEWELRY AND PRECIOUS-METAL WARE

SN 12,819. D. Lisner & Co. Inc., New York, N. Y. Filed July 25, 1956. Sec. 2(f) as to "Lisner."

**Lisner**

For Jewelry—Namely, Necklaces, Bracelets, Earrings, and Brooches, for Personal Wear or Adornment, Not Including Watches.
First use June 25, 1956; and 1938 as to "Lisner."

## CLASS 29

## BROOMS, BRUSHES, AND DUSTERS

SN 10,594. Stanley M. Gower, d. b. a. The Autodent Company, Skowhegan, Maine. Filed June 20, 1956.

**AUTODENT VIBRATORY**

Owner of Reg. No. 376,374.
For Toothbrushes.
First use December 1955.

## CLASS 31

## FILTERS AND REFRIGERATORS

SN 661,989. Dole Refrigerating Company, Chicago, Ill. Filed Mar. 4, 1954.

For Refrigerating Units.
First use Aug. 26, 1953.

SN 695,269. Bally Case and Cooler Company, Bally, Pa. Filed Sept. 26, 1955.

**BALLY SERVICOLD**

For Refrigerated Display Cases.
First use Feb. 1, 1953.

SN 2,592. Sweden Freezer Manufacturing Company, Seattle, Wash. Filed Feb. 13, 1956.

**SWEDEN SHAKEMAKER**

For Refrigerating Machine for Making Milk Shakes.
First use June 27, 1955.

SN 10,628. United Electric Company, Wichita Falls, Tex. Filed June 20, 1956.

**Strato Aire**

For Evaporative Cooling Units, Coils, and Air Cooled Condensers.
First use in March of 1956.

SN 12,582. C. L. B. Company, Houston, Tex. Filed July 23, 1956.

**SNAP IT**

For Air Filters.
First use on or about Dec. 1, 1955.

SN 12,583. C. L. B. Company, Houston, Tex. Filed July 23, 1956.

**CLIP IT**

For Air Filters.
First use on or about Apr. 11, 1956.

SN 12,674. Sovereign International Corporation, Forest Hills, N. Y. Filed July 23, 1956.

**ANDREA**

For Refrigerators.
First use May 31, 1956.

SN 12,738. John R. Mudge, d. b. a. Swimming Pool Construction & Equipment Co., Los Angeles, Calif. Filed July 24, 1956.

**SWIMCO**

For Chlorinators, Water Softeners, Water Filters, and Ammonators.
First use 1940.

SN 13,189. Barnes Ice & Fuel Co., Inc., Gary, Ind. Filed Aug. 1, 1956.

**BARNES ICELLER**

For Ice Cabinets.
First use July 14, 1956.

SN 13,247. Ron-Vik, Inc., Minneapolis, Minn. Filed Aug. 1, 1956.

**RON-VIK**

For Conduit Coupling Washer and Filter.
First use on or about May 1, 1955.

SN 13,450. Inflico Incorporated, Tucson, Ariz. Filed Aug. 6, 1956.

**SURFLEX**

For Filters and Parts Thereof.
First use Apr. 16, 1956.

SN 13,565. Bally Case and Cooler Company, Bally, Pa. Filed Aug. 8, 1956.

**DAIRY BOY JUNIOR**

For Refrigerated Display Cases.
First use Mar. 5, 1956.

SN 13,658. Flakice Corporation, Brooklyn, N. Y. Filed Aug. 9, 1956. Sec. 2(f).

**FLAKICE**

Owner of Reg. No. 178,966.
For Ice-Manufacturing Machines and Parts Thereof.
First use May 19, 1922.

SN 13,884. Tyler Refrigeration Corporation, Niles, Mich. Filed Aug. 13, 1956. Sec. 2(f).

**TYLER**

Owner of Reg. Nos. 625,850, 510,184, and 560,387.
For Refrigerators and Refrigerated Cabinets.
First use Mar. 26, 1956.

SN 13,984. Great Lakes Carbon Corporation, New York, N. Y. Filed Aug. 15, 1956.

**DIABESTOS**

For Precoat Filter Aid.
First use July 31, 1956.

SN 14,024. United Refrigerator Company, Hudson, Wis. Filed Aug. 15, 1956.

**HARVEST PANTRY**

For Refrigerators and Freezers and Combination Refrigerator Freezers.
First use July 5, 1956.

SN 14,250. Komline-Sanderson Engineering Corporation, Peapack, N. J. Filed Aug. 20, 1956.

**FLEXIBELT**

For Filtration Apparatus.
First use July 23, 1956.

SN 14,312. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**APRA**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,313. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAIRE**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,314. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAC**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,315. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,316. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,317. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,318. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,319. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,320. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,321. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,322. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,323. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,324. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,325. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,326. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,327. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,328. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,329. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,330. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,331. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,332. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,333. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,334. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,335. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,336. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,337. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,338. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,339. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,340. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,341. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,342. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,343. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,344. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,345. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,346. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,347. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,348. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,349. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,350. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,351. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,352. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,353. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,354. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,355. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,356. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,357. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,358. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,359. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,360. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,361. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,362. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,363. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,364. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,365. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,366. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

SN 14,367. Apra Precipitator Corporation, New York, N. Y. Filed Aug. 21, 1956.

**PRECIPAK**

For Gas Cleaning Apparatus and Systems, Particularly Electrostatic Precipitators.
First use Feb. 24, 1956.

639,135. DESIGN OF EMBLEM. Sigma Alpha Iota. SN 98. Pub. 10-9-56. Filed 1-3-56.

## SUPPLEMENTAL REGISTER

These registrations are not subject to opposition.

### CLASS 6

### CHEMICALS AND CHEMICAL COMPOSITIONS

639,136. Hodgins Copper-Hide, Inc., Cleveland, Ohio. SN 645,892. Filed P. R. 4-24-53. Am. S. R. 10-29-56.

**Aqua-Treat**

For Water-Softening Compound.
First use Oct. 19, 1949.

### CLASS 12

### CONSTRUCTION MATERIALS

639,137. Robinson Plywood and Timber Company, Everett, Wash. SN 695,763. Filed P. R. 10-3-55. Am. S. R. 10-1-56.

**BRUSHT-PLY**

For Plywood.
First use Sept. 6, 1955.

639,138. Fredmar Builders Supply Co., Indianapolis, Ind. SN 699,557. Filed P. R. 12-7-55. Am. S. R. 10-12-56.

The drawing is lined for black and silver.
For Simulated Stone Veneer Blocks.
First use Sept. 22, 1955.

### CLASS 13

### HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES

639,139. Saf-T-Rail Industries, Inc., St. Petersburg, Fla. SN 1,513. Filed P. R. 1-31-56. Am. S. R. 10-26-56.

**SAF-T-RAIL**

For Hand Railings for Bathroom Use.
First use Feb. 2, 1953.

639,140. Hydro-Air Engineering, Inc., Kent, Ohio. SN 699,558. Filed P. R. 12-7-55. Am. S. R. 10-12-56.

**HYDRO-AIR**

For Air Conditioning Units.
First use Nov. 1, 1955.

639,141. Hydro-Air Engineering, Inc., Kent, Ohio. SN 699,559. Filed P. R. 12-7-55. Am. S. R. 10-12-56.

**HYDRO-AIRE**

For Air Conditioning Units.
First use Nov. 1, 1955.

639,142. Hydro-Air Engineering, Inc., Kent, Ohio. SN 699,560. Filed P. R. 12-7-55. Am. S. R. 10-12-56.

**HYDRO-AIRE**

For Air Conditioning Units.
First use Nov. 1, 1955.

639,143. Hydro-Air Engineering, Inc., Kent, Ohio. SN 699,561. Filed P. R. 12-7-55. Am. S. R. 10-12-56.

**HYDRO-AIRE**

For Air Conditioning Units.
First use Nov. 1, 1955.

CLASS 16

PROTECTIVE AND DECORATIVE COATINGS

639,140. Iddings Paint Company, Inc., Long Island City, N. Y. SN 666,598. Filed P. R. 5-31-55. Am. S. R. 9-7-56.

PRO-TEEN

For Protein or Casein Paste Paint.
First use January 1953.

639,141. The Eagle-Picher Company, Cincinnati, Ohio. SN 667,770. Filed P. R. 11-7-55. Am. S. R. 9-4-56.

SPRAY-MASTIC

For Asphalt Emulsion Weather Coating for the Protection of Insulation and Structural Steel.
First use Aug. 24, 1955.

CLASS 19

VEHICLES

639,142. Griffith Rubber Mills, Portland, Oreg. SN 666,752. Filed P. R. 5-20-54. Am. S. R. 10-15-56.

Griffith RUBBER MILLS

For Automotive Rubber Goods—Namely, Bumpers and Marine Rubber Goods—Namely, Marine Fenders, Deck Mats, Rug Strips, Step Plates, Transom Pads, and Outboard Motor Bracket Feet.
First use September 1953.

639,143. Truckstell Manufacturing Co., Cleveland, Ohio. SN 669,597. Filed P. R. 6-15-55. Am. S. R. 10-1-56.

SWIVEL FRAME

For Truck Frames.
First use May 3, 1955.

CLASS 21

ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES

639,144. Electrical Fittings Corporation, Woodside, N. Y. SN 668,227. Filed P. R. 5-25-55. Am. S. R. 10-24-56.

SWING TOP

For Electrical Wiring Supplies and Accessories Therefor—Namely, Entrance Caps.
First use March 1955.

639,145. Miles, Incorporated, Minneapolis, Minn. SN 667,488. Filed P. R. 11-1-55. Am. S. R. 9-27-56.

MILES

For Electric Welding Machines.
First use Sept. 22, 1955.

CLASS 23

CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF

639,146. Irving Machinery Company, Inc., Philadelphia, Pa. SN 669,946. Filed P. R. 6-21-55. Am. S. R. 9-6-56.

PRESSURE PAK'D

For Meat Packaging and Pressure Sealing Machines, Sealing Clamps and Parts Thereof.
First use Mar. 1, 1954.

CLASS 26

MEASURING AND SCIENTIFIC APPLIANCES

639,147. Heat Timer Corporation, New York, N. Y. SN 669,224. Filed P. R. 6-9-55. Am. S. R. 8-1-56.

recorder + totalizer

For Tape Recording Machines for Measuring and Totaling Time Operations.
First use May 15, 1954.

CLASS 32

FURNITURE AND UPHOLSTERY

639,148. Hussmann Refrigerator Co., St. Louis, Mo. SN 1,873. Filed P. R. 2-1-56. Am. S. R. 10-18-56.

SHELF SERVICE

For Shelving, Particularly Adapted for Use in Super Markets and Other Food Stores.
First use Oct. 3, 1955.

CLASS 46

FOODS AND INGREDIENTS OF FOODS

639,149. Valley View Packing Co., Inc., San Jose, Calif. SN 667,652. Filed P. R. 5-16-55. Am. S. R. 8-10-56.

MITY-SWEET

For Dried Fruits.
First use Apr. 13, 1955.

639,150. Società in Accomandita Giuseppe Citterio, Milan, Italy. SN 692,021. Filed P. R. 7-27-55. Am. S. R. 7-25-56.

CITTERIO

The English translation of "Il Salame Famoso in Tutto il Mondo" is "the salami which is famous throughout the world." Owner of Italian Reg. No. 92,283, dated Oct. 31, 1949.
For Salamis.

639,151. The South Shore Packing Corporation, Vermilion, Ohio. SN 122. Filed P. R. 1-4-56. Am. S. R. 9-17-56.

The trademark consists of the word "Handi," the representation of a carpenter's square, and a square bottle.
For Food Products—Namely, Olives, Pickles, Table Syrups, Food Flavoring Extracts, and Jellies.
First use May 23, 1955.

639,152. Alagonia Importing Company, Worcester, Mass. SN 5,962. Filed 4-9-56.

ALAGONIA

For Pure Olive Oil for Food Purposes.
First use Aug. 15, 1953.

CLASS 51

COSMETICS AND TOILET PREPARATIONS

639,153. Estée Lauder, d. b. a. Estée Lauder Cosmetic Co., New York, N. Y. SN 693,465. Filed P. R. 8-22-55. Am. S. R. 8-28-56.

*WAKE UP...looking younger*

For Cosmetic Face Creams.
First use Aug. 30, 1952.
